ABSTRACT BOOK

Oral · Poster / E-Poster Presentations

XXIII. WORLD CONGRESS OF

OTORHINOLARYNGOLOGY HEAD AND NECK SURGERY

9 – 13 September 2026

Istanbul Congress Center · Istanbul, Türkiye

Innovation, Artificial Intelligence,
Global Diversity, and Education-Training

International Federation of Oto-Rhino-Laryngological Societies

XXIII. World Congress of Otorhinolaryngology Head and Neck Surgery

IFOSTANBUL 2026

September 9–13, 2026 · Istanbul Congress Center (ICC) · Istanbul, Türkiye

Main theme: Innovation, Artificial Intelligence, Global Diversity, and Education-Training

ABSTRACT BOOK

1433 oral · 767 poster / e-poster · 2200 abstracts

Editors

Prof. Özgür Yiğit — Congress President

Prof. Metin Önerci — Congress General Secretary and Scientific Committee Chair

Prof. Fazıl Necdet Ardıç — Scientific Committee Coordinator

EDITORIAL

The XXIII. World Congress of Otorhinolaryngology Head and Neck Surgery — IFOS 2026 Istanbul — is now behind us, and it was a great success. Colleagues from 131 countries came together in Istanbul for five days of lectures, round tables, symposia, instructional courses, free paper and poster sessions. We are grateful to everyone who made this possible: to the delegates who filled the halls and kept the discussion going, to the faculty who shared their experience so generously, and to everyone who worked behind the scenes to hold it all together.

This volume brings together the scientific work presented at the congress.

Every abstract printed here has travelled the same road: submitted by its authors, read and evaluated by the members of our scientific groups, and placed in the programme on the strength of that review. They come from every continent and from departments of very different size and resource, which is exactly what a world congress should look like. Some report large multicenter series; others describe a single instructive case, a first experience with a new technique, or a question that has not yet found its answer. All of them are part of how our specialty moves forward.

The abstracts appear in two parts, oral presentations first and poster presentations second, each grouped under the scientific track to which it was assigned. Within the book every abstract carries its own number — OP for oral, PP for poster — and these numbers are the ones used throughout the congress, so that a presentation can be found quickly from the scientific programme and referred to unambiguously afterwards. The scientific programme itself precedes the abstracts, arranged hall by hall across the five days of the congress.

Abstracts are published as submitted by their authors. Beyond formatting and the correction of obvious typographical errors, the scientific content, the wording, the terminology and the author information have been left untouched, and the responsibility for them remains with the authors.

We would like to thank the chairs, co-chairs, secretaries and members of our scientific committees, who read and evaluated thousands of submissions within a demanding timetable, and the congress secretariat, whose work turned all of this into a programme. Above all, we thank the authors. Without the work collected in these pages there would be no congress.

We would also like to thank our Treasurer, the members of the Local Organizing Committee, all members of the Scientific Committees, for their trust and support during three long and demanding years.

COMMITTEES

EXECUTIVE COMMITTEE

Özgür Yiğit — President
Metin Önerci — Scientific Committee Chair & General Secretary
Cem Uzun — Treasurer

LOCAL ORGANIZING COMMITTEE

Mustafa Gerek
Tayyar Kalcıoğlu
Bülent Topuz
Suat Turgut

SCIENTIFIC COMMITTEE COORDINATOR

Fazıl Necdet Ardıç, Türkiye

SCIENTIFIC COMMITTEES

Otology Group

Chair: Tayfun Kirazlı, Türkiye
Co-Chair: Armağan İncesulu, Türkiye
Secretary: Evren Hızal, Türkiye
Members: Tatsuya Yamasoba (Japan) · Manuel Manrique (Spain) · Chung Fu Dai (Republic of China) · Abdelhamid Benghalem (Morocco) · Neil Donnelly (United Kingdom) · Badr Eldin Mostafa (Egypt)
Sub Group – Endoscopic Ear Surgery: Ediz Yorgancılar, Türkiye

Audiology Group

Chair: Ahmet Ataş, Türkiye
Co-Chair: Didem Türkyılmaz, Türkiye
Secretary: Eyüp Kara, Türkiye
Members: Hung Thai-Van (France) · Louise Hickson (Australia) · Astrid van Wieringen (Belgium)

Equilibrium Group

Chair: O. Nuri Özgirgin, Türkiye
Co-Chair: Fazıl Necdet Ardıç, Türkiye
Secretary: Enis Alpin Güneri, Türkiye
Members: Joichi Ito (Japan) · Andrej Zarowski (Belgium) · Mans Magnusson (Sweden) · Oliver Profant (Czech Republic) · Leonardo Manzari (Italy)

Rhinology Group

Chair: Cem Meço, Türkiye
Co-Chair: Desidero Passali (Italy), Anderson Eloy (USA)
Secretary: Serdar Özer, Türkiye
Members: Melih Şahin (Türkiye) · Pavol Surda (United Kingdom) · Julio Heiniken (Paraguay) · Saad Al Saleh (Saudi Arabia) · Prepagaran Narayanan (Malaysia) · Ashutosh Kacker (India)

Cochlear Implant and Implantable Devices Group

Chair: Levent Sennaroğlu, Türkiye
Co-Chair: Abdulrahman Hagr, Saudi Arabia
Secretary: Serkan Orhan, Türkiye
Members: Levent Olgun (Türkiye) · Angel Ramos (Spain) · Clemence Chidziwa (Zimbabwe) · Thomas Lenarz (Germany) · Steven O'Leary (Australia)

Hearing Aids Group

Chair: Seyra Erbek, Türkiye

Co-Chair: Ayça Çiprut, Türkiye
Secretary: Serpil Mungan Durankaya, Türkiye
Members: Esra Yücel (Türkiye) · Sıdıka Cesur (Türkiye) · Bahar Çolpan (Türkiye) · Mark Laureyns (Belgium)

Allergy Group

Chair: Aslı Şahin Yılmaz, Türkiye
Co-Chair: Hideyuki Kawauchi, Japan
Secretary: Müge Özcan, Türkiye
Members: İlknur Haberal Can (Türkiye) · Berna Uslu Coşkun (Türkiye) · Ulugbek Khasanov (Uzbekistan) · Ralph Mösges (Germany) · Isam Alobid (Spain)

Facial Plastic Surgery Group

Chair: Taşkın Yücel, Türkiye
Co-Chair: Pamela Pol, Dominican Republic
Secretary: Özcan Çakmak, Türkiye
Members: Juan David Carvajal (Venezuela) · Hossam Foda (Egypt) · Fazıl Apaydın (Türkiye) · Ali Reza Mesbahi (Iran) · Jong Ju Jang (Korea) · Jose Carlos Neves (Portugal)

Sleep Group

Chair: Ozan Bağış Özgürsoy, Türkiye
Co-Chair: Maria Suurna, Estonia
Members: Murat Özcan (Türkiye) · Frederich Chabolle (France) · Joachim Maurer (Germany) · Shirinivas Kishore (India) · Uri Alkan (Israel) · Rudolfo Lugo Saldana (South America)

Head and Neck Oncology Group

Chair: Şefik Hoşal, Türkiye
Co-Chair: Johannes Fagan (South Africa), Nicolas Fakhry (France)
Secretary: Kürşat Gökcan, Türkiye
Members: Marco Piemonte (Italy) · Rashid Al-Abri (Oman) · Luiz Kowalski (Sao Paolo) · Pankaj Chaturvedi (India) · Sheng-Po Hao (Taiwan)

Sialendoscopy Group

Chair: Süleyman Özdemir, Türkiye
Co-Chair: Emad A. Magdy (Egypt), Rashid Al-Abri (Oman)
Secretary: Mazhar Çelikoyar, Türkiye
Members: Michael Koch (Germany) · Mark Marzouk (USA) · Gabriela Robaskewicz Pascoto (Brazil)

Phoniatrics Group

Chair: Haldun Oğuz, Türkiye
Co-Chair: Sevtap Akbulut, Türkiye
Secretary: Bengü Yaldız Çobanoğlu, Türkiye
Members: Tamer Mesallam (Egypt) · Ahmed Geneid (Finland) · Chadwan AlYaghci (United Kingdom) · Carlos Manzano (Mexico) · Khalid AlMalki (Saudi Arabia)

Laryngology Group

Chair: Ferhan Öz, Türkiye
Co-Chair: Kürşat Yelken, Türkiye
Secretary: Necati Enver, Türkiye
Members: Nupur Nerurkar (India) · Brian Dorman (New Zealand) · Marc Remacle (Luxembourg) · Hakan Birkent (Türkiye) · Markus Hess (Germany) · Esra Özcebe (Türkiye)

Swallowing Group

Chair: Kayhan Öztürk, Türkiye
Co-Chair: Hamdi Hakan Çoşkun, Türkiye
Secretary: Çiler Büyükatalay, Türkiye
Members: Ramil Hashimli (Azerbaijan) · Dinara Toguzbayeva (Kazakhstan) · Emel Çadallı Tatar (Türkiye) · Tamer Abou El Saad (Egypt) · Daniele Farneti (Italy) · Ana Danic Hadzibegovic (Croatia) · Seyhun Topbaş (Türkiye)

Pediatric ENT Group

Chair: Faruk Ünal, Türkiye
Co-Chair: Vincent Coulognier, France
Secretary: Erdinç Aydın, Türkiye
Members: Luisa Bellussi (Italy) · Alan Chang (Australia) · Talal Al Khatip (Saudi Arabia) · Mike Rutter (New Zealand) · Michael Kuo (United Kingdom) · Denis Katundu (Tanzania)

Young IFOS Group

Chair: Alperen Vural, Türkiye
Co-Chair: Francois Simon, France
Secretary: Özlem Önerci Çelebi, Türkiye
Members: Ahmad Aldhafeeri (Saudi Arabia) · Shazia Peer (South Africa) · Hazan Başak (Türkiye) · Mussayev Abdukhalil (Uzbekistan) · Deborah Pazinatto (Brazil)

Global Outreach Group

Chair: Cemal Cingi, Türkiye
Co-Chair: Thierry Mom, France
Secretary: Süha Beton, Türkiye
Members: Tran P Ch Thuy (Vietnam) · Vincent Cousins (Australia) · Milan Profant (Slovakia) · Orhan Özturan (Türkiye) · Hussein Alrand (United Arab Emirates) · Per Caye Thomasen (Denmark) · Hesham Negm (Egypt)

Transverse Activities: Innovation, Basic Research, Education Group

Chair: İlter Denizoğlu, Türkiye
Co-Chair: Bernard Fraysse, France
Secretary: Erdoğan Bulut, Türkiye
Members: Wu Hao (China) · Mehmet İlhan Şahin (Türkiye) · Cüneyt Orhan Kara (Türkiye) · Fatih Turgut (Türkiye) · Pawel Golusinski (Poland) · Simel Ayyıldız (Türkiye) · Süreyya Şeneldir (Türkiye)

PARTICIPATING COUNTRIES

Delegates came to IFOS 2026 Istanbul from 131 countries

Afghanistan
Albania
Algeria
Antigua and Barbuda
Argentina
Armenia
Australia
Austria
Azerbaijan
Bahrain
Bangladesh
Belarus
Belgium
Belize
Bolivia
Bosnia and Herzegovina
Brazil
Bulgaria
Canada
Chile
China
Colombia
Costa Rica
Croatia
Czechia
Denmark
Dominican Republic
Dutch Antilles
Ecuador
Egypt
El Salvador
Equatorial Guinea
Estonia
Ethiopia
Finland
France
Georgia
Germany
Ghana
Greece
Guatemala
Guinea
Honduras
Hong Kong
Hungary
Iceland
India
Indonesia
Iran
Iraq
Ireland
Israel
Italy
Jamaica
Japan
Jordan
Kazakhstan
Kenya
Kosovo
Kuwait
Kyrgyzstan
Latvia
Lebanon
Libya
Lithuania
Luxembourg
Macedonia
Malaysia
Mali
Malta
Mauritania
Mexico
Moldova
Mongolia
Montenegro
Morocco
Mozambique
Nepal
Netherlands
New Zealand
Nicaragua
Nigeria
North Cyprus
Norway
Oman
Pakistan
Palestine
Panama
Paraguay
Peru
Philippines
Poland
Portugal
Qatar
Romania
Russia
Rwanda
Saudi Arabia
Senegal
Serbia
Singapore
Slovakia
Slovenia
Somalia
South Africa
South Cyprus
South Korea
Spain
Sri Lanka
Sudan
Sweden
Switzerland
Syria
Taiwan
Tajikistan
Tanzania
Thailand
Tunisia
Türkiye
Turkmenistan
Uganda
Ukraine
United Arab Emirates
United Kingdom
United States
Uruguay
Uzbekistan
Venezuela
Vietnam
Yemen
Zimbabwe

Participating countries shown in blue. Some small states are not visible at this scale.

SCIENTIFIC PROGRAMME

September 9–13, 2026 · Istanbul Congress Center

TRACK COLOURS

- Cochlear Implants and implantable devices
- Hearing Aids
- Rhinology
- Allergy
- Facial Plastic Surgery
- Sleep Medicine
- Head and Neck Oncology
- Laryngology
- Phoniatrics
- Swallowing
- Pediatric Otolaryngology
- Yo-IFOS (Young IFOS)
- Global Outreach (Regional or ENT related Organizations Symposia)
- Transverse activities (Innovation, Basic Research, Education)
- Sialendoscopy
- Equilibrium
- Otology/Neurotology
- Ceremony
- Industrial
- Notable Abstracts
- Audiology

HALLS

56 halls · 2062 sessions · 9–13 September 2026

3D Course // 3B - 30 1
Audiology 1 · ICC - B3 Floor - 3B/68 36
Audiology 2 · ICC - B3 Floor - 3B/61 37
B2 Floor // ICC 5
Dissection Hall · ICC - B2 Floor - Maçka 20
Equilibirium 3 · ICC - B3 Floor - 3B/16 52
Equilibrium 2 · ICC - B2 Floor - Hamidiye 43
Equlibirium 1 · ICC - B2 Floor - Üsküdar 1 38
Facial Plastic 1 · ICC - B2 Floor - Çamlıca 86
Facial Plastic 2 · ICC - B3 Floor - 3B/01 75
Facial Plastic 3 · Hilton - Ambassador Hall 55
Facial Plastic 4 · ICC - B3 Floor - 3B/22 45
Free Paper Hall 1 · ICC - B3 Floor - 3B/07 19
Free Paper Hall 2 · ICC - B3 Floor - 3B/08 20
Free Paper Hall 3 · ICC - B3 Floor - 3B/67 21
Free Paper Hall 4 · ICC - B3 Floor - 3B/69 19
Free Paper Hall 5 · ICC - B3 Floor - Glazed 1 21
Free Paper Hall 6 · ICC - B3 Floor - Glazed 2 21
Free Paper Hall 7 · ICC - B3 Floor - Glazed 3 20
Free Paper Hall 8 · ICC - B3 Floor - Glazed 4 22
Head & Neck 1 · ICC - B2 Floor - Üsküdar 2 37
Head & Neck 2 · Hilton - Connie 3 39
Head & Neck 3 · ICC - B3 Floor - 3B/38 56
Head & Neck 4 · ICC - B3 Floor - 3B/03 55
Head n Neck 1 - ICC 3B/01 8
Hearing Aids · ICC - B3 Floor - 3B/02 57
Hearing Implant 1 · ICC - B2 Floor - Üsküdar 3 34
Hearing Implant 2 · ICC - B3 Floor - 3B/70 35
Hearing Implant 3 · ICC - B3 Floor - 3B/66 41
Hum+ Trverse+Global 2 · ICC - B3 Floor - 3B/10 30
Hum+Trverse+Global 1 · ICC - B3 Floor - 3B/11 37
ICC - Main Entrance 1

3D COURSE // 3B - 30

Istanbul Congress Center

Saturday, 12 September 2026

09:00–11:50 **3D Biomodeling and Temporal Bone Dissection Workshop**

Transverse activities (Innovation, Basic Research, Education) · Dissection *Ayşegül Batıoğlu Karaaltın; Özlem Saatci*

AUDIOLOGY 1

ICC - B3 Floor - 3B/68

Wednesday, 9 September 2026

14:00–14:40 **Syndromic Hearing Losses And Treatment Options**

Audiology · Panel Presentation *Isabelle Mosnier; Yesim Oruc; Züleyha Dilek Gülmez*

14:40–15:00 **Audiology In Differential Diagnosis**

Audiology · Panel Presentation *Erva Değirmenci Uzun; Belde ÇULHAOĞLU*

15:00–16:00 **How To Manage Tinnitus Patients: A Practical Guide For Clinicians**

Audiology · Instructional Course *Mevlude ISIK; Gözde Bayramoğlu Çabuk; Ayberk Aydın Tunç; Aysun Parlak Kocabay*

16:30–17:30 **“Dual Deficits In Inner Ear Malformations: Auditory And Vestibular Perspectives”**

Audiology · International Symposia *Nadia kamal; Nagwa Hazzaa; Hesham Taha; Shehata-Dieler, Wafaa; Nithreen Said;; Soumit Dasgupta*

17:30–18:00 **Single Side Deafness-Biomarkers And Treatment-Rehabilitation Options For Unilateral Hearing Loss.**

Audiology · Keynote Lecture *Artur Lorens; Vincent Van Rompaey*

Thursday, 10 September 2026

07:30–07:45 **Vestibular Implantation Of The Saccule: Impact On Residual Hearing**

Audiology · Remarkable Presentation *Andy Beynon; Burak Kabiş*

07:45–08:00 **Auditory And Speech Rehabilitation Of Children After Cochlear Implantation**

Audiology · Remarkable Presentation *Mukhlisa Abdukamilova; Halide Çetin Kara*

08:00–09:00 **The Importance Of Hearing In Developing Countries, Overcoming Resistance To Hearing Aids, And Normalizing The Use Of Hearing Aids**

Audiology · Round Table *Carolina Der; Amarilis Menendez; Meral Didem Türkyılmaz; Aderinola Olopade;; Mark Laureyns*

09:00–10:00 **Global Outcomes In Newborn Hearing Screening**

Audiology · Panel Presentation *Ahmet Atas; Katrin Neumann; Carolina Der*

10:45–11:15 **Assessment Of Suprathreshold Auditory Processing In Clinical Audiology**

Audiology · Instructional Course *Mustafa Yüksel; Atılım ATILGAN*

11:15–11:45 **Audiological And Otologic Evaluation In First Year Of Life**

Audiology · Panel Presentation *Okan Öz; Züleyha Dilek Gülmez; Yesim Oruc*

11:45–12:45 **Auditory Electrophysiological Approaches To Hearing Loss**

Audiology · Panel Presentation *Rışvan Deniz; Nazlı Akkaya Kurt; Piotr Henryk Skarzynski; Sıdıka Cesur Çoskun*

14:00–15:00 **Puretone Tests And Beyond In Audiological Evaluations Of Middle Ear Pathologies-Points To Consider In Audiological Evaluations For Middle Ear Pathologies**

Audiology · Panel Presentation *Nadir Yıldırım; SUELA SALLAVACI; dugagjin spanca; Bilgehan Böke; Yağmur Ünal*

15:00–16:00 **Listening Effort- Psychophysiological Measures In Listening Effort Research**

Audiology · Panel Presentation *Samet Kılıç; Oğulcan Gündoğdu*

16:30–18:00 **Audiology Education; What Does General Audiologist Mean?**

Audiology · Continental or International Societies Sessions *Ahmet Atas; Norbert Dillier; Piotr Henryk Skarzynski*

Friday, 11 September 2026

07:00–07:15 **PATHOPHYSIOLOGICAL MECHANISMS OF TINNITUS: AN UPDATE AND HOW TO OBTAIN THE GOLD STANDARD TREATMENT?**

Audiology · Remarkable Presentation *Pelin Pıştav AKMEŞE*

07:15–07:45 **The Role Of Wideband Tympanometry In Predicting The Degree Of Hearing Loss In Children With Otitis Media With Effusions**

Audiology · Instructional Course *Pelin Pıştav AKMEŞE; Leigh Martin*

07:45–08:15 **From Resistance To Redirection: Review Of Artificial Intelligence In Audiology; A Judo-Inspired Strategy**

Audiology · Keynote Lecture *Reham Elrashidy; Pelin Pıştav AKMEŞE*

08:15–09:00 **What Can We Learn By Applying Workers’ Hearing Screening To The Elderly?**

Audiology · Panel Presentation *Yasue Uchida; Bulent Şerbetçioğlu; Günay KIRKIM*

09:00–09:30 **Rethinking Hearing Aid Prescription: Artificial Intelligence Application In Next-Generation NAL-NL3 Fitting System**

Audiology · Keynote Lecture *Paola Incerti; Eyyup KARA*

09:30–10:00 **Audiology Notable Abstract Session**

Notable Abstracts · Notable Abstract *Vincent Van Rompaey*

10:45–11:45 **Status And Development Of Equipment (Innovation And AI) For Auditory Implants; Software And Connectivity Equipment**

Audiology · Panel Presentation *Artur Lorens; Ahmet Atas; Angel Ramos de Miguel*

11:45–12:45 **Electrophysiology & Auditory Evoked Potentials**

Audiology · Panel Presentation *Michael Soganov; Ahmet Atas; Mehmet YARALI*

14:00–15:00 **Listening With The Brain: Neuroplasticity-Based Approaches In Auditory Rehabilitation**

Audiology · Panel Presentation *Doris-Eva Bamiou; Esra YÜCEL; Halide Çetin Kara; Özlem İçöz*

16:30–17:00 **Patient And Family-Centered Speech-Language Pathology And Audiology**

Audiology · Keynote Lecture *Ahmet Atas; Esra Özcebe*

17:00–18:00 **Sister Disorders Of The Inner Ear:A Unified Clinical Approach To Hearing And Balance**

Audiology · International Symposia *Hesham Kozou; Büşra Altın*

Saturday, 12 September 2026

07:30–08:30 **Assessment Of Central Auditory Processing And Audiotory Cognitive Training**

Audiology · Panel Presentation *Büşra Nur Eser; Bulent Şerbetçioğlu; Mazen El-Banna*

08:30–09:00 **The Effect Of Personality Chracateristics On The Effectiveness Of Group Cognitive Psychotherapy Treatment For Tinnitus**

Audiology · Keynote Lecture *Beáta Bencsik; Bülent Gündüz*

09:00–09:30 **Hearing System: Hearing Aid System And Connectivity Equipment related to success at work**

Audiology · Keynote Lecture *Mark Laureyns; Meral Didem Türkyılmaz*

09:30–10:00 **Big Data In Audiology**

Audiology · Keynote Lecture *Hung THAI-VAN; Ahmet Atas*

10:45–11:45 **Hearing Health Equity: Global Perspectives On Access To Auditory Rehabilitation**

Audiology · Panel Presentation *Esra YÜCEL; Sadie Hardison*

11:45–12:15 **Electrophysiological Measures In Cochlear Implantation**

Audiology · Keynote Lecture *George Tavartkiladze; Ahmet Atas*

12:15–12:45 **User-Operated Audible Contrast Threshold (U-ACT): An Automated Approach To Assessing Aided Speech-In-Noise Performance**

Audiology · Instructional Course *Leigh Martin; Eyyup KARA*

14:00–15:00 **Lifelong Balance Disorders And Approach**

Audiology · Panel Presentation *Gulce Kirazli; Burak Kabiş; Tuğba Yılmaz; Sanem Can Sarıoğlu*

15:00–16:00 **Multimodal Plasticity To Tinnitus And Hyperacousis**

Audiology · Panel Presentation *Shi Nae Park; Ayça Çiprut; Ayberk Aydın Tunç*

16:30–17:15 **Audiotory Perception In Individuals With Listening Difficulties**

Audiology · Panel Presentation *Hatice Merve Yücel; Meral Didem Türkyılmaz*

AUDIOLOGY 2

ICC - B3 Floor - 3B/61

Wednesday, 9 September 2026

14:00–14:30 **Speech Auditory Brainstem Response (Sabr): A Valuable Tool For Predicting Auditory Rehabilitation Training In Cochlear Implant Recipients**
Audiology · Instructional Course *Meral Didem Türkyılmaz*

14:30–15:00 **Effective Implementation Of Wideband Tympanometry (WBT)**
Audiology · Instructional Course *Meral Didem Türkyılmaz; Laura Prigge*

15:00–16:00 **Chemical Exposure And Auditory Dysfunction: Evidence, Challenges, And Prevention Strategies**
Audiology · Round Table *Adrian Fuente; Thais C. Morata; Benoit Pouyatos*

16:30–17:30 **Advanced Electrophysological Studies In Audiology (Fnirs- Pupilometry, EEG Testing)**
Audiology · Instructional Course *Meral Didem Türkyılmaz; Oğulcan Gündoğdu; Samet Kılıç*

17:30–17:45 **Machine-Learning–Driven AI For Rapid Brain-Response-Based Hearing Assessment In Hard To Test Populations**
Audiology · Remarkable Presentation *Meral Didem Türkyılmaz; Timothee Guyonnet Hencke*

17:45–18:00 **Cochlear Implants In Developing Countries: Challenges And Innovations**
Audiology · Remarkable Presentation *Meral Didem Türkyılmaz*

Thursday, 10 September 2026

08:00–09:00 **Cochlear Implants Are Not Enough: What Makes A Rehabilitation Program Truly Successful?**
Audiology · Panel Presentation *Mukhlisa Abdukamilova; Merve Torun Topçu; Nedim TURGUT; Aysun Parlak; Kocabay; Yağmur Ünal*

09:00–10:00 **Audiological Management Of Congenital CMV Infection: Current Trends And Future Perspectives**
Audiology · Round Table *Belde ÇULHAOĞLU; Çağıl Gökdoğan; Ayça Çiprut*

10:45–11:45 **Audiological Aspects Of Auditory Implants: Current Status And Developments**
Audiology · Panel Presentation *Martin Kompis; Norbert Dillier; Adrien A. Eshraghi; Tayyar Kalcıoğlu*

11:45–12:15 **Comprehensive Audiometric Assessment And The Relationship Between Specific Auditory Parameters**
Audiology · Keynote Lecture *Oliver Profant*

12:15–12:45 **Restoring Hearing In Pediatric Audiology**
Audiology · Instructional Course *Yesim Oruc; Ergin Eroğlu*

14:00–15:00 **Newborn Hearing Screening Programs Worldwide**
Audiology · Panel Presentation *Michael Tong; Birkena Qirjazi; Yusuf Kemal Kemaloğlu*

15:00–15:30 **Understanding Oto-Acoustic Emissions – An Easy And Intuitive Introduction**
Audiology · Instructional Course *Martin Kompis; Ahmet Atas*

15:30–16:00 **The Outcomes Of Cochlear Implantation In Children And Adults With Single-Sided Deafness (SSD)**
Audiology · Keynote Lecture *Bülent Gündüz; Artur Lorens*

16:30–17:30 **Hearing, Cognition And Auditory Processing**
Audiology · Round Table *Doris-Eva Bamiou; Büşra Nur Eser; Esra Özcebe; Nicholas Reed; Birgul Gumus*

17:30–17:45 **Current Approaches To Presbyacusis. Mini-Study Regarding Hearing Aid Compliance And Usage Rates Among Patients With Presbycusis**
Audiology · Remarkable Presentation *Meltem Demirdağ Çevikkan; Talha Çögen*

17:45–18:00 **Hidden Hearing Loss**
Audiology · Remarkable Presentation *Nilüfer Bal; Merve Ozbal Batuk*

Friday, 11 September 2026

07:15–07:30 **Early Outcomes Of The CI Program In Albania**
Audiology · Remarkable Presentation *Birkena Qirjazi; Bülent Gündüz*

07:30–08:00 **The Development And Clinical Implementation Of The Manu-IRU Stimuli For Measurement Of Aided Cortical Responses**
Audiology · Instructional Course *Michael East; Eyyup KARA*

08:00–09:00 **E-Health, Tele-Audiology**
Audiology · Panel Presentation *De Wet Swanepoel; Duygu Hayır Şenkaya*

09:00–10:00 **World Health Organization-Make Listening Safe**
Audiology · International Symposia *Angel Ramos de Macias; Amarilis Menendez; Carolina Der; Mark Laureyns;; Aderinola Olopade*

10:45–11:45 **Contemporary Issues In Assessment Of Spatial Listening**
Audiology · Round Table *Wafaa El Kholy; Dalia Hassan; Somia Tawfik; Sevgi Kadihanoglu*

11:45–12:45 **Artificial Intelligence Technologies For Clinical Decision In Hearing Health**
Audiology · Panel Presentation *Piotr Henryk Skarzynski; Talha Çögen; Berna Özge MUTLU*

14:00–15:00 **Noise Exposure And Hearing Protection Programs**
Audiology · Panel Presentation *Thais C. Morata; Sefa Dereköy; Adrian Fuente; Carolina Der*

15:00–15:30 **Beyond the Clinic: Transforming Hearing Aid Provision in Underserved Populations**
Audiology · Keynote Lecture *De Wet Swanepoel; Meral Didem Türkyılmaz*

15:30–16:00 **Childhood Screening**
Audiology · Keynote Lecture *Eyyup KARA; Ecem Savaş*

16:30–17:00 **The Interactions Of Hearing Sensitivity And Auditory Processing Skills With Cognition**
Audiology · Keynote Lecture *Doris-Eva Bamiou; Martin Kompis*

17:00–18:00 **Hearing Attention In Children With Unilateral Hearing Loss With And Without Hearing Aids**
Audiology · Panel Presentation *Francesca Yoshie Russo; Günay KIRKIM; Betül Çiçek Çınar*

Saturday, 12 September 2026

07:00–08:00 **Ifastsrt50 - A New National Multicenter Proposal Of Audiologic Pre- Surgical Evaluation**
Audiology · Panel Presentation *Italo Cantore; Samet Kılıç; Mehmet YARALI*

08:00–09:00 **Hidden Contributors To Cognition: The Overlooked Role Of Vestibular And Auditory Dysfunction**
Audiology · Panel Presentation *Nizamettin Burak Avcı; Hung THAI-VAN; Melda Acar*

09:00–10:00 **Meniere's disease**
Audiology · Round Table *Enis Alpin Güneri; Onur Çelik; Nizamettin Burak Avcı*

10:45–11:45 **Central Auditory Encoding In Cochlear Implant Users**
Audiology · Panel Presentation *Mehmet YARALI; Samet Kılıç; Norbert Dillier; Elçin Orçan*

11:45–12:45 **Contemporary Management Of Tinnitus**
Audiology · Panel Presentation *Mariko Takahashi; Ana Carolina Binetti; Hatice Merve Yücel; Erdogan Bulut*

14:00–14:40 **Current Approaches In Behavioral Hearing Threshold Estimation Methods**
Audiology · Keynote Lecture *Seval Ceylan*

15:00–15:30 **Barriers And Enablers To Referral Of Older Adults To Hearing Care**
Audiology · Panel Presentation *Sadie Hardison; Halide Çetin Kara; Gonca Sennaroğlu*

16:30–17:00 **Auditory Threshold Estimation In Children: Advanced Physiologic Strategies And Clinical Considerations**
Audiology · Instructional Course *Yesim Oruc; Züleyha Dilek Gülmez*

17:00–17:30 **The Potential Biomarker In Assessing Cochlear Synaptopathy: Evidence From Animal And Human Studies**
Audiology · Instructional Course *Pelin Kocdor; Nilüfer Bal*

B2 FLOOR // ICC

Istanbul Congress Center

Thursday, 10 September 2026

07:30–07:40 **A Science & Art Exhibiton**

Cochlear Implants and implantable devices · Panel Presentation *Yusuf Kemal Kemaloğlu*

Saturday, 12 September 2026

07:00–10:00 **Phoneme Sculptures Three-Dimensional Models of Turkish Phonemes & A History of Visualizing Sound . Voice . Speech**

Audiology · Continental or International Societies Sessions

10:45–12:45 **Phoneme Sculptures Three-Dimensional Models of Turkish Phonemes & A History of Visualizing Sound . Voice . Speech**

Audiology · Continental or International Societies Sessions

14:00–16:00 **Phoneme Sculptures Three-Dimensional Models of Turkish Phonemes & A History of Visualizing Sound . Voice . Speech**

Audiology · Continental or International Societies Sessions

16:30–18:00 **Phoneme Sculptures Three-Dimensional Models of Turkish Phonemes & A History of Visualizing Sound . Voice . Speech**

Audiology · Continental or International Societies Sessions

DISSECTION HALL

ICC - B2 Floor - Maçka

Wednesday, 9 September 2026

13:30–13:40 **Tuesday 08:30-13:00 Head Neck UltrasonographyCourse**
Sialendoscopy · Dissection *Suleyman Ozdemir*

13:40–13:50 **Tuesday 14:00-18:00 Sialendoscopy Course Part 1**
Sialendoscopy · Dissection *Suleyman Ozdemir*

13:50–14:00 **Wednesday 8:00-12:00 Sialendoscopy Course Part 2**
Sialendoscopy · Dissection *Suleyman Ozdemir*

14:00–14:30 **Opening Remarks, General Information About Sialendoscopy, And A Salutation To The Founders Of Sialendoscopy**
Sialendoscopy · Keynote Lecture *Suleyman Ozdemir; Emad Magdy*

14:30–15:00 **Evolution And Current Scope Of Diagnostic And Interventional Sialendoscopy/Ethical Principles**
Sialendoscopy · Keynote Lecture *MICHAEL KOCH; Emad Magdy*

15:00–16:00 **An Introduction To Sialendoscopy**
Sialendoscopy · Round Table *Gabriela Robaskewicz Pascoto; Gokhan Altin; Bini Faizal; Carlos Chiesa-Estomba;; Rashid Al Abri*

16:30–17:00 **Ductal Anatomy**
Sialendoscopy · Instructional Course *Ozlem Onerci Celebi; Salma Alsheibani; Rashid Al Abri*

17:00–17:30 **Imaging Of The Salivary Glands And Ducts: A Practical Overview**
Sialendoscopy · Instructional Course *Hesham Zoheir; Rashid Al Abri*

17:30–18:00 **Medical Aspects Of Sialendoscopy**
Sialendoscopy · Controversies *Cengiz Ozcan; Carlos Chiesa-Estomba; Giulianno Molina de Melo*

Thursday, 10 September 2026

08:30–10:00 **Endoscopic Sinus Surgery: Essential Corridors & Surgical Landmarks**
Rhinology · Dissection *Metin Onerci; Meryem Nesil Keles Türel*

10:45–11:45 **Approaches to the Frontal Sinus**
Rhinology · Dissection *Davide Mattavelli; Uygar DEMIR*

11:45–12:45 **Endoscopic Anterior Skull Base: Transcribriform Approach**
Rhinology · Dissection *Shazada Ahmed; lütfi barlas aydoğan*

14:00–15:00 **Beyond the Maxillary Sinus: Pterygopalatine & Infratemporal Corridors**
Rhinology · Dissection *Marco Ferrari; Alperen Vural*

15:15–16:00 **Skull Base Reconstruction & Skull Base Corridors**
Rhinology · Dissection *Benjamin Verillaud; Suha Beton*

Friday, 11 September 2026

08:30–10:00 **TEMPORAL BONE DISSECTION: 1. Endoscopic Middle Ear Anatomy (BM)- 2. Endoscopic Ossiculoplasty (AÖ)- 3. Endoscopic Atticotomy (EY)**
Cochlear Implants and implantable devices · Dissection *Suat TURGUT; Mohamed Badr-El-Dine; Ediz Yorgancılar; Ali Özdek; Tayfun Kirazlı;; Emine Deniz Gözen*

10:45–12:45 **TEMPORAL BONE DISSECTION: 1. Mastoidectomy (EAG)- 2. Endolymphatic Suc Surgery (JK)- Posterior Tympanotomy and CI (CCW)- Facial Nerve Decompression (KSO)**
Cochlear Implants and implantable devices · Dissection *Kadir Serkan Orhan; Enis Alpin Güneri; Ja-Won Koo; Chen-Chi Wu; OSMAN NURİ; ÖZGİRGİN; Emre Ocak; Doğan Çakan*

14:00–16:30 **TEMPORAL BONE DISSECTION: 1. Middle Fossa Approach (SA)- 2. Labrynthectomy (CD) 3. Translab and Transcochlear Approach**
Cochlear Implants and implantable devices · Dissection *Chunfu Dai; Yıldırım Bayazıt; Hakan Tutar; Simon I Angeli; Said Sönmez*

Saturday, 12 September 2026

08:30–10:00 **Master cadaver dissection for rhinoplasty**
Facial Plastic Surgery · Dissection *Sam Most; Fazıl Apaydın*

10:45–12:45 **Master cadaver dissection for aging face**
Facial Plastic Surgery · Dissection *Özcan Çakmak; Kerem Sami Kaya*

14:00–16:00 **Master cadaver dissection for local flaps**

Facial Plastic Surgery · Dissection *Sam Most; Fazıl Apaydın*

EQUILIBIRIUM 3

ICC - B3 Floor - 3B/16

Wednesday, 9 September 2026

16:30–16:45 **Virtual Reality-Based Vestibular Rehabilitation In Patients With Peripheral Vestibular Hypofunction**
Equilibrium · Remarkable Presentation *Yuşa Başoğlu; Murat Haluk Özkul*

16:45–17:00 **Benign Positional Vertigo**
Equilibrium · Remarkable Presentation *Mehmet Birol Uğur; Murat Haluk Özkul*

17:00–17:15 **Benign Paroxysmal Positional Vertigo (BPPV) Management**
Equilibrium · Remarkable Presentation *Murat Haluk Özkul*

17:15–17:30 **The Efficacy Of Automated Repositioning Chair In Refractory Benign Paroxysmal Positional Vertigo-A Pilot Study**
Equilibrium · Remarkable Presentation *Murat Haluk Özkul*

17:30–17:45 **Endoscopic Underwater Superior Semicircular Canal Occlusion: A Minimally Invasive Approach For Superior Canal Dehiscence Syndrome**
Equilibrium · Remarkable Presentation *Murat Haluk Özkul; hasan demırhan*

17:45–18:00 **Clinical Relevance Of Saccadometry In Vestibular Balance And Central Compensation**
Equilibrium · Remarkable Presentation *Murat Haluk Özkul; Gokce SAYGI UYSAL*

Thursday, 10 September 2026

07:00–07:30 **Vestibular Problems In Pediatric Otological Surgery**
Equilibrium · Instructional Course *Antonio Della Volpe; Ceren Karaçaylı*

07:30–08:00 **Management Of Chronic , Recurrent Small Particle BPPV**
Equilibrium · Instructional Course *Ahmad Alamadi; Ali Özdek*

08:00–08:30 **Central Eye Movement Disorders**
Equilibrium · Instructional Course *Soumit Dasgupta; Ali Özdek*

08:30–09:00 **BPPV Challenging Cases**
Equilibrium · Instructional Course *Ali Özdek*

09:00–09:30 **Horizontal Canal BPPV Revisited**
Equilibrium · Keynote Lecture *Enis Alpin Güneri; Armağan İncesulu*

10:45–11:15 **Emerging Role Of CGRP Antagonists In Vestibular Migraine**
Equilibrium · Instructional Course *Vishal Pawar; Nesibe Gül Yüksel Aslıer*

11:15–11:45 **Bedside Examination In Patients With Vestibular Symptoms**
Equilibrium · Instructional Course *Onur Çelik; Nesibe Gül Yüksel Aslıer*

11:45–12:15 **VIRTUAL REALITY : A Major Innovation For Vestibular Rehabilitation**
Equilibrium · Instructional Course *Franck Assaban; Nesibe Gül Yüksel Aslıer*

12:15–12:45 **Suppression Head Impulse Test In Children-Experiences In A Tertiary Paediatric Vestibular Centre**
Equilibrium · Keynote Lecture *Sudhira Ratnayake; Nesibe Gül Yüksel Aslıer*

14:00–14:30 **The Otolith Tests And Their Functional Relevance**
Equilibrium · Instructional Course *Michel Lacour; Kemal Görür*

14:30–15:00 **Gaze-Dependent Modulation Of Vertical And Torsional Nystagmus: A Video-Based Clinical Observation**
Equilibrium · Keynote Lecture *Kemal Görür; Halil Erdem Özel*

15:00–15:30 **The Dizzy Patient In The ER**
Equilibrium · Instructional Course *Badr Eldin Mostafa; Kemal Görür*

15:30–16:00 **Proposed Diagnostic Criteria For Definite Isolated Otolith Dysfunction**
Equilibrium · Keynote Lecture *Myung-Whan Suh; Kemal Görür*

16:30–17:00 **Clinical Application Of Hydrops MRI**
Equilibrium · Keynote Lecture *Yi-Ho Young; Alper Özdilek*

17:00–17:30 **Vestibular Imaging Updates “Indications, Interpretation And Cost- Effectiveness Analysis”**
Equilibrium · Instructional Course *Mahmoud Mandour; Alper Özdilek*

17:30–18:00 **A New Type Of Third Window Lesion: Vestibular Aqueduct Dehiscence With Hyperpneumatized Air Cells**
Equilibrium · Instructional Course *Sawsan Abuzaid; Alper Özdilek*

Friday, 11 September 2026

07:00–07:30 **Augmented Reality In Vestibular Rehabilitation, 10 Years Experience**
Equilibrium · Keynote Lecture *Dimitris Kikidis; Gülin Gökçen Kesici*

07:30–08:00 **Vestibular Testing And Therapy In The Pediatric Population: Virtual Reality, Gene Therapy, And Vestibular Implantation**
Equilibrium · Keynote Lecture *Jacob Brodsky; Gülin Gökçen Kesici*

08:00–08:30 **HINTS Protocol For Daily And Quick Use In General ENT**
Equilibrium · Keynote Lecture *Gülin Gökçen Kesici; Anis Bouazzaoui*

08:30–09:00 **Positional Vestibular Migraine: A Distinct Clinical Entity**
Equilibrium · Instructional Course *Vishal Pawar; Alain Thiry; Gülin Gökçen Kesici*

09:00–09:30 **Galvanic Vestibular Stimulation**
Equilibrium · Instructional Course *Anna Paula Batista de Ávila Pires; Gülin Gökçen Kesici*

09:30–10:00 **Vestibular Migraine: Clinical Challenges And Opportunities For Multidisciplinarity -**
Equilibrium · Keynote Lecture *Leonel Luis; Gülin Gökçen Kesici*

10:45–11:45 **IAOHNS Session: Decision Making In The Grey Zone: When There Is No Single Right Answer**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *P. Vijaya Krishnan; Mohan Kameswaran; Gautam Khaund; Sandeep Bansal; Paresh; Pramod Naik*

11:45–12:15 **Provocative Tests In Videonystagmography**
Equilibrium · Instructional Course *Alfarghal Mohamad; Bahar çolpan*

12:15–12:45 **Vestibular Neuritis And Multifrequency Tests**
Equilibrium · Instructional Course *Enrico Armato; Bahar çolpan*

14:00–16:00 **Equilibrium Free Papers 2**
Equilibrium · Free Paper Session *Gözde Günay*

16:30–17:00 **Eye Movements For Vestibular Physicians**
Equilibrium · Instructional Course *Pradeep Vundavalli; Bahar çolpan*

17:00–17:30 **Vestibular Dysfunction In Athletes: The Hidden Impact On Performance, Balance And Return To Sport**
Equilibrium · Keynote Lecture *Bahar çolpan; Pierre Merheb*

17:30–18:00 **Radiation Therapy For The Treatment Of Vestibular Schwannoma: A Critical Evaluation**
Equilibrium · Keynote Lecture *Marc Bassim; Armağan İncesulu*

Saturday, 12 September 2026

07:00–07:30 **An Obliterated Semicircular Canal And Still Functioning Vestibular Perception. A Comprehensive Explanation Of The Phenomenon.**
Equilibrium · Keynote Lecture *Georgi Kukushev; Burak Ömür Çakır*

07:30–08:00 **Diagnosis Of Vestibular Migraine Beyond The Published Diagnostic Criteria**
Equilibrium · Keynote Lecture *Alfarghal Mohamad; Burak Ömür Çakır*

08:00–08:30 **Essential Differences In Vestibular Rehabilitation Strategies Imposed By Various Types Of Bilateral Areflexia And Hyporeflexia (Cogan, CANVAS, Ototoxicity, Etc.)"**
Equilibrium · Instructional Course *Voda Ioana Alexandra; Burak Ömür Çakır*

08:30–09:00 **Vestibular Rehabilitation: Expectations And Fulfillment**
Equilibrium · Keynote Lecture *Zdeněk Čada; Burak Ömür Çakır*

09:00–09:15 **The VCD Score: A Biomarker-Based Tool For BPPV Risk Stratification And Seasonal Variation In The Gulf Region: A Case-Control Study**
Equilibrium · Remarkable Presentation *Burak Ömür Çakır; Iman Ibrahim*

09:15–09:30 **Anterior Canal BPPV**
Equilibrium · Remarkable Presentation *Burak Ömür Çakır*

09:30–09:45 **Positional Nomenclature Using Repositioning Chair**
Equilibrium · Remarkable Presentation *Burak Ömür Çakır; Haider W. Alsarhan*

10:45–11:15 **Hyperventilation Induced Nystagmus In The Early Stage Of Acute Unilateral Vestibulopathy**
Equilibrium · Instructional Course *Luigi Califano; Nadir Yıldırım*

11:15–11:45 **Horizontal Canal BPPV - Tips And Tricks**
Equilibrium · Instructional Course *Haider W. Alsarhan; Nadir Yıldırım*

12:15–12:45 **Acute Vestibular Syndrom**
Equilibrium · Keynote Lecture *Athanasia Korda; Nadir Yıldırım*

14:00–14:30 **Vestibular Assessment As A Key Component Of Follow-Up In Children With Congenital CMV Infection**

Equilibrium · Keynote Lecture *Salma Jbyeh, MD; Wiener Vacher sylvette R.*

14:30–15:00 **Integrating Vestibular Testing Into Comprehensive Fall Assessment**

Equilibrium · Keynote Lecture *Gokce SAYGI UYSAL; Anita Bhandari*

15:00–15:30 **Controversies In The Diagnosis And Management Of Non-Tuberculous Mycobacterial Adenitis In Children**

Pediatric Otolaryngology · Keynote Lecture *Jeffrey Yeung; Seçil Bahar Dal*

15:30–16:00 **Newborn Hearing Screening Program**

Pediatric Otolaryngology · Keynote Lecture *Yusuf Kemal Kemaloğlu; Seçil Bahar Dal*

16:30–17:00 **Open Airway Surgery ' Hacettepe Experience'**

Pediatric Otolaryngology · Keynote Lecture *Oğuzhan Katar; R. Önder Günaydın*

17:00–17:30 **Indications For Adenoid And Tonsil Surgery: The Northern Ghana Experience**

Pediatric Otolaryngology · Keynote Lecture *Theophilus Justus Kofi Adjeso; Oğuzhan Katar*

17:30–18:00 **Surgical Management For Congenital Subglottic Stenosis**

Pediatric Otolaryngology · Remarkable Presentation *Talal Al-khatib; Oğuzhan Katar*

EQUILIBRIUM 2

ICC - B2 Floor - Hamidiye

Wednesday, 9 September 2026

14:00–14:30 **Eye Movements; What A Vestibular Specialist Needs To Know**
Equilibrium · Instructional Course *Nigar Muradova; Bülent Satar*

14:30–15:00 **Video Head Impulse Test: The Guiding Light In Peripheral And Central Vestibular Disorders**
Equilibrium · Keynote Lecture *Enrico Armato; Bülent Satar*

15:00–15:30 **Isolated Otolith Dysfunction**
Equilibrium · Keynote Lecture *Bülent Satar; Simon I Angeli*

15:30–16:00 **VEMPs**
Equilibrium · Instructional Course *Leonardo Manzari; Bülent Satar*

16:30–17:00 **Vestibular Evoked Myogenic Potentials In Patients With BPPV**
Equilibrium · Keynote Lecture *Ozan Gökdoğan*

17:00–17:30 **Virtual Reality In Vestibular Rehabilitation: Hype Or Hope?**
Equilibrium · Keynote Lecture *Ozan Gökdoğan; Salma Jbyeh, MD*

17:30–18:00 **Vertigo In Amazonia: Past, Present And Futurei**
Equilibrium · Keynote Lecture *Ozan Gökdoğan; Silvana maziviero*

Thursday, 10 September 2026

07:00–07:30 **AI Applications In Otology & Neurotology: A New Dimension In A Novel Horizon.**
Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Waleed Moneir; Emel Tahir*

07:30–08:00 **Vestibular Health Across Hormonal Milestones: Menarche, Pregnancy, And Menopause**
Equilibrium · Keynote Lecture *Melissa Castillo-Bustamante; Emel Tahir*

08:00–08:30 **Diagnosis And Treatment Of Vestibular Migraine**
Equilibrium · Expert Discussion *Chisato Fujimoto; Fumiyuki Goto; Emel Tahir; Pelin Kocdor*

08:30–09:00 **How Do You Optimize Your Video Head Impulse Test?**
Equilibrium · Instructional Course *Dan Dupont Hougaard; Ceren Karaçaylı*

09:00–09:30 **Impact Of Cerebellum On Vestibular System**
Equilibrium · Instructional Course *Ceren Karaçaylı*

09:30–10:00 **A Novel Test For Endolymphatic Hydrops — Furosemide-Loading VEMP**
Equilibrium · Instructional Course *Ceren Karaçaylı; TORU SEO*

10:45–11:45 **Vestibular Disorders In Children**
Equilibrium · Round Table *Josine Widdershoven; Leen Maes; Soumit Dasgupta; Nina Bozanic Urbancic;; Georgios Korres*

11:45–12:45 **International Pediatric Balance Network (IPBN) Session Vestibular Testing In The Pediatric Population: New Indications And Approaches**
Equilibrium · International Symposia *Jacob Brodsky; François Simon; Jeyasakthy Saniasiaya; Leen Maes; Wiener Vacher; sylvette R.*

14:00–15:00 **Prognosis of asymptomatic endolymphatic hydrops in healthy volunteers: A five-year cohort study**
Equilibrium · International Symposia *Ja-Won Koo; Tadashi Kitahara; Kyu Sung Kim; Wenyan Li*

15:00–16:00 **Updates In Meniere's Disease And Vestibular Migraine**
Equilibrium · Round Table *Michael Hoa; Michael Hoffer; Elizabeth H. Toh*

16:30–18:00 **LATAM Panel: Vestibular Health In Latin America: From Inequities To Innovation**
Equilibrium · International Symposia *Melissa Castillo-Bustamante; Claudia del Cid; Alejandra Gutiérrez; Henrique Furlan; Pauna*

Friday, 11 September 2026

07:00–07:30 **Diagnostics And Treatments With Mechanical Rotation Chairs - What Have We Learned After More Than Ten Years Of Use?**
Equilibrium · Keynote Lecture *Dan Dupont Hougaard; Ceren Karaçaylı*

07:30–08:00 **Meniere's Disease Past Present And Future**
Equilibrium · Keynote Lecture *isa dagli; Ilka Naumann*

08:00–09:00 **Chez ENT Society: Comprehensive Approaches To Diagnosis And Rehabilitation In Peripheral Vestibular Lesion**
Equilibrium · International Symposia *Zdeněk Čada; Markéta Bonaventurová; Zuzana.Balatkova*

09:00–10:00 **Italian Vestibular Society Session. Acute Unilateral Vestibulopathy: Diagnosis And Treatment**
Equilibrium · International Symposia *Leonardo Manzari; Luigi Califano; Augusto Pietro Casani; Marco Mandala*

10:45–11:45 **Central Vestibular Disorders**
Equilibrium · Round Table *Alexandra Guseva; Amy Lennox-Bowley*

11:45–12:15 **Skull Vibration Induced Afternystagmus - A New Clinical Indicator Of Superior Canal Dehiscence**
Equilibrium · Instructional Course *Georges Dumas; SCHMERBER Sébastien*

12:15–12:45 **Is There Progression Of Endolymphatic Hydrops In Ménière's Disease?**
Equilibrium · Keynote Lecture *Leonel Luis; Ceren Karaçaylı*

14:00–15:00 **Korean Vestibular Rehabilitation Session**
Equilibrium · International Symposia *Jae Sang Han; Eun-Ju Jeon; Ja-Won Koo; Sung Kwang Hong*

15:00–15:30 **Estimated Vestibulogram (EVEST) For Effective Vestibular Assessment**
Equilibrium · Keynote Lecture *Oliver Profant; Armağan İncesulu*

15:30–16:00 **Bilateral Gravitational Palsy**
Equilibrium · Keynote Lecture *Ana Carolina Binetti; Armağan İncesulu*

16:30–17:00 **Vestibulotoxicity**
Equilibrium · Keynote Lecture *Soumit Dasgupta; Emel Tahir*

17:00–17:30 **Skull Vibration-Induced Nystagmus (SVIN)-An Update**
Equilibrium · Keynote Lecture *Georges Dumas; Emel Tahir*

17:30–18:00 **Residual Dizziness Or Something More? Overlapping Diagnoses After BPPV Treatment**
Equilibrium · Instructional Course *Emel Tahir*

Saturday, 12 September 2026

07:00–07:30 **Advances In The Diagnosis And Management Of Chronic Dizziness**
Equilibrium · Instructional Course *Hiroaki Fushiki; Levent Naci Özlüoğlu*

07:30–08:00 **Frontiers In Vestibular Research**
Equilibrium · Keynote Lecture *Takao Imai; Levent Naci Özlüoğlu*

08:00–08:30 **Mal De Debarquement Syndrome**
Equilibrium · Keynote Lecture *Floris Wuyts; Levent Naci Özlüoğlu*

08:30–09:00 **Benign Paroxysmal Positional Vertigo: Clinical News And Controversies**
Equilibrium · Instructional Course *Augusto Pietro Casani; Levent Naci Özlüoğlu*

09:00–10:00 **FINO (Fundacion Iberamericano Neurotologia) Session: Acute Vestibular Syndrome (AVS)**
Equilibrium · International Symposia *Rosmaninho Seabra; Rosa María Castillo Ramos; Fabricio Martínez; Romina; Weinschelbaum*

10:45–11:45 **Vestibular Schwannoma: Contemporary Approach**
Equilibrium · Round Table *Daniele BERNARDESCHI; Italo Cantore; Andy Beynon; Franco Trabalzini*

11:45–12:45 **Diagnostic Challenges And Pitfalls In Neurotology: A Clinical Case- Based Approach**
Equilibrium · Panel Presentation *Nesibe Gül Yüksel Aslıer; Asuman Feda Bayrak; Diana Mihai Coman; Frederik; Kragerud Goplen*

14:00–14:30 **The Vestibulo-Cochlear Implant: Update By The Geneva-Maastricht Team**
Equilibrium · Keynote Lecture *Stan van Boxel; Levent Naci Özlüoğlu*

14:30–15:00 **Vestibular Migraine**
Equilibrium · Instructional Course *Levent Naci Özlüoğlu*

15:00–16:00 **Video Head Impulse Test**
Equilibrium · Panel Presentation *Gulce Kirazli; Anna Paula Batista de Ávila Pires; Marco Mandala; Gokce SAYGI; UYSAL; Gözde Bayramoğlu Çabuk*

16:30–17:00 **Light Cupula**
Equilibrium · Keynote Lecture *Chang-Hee Kim; Mario Milkov*

17:00–18:00 **Novel Approaches To Vestibular Disorders**
Equilibrium · Panel Presentation *Takao Imai; Diana Mihai Coman; Mario Milkov*

EQULIBIRIUM 1

ICC - B2 Floor - Üsküdar 1

Wednesday, 9 September 2026

14:00–14:30 **Applicability Of Vestibular Tests Other Than Positional Maneuvers In Patients With BPPV**
Equilibrium · Keynote Lecture *Sertaç Yetişer*

14:30–15:00 **Re-Visiting Rotation Chair Tests**
Equilibrium · Keynote Lecture *Sertaç Yetişer*

15:00–15:30 **Chirp Stimuli In VEMP Testing: A True Alternative To Traditional Tone- Burst?**
Equilibrium · Expert Discussion *Gülin Gökçen Kesici; Seval Ceylan; Sertaç Yetişer*

15:30–16:00 **Vestibular Migraine: Diagnosis And Treatment**
Equilibrium · Keynote Lecture *Augusto Pietro Casani; Sertaç Yetişer*

16:30–17:00 **Pharmacological Interventions For Persistent Postural-Perceptual Dizziness (PPPD**
Equilibrium · Keynote Lecture *Owen Judd; Sertaç Yetişer*

17:00–17:30 **Motion Sickness: What Approach To Take.**
Equilibrium · Keynote Lecture *Alain Thiry; Bülent Satar*

Thursday, 10 September 2026

07:00–07:30 **Treatment For Vestibular Disorders From The Cochrane Perspective**
Equilibrium · Keynote Lecture *Owen Judd; Pelin Kocdor*

07:30–08:30 **Barany Society Session I - Acute Unilateral Vesibulopathy - Vestibular Neuritis: Diagnosis & Treatment"**
Equilibrium · International Symposia *Mikael Karlberg; Julia Sjögren; Herman Kingma*

08:30–09:30 **Vestibular Migraine & Comorbidities**
Equilibrium · Panel Presentation *Fumiyuki Goto; Ozan Gökdoğan; Vishal Pawar; Pelin Kocdor; Pınar Yalınay Dikmen*

09:30–10:00 **Meniere's Disease - Diagnostic And Therapeutic Challenges**
Equilibrium · Keynote Lecture *Raquel Manrique Huarte; Bülent Satar*

11:15–12:45 **IVS Panel: Bilateral Vestibular Disease & Compensation**
Equilibrium · International Symposia *Herman Kingma; Angel Ramos de Macias; Badr Eldin Mostafa; Michel Lacour;; OSMAN NURİ ÖZGİRGİN*

13:00–14:00 **Industry Sponsored Session**
Industrial · Satellitte Symposium *Herman Kingma; Leonardo Manzari; Michel Lacour; OSMAN NURİ ÖZGİRGİN*

14:00–14:30 **Vestibular Implants New Aspects And Results**
Equilibrium · Keynote Lecture *Angel Ramos de Macias; Fazıl Necdet Ardıç*

14:30–15:00 **Scientific And Clinical Insights From Vestibular Implant Clinical Studies**
Equilibrium · Keynote Lecture *Angelica Perez Fornos; Fazıl Necdet Ardıç*

15:00–16:00 **New Aspects In Vestiblar Implants Technologies**
Equilibrium · Panel Presentation *Morgana Sluydts; Raquel Manrique Huarte; Angel Ramos de Miguel; Raymond van; de Berg; Nils Guinand*

16:30–17:30 **Innovations And Technology In Diagnosis And Management Of Vestibular Disorders**
Equilibrium · Panel Presentation *Fazıl Necdet Ardıç; Hiroaki Fushiki; Meichan Zhu; Ali Melliti; Georgi Kukushev*

17:30–18:00 **Chronic Unilateral Vestibular Hypofunction (UVH): From Symptoms To A Patient-Oriented Measure**
Equilibrium · Keynote Lecture *Mustafa Karabulut; Fazıl Necdet Ardıç*

Friday, 11 September 2026

07:00–07:30 **The Developmental And Aging Mechanisms Of The Vestibular System**
Equilibrium · Keynote Lecture *Wenyan Li; Mete İşeri*

07:30–08:00 **Intratympanic Gentamicin For Long-Term Vertigo After Cochlear Implantation**
Equilibrium · Keynote Lecture *Nicola Quaranta; Mete İşeri*

08:00–08:30 **Micro CT And Inner Ear**
Equilibrium · Keynote Lecture *Mete İşeri; Meichan Zhu*

08:30–09:00 **Vibration Stimulation Of The Vestibular Labyrinth**
Equilibrium · Keynote Lecture *Mete İşeri; Leonardo Manzari*

09:00–10:00 **The Bárány Society Session II - Who Was Robert Bárány And What Did He Do? What Is The Barany Society?**

Equilibrium · International Symposia *Mikael Karlberg; Raymond van de Berg; Melissa Castillo-Bustamante*

10:45–11:15 **An Update On Recent Vestibular Physiotherapy Treatment And Outcomes**

Equilibrium · Keynote Lecture *Regan Harrell*

11:15–12:45 **Vestibular Rehabilitation: Expectations And Fulfillment**

Equilibrium · Panel Presentation *Karimova Nargiza Abdullayevna; Nour salman; Doris-Eva Bamiou; Madalina; Georgescu; Regan Harrell*

14:00–15:20 **BPPV- Residual Dizziness**

Equilibrium · Round Table *Herman Kingma; Ceren Karaçaylı; Peixia Wu; Anita Bhandari; Domuta Eugenia; Maria; Michel Lacour*

15:20–16:00 **Equilibirium Notable Abstracts**

Notable Abstracts · Notable Abstract *Fazıl Necdet Ardıç*

16:30–17:00 **Inner Ear Therapy By Local Drug Delivery**

Equilibrium · Keynote Lecture *Stefan K. Plontke; Levent Naci Özlüoğlu*

17:00–18:00 **Acute Vestibular Disorders**

Equilibrium · Expert Discussion *Bjarki Djurhuus; Alain Thiry; Levent Naci Özlüoğlu; Fatma Ceyda Akın Öçal*

Saturday, 12 September 2026

07:00–07:30 **Quantifying Function: A Data-Driven Framework For Functional VOR Assessment And Training**

Equilibrium · Instructional Course *Michael East; Yüksel Olgun*

07:30–08:00 **Surgical Treatment Of Meniere's Disease**

Equilibrium · Keynote Lecture *Ambrose Lee; Fazıl Necdet Ardıç*

08:00–09:30 **BPPV - Is Completely Clarified?**

Equilibrium · Panel Presentation *Anita Bhandari; Konrad P. Weber; Anis Bouazzaoui; Mayada El Sherif; Chang-Hee; Kim*

09:30–10:00 **Clinical Pearls For Optimizing Diagnosis And Treatment Of Persistent Postural-Perceptual Dizziness (PPPD)**

Equilibrium · Instructional Course *Jeffrey P Staab; Anita Bhandari*

10:45–11:45 **Paraclinical Assessment Of Dizziness In Otolaryngology: Tools, Trends, And Integration**

Equilibrium · International Symposia *Frederik Kragerud Goplen; Bjarki Djurhuus; Louise Devantier; Mikael Karlberg*

11:45–12:45 **Surgical Treatment Of Vestibular Disorders**

Equilibrium · Round Table *Andrzej Zarowski; Miguel Arístegui; Ja-Won Koo; Alper Özdilek*

14:00–15:00 **Third Window**

Equilibrium · Round Table *Kemal Görür; Stefan K. Plontke; Eugen Constant Ionescu; Holger Sudhoff*

15:00–16:00 **Rare Conditions In Vestibular Medicine**

Equilibrium · Panel Presentation *Voda Ioana Alexandra; Emre Ocak; Büşra Altın*

16:30–17:00 **The Elusive Primary Vestibular Cortex – What Do We Really Know?**

Equilibrium · Keynote Lecture *Louise Devantier; Burak Ömür Çakır*

17:00–18:00 **Otolith Complexity And Vestibular Precision: From Normal Function To Clinical Disorders**

Equilibrium · Panel Presentation *Nagwa Hazzaa; Alfarghal Mohamad; Sawsan Abuzaid; Rasha El Kabarity; Burak; Ömür Çakır*

FACIAL PLASTIC 1

ICC - B2 Floor - Çamlıca

Wednesday, 9 September 2026

14:00–14:10 **Nose Enlargement: Problems And Management**
Facial Plastic Surgery · Master of Surgery Video Presentation *Erkan Soylu; Ozan Altuntaş; H. Baki Yilmaz*

14:10–14:20 **Managing Costal Cartilage Harvest Complications In Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Ihsan Ceceli; Ozan Altuntaş; H. Baki Yilmaz*

14:20–14:27 **The L-Shaped Septocolumellar Extension Graft: A Multi-Point Fixation Technique For Nasal Tip Stabilization**
Facial Plastic Surgery · Master of Surgery Video Presentation *Alper Yenigun; Ozan Altuntaş; H. Baki Yilmaz*

14:27–14:34 **Membranous Tongue-In-Groove Technique In Tip Surgery**
Facial Plastic Surgery · Master of Surgery Video Presentation *Ozan Altuntaş; H. Baki Yilmaz*

14:34–14:41 **Rhinoplasty Dead Space Reducing With Intranasal Electrical Drainage**
Facial Plastic Surgery · Master of Surgery Video Presentation *Yuri Rusetskiy; Ozan Altuntaş; H. Baki Yilmaz*

14:41–14:48 **Internal Suspension Sutures In Tip Rhinoplasty**
Facial Plastic Surgery · Master of Surgery Video Presentation *Andrés Alvo; H. Baki Yilmaz; Ozan Altuntaş*

14:48–14:55 **Approach To The Crooked Nose With Closed Rhinoplasty**
Facial Plastic Surgery · Master of Surgery Video Presentation *Zülküf Burak ERDUR; H. Baki Yilmaz; Ozan Altuntaş*

14:55–15:02 **Semi-Dried PRP-Stabilized Diced Cartilage: A Novel Technique For Stable And Moldable Dorsal Nasal Augmentation In Rhinoplasty**
Facial Plastic Surgery · Master of Surgery Video Presentation *Alper Yenigun; H. Baki Yilmaz; Ozan Altuntaş*

15:02–15:09 **Comparison Of Lateral Crural Repositioning And Lateral Crural Z-Flap In Alar Retraction Correction**
Facial Plastic Surgery · Master of Surgery Video Presentation *Mehmet Ali Karsavul; H. Baki Yilmaz; Ozan Altuntaş*

15:09–15:16 **NASAL DORSUM PRESERVATION**
Facial Plastic Surgery · Master of Surgery Video Presentation *H. Baki Yilmaz; Ozan Altuntaş*

15:16–15:26 **NOVA Spare Roof Technique And The Sail Maneuver- Step-To-Step For Optimal Results**
Facial Plastic Surgery · Master of Surgery Video Presentation *Joana Dias; H. Baki Yilmaz; Ozan Altuntaş*

15:26–15:41 **Cadaveric Anatomy Of The Alar Base And Nasal Sill**
Facial Plastic Surgery · Remarkable Presentation *Tural Fatullayev; H. Baki Yilmaz; Ozan Altuntaş*

15:41–15:56 **The Use Of Cylindrical Burr In Closed Rhinoplasty: Why, When, And How?**
Facial Plastic Surgery · Remarkable Presentation *Zülküf Burak ERDUR; H. Baki Yilmaz; Ozan Altuntaş*

16:30–16:45 **Spreader Grafts And Flaps, My Own Technique And Review**
Facial Plastic Surgery · Remarkable Presentation *Zülküf Burak ERDUR*

16:45–17:00 **Thick Skin Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Zülküf Burak ERDUR*

17:00–17:15 **Muscular Nose As A Clinical Concept Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Hesam Jahandideh; Zülküf Burak ERDUR*

17:15–17:30 **Short Nose**
Facial Plastic Surgery · Remarkable Presentation *Shahin Bastaninejad; Zülküf Burak ERDUR*

17:30–17:45 **Potential Aesthetic Effect Of Septoplasty With Barbed Suture On The Cartilaginous Dorsum**
Facial Plastic Surgery · Remarkable Presentation *Hyo Yeol Kim; Zülküf Burak ERDUR*

Thursday, 10 September 2026

08:00–08:30 **Is Extending Beyond Pitanguy Always Better?**
Facial Plastic Surgery · Keynote Lecture *capi wever; Zeliha Kapusuz Gencer*

08:30–08:45 **Endoscopic Cheek Lift**
Facial Plastic Surgery · Instructional Course *Zeliha Kapusuz Gencer*

08:45–09:15 **Non - Delaminating Deep Plane Face Lift - Enhancing Recovery**
Facial Plastic Surgery · Keynote Lecture *Holger Gasner; Zeliha Kapusuz Gencer*

09:15–09:30 **Face Lift/Temporal Lift**
Facial Plastic Surgery · Remarkable Presentation *Zeliha Kapusuz Gencer*

09:30–10:00 **Management Of Facial Paralysis – Getting To Optimal Outcomes**
Facial Plastic Surgery · Keynote Lecture *Samuel Oyer; Zeliha Kapusuz Gencer*

10:45–11:45 **Neck Lift**

Facial Plastic Surgery · Round Table *Özcan Çakmak; Holger Gasner; Ullas Raghavan; capi wever; Isa Kaya; TEVFIK; SOZEN; Ghazal S. Daher*

11:45–12:00 **Facial Implants And The Importance Of Achieving Facial Harmony**

Facial Plastic Surgery · Remarkable Presentation *Gurkan Kayabasoglu; Ghazal S. Daher; Isa Kaya*

12:00–12:15 **Rejuvenation Techniques In Reconstruction**

Facial Plastic Surgery · Remarkable Presentation *Ullas Raghavan; Ghazal S. Daher; Isa Kaya*

12:15–12:30 **Mastering The Chin Profile: My Surgical Philosophy In Reduction Genioplasty**

Facial Plastic Surgery · Master of Surgery Video Presentation *AKIN ŞAHİN; Isa Kaya*

12:30–12:45 **Hidden Incision:Why I Prefer The Transconjunctival Approach**

Facial Plastic Surgery · Panel Presentation *ahmet caymaz; Isa Kaya*

14:00–14:15 **Deep Neck Contouring: When And How**

Facial Plastic Surgery · Remarkable Presentation *Özcan Çakmak; KÜBRA TOPAL*

14:15–14:30 **Deep Plane Facelift And Endoscopic Browlift**

Facial Plastic Surgery · Remarkable Presentation *Kerem Sami Kaya; KÜBRA TOPAL*

14:30–14:45 **Profiloplasti With Fat Injection**

Facial Plastic Surgery · Remarkable Presentation *ilker yiğit; KÜBRA TOPAL*

14:45–15:00 **TEMPORAL AREA VOLUMIZATION TECHNIQUES**

Facial Plastic Surgery · Remarkable Presentation *KÜBRA TOPAL*

15:00–15:15 **Soft Tissue Facial Changes Following Massive Weight Loss Secondary To Medical And Surgical Bariatric Interventions: A Systematic Review**

Facial Plastic Surgery · Remarkable Presentation *Ali Jafar; KÜBRA TOPAL*

15:15–15:30 **Fat Grafting And My Appoach In Fat Grafting**

Facial Plastic Surgery · Remarkable Presentation *Eric Dobratz; KÜBRA TOPAL*

15:30–15:45 **When Is It Truly Deep Plane ? Defining The Anatomy Behind The Technique**

Facial Plastic Surgery · Remarkable Presentation *ahmet caymaz; KÜBRA TOPAL*

15:45–16:00 **Aging Face Surgery Which Is In Case Primary Cases And Revision Cases**

Facial Plastic Surgery · Remarkable Presentation *TEVFIK SOZEN; KÜBRA TOPAL*

16:30–16:45 **Diagnosis And Management Of Nasal Septal Perforation**

Facial Plastic Surgery · Remarkable Presentation *Yu Hosokawa; KÜBRA TOPAL; Uzdan Uz*

16:45–17:00 **Assessment Of Rib Cartilage Calcification By Plain Radiography: Implications For Graft Planning In Rhinoplasty**

Facial Plastic Surgery · Remarkable Presentation *Shin Hyuk Yoo; Uzdan Uz; KÜBRA TOPAL*

17:00–17:15 **Balancing The Bony Sidewalls: New Technique To Manage The Bony Vault Deviation**

Facial Plastic Surgery · Remarkable Presentation *Hyo Yeol Kim; Uzdan Uz; KÜBRA TOPAL*

17:15–17:30 **The Impact Of Rhinoplasty On Smile**

Facial Plastic Surgery · Remarkable Presentation *Babak Saedi; Uzdan Uz; KÜBRA TOPAL*

17:30–17:45 **The Role Of Footplates In Advanced Nasal Tip Correction And Nostril Shape Optimization**

Facial Plastic Surgery · Remarkable Presentation *Uzdan Uz; KÜBRA TOPAL*

17:45–18:00 **Rhinoplasty And Facial Rejuvenation Effect**

Facial Plastic Surgery · Remarkable Presentation *Uzdan Uz; KÜBRA TOPAL*

Friday, 11 September 2026

07:30–08:00 **Step-By-Step Upper Blepharoplasty Course**

Facial Plastic Surgery · Instructional Course *Gökçe Özel*

08:00–08:15 **“Gender Affirming Surgery: The Latest Thoughts And Techniques”**

Facial Plastic Surgery · Remarkable Presentation *Danial Knott; Gökçe Özel*

08:15–08:45 **Facial Autologous Fat Grafting**

Facial Plastic Surgery · Keynote Lecture *Gökçe Özel*

08:45–09:00 **Chin İmplant In Difficult And Severe Chin Deformitied**

Facial Plastic Surgery · Remarkable Presentation *Gökçe Özel*

09:00–09:15 **Modified Scalp Preserving Coronal Forehead Lift**

Facial Plastic Surgery · Instructional Course *Akbar Bayat; Gökçe Özel*

09:15–09:45 **Extended Deep Plane Face Lift**
Facial Plastic Surgery · Instructional Course *Saeed Golparvaran; Gökçe Özel*

09:45–10:00 **Direct Brow Lift; Has It A Role In Rejuvenation Surgery**
Facial Plastic Surgery · Remarkable Presentation *Ullas Raghavan; Ismet Emrah Emre*

10:45–11:45 **Facelift Techniques**
Facial Plastic Surgery · Round Table *Holger Gasner; capi wever; Ullas Raghavan; Ismet Emrah Emre; Kerem Sami Kaya*

11:45–12:00 **Scalp Reshaping**
Facial Plastic Surgery · Remarkable Presentation *Saleh Mohebbi; Ismet Emrah Emre*

12:00–12:15 **Anatomic Basis For Facelift Surgery: What Is New And What Is Old?**
Facial Plastic Surgery · Panel Presentation *Sam Most; Saleh Mohebbi; Ismet Emrah Emre*

12:15–12:30 **Midface Lift-When Is It Most Effective As A Sole Procedure**
Facial Plastic Surgery · Remarkable Presentation *Ismet Emrah Emre; Saleh Mohebbi*

12:30–12:45 **Reconstruction Of Nasal Cutaneous Defects After Mohs Microscopic Surgery**
Facial Plastic Surgery · Remarkable Presentation *Burçay Tellioğlu; Saleh Mohebbi; Ismet Emrah Emre*

14:00–15:00 **Facial Reconstruction**
Facial Plastic Surgery · Round Table *stephen park; Eric Dobratz; Peter C. Revenaugh; Sam Most*

15:00–15:15 **Internal Lining Tips For Paramedian Forehead Flaps**
Facial Plastic Surgery · Remarkable Presentation *Krıshna Patel; Kritsada Kowitwibool; Özcan Çakmak*

15:15–15:30 **My Journey As A Facelift Surgeon**
Facial Plastic Surgery · Remarkable Presentation *Ullas Raghavan; Özcan Çakmak; Kritsada Kowitwibool*

15:30–15:45 **My Surgical Experince With Vaser-Assisted Double Chin Liposuction**
Facial Plastic Surgery · Master of Surgery Video Presentation *Kritsada Kowitwibool; AKIN ŞAHİN; Özcan Çakmak*

15:45–16:00 **Asian Short Incision Blepharoplasty**
Facial Plastic Surgery · Remarkable Presentation *Kritsada Kowitwibool; Özcan Çakmak*

16:30–17:00 **Essentials Of Eyelid Surgery**
Facial Plastic Surgery · Instructional Course *Gurkan Kayabasoglu; Mazahir Guliyev; Teoman Dal*

17:00–17:30 **Decision-Making In Dorsal Preservation Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *Teoman Dal; Sam Most; Mazahir Guliyev*

17:30–17:45 **Innovative Approaches In Revision Rhinoplasty:Our Clincal Experience**
Facial Plastic Surgery · Remarkable Presentation *Mazahir Guliyev; Teoman Dal*

17:45–18:00 **Primary Septal Reconstruction In Severe Septal Deviations**
Facial Plastic Surgery · Master of Surgery Video Presentation *Teoman Dal; Mazahir Guliyev*

Saturday, 12 September 2026

07:30–08:00 **Extreme Revisions**
Facial Plastic Surgery · Instructional Course *Erkan Soylu; Özcan Çakmak; Ismet Emrah Emre*

08:00–08:30 **Facelift Surgery-Things I Have Learned**
Facial Plastic Surgery · Keynote Lecture *Ismet Emrah Emre; Özcan Çakmak*

08:30–09:00 **Trans Temporal Extended Deep Plane Face Lift**
Facial Plastic Surgery · Instructional Course *Ismet Emrah Emre; Özcan Çakmak*

09:00–09:30 **Modified Composite Plane Facelift With Extended Neck Dissection**
Facial Plastic Surgery · Keynote Lecture *Özcan Çakmak; Ismet Emrah Emre*

09:30–09:50 **Anatomy For Face And Neck Lift**
Facial Plastic Surgery · Instructional Course *Holger Gasner; Özcan Çakmak; Ismet Emrah Emre*

09:50–10:00 **Lateral Wall Collapse**
Facial Plastic Surgery · Panel Presentation *Helena Silveira; Özcan Çakmak; Ismet Emrah Emre*

10:45–12:15 **Lower Eyelid Blepharoplasty**
Facial Plastic Surgery · Panel Presentation *Holger Gasner; Mehtap Ozkahraman Kirik; Sam Most; Gurkan Kayabasoglu*

12:15–12:30 **Advances In Forehead Flap Reconstruction**
Facial Plastic Surgery · Remarkable Presentation *Sam Most; Eric Dobratz; Gurkan Kayabasoglu*

12:30–12:45 **Lower Blepharoplasty-Tips And Pearls**
Facial Plastic Surgery · Keynote Lecture *Ismet Emrah Emre; Gurkan Kayabasoglu; Eric Dobratz*

14:00–14:10 **Surgical Nuances In My Blepharoplasty Cases**

Facial Plastic Surgery · Master of Surgery Video Presentation *AKIN ŞAHİN; Eric Dobratz; Gurkan Kayabasoglu*

14:10–14:25 **Perichondrial Cutaneous Composite Grafts For Nasal Defects**

Facial Plastic Surgery · Remarkable Presentation *Eric Dobratz; Gurkan Kayabasoglu*

14:25–14:55 **20 Years Of Facelift Evolution, From The Perspective Of Patients And Surgeons**

Facial Plastic Surgery · Keynote Lecture *Gurkan Kayabasoglu; Eric Dobratz*

14:55–15:05 **Botox And The Science Behind It**

Facial Plastic Surgery · Remarkable Presentation *Ismet Emrah Emre; AKIN ŞAHİN*

15:05–15:15 **Predictable Algorithm To Manage Nasal Tip Projection And Rotation To Improve Nasal Aesthetics And Function.**

Facial Plastic Surgery · Master of Surgery Video Presentation *Marcin Jadczak; Ender İnci; AKIN ŞAHİN*

15:15–15:25 **Skin, Muscle And Fat Management In Lower Blepharoplasty**

Facial Plastic Surgery · Master of Surgery Video Presentation *Yusufhan suoglu; AKIN ŞAHİN*

15:25–15:35 **My Surgical Strategy For Aesthetic Bichectomy.**

Facial Plastic Surgery · Master of Surgery Video Presentation *AKIN ŞAHİN*

15:35–16:00 **Surgical Treatment Of Blepharoptosis**

Facial Plastic Surgery · Instructional Course *Mehtap Ozkahraman Kirik; Ullas Raghavan*

16:30–16:40 **Lower Lid Blepharoplasty**

Facial Plastic Surgery · Master of Surgery Video Presentation *Mehtap Ozkahraman Kirik; Ullas Raghavan*

16:40–17:00 **Multi-Ethnic Facial Beautification And Rejuvenation: White, Afro- Descendant, Indigenous, And Mestizo**

Facial Plastic Surgery · Keynote Lecture *Mehtap Ozkahraman Kirik; Ullas Raghavan*

17:00–17:15 **Dorsal Augmentation In Revision Rhinoplasty**

Facial Plastic Surgery · Remarkable Presentation *Tural Fatullayev; Mehtap Ozkahraman Kirik*

17:15–17:30 **Surgical Management Of Nasal Vestibular Stenosis**

Facial Plastic Surgery · Remarkable Presentation *Tural Fatullayev; Mehtap Ozkahraman Kirik*

17:30–17:45 **Subciliary Lower Eyelid Blepharoplasty: How To Avoid Complications**

Facial Plastic Surgery · Remarkable Presentation *Özcan Çakmak; Mehtap Ozkahraman Kirik; Ullas Raghavan*

17:45–18:00 **Septal Extension Grafts In Rhinoplasty: Classification, Techniques, And Clinical Applications**

Facial Plastic Surgery · Remarkable Presentation *Burak Ulkumen; Erkan Soylu*

FACIAL PLASTIC 2

ICC - B3 Floor - 3B/01

Wednesday, 9 September 2026

14:00–14:15 **Single-Stage Alar Nostril Ring Correction Using Auricular Composite Grafts İn Reconstructive Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Suzuki Masanobu; Pamela Pol*

14:15–14:30 **Cleft Nose Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Pamela Pol; Suzuki Masanobu*

14:30–14:45 **Surgical Techniques For Caudal Septoplasty**
Facial Plastic Surgery · Remarkable Presentation *Yu Hosokawa; Pamela Pol*

14:45–15:45 **TIP SURGERY 1**
Facial Plastic Surgery · Panel Presentation *Burak Ulkumen; Rui Xavier; Pamela Pol; Suzuki Masanobu; Saif Ali*

15:45–16:00 **Dorsal Augmentation Using High Spreader Graft**
Facial Plastic Surgery · Remarkable Presentation *Saif Ali; Uzdan Uz*

16:30–16:40 **Functional Septorhinoplasty**
Facial Plastic Surgery · Master of Surgery Video Presentation *lütfi barlas aydoğan; Yu Hosokawa*

16:40–16:50 **Pediatric Septoplasty**
Facial Plastic Surgery · Remarkable Presentation *Sara Rahavi; lütfi barlas aydoğan; Yu Hosokawa*

16:50–17:00 **Septal Extension Grafts**
Facial Plastic Surgery · Master of Surgery Video Presentation *Burak Ulkumen; Yu Hosokawa*

17:00–17:30 **Master Of Surgery Video Presentation 2**
Facial Plastic Surgery · Master of Surgery Video Presentation *TARIK ŞAPÇI; lütfi barlas aydoğan; Fikret Kasapoglu; Erkan Soylu; Yu Hosokawa*

17:30–17:40 **Cartilage saving proceduresin tipplasty for crooked noses**
Facial Plastic Surgery · Panel Presentation *Tülay Erden Habeşoğlu*

Thursday, 10 September 2026

08:45–09:00 **Facial Reanimation Techniques In Long-Term Lower Lip Asymmetry**
Facial Plastic Surgery · Master of Surgery Video Presentation *Köksal YUCA; Ender İnci*

09:00–09:15 **Safe, Precise And Practical Decision-Making During Modified Selective Neurectomy Surgery**
Facial Plastic Surgery · Master of Surgery Video Presentation *Köksal YUCA; Ender İnci*

09:15–09:30 **Orbicularis Oculi Selective Myectomy For Treatment Of Periocular Synkinesis.**
Facial Plastic Surgery · Remarkable Presentation *Alireza Mesbahi; Ghazal S. Daher; Köksal YUCA*

09:30–09:45 **Key Points For Projection, Rotation And Definition In Tip Plasty Using Just Suture Technique Without Any Cartilage Extension Graft**
Facial Plastic Surgery · Master of Surgery Video Presentation *Ender İnci; Uzdan Uz*

10:45–11:45 **Managing Patients With Synkinesis: How To Decide On Treatments For This Complex Patient Population**
Facial Plastic Surgery · Round Table *Matthew Q. Miller; Catherine Meller; Samuel Oyer*

11:45–12:00 **Facial Nerve Grafting With Temporalis Transfer - A New Frontier**
Facial Plastic Surgery · Instructional Course *Vijayendra Honnurappa; Köksal YUCA; Zeliha Kapusuz Gencer*

12:00–12:10 **Case By Case Facial Paralysis**
Facial Plastic Surgery · Master of Surgery Video Presentation *Köksal YUCA; Zeliha Kapusuz Gencer*

12:10–12:25 **Facial Nerve 5-7 Transfer Techniques**
Facial Plastic Surgery · Remarkable Presentation *Zeliha Kapusuz Gencer; Köksal YUCA*

14:00–15:00 **Facial Reanimation: Proven Contemporary Techniques**
Facial Plastic Surgery · Round Table *Samuel Oyer; Alireza Mesbahi; Isa Kaya*

15:00–15:30 **Getting Everyone On The Same Page: Standardization Of Facial Reanimation Surgical Outcomes**
Facial Plastic Surgery · Keynote Lecture *Matthew Q. Miller; Yusufhan suoglu; Köksal YUCA*

16:30–16:45 **Importance Of SEG (Septal Extension Graft) In Asian Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Soo-Whan Kim; Oguzhan Oguz*

17:00–17:15 **Novel Anguloplasty Technique In Static Facial Reanimation To Improve Lip Excursion**
Facial Plastic Surgery · Remarkable Presentation *Ali Jafar; Soo-Whan Kim; Oguzhan Oguz*

17:15–17:30 **Pediatric Combat Trauma - Frontline Lessons From Ukraine**
Facial Plastic Surgery · Panel Presentation *Igor Berezniuk; Oguzhan Oguz; Soo-Whan Kim*

17:30–17:45 **General Approaches And Surgical Management In Maxillofacial Trauma**
Facial Plastic Surgery · Remarkable Presentation *Vedat Oruk; Oguzhan Oguz; Soo-Whan Kim*

17:45–18:00 **Botulinum Neurotoxin Applications In Facial Aesthetics**
Facial Plastic Surgery · Panel Presentation *Vedat Oruk; Oguzhan Oguz; Soo-Whan Kim*

Friday, 11 September 2026

07:30–08:00 **Tip Plasty Just Whit Suture Technique**
Facial Plastic Surgery · Instructional Course *Ender İnci*

08:00–08:15 **Rhinoplasty Nasal Tip Surgery With Modified Septal Extension Graft**
Facial Plastic Surgery · Master of Surgery Video Presentation *Köksal YUCA; Shin Hyuk Yoo*

08:15–08:30 **Male Rhinoplasty. Beyond Facial Definition**
Facial Plastic Surgery · Remarkable Presentation *Elvigia Adams; Köksal YUCA; Ahmed Mansour*

08:30–09:00 **Mastering In Rhinoplasty**
Facial Plastic Surgery · Panel Presentation *Gurkan Kayabasoglu; Köksal YUCA*

09:00–09:15 **Molded Diced Cartilage Grafting For Dorsal Augmentation: Early Experience With Jang's Mold**
Facial Plastic Surgery · Panel Presentation *Shin Hyuk Yoo; Köksal YUCA*

09:15–09:30 **Management of Deviated Nasal Septum: Surgical Strategies & Structural Support**
Facial Plastic Surgery · Remarkable Presentation *Köksal YUCA; Ahmed Mansour*

09:30–10:00 **Surgical Management Of The Nasal Tip**
Facial Plastic Surgery · Keynote Lecture *FRANCISCO JAVIER SALAVERRY RAMOS; Habiba Sultan Almaskari*

10:45–11:00 **Condylar Hyperplasia And Facial Asymmetry: From Diagnosis To Surgical Management”**
Facial Plastic Surgery · Remarkable Presentation *Nagihan Bilal*

11:15–11:30 **Dorsal Augmentation Using Glued Diced Costall Cartilage Shaped With Mold**
Facial Plastic Surgery · Remarkable Presentation *Yong Ju Jang; Habiba Sultan Almaskari*

11:30–11:45 **The Tri-Functional T-Graft Tip Plasty**
Facial Plastic Surgery · Panel Presentation *Amin Amali; Habiba Sultan Almaskari*

11:45–12:15 **Southeast Asian Rhinoplasty: Structure, Softness And Function**
Facial Plastic Surgery · Keynote Lecture *James Wai Leong Kok; Habiba Sultan Almaskari*

12:15–12:30 **Early Vs Delayed Rhinoplasty Post Nasal Trauma; Timeline,Tips & What To Expect.**
Facial Plastic Surgery · Remarkable Presentation *Habiba Sultan Almaskari*

12:30–12:45 **Short Nose Correction**
Facial Plastic Surgery · Master of Surgery Video Presentation *Alireza Mohebbi; Habiba Sultan Almaskari*

14:00–14:15 **Surgical Options For Dealing With Alar Retraction**
Facial Plastic Surgery · Remarkable Presentation *Rui Xavier; Talal Abdulla*

14:15–14:25 **Nasal Tip Surgery In Rhinoplasty**
Facial Plastic Surgery · Panel Presentation *Iütfi barlas aydoğan; Melih Güven Güvenç*

14:25–14:35 **Nasal Tip Surgery-My Way**
Facial Plastic Surgery · Master of Surgery Video Presentation *Fikret Kasapoglu; Melih Güven Güvenç*

14:35–14:50 **Male Nose: Pitfalls And Pearls**
Facial Plastic Surgery · Keynote Lecture *Melih Güven Güvenç*

14:50–15:05 **Present-Day Indications For Using Spreader Grafts**
Facial Plastic Surgery · Remarkable Presentation *Rui Xavier; Melih Güven Güvenç*

15:05–15:20 **40+ Rhinoplasty(Rhinoplast over 40 years old)**
Facial Plastic Surgery · Remarkable Presentation *Ethem Şahin; Melih Güven Güvenç*

15:20–15:35 **Low Strip Dorsal Preservation- A Technique That All Otolaryngologists Should Know.**
Facial Plastic Surgery · Remarkable Presentation *Peter C. Revenaugh; Talal Abdulla; Melih Güven Güvenç*

15:35–16:00 **Rhinopreservation By Foundation Techniques In Caucasian Noses. Expanding Its Indications**
Facial Plastic Surgery · Master of Surgery Video Presentation *Jaime Farfan; Shin Hyuk Yoo; Köksal YUCA*

16:30–16:45 **My Osteotomy Technique**
Facial Plastic Surgery · Remarkable Presentation *ignazio tasca; Melih Güven Güvenç*

16:45–17:00 **Management Of Nasal Valve Collapse Following Rhinoplastic Surgery**
Facial Plastic Surgery · Remarkable Presentation *Orhan Ozturan; Melih Güven Güvenç*

17:00–17:15 **Red Flags In Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *Talal Abdulla; Melih Güven Güvenç*

17:15–17:30 **Alar Base And Nasal Sill: Key Surgical Maneuvers**
Facial Plastic Surgery · Remarkable Presentation *Tural Fatullayev; Talal Abdulla*

17:30–17:45 **Modern Concepts Of The Complex Anatomy Of The Nose And Its Significance In Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Denizhan Dizdar; Arzu-Almaz Mashurov; Melih Güven Güvenç*

17:45–18:00 **Facial Assymmety And Its Impact On Rhinoplasty Results**
Facial Plastic Surgery · Remarkable Presentation *Denizhan Dizdar; Melih Güven Güvenç*

Saturday, 12 September 2026

07:30–08:00 **Surgical Reconstruction After Resection Of Skin Cancers In Head And Neck**
Facial Plastic Surgery · Instructional Course *Mehmet Düzlü; AKIN ŞAHİN; Rinor Ajeti*

08:00–08:30 **Comprehensive Management Of Congenital Ear Malformations: From Aesthetic Correction To Functional Reconstruction**
Facial Plastic Surgery · Keynote Lecture *Chen-Long Li; AKIN ŞAHİN; Rinor Ajeti*

08:30–09:00 **Otoplasty ,Indication, Technique And It's Complications**
Facial Plastic Surgery · Keynote Lecture *AKIN ŞAHİN; Rinor Ajeti*

09:00–09:15 **How To Prevent Protruding Ears**
Facial Plastic Surgery · Remarkable Presentation *hermann raunig; AKIN ŞAHİN; Rinor Ajeti*

09:15–09:30 **Otoplasty: My Surgical Approach – Insights From 300 Successful Cases**
Facial Plastic Surgery · Master of Surgery Video Presentation *Rinor Ajeti; AKIN ŞAHİN*

09:30–09:45 **Macrotia Surgery, How I Do It: A Step-By-Step Video Guide To Ear Reduction**
Facial Plastic Surgery · Master of Surgery Video Presentation *AKIN ŞAHİN; Rinor Ajeti*

09:45–10:00 **Global Perspectives On Auricular Reconstruction: Surgical Strategies, Functional Outcomes, And Emerging Technologies**
Facial Plastic Surgery · Keynote Lecture *Chen-Long Li; AKIN ŞAHİN; Rinor Ajeti*

10:45–11:15 **Surgical Otoplasty-Long Term Results**
Facial Plastic Surgery · Keynote Lecture *hermann raunig; KÜBRA TOPAL; Denizhan Dizdar*

11:15–11:25 **Otoplasty For Beginners**
Facial Plastic Surgery · Master of Surgery Video Presentation *Denizhan Dizdar; KÜBRA TOPAL*

11:25–11:40 **Advances In Otoplasty: Techniques, Outcomes, And Future Directions**
Facial Plastic Surgery · Remarkable Presentation *Mehmet Murat Günay; KÜBRA TOPAL; Denizhan Dizdar*

11:40–11:50 **My Evolving Techniques In Aesthetic Otoplasty**
Facial Plastic Surgery · Master of Surgery Video Presentation *AKIN ŞAHİN; KÜBRA TOPAL; Denizhan Dizdar*

11:50–12:00 **Submental Endolaser Lifting**
Facial Plastic Surgery · Remarkable Presentation *BETUL SAHİN; Denizhan Dizdar; KÜBRA TOPAL*

12:00–12:10 **Indirect Lip Lift Surgery Video**
Facial Plastic Surgery · Master of Surgery Video Presentation *Denizhan Dizdar; KÜBRA TOPAL*

12:10–12:25 **Facial Anti-Aging Treatment**
Facial Plastic Surgery · Remarkable Presentation *KÜBRA TOPAL; Zeliha Kapusuz Gencer; Başak Çaypınar*

12:25–12:45 **Upper Facial Neurotoxin Enjection Techniques**
Facial Plastic Surgery · Remarkable Presentation *KÜBRA TOPAL; Denizhan Dizdar*

14:00–14:15 **Uppereyelid Filler Injections**
Facial Plastic Surgery · Remarkable Presentation *BETUL SAHİN; Gökçe Özel*

14:15–14:30 **The Digital Renaissance: Integrating Artificial Intelligence In Our Facial Rejuvenation Practice**
Facial Plastic Surgery · Instructional Course *Roberto Quijano; Gökçe Özel; BETUL SAHİN*

14:30–15:00 **Endolifting Laser:Laser Facelift**
Facial Plastic Surgery · Keynote Lecture *Gökçe Özel; BETUL SAHİN*

15:00–15:15 **Midface Shaping With Hyalouronic Acid Fillers**
Facial Plastic Surgery · Remarkable Presentation *BETUL SAHİN; Gökçe Özel*

15:15–15:45 **Complications In Revision Rhinoplasty And Their Management**
Facial Plastic Surgery · Instructional Course *Ahmet Alp; BETUL SAHİN; Gökçe Özel*

15:45–16:00 **Grafts is Rhinoplasty, When and How?**
Facial Plastic Surgery · Instructional Course *Ayman Jaber*

16:30–17:30 **Filler Complications**

Facial Plastic Surgery · Round Table *BETUL SAHİN; Özcan Çakmak; KÜBRA TOPAL; Gökçe Özel; Zeliha Kapusuz Gencer;; Tülay Erden Habeşoğlu*

17:30–18:00 **Radix Augmentation By The Nasal Fibro-Fat Graft**

Facial Plastic Surgery · Keynote Lecture *Mohsen Naraghi; BETUL SAHİN*

FACIAL PLASTIC 3

Hilton - Ambassador Hall

Wednesday, 9 September 2026

14:00–14:15 **Ethnic Rhinoplasty With Cases**
Facial Plastic Surgery · Panel Presentation *şaban çelebi; Özgür Kemal*

14:15–14:30 **Bony Suturing In Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Yuri Rusetskiy; Özgür Kemal; Erkan Soylu*

14:30–14:45 **Endonasal Treatment Of Difficult Caudal Septal Deviations**
Facial Plastic Surgery · Remarkable Presentation *Eric Dobratz; Özgür Kemal; Erkan Soylu*

14:45–15:00 **Presentation Rhinoplasty Vs Structure Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Özgür Kemal; Erkan Soylu*

15:00–15:15 **My Approach To Saddle Nose Deformity**
Facial Plastic Surgery · Remarkable Presentation *Yeganeh Teimouri; Özgür Kemal; Erkan Soylu*

15:15–15:30 **Rhinoplasty With A Crushed Septum FPS**
Facial Plastic Surgery · Remarkable Presentation *Yuri Rusetskiy; Özgür Kemal; Erkan Soylu*

15:30–15:45 **Advanced Septal Reconstruction**
Facial Plastic Surgery · Remarkable Presentation *Sam Most; Özgür Kemal; Erkan Soylu*

16:30–17:00 **Challenges And Solutions In Thick Skin Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *JOSÉ STURLA PELLERANO; Kivanc Gunhan; Nigar Ahmedli*

17:00–17:15 **An Algorithmic Model For Decision- Making In Dorsal Preservation Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Mohammadreza Nazari; Kivanc Gunhan; Nigar Ahmedli*

17:15–17:30 **Insidious Enemy In Revision Rhinoplasty: Non-Floral Colonization**
Facial Plastic Surgery · Remarkable Presentation *Kivanc Gunhan; Nigar Ahmedli*

17:30–17:45 **Subtleties Of The Infratip Lobule In Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Nigar Ahmedli; Kivanc Gunhan*

Thursday, 10 September 2026

08:45–09:00 **Endoscopic Septoplasty In Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Marcel Sauvalle Ceballos; Vedat Oruk*

09:00–09:30 **Precision Rhinoplasty Dorsal Sidewall And Tip Engineering**
Facial Plastic Surgery · Keynote Lecture *a. emre ilhan; Vedat Oruk*

09:30–10:00 **Step By Step Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *Zaur Nagiyev; Vedat Oruk; Yaşar Çokkeser*

10:45–11:15 **Personal Tips For Difficult Revision**
Facial Plastic Surgery · Keynote Lecture *Yong Ju Jang; Burak Ulkumen*

11:15–11:45 **Aproach For Nasal Dorsum In Rhinoplasty**
Facial Plastic Surgery · Expert Discussion *Yusufhan suoglu; Alireza Mesbahi; Burak Ulkumen*

11:45–12:15 **Contemporary Approaches To Nasal Valve Evaluation And Management**
Facial Plastic Surgery · Instructional Course *Edward Zhang; Burak Ulkumen*

12:15–12:30 **Blocking Points In Preservation Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *Abdülkadir göksel; Burak Ulkumen*

12:30–12:45 **Dorsal Augmentation With Diced Cartilage In Glue-Its Predictability And Difficulties**
Facial Plastic Surgery · Panel Presentation *keng lu; Burak Ulkumen*

14:00–15:00 **APPROACH TO THE TİP IN RHINOPLASTY**
Facial Plastic Surgery · Round Table *Erkan Soylu; Kritsada Kowitwibool; Sam Most*

15:00–15:15 **Advanced Flap And Graft Thecniques In Complex Revision Cases And Cleft Noses**
Facial Plastic Surgery · Master of Surgery Video Presentation *Oguzhan Oguz; taşkın yücel*

15:15–15:45 **Controversies; Structural Versus Preservation**
Facial Plastic Surgery · Controversies *Abdülkadir göksel; eren tastan; taşkın yücel*

15:45–16:00 **The Key Factors In Asian Septorhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Soo-Whan Kim; taşkın yücel*

16:30–17:00 **Pearls And Tips For A Multiethnic Rhinoplasty.**
Facial Plastic Surgery · Keynote Lecture *Nagihan Bilal*

17:00–17:15 **Piezo Structural Rhinoplasty**
Facial Plastic Surgery · Panel Presentation *Vedat Oruk; Nagihan Bilal*

17:15–17:45 **Reasons For Choosing A Septal Extension Graft**
Facial Plastic Surgery · Instructional Course *Rui Xavier; Nagihan Bilal*

Friday, 11 September 2026

08:00–08:30 **Osteotomy – New Techniques**
Facial Plastic Surgery · Instructional Course *Serkan Bariskan*

08:30–09:00 **Oblique Split ; State Of The Art In Revision Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *eren tastan; taşkın yücel*

09:00–09:30 **Good Long Term Results In Rhinoplasty:Technical Considerations**
Facial Plastic Surgery · Keynote Lecture *Alireza Mesbahi; taşkın yücel*

09:30–09:45 **Revision Rhinoplasty Strategies: Structural Reconstruction Using Conchal Cartilage**
Facial Plastic Surgery · Remarkable Presentation *taşkın yücel; Ahmed Mansour*

09:45–09:55 **Nomenclature For Lateral Wall Insufficiency: Evidence And Treatment**
Facial Plastic Surgery · Round Table *Sam Most; taşkın yücel*

10:45–11:45 **Rhinoplasty In Turkey (1) : Practial Pearls And Videopresentations From Turkish Rhinoplasty Surgeons**
Facial Plastic Surgery · Panel Presentation *taşkın yücel; Sureyya Seneldir; Ahmet Alp; tamer erdem; Abdülkadir göksel; sercan; göde*

11:45–12:45 **OSTEOTOMY IN RECENT YEARS**
Facial Plastic Surgery · Panel Presentation *lütfi barlas aydoğan; Sureyya Seneldir; ignazio tasca; TEVFIK SOZEN*

14:00–14:30 **Closed Functional Rhinoplasty:A Philosophy**
Facial Plastic Surgery · Keynote Lecture *ignazio tasca; Orhan Ozturan; taşkın yücel*

14:30–15:30 **Functional Problems In Rhinoplasty**
Facial Plastic Surgery · Panel Presentation *Orhan Ozturan; Yu Hosokawa; Hyo Yeol Kim; Sara Rahavi; taşkın yücel*

15:30–16:00 **3 Dimensional Approach To Nasal Dorsum**
Facial Plastic Surgery · Keynote Lecture *taşkın yücel; Orhan Ozturan*

16:30–17:30 **Hybrid Techniques And New Technologies In Rhinoplasty**
Facial Plastic Surgery · Panel Presentation *ignazio tasca; Tural Fatullayev; Shahryar Nazari; a. emre ilhan*

17:30–17:45 **Alar Hanging Correction**
Facial Plastic Surgery · Remarkable Presentation *Kritsada Kowitwibool; Ender İnci*

17:45–18:00 **How I Built Ideal Profile**
Facial Plastic Surgery · Master of Surgery Video Presentation *Ender İnci; Kritsada Kowitwibool*

Saturday, 12 September 2026

08:00–08:30 **Reconstruction Of Nose Framework**
Facial Plastic Surgery · Keynote Lecture *Erkan Soylu; Unnamed user; tamer erdem; Oguzhan Oguz*

08:30–08:45 **Fat Membrane , A New Era In Facial Plastic Surgery**
Facial Plastic Surgery · Keynote Lecture *Shahryar Nazari; tamer erdem; Oguzhan Oguz*

08:45–09:00 **My Osteotomy Approach**
Facial Plastic Surgery · Remarkable Presentation *Sureyya Seneldir; tamer erdem; Oguzhan Oguz*

09:00–09:15 **Management Of Columellar Necrosis And Retrocolumellar Perforation**
Facial Plastic Surgery · Remarkable Presentation *Tural Fatullayev; tamer erdem; Oguzhan Oguz*

09:15–09:45 **Revision Rhinoplasty -Extreme Cases With Skin Problems**
Facial Plastic Surgery · Keynote Lecture *sercan göde; tamer erdem; Oguzhan Oguz*

09:45–10:00 **Revision Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *tamer erdem; Oguzhan Oguz*

10:45–11:45 **NASAL DORSUM IN RHINOPLASTY**
Facial Plastic Surgery · Round Table *Yusufhan suoglu; lütfi barlas aydoğan; Fazıl Apaydın; Yong Ju Jang*

11:45–12:00 **How Do I Deal With Nasal Hump?**
Facial Plastic Surgery · Round Table *Fazıl Apaydın; tamer erdem; TARIK ŞAPÇI*

12:00–12:10 **Implementation Of 3D Simulation And Surgical Planning For Rhinoplasty**
Facial Plastic Surgery · Keynote Lecture *Uzdan Uz; tamer erdem; TARIK ŞAPÇI*

12:10–12:25 **Management Of The Caribbean And Afro-Latin Nose**

Facial Plastic Surgery · Remarkable Presentation *Pamela Pol; tamer erdem; TARIK ŞAPÇI*

12:25–12:45 **Profile Alignment In Rhinoplasty**

Facial Plastic Surgery · Instructional Course *Fazıl Apaydın; TARIK ŞAPÇI; tamer erdem*

14:00–15:00 **REVISION RHINOPLASTY**

Facial Plastic Surgery · Panel Presentation *Yong Ju Jang; Shahin Bastaninejad; Abdülkadir göksel; tamer erdem; Oguzhan; Oguz*

15:00–15:10 **My Tipplasty Technique**

Facial Plastic Surgery · Master of Surgery Video Presentation *TARIK ŞAPÇI; tamer erdem*

15:10–16:00 **Ethnic Rhinoplasty**

Facial Plastic Surgery · Panel Presentation *Habiba Sultan Almaskari; James Wai Leong Kok; Soo-Whan Kim*

16:30–17:30 **Rhinoplasty In Turkey (2) : Practial Pearls And Videopresentations From Turkish Rhinoplasty Surgeons**

Facial Plastic Surgery · Round Table *H. Baki Yilmaz; eren tastan; TEVFIK SOZEN; Köksal YUCA; Gurkan Kayabasoglu*

17:30–18:00 **Ethnic And Racial Variations In Facelift Surgery: Tailoring Principles And Techniques For Optimal Outcomes**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Gurkan Kayabasoglu; Halis Ünlü*

FACIAL PLASTIC 4

ICC - B3 Floor - 3B/22

Wednesday, 9 September 2026

15:00–16:00 **Medical And Surgical Treatment Of Crswnp**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Afruz Masimova; Ceren Gunel; Egehan Salepci; Sevinc Hepkarsi; Ceyda ÜSTE*

16:30–17:30 **The Role Of Artificial Intelligence In Diagnosis, Treatment And Academic Publishing**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Dan Iovanescu; Yunus Emre Topan; Mustafa Burak KARAHAN; Arda Yavuz; Banu; Erkal; Ömer Necati Develioglu*

Thursday, 10 September 2026

09:00–09:30 **Facial Plastic Surgery Notable Abstracts**

Notable Abstracts · Notable Abstract *taşkın yücel*

10:45–11:00 **A Chanllenge In Rhinoplasty: High Projected And Bulbous Tip**

Facial Plastic Surgery · Remarkable Presentation *Erkan Soylu; Rui Xavier*

11:00–11:30 **Augmentation Rhinoplasty In Middle Eastern Noses; How To Achieve An Ideal Profile Projection And Shape.**

Facial Plastic Surgery · Keynote Lecture *Habiba Sultan Almaskari; Rui Xavier; Erkan Soylu*

11:30–11:45 **The Novel Traction-Suturing Technique In Correction Of Caudal End Deviation Of The Nasal Septum**

Facial Plastic Surgery · Master of Surgery Video Presentation *Rui Xavier; Erkan Soylu*

14:00–14:15 **Evidence-Based Comparison Of Preservation And Structural Rhinoplasty For Hump Nose Surgery**

Facial Plastic Surgery · Remarkable Presentation *Ceren Gunel; Ki Il Lee; Selim Sermed Erbek*

14:15–14:30 **Nasal Tip Support**

Facial Plastic Surgery · Master of Surgery Video Presentation *Ceren Gunel; Selim Sermed Erbek*

14:30–14:45 **Preservation Extracorporeal Aesthetic Septoplastyin Pediatreic Patients**

Facial Plastic Surgery · Remarkable Presentation *Ceren Gunel; Mazahir Guliyev; Selim Sermed Erbek*

14:45–15:00 **LEGO CONCEPT: The Secret To Columellar Control**

Facial Plastic Surgery · Remarkable Presentation *Selim Sermed Erbek; Gustavo Romero; Ceren Gunel*

15:00–15:30 **Restoring Nasal Alignment In Preservation Rhinoplasty For Asian Patients**

Facial Plastic Surgery · Instructional Course *Ki Il Lee; Selim Sermed Erbek; Ceren Gunel*

15:30–15:45 **Crooked Nose Surgery**

Facial Plastic Surgery · Remarkable Presentation *Selim Sermed Erbek; Ceren Gunel*

16:30–17:30 **Turkish Rhinoplasty Rising Stars Panel: Ethnic Variations In Nasal Deformities And Contemporary Correction Techniques**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Gürcan Sünnetci; Cemal Cingi; Erdi Özdemir; Yunus Emre Topan; Ahmet Arslanoğlu;; Ali Değirmenci*

17:30–18:00 **WHO New Resolution On Sensory Impairment**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Milan Profant; Cemal Cingi*

Friday, 11 September 2026

08:15–08:30 **Preservation Vs Structural Rhinoplasty In Deviated Noses**

Facial Plastic Surgery · Instructional Course *Mohsen Naraghi; Uzdan Uz*

08:30–08:45 **Various Graft Locations On The Nose**

Facial Plastic Surgery · Remarkable Presentation *Nar Maya Thapa; Uzdan Uz*

08:45–09:15 **All About The Costal Cartilage Rhinoplasty**

Facial Plastic Surgery · Keynote Lecture *Yong Ju Jang; Uzdan Uz*

09:15–09:45 **The Ageing Nose: Anatomical, Functional, And Gender-Specific Changes Across The Lifespan**

Facial Plastic Surgery · Remarkable Presentation *Uzdan Uz*

09:45–10:00 **Bloodless Field During Septorhinoplasty**

Facial Plastic Surgery · Remarkable Presentation *Alireza Mesbahi; Uzdan Uz*

10:45–11:00 **Pediatric Rhinoplasty, Timing And Considerations**

Facial Plastic Surgery · Remarkable Presentation *Krıshna Patel; Alireza Mesbahi*

11:00–11:15 **Nasal Tip Surgery**
Facial Plastic Surgery · Remarkable Presentation *Alireza Mesbahi; Krıshna Patel*

11:15–11:30 **Medial Crura Footplate Reduction And Its Effects On Nasal Measurement**
Facial Plastic Surgery · Keynote Lecture *Mohammad Aleisa; Krıshna Patel; Alireza Mesbahi*

11:30–11:45 **Structural Rhinoplasty Vs Preservation Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *Krıshna Patel; Alireza Mesbahi*

12:00–12:30 **Master Of Surgery Rhinoplasty Video 2**
Facial Plastic Surgery · Master of Surgery Video Presentation *Ender İnci; Alireza Mohebbi; Vedat Oruk*

12:30–12:45 **Revision Rhinoplasty Tips&Trick**
Facial Plastic Surgery · Remarkable Presentation *Abdülkadir göksel; Mohsen Naraghi*

14:00–14:15 **Rhinoplasty Complications Early Management**
Facial Plastic Surgery · Remarkable Presentation *Marcel Sauvalle Ceballos; Mohsen Naraghi; Denizhan Dizdar*

14:15–14:30 **Endonasal Application Of Spreader Grafts**
Facial Plastic Surgery · Remarkable Presentation *Helena Silveira; Mohsen Naraghi; Denizhan Dizdar*

14:30–15:00 **Minimally Invasive Secondary Rhinoplasty In Over-Resected Noses Without Rib Grafts**
Facial Plastic Surgery · Keynote Lecture *Mohsen Naraghi; Denizhan Dizdar*

15:00–15:30 **Chin Augmentation By Fillers Versus Surgery**
Facial Plastic Surgery · Keynote Lecture *Mohsen Naraghi; Denizhan Dizdar*

15:30–16:00 **Management Of Nasal Septum In Crooked Nose**
Facial Plastic Surgery · Keynote Lecture *Mohsen Naraghi; Denizhan Dizdar; Fazıl Apaydın*

16:30–17:30 **Master Of Surgery Videos 1**
Facial Plastic Surgery · Master of Surgery Video Presentation *Denizhan Dizdar; Yusufhan suoglu; lütfi barlas aydoğan; Benyamin Rahmaty; Ceren; Gunel*

17:30–18:00 **Preservation Rhinoplasty For Beginners**
Facial Plastic Surgery · Instructional Course *Uzdan Uz; Ceren Gunel*

Saturday, 12 September 2026

08:00–08:30 **RHINOPLASTY IN DEVIATED NOSES**
Facial Plastic Surgery · Round Table *Mohsen Naraghi; Selim Sermed Erbek*

08:30–08:45 **Correction Of Primary Lateral Crural Concavity**
Facial Plastic Surgery · Master of Surgery Video Presentation *Mohsen Naraghi; Uzdan Uz*

08:45–09:00 **Nasal Tip Stabilization**
Facial Plastic Surgery · Remarkable Presentation *KÜBRA TOPAL; Uzdan Uz*

09:00–09:15 **Do Septocolumellar Sutures Work To Keep The Nasal Tip In Position?**
Facial Plastic Surgery · Remarkable Presentation *Meshari Saghir; Uzdan Uz*

09:15–09:30 **Which Patient Should You Reject For Rhinoplasty?**
Facial Plastic Surgery · Remarkable Presentation *Meshari Saghir; Uzdan Uz*

09:30–09:45 **Dorsal Preservation Rhinoplasty**
Facial Plastic Surgery · Remarkable Presentation *lütfi barlas aydoğan; Uzdan Uz*

09:45–10:00 **How To Refine Bulbous And Poorly- Projected Nasal Tip**
Facial Plastic Surgery · Remarkable Presentation *Yong Ju Jang; Uzdan Uz*

10:45–11:45 **Central American Perspectives In Rhinology**
Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Roberto Quijano; Jolie Anna Crespo Chanis; Roberto Calzada Lang*

11:45–12:45 **Women In Otolaryngology**
Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Doreen Naku; Leila Essakali; Zeynep Alkan; Banu Erkal*

14:00–15:00 **International Academy ORL-HNS Symposium, Advances In Otorhinolaryngology: A Global Perspective**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *George Tavartkiladze; Desiderio Passali; Hesham Negm; Sergey Karpishchenko;; Marco Piemonte*

15:00–16:00 **Structural Versus Preservation Rhinoplasty**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Oguzhan Oguz; Yong Ju Jang; Muhammed Sefa Uyar; Serkan Bariskan*

16:30–17:00 **Oral Cavity Cancer: A Global Perspective**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Akif Abakay; Yunus Emre Topan*

17:00–18:00 **Pan Asian Academy Of Facial Plastic & Reconstructive Surgery(PAAFPRS) Panel: Rhinoplasty Techniques Update In East & West Part Of Asia**

Global Outreach (Regional or ENT related Organizations Symposia) · Panel Presentation *Habiba Sultan Almaskari; Dr Chih-Wen Twu; Alireza Mesbahi; Yong Ju Jang*

Head and Neck Oncology · Round Table *Marika Russell; Ahmet Ömer İkiz; Mine Araz; Tobias Todsen; Mustafa Kürşat Gökcan*

09:00–10:00 **Challenges And Solutions To Head And Neck Cancer Care In Africa And In Lower- And Middle-Income Countries**

Head and Neck Oncology · International Symposia *Johannes Fagan; Kenneth Baidoo; Kagga Douglas Senyonjo; Clemence Chidziva*

10:45–11:45 **ASHNO Panel: Contemporary Management Of Nasopharyngeal Carcinoma**

Head and Neck Oncology · International Symposia *Sheng Po Hao; Jason Y K Chan; Thuy Tran; Napadon Tangjaturonrasme*

11:45–12:45 **What Surgical Action Is Needed For What Specific Clinical Scenario Of Salivary Gland Cancer?**

Head and Neck Oncology · Round Table *Jens Peter Klussmann; Ricard Simo; Giuseppe Mercante; Görkem Eskiizmir; Vincent; Vander Poorten*

14:00–14:30 **20 Years Of Supratracheal Laryngectomy: A Comprehensive Review And Future Perspectives**

Head and Neck Oncology · Keynote Lecture *Giovanni Succo; Utku Aydil*

14:30–15:30 **Management Of Intermediate And Advanced Laryngeal Cancer (T3- T4)**

Head and Neck Oncology · Panel Presentation *Basim Wahba; Giovanni Succo; Dusan Milisavljevic; Vladimir Pavićević; Utku Aydil*

15:30–16:00 **Redefining Prognosis: Long-Term Outcomes Of TORS For Hypopharyngeal And Laryngeal Cancers**

Head and Neck Oncology · Instructional Course *Chen-Chi Wang; Utku Aydil*

16:30–17:30 **Salvage Surgery For Local Recurrence In Nasopharyngeal Carcinoma– Choosing The Right Approach**

Head and Neck Oncology · Round Table *Chen-Chi Wang; Jason Y K Chan; Joseph Chun-Kit Chung; Samuel Cheng*

17:30–18:00 **Transoral Ultrasonic Surgery (TOUSS): From Setup To Safe Resection —A Practical Surgical Guide**

Head and Neck Oncology · Instructional Course *Mario Fernandez; Senem Çengel Kurnaz*

Friday, 11 September 2026

07:00–08:00 **Advanced Resection And Reconstruction In Maxillary Sinus Malignancies: Technical Pearls, Pitfalls, And Future Directions**

Head and Neck Oncology · Round Table *Betsy Davis; Mauricio Moreno, MD- Arkansas; Larissa Sweeny*

08:00–09:00 **Management Of Early-Stage Oropharyngeal Cancers**

Head and Neck Oncology · Panel Presentation *Michael Hinni; Sebastien Vergez; Hisham Mehanna; Jan Klozar; Emre Vural*

09:00–10:00 **SOCIETAS OTORHINOLARYNGOLOGICA LATINA: Leading Technologies In The Treatment Of Cancer In The Different Head And Neck Sites: Advances And Controversies**

Head and Neck Oncology · International Symposia *Desiderio Passali; Gaetano Motta; Metin Onerci; CODRUT SARAFOLEANU; Marco; Piemonte; Eddy Wong*

10:45–11:45 **Austrian HNS Panel: Frailty And Major Head And Neck Surgery – A Growing Problem In An Aging Population?**

Head and Neck Oncology · International Symposia *Dietmar Thurnher; Gregor Heiduschka; Markus Brunner; Stephan Härle; Cesare; Piazza*

11:45–12:45 **What A Messi Trying To Bring Order To Head And Neck Cancer Patients Treated Inadequately – Reflections On Clinical Cases**

Head and Neck Oncology · Round Table *Luca Gazzini; Jeroen Meulemans; Alfred Aga; Remo Accorona*

14:00–15:00 **Planning The Resection And Reconstruction Of Oral Cavity Cancers For The Best Functional And Oncologic Results**

Head and Neck Oncology · Round Table *Bülent Evren Erkul; Ehab Hanna; Mustafa Kürşat Gökcan*

15:00–15:30 **Contemporary Management Of Early-Stage HPV Positive Oropharyngeal Cancer.**

Head and Neck Oncology · Keynote Lecture *Michael Hinni; Emre Vural*

15:30–16:00 **Surgery Or Radiotherapy For HPV Positive Oropharyngeal Cancer**

Head and Neck Oncology · Controversies *Emre Vural; Hisham Mehanna; Enis Ozyar*

16:30–17:00 **Shared Decision Making In Advanced Laryngeal Cancer**

Head and Neck Oncology · Keynote Lecture *Michiel van den Brekel; Kerem Ozturk*

17:00–18:00 **Future Of Head And Neck Oncology: Neoadjuvant Treatments, Immunotherapies And Response Adapted Surgeries**

Head and Neck Oncology · Panel Presentation *Takahiro Tsujikawa; Pen-Yuan Chu; Nicole Schmitt; Barbara Wollenberg*

Saturday, 12 September 2026

07:00–07:30 **Management Of Facial Nerve In Parotid Cancers**

Head and Neck Oncology · Instructional Course *Nicolas Fakhry; Ahmet Ömer İkiz*

07:30–08:00 **What Molecular Biological Discoveries Have Clinical Impact And Relevance In Salivary Gland Cancer?**

Head and Neck Oncology · Keynote Lecture *Ahmet Ömer İkiz; Vincent Vander Poorten*

08:00–08:30 **Integration Of Modeling Into Complex Head And Neck Reconstruction**

Head and Neck Oncology · Expert Discussion *Süleyman Cebeci; Brett Miles, MD, DDS*

08:30–09:00 **Neoadjuvant Immunotherapy In Head And Neck Cancer: Where We Are And Where We Are Going?**

Head and Neck Oncology · Expert Discussion *Sid Puram; Erdogan OZGUR*

09:00–09:30 **Novel And Modifiable Risk Factors For Head And Neck Cancer**

Head and Neck Oncology · Expert Discussion *Brittany Barber, MD, MSc; Erdogan OZGUR*

09:30–10:00 **Management And Recommendations Of Osteoradionecrosis Of The Head And Neck**

Head and Neck Oncology · Expert Discussion *Larissa Sweeny; Erdogan OZGUR*

10:45–11:15 **Neoadjuvant Therapy For Advanced Differentiated Thyroid Cancer**

Head and Neck Oncology · Keynote Lecture *Gregory W. Randolph; Mustafa Kürşat Gökcan*

11:15–11:45 **Establishing An Endocrine Surgery Unit Within An Academic Department Of Otolaryngology–Head And Neck Surgery**

Head and Neck Oncology · Instructional Course *Mustafa Kürşat Gökcan*

11:45–12:45 **Surgery For Thyroid Cancer - Masters All Around The World Panel**

Head and Neck Oncology · Panel Presentation *Miroslav Tedla; Luiz P. Kowalski; Gregory W. Randolph; Anastasios Maniakas;; Shigeru Hirano; Soon-Hyun Ahn; Mustafa Kürşat Gökcan*

14:00–15:00 **Access To High Quality Head And Neck Cancer Care: Challenges And Potential Solutions**

Head and Neck Oncology · Round Table *Bevan Yueh; Johannes Fagan; Heikki Irjala; Lovisa Farnebo; Michiel van den Brekel;; Seiichi Yoshimoto*

15:00–16:00 **Management Of Advanced Oral Cancer**

Head and Neck Oncology · Panel Presentation *Igor Reshetoviv; Murat Yener; Anastasios Maniakas; Gregoire B. Morand*

16:30–17:00 **Mohs Micrographic Surgery In Head And Neck Skin Cancer: Precision Oncology At The Microscopic Level**

Head and Neck Oncology · Keynote Lecture *Isa Kaya; Ozan Erdem*

17:00–18:00 **Management Of Advanced Skin Cancers: Updates And Novel Approaches**

Head and Neck Oncology · Panel Presentation *Wojciech Golusinski; İrfan Kara; Jeroen Kraak; Marija Pastorčić Grgić*

HEAD & NECK 3

ICC - B3 Floor - 3B/38

Wednesday, 9 September 2026

14:00–14:30 **Instructional Course**

Head and Neck Oncology · Instructional Course *Tobias Todsen; Günter HAFIZ; Benedikt Gabriel Hofauer; Aysenur MERIC HAFIZ*

14:30–15:00 **Instructional Course**

Head and Neck Oncology · Instructional Course *Benedikt Gabriel Hofauer; Günter HAFIZ; Tobias Todsen; Aysenur MERIC HAFIZ*

15:00–15:30 **Instructional Course**

Head and Neck Oncology · Instructional Course *Tobias Todsen; Günter HAFIZ; Benedikt Gabriel Hofauer; Aysenur MERIC HAFIZ*

15:30–16:00 **Instructional Course**

Head and Neck Oncology · Instructional Course *Aysenur MERIC HAFIZ; Günter HAFIZ; Tobias Todsen; Benedikt Gabriel Hofauer*

16:30–17:00 **Cervical Paraganglioma: From Diagnosis To Management**

Head and Neck Oncology · Instructional Course *Pietro Perotti; Sema Zer Toros*

17:00–17:30 **Step By Step Carotid Paraganglioma Excision Surgery**

Head and Neck Oncology · Instructional Course *Murat Ozturk; Sema Zer Toros*

17:30–18:00 **CO2 Laser Surgery In Laryngeal Carcinoma**

Head and Neck Oncology · Master of Surgery Video Presentation *lütfi barlas aydoğan; Sema Zer Toros*

Thursday, 10 September 2026

07:00–07:30 **Temporary Tracheotomy In Transoral Robotic Surgery(TORS): A Proposal Of Decision-Making Algorithm.**

Head and Neck Oncology · Instructional Course *sahin ogreden*

07:30–08:00 **Function Preservation In Cervical Schwannoma - How And Why To Do Intracapsular Enucleation Surgery.**

Head and Neck Oncology · Instructional Course *Rupert Obholzer; Sibel Yıldırım Moral*

08:00–08:30 **KNOWLEDGE AND ATTITUDES OF OTOLARYNGOLOGISTS REGARDING HUMAN PAPILLOMAVIRUS INFECTION AND VACCINATION**

Head and Neck Oncology · Instructional Course *Sibel Yıldırım Moral; Erim Pamuk*

08:30–09:30 **Advances In Oral Cavity Surgery: Precision, Preservation, And Progress In Oncologic And Functional Outcomes**

Head and Neck Oncology · Panel Presentation *Christian Grønhøj; Antoine Melkane; Çağlar Eker; Davide Mattavelli; Monir; Abousiam*

09:30–10:00 **Clinical Utility Of Narrow Band Imaging For Early Detection Of Pharyngeal And Laryngeal Cancer And Minimally Invasive Endoscopic Laryngo-Pharyngeal Surgery**

Head and Neck Oncology · Instructional Course *ichiro tateya; Erdogan OZGUR*

10:45–11:15 **The Role Of Partial Laryngectomy Among Organ Preservation Strategies In T3 Laryngeal Cancer**

Head and Neck Oncology · Instructional Course *Çağlar Eker; Hakkı Caner İNAN*

11:15–11:45 **Variability Of The Incidence And Risk Factors For The Development Of Pharyngocutaneous Fistula After Laryngectomy In Different Time Periods**

Head and Neck Oncology · Instructional Course *Robert Šifrer; Çağlar Eker*

11:45–12:45 **Personalized Approaches In Head And Neck Cancer: Biomarkers, Targeted Therapies, And Surgical Decision-Making**

Head and Neck Oncology · Panel Presentation *Trevor Hackman; Hatime Arzu Yaşar; Gözde Yazıcı; SEDA TÜRKOĞLU BABAKURBAN;; Markus Blaurock*

14:00–15:00 **APTS Symposium: Advanced Technology In Thyroid Surgery**

Head and Neck Oncology · International Symposia *Kyung Tae; Che-Wei Wu; KANG-DAE LEE; Shigeru Hirano; Abdulwahid M. Salih*

15:00–16:00 **Field Cancerization In Head And Neck Carcinoma - Biomarkers And Novel Insights On Surgical Margins**

Head and Neck Oncology · Panel Presentation *Todor Popov; Marco Ferrari; Linda Marklund*

16:30–17:00 **Early-Stage Detection And Prevention Of Head And Neck Cancers**

Head and Neck Oncology · Instructional Course *Erim Pamuk; Sara Pai*

17:00–17:30 **TORS For Oropharynx Squamous Cell Carcinomas**

Head and Neck Oncology · Instructional Course *Fernando Danelon Leonhardt; Erim Pamuk*

17:30–18:00 **INCIDENCE OF POSTOPERATIVE DELIRIUM AMONG PATIENTS WHO UNDERWENT HEAD & NECK SURGERY**

Head and Neck Oncology · Instructional Course *rezarta TAGA SENİRLİ; Hakkı Caner İNAN*

Friday, 11 September 2026

07:00–07:30 **Endolaryngeal Laser Surgery In Early Stage Laryngeal Carcinoma**
Head and Neck Oncology · Instructional Course *Meltem Akpınar; Hakkı Caner İNAN*

07:30–08:00 **Transoral Laser Microsurgery For Early Stage Glottic Laryngeal Cancers**
Head and Neck Oncology · Instructional Course *Hakkı Caner İNAN; Meltem Akpınar*

08:00–08:30 **Partial Laryngectomy**
Head and Neck Oncology · Instructional Course *Elvan Evrim Ünsal Tuna; Burcu Vural Çamalan*

08:30–09:00 **Step By Step: Total Laryngectomy**
Head and Neck Oncology · Instructional Course *Yetkin Zeki YILMAZ; Ozlem Unsal*

09:00–10:00 **Danish Society Of ORL-HNS: Novel Strategies In Diagnostics, Treatment, And Surveillance Of Oropharyngeal Carcinoma: The Role Of TORS And Cthpv-DNA**
Head and Neck Oncology · International Symposia *Thomas Kjaergaard; Chris Holsinger; Vinidh Paleri; Christian von Buchwald;; Christian Grønhøj*

10:45–11:45 **Global Epidemiology And Perspectives For Salivary Gland Tumors**
Head and Neck Oncology · Round Table *Malgorzata Wierzbicka; Çiğdem Tepe Karaca; Ravindra Deo; Yetkin Zeki YILMAZ;; Mehmet Düzlü*

11:45–12:45 **Surgical Margins In Oral Cavity Cancer**
Head and Neck Oncology · Round Table *Tobias Todsen; Senada Koljenović; Bülent Evren Erkul; Patrick Sheahan*

14:00–14:30 **TRANSORAL ROBOTIC SURGERY FOR OROPHARYNGEAL CANCER: PERSONAL EXPERIENCE**
Head and Neck Oncology · Instructional Course *Andrea De Vito; Oğuz Kuşcu; David Virós Porcuna*

14:30–15:00 **Salvage Surgery For Local Recurrence In Nasopharyngeal Carcinoma**
Head and Neck Oncology · Instructional Course *Joseph Chun-Kit Chung; Cömert Şen*

15:00–15:30 **Salvage Surgery For Recurrent Head And Neck Cancer: Is It Worthwhile?**
Head and Neck Oncology · Keynote Lecture *Patrick Sheahan; Murat Yener*

15:30–16:00 **How To Prevent Postoperative Pharyngocutaneous Fistula In Salvage Total Laryngectomy?**
Head and Neck Oncology · Instructional Course *Roland Giger; Murat Yener*

16:30–17:00 **Neoadjuvant Chemotherapy In Hypopharyngeal Cancer**
Head and Neck Oncology · Instructional Course *Pen-Yuan Chu; Bayram Barış BUYUK*

17:00–18:00 **Defining The Standard: Controversies In Primary And Neck Treatment For HPV-Negative Oropharyngeal Cancer**
Head and Neck Oncology · Round Table *J. Scott Magnuson; Asit Arora; Vinidh Paleri; Thiago Bueno de Oliveira*

Saturday, 12 September 2026

07:00–07:30 **Head And Neck Reconstruction**
Head and Neck Oncology · Instructional Course *Mehmet Düzlü; Süleyman Cebeci*

07:30–08:00 **Management Of Locally Advanced Thyroid Carcinoma**
Head and Neck Oncology · Instructional Course *MOHAMMED ALESSA; Ali Bayram*

08:00–08:30 **Neuromonitoring And Signal Loss Management In Thyroidectomy**
Head and Neck Oncology · Instructional Course *Nihal Seden Boyoğlu; Ali Bayram; Zehra Veli Cinar*

08:30–09:00 **The Thyroid And The Airway - An Evidence Based Approach**
Head and Neck Oncology · Instructional Course *Ricard Simo; Nihal Seden Boyoğlu*

09:00–09:30 **Tips And Pearls In TOETVA Procedure**
Head and Neck Oncology · Instructional Course *Prachya Maneeprasopchoke; Büşra Kaplan*

09:30–10:00 **Comprehensive Tool To Enhance Quality And Optimize Hospitalization Of Patients Scheduled For Laryngopharyngeal Surgery-Ready For Safe Cancer Treatment (RESET-LC)**
Head and Neck Oncology · Instructional Course *Malgorzata Wierzbicka; Büşra Kaplan*

10:45–11:45 **Management Of Resection Margins In Oral Cavity Squamous Cell Carcinoma**
Head and Neck Oncology · Round Table *Luca Gazzini; Erdogan OZGUR*

11:45–12:15 **Salvage For Recurrent Nasopharyngeal Carcinoma: Surgery Vs Re- Radiotherapy**
Head and Neck Oncology · Controversies *Sümerya Duru Birgi; Stephanie Nga-Sze Wong; Hatime Arzu Yaşar*

12:15–12:45 **Transoral Robotic Surgery For Parapharyngeal Space Tumor**
Head and Neck Oncology · Instructional Course *Chen-Chi Wang; Erdem Koroglu*

14:00–15:00 **Educating The Next Generation Of Head And Neck Robotic Surgeons: Pathways, Standards And Fellowship**

Head and Neck Oncology · Round Table *Tom Vauterin; Şefik Hoşal; Asit Arora; J. Scott Magnuson; Umamaheswar Duvvuri; MD PhD; Robbie Stewart*

15:00–16:00 **Feasibility Of Functional Preservation Surgery Of T3/T4 Head And Neck Cancer - A Pirouette Around The Cricoarytenoid Joint**

Head and Neck Oncology · Round Table *Todor Popov; Jerome LECHIEN; Giovanni Succo; Dusan Milisavljevic; Andy Bertolin-; Italy; Ben Dixon*

16:30–17:00 **Risk Adaptive Neoadjuvant Surgery Approach For Head And Neck Cancer: Lessons Learned From The Experience**

Head and Neck Oncology · Expert Discussion *Trevor Hackman; Sid Puram; Erdogan OZGUR*

17:00–17:30 **Is There Still A Place For Total Laryngectomy?**

Head and Neck Oncology · Instructional Course *Giuseppe Spriano; Erdogan OZGUR*

Sunday, 13 September 2026

07:00–07:30 **TORS For P16+Ve OPSCC: First 3 Cases In Kuwait**

Head and Neck Oncology · Instructional Course *Maha Gilani; Yavuz Gündoğdu*

07:30–08:00 **The Impact Of Chatgpt In Plastic Reconstructive Surgery: A Focus On Head And Neck Abnormality**

Head and Neck Oncology · Instructional Course *Murod Jafarov; Cömert Şen*

08:00–08:30 **Free Flap Reconstruction In Head And Neck Cancer: Current Concepts And Challenges**

Head and Neck Oncology · Instructional Course *Yavuz Gündoğdu; Cömert Şen*

08:30–09:00 **Management Of Advanced Goiters Under Nerve Monitoring**

Head and Neck Oncology · Instructional Course *Osama Hamarneh; Cömert Şen*

09:00–09:30 **Free Flap Reconstruction Alternatives For Various Defects After Oral Cavity Cancer Ablation**

Head and Neck Oncology · Keynote Lecture *Cömert Şen; Osama Hamarneh*

09:30–10:00 **Oral Cavity Reconstruction With Pedicled Flaps Following Cancer Resection**

Head and Neck Oncology · Instructional Course *Murat Yener; Cömert Şen*

10:45–11:15 **Anterior Commissure In Laryngeal Cancer**

Head and Neck Oncology · Instructional Course *Abdulvahap Akyigit; Aylin Eryılmaz*

11:15–11:45 **Management Of Post Chemoradiation Dysphagia In Head And Neck Cancers**

Head and Neck Oncology · Instructional Course *Ika Dewi Mayangsari; Ali Bayram*

11:45–12:15 **Avoidance Of Bilateral Vocal Cord Palsy After Thyroidectomy: What Are The Nuances?**

Head and Neck Oncology · Instructional Course *Ali Bayram; Hamzeh Khair*

12:15–12:45 **Second Branchial Arch Cyst Surgery: Surgical Anatomy, Diagnosis, And Management**

Head and Neck Oncology · Instructional Course *Hazem Saleh; Hamzeh Khair*

Wednesday, 9 September 2026

14:00–14:30 **Mastering Parotid Surgery: Pearls, Pitfalls, And Lessons From 1000+ Cases**
Head and Neck Oncology · Instructional Course *Saleh Mohebbi; imdat yüce*

14:30–15:00 **Minimally Invasive Parotid Surgery (Periauricular Approach)**
Head and Neck Oncology · Master of Surgery Video Presentation *Erdem Koroglu; imdat yüce*

15:30–16:00 **Controversial And Challenging Conditions In The Treatment Of Parotid Tumors**
Head and Neck Oncology · Controversies *Bülent Evren Erkul; SEDA TÜRKOĞLU BABAKURBAN*

16:30–17:00 **Advancing Surgical Access: Transparotid Approach For Parapharyngeal Tumour Excision"**
Head and Neck Oncology · Instructional Course *Bülent Evren Erkul; Secil Akyildiz*

17:00–17:30 **Salivary Gland Tumors: Modern Approach From Diagnosis To Treatment**
Head and Neck Oncology · Instructional Course *Utku Aydil; Bülent Evren Erkul*

Thursday, 10 September 2026

07:00–07:30 **Evaluating The Evidence On Perioperative Antibiotics In Head And Neck Surgery**
Head and Neck Oncology · Controversies *Markus Blaurock; Banu Atalay Erdogan*

07:30–08:00 **Advanced Thyroid Cancer Surgery: Central Neck, Lateral Neck, And Reoperative Challenges**
Head and Neck Oncology · Instructional Course *Meltem Akpınar; Gul Acar*

08:00–08:30 **Advances In Thyroid Surgery & Active Surveillance**
Head and Neck Oncology · Instructional Course *Christian Grønhøj; Gul Acar*

08:30–09:00 **Strategies For Safe Thyroid Surgery: Lessons From Video Cases**
Head and Neck Oncology · Instructional Course *Gul Acar; Banu Atalay Erdogan*

09:00–09:30 **Video Demonstration Of Interesting Parathyroid Surgery Cases**
Head and Neck Oncology · Instructional Course *imdat yüce; Senem Çengel Kurnaz*

09:30–10:00 **Approach In Locally Advanced Poorly Differentiated Thyroid Cancer Followed By Salvage Surgery: A Video-Based Case Presentation**
Head and Neck Oncology · Instructional Course *orhan Asya; Oğuz Kuşcu*

10:45–11:45 **Artificial Intelligence Models For Differantiation Thyroid Cancers**
Head and Neck Oncology · Round Table *Büşra Kaplan; Erim Pamuk; Oğuz Kuşcu*

11:45–12:15 **Thermal Ablation For Thyroid Nodules**
Head and Neck Oncology · Instructional Course *Konstantinos Chaidas; Büşra Kaplan*

12:15–12:45 **Clinical Trials For Advanced Thyroid Cancer: Intergrating Tumor Genomics With Targeted Therapy And Surgery**
Head and Neck Oncology · Keynote Lecture *Mark Zafereo; Sibel Yıldırım Moral*

14:00–14:30 **Neuromonitoring In Thyroid Surgery**
Head and Neck Oncology · Instructional Course *Ahmet Ömer İkiz; Levent Soylu*

14:30–15:00 **Anaplastic Carcinoma Thyroid --Recent Update In Management.**
Head and Neck Oncology · Instructional Course *Rajjyoti Das; Levent Soylu*

15:30–16:00 **Sino-Orbital And Skull Base Reconstruction: Maximizing Form And Function**
Head and Neck Oncology · Keynote Lecture *Cömert Şen; Leila J. Mady*

16:30–17:00 **Thyroid And Parathyroid Surgery**
Head and Neck Oncology · Instructional Course *Senem Çengel Kurnaz; Aylin Eryılmaz*

17:00–17:30 **Video-Based Case Illustrations In Safe Thyroid Surgery**
Head and Neck Oncology · Instructional Course *imdat yüce; Aylin Eryılmaz*

17:30–18:00 **Surgical Management Of Parathyroid Adenomas With Non- Concordant Imaging: Strategies And Intraoperative Decision-Making**
Head and Neck Oncology · Instructional Course *orhan Asya; Aylin Eryılmaz*

Friday, 11 September 2026

07:00–07:30 **Partial Larygectomy**
Head and Neck Oncology · Instructional Course *Murat Unal; Harun Cansız*

07:30–08:00 **Salvage Total Laryngectomy Following Organ Preservation Treatment**
Head and Neck Oncology · Expert Discussion *Cem Özer; Tim Efthymios Kyrodimos*

08:00–08:30 **Transoral Laser Microsurgery In Laryngeal Carcinoma**
Head and Neck Oncology · Instructional Course *Harun Cansız; Abdulvahap Akyigit*

08:30–09:00 **Evidence-Based Laryngeal Preservation: Indications, Limitations, And Expected Outcomes—A Practical Guide For 2026**
Head and Neck Oncology · Instructional Course *Abdulvahap Akyigit*

09:00–10:00 **Mastering Transoral Laser Surgery: Margin Control, Cordectomy Classification, And Functional Optimization**
Head and Neck Oncology · Round Table *Kerem Ozturk; ichiro tateya; Rajko Jović; Ayşegül Batıoğlu Karaaltın*

10:45–11:45 **NASAL VESTIBULE CARCINOMAS: SETTING NEW STANDARDS FOR A NEGLECTED DISEASE**
Head and Neck Oncology · Panel Presentation *Francesco Bussu; Luca Tagliaferri; Marco Piemonte*

11:45–12:15 **Artificial Intelligence Applications In Laryngeal Cancer Modelling**
Head and Neck Oncology · Instructional Course *Erim Pamuk; Oğuz Kuşcu*

12:15–12:45 **The Evolution Of Transoral Laser Microsurgery (TLM): A 600-Case Odyssey From CO_2 To Blue Laser Innovation**
Head and Neck Oncology · Instructional Course *jaiganesh manickavasagam; Oğuz Kuşcu*

14:00–14:30 **Salvage Surgery In Head And Neck Squamous Cell Carcinoma: How To Optimize Oncologic And Functional Outcome?**
Head and Neck Oncology · Instructional Course *Roland Giger; Murat Ozturk*

14:30–15:00 **Salvage Laryngectomy**
Head and Neck Oncology · Instructional Course *Banu Atalay Erdogan; Murat Ozturk*

15:30–16:00 **Non-Squamous Cancers Of The Larynx**
Head and Neck Oncology · Expert Discussion *Bengu Cobanoglu; Banu Atalay Erdogan*

16:30–17:00 **Hypopharyngeal Malignancy - Standard Of Care In Montenegro**
Head and Neck Oncology · Instructional Course *Vladimir Pavićević; Bengu Cobanoglu*

17:00–17:30 **Modern Concept Of Optimal Treatment Of Laryngeal Carcinoma**
Head and Neck Oncology · Instructional Course *Rajko Jović; Milan Dusan Stankovic; Bengu Cobanoglu*

17:30–18:00 **Precision And Perplexity: A 13-Year Journey In Managing Advanced Parotid Cancer – Evidence, Ethics, And Expertise**
Head and Neck Oncology · Instructional Course *jaiganesh manickavasagam; Utku Aydil*

Saturday, 12 September 2026

07:30–08:00 **The Cervico-Mediastinal Junction Surgery: Tips And Tricks**
Head and Neck Oncology · Instructional Course *Marco Piemonte; Nihal Seden Boyoğlu*

08:00–08:30 **Melanoma Of The Head And Neck: Management And Controversial Aspects**
Head and Neck Oncology · Instructional Course *Jeroen Kraak; Ibrahim Salih Gecer*

08:30–09:00 **Non-Melanoma Skin Cancers Of The Head And Neck: Management And Controversial Aspects**
Head and Neck Oncology · Instructional Course *Görkem Eskiizmir; Ibrahim Salih Gecer*

09:00–09:30 **Synchronous Metachronous Cancers In Head And Neck Cancers: Case Reports**
Head and Neck Oncology · Instructional Course *Melek Kezban Gürbüz; Mehmet Düzlü*

09:30–10:00 **Transoral Laser Microsurgery For Laryngeal Cancer: Principles, Indications, And Pitfalls**
Head and Neck Oncology · Instructional Course *Kerem Ozturk; Mehmet Düzlü*

10:45–11:15 **Neck Dissections**
Head and Neck Oncology · Instructional Course *Sema Zer Toros; Banu Atalay Erdogan*

11:15–11:45 **De-Escalation Strategies For HPV Positive Oropharyngeal Cancer**
Head and Neck Oncology · Instructional Course *Pawel Golusinski; Oğuz Kuşcu*

11:45–12:45 **Hyperbaric Oxygen For Head And Neck Tumors**
Head and Neck Oncology · Panel Presentation *Paolo Marcolin; Selin Ünsaler*

14:00–15:00 **Turkish Head And Neck Society Session II: Global Guidelines On The Management Of Thyroid Malignancies And Local Practices**
Head and Neck Oncology · International Symposia *Mehmet Hakan Korkmaz; Güleser Saylam; Ersoy Doğan; Levent Soylu; Ömer Bayır*

15:00–15:30 **New Prognostic Markers For Laryngeal Cancer**

Head and Neck Oncology · Instructional Course *Elvir Zvrko; Nicolas Fakhry*

15:30–16:00 **Surveillance After Curative Treatment Of Head And Neck Cancer**

Head and Neck Oncology · Expert Discussion *Petri Koivunen; Togay Müderris*

16:30–17:00 **The Evolution Of Total Laryngectomy Procedure From Theodore Billroth To Today**

Head and Neck Oncology · Keynote Lecture *Dietmar Thurnher; Utku Aydil*

17:00–18:00 **Multidisplinary Treatment Of Sinonasal Malignancies**

Head and Neck Oncology · Round Table *CODRUT SARAFOLEANU; Luca Tagliaferri; Paul Boettiger; Thiago Bueno de Oliveira*

Sunday, 13 September 2026

08:00–08:30 **Management Of Thyroid Cancers Under Nerve Monitoring At The Otolaryngology Deparment Of A Tertiary Hospital In Jordan**

Head and Neck Oncology · Instructional Course *Hamzeh Khair; Ali Bayram*

08:30–09:00 **Management Of Recurrent Nasopharyngeal Carcinoma, From Diagnosis To Potential Complications.**

Head and Neck Oncology · Expert Discussion *Jacopo Zocchi; Bayram Barış BUYUK*

09:00–09:30 **Reconstruction Of Oral Cavity Tumors With Free Flaps**

Head and Neck Oncology · Instructional Course *Bayram Barış BUYUK; sahin ogreden*

09:30–09:45 **HEAD AND NECK PARAGANGLIOMAS**

Head and Neck Oncology · Remarkable Presentation *sahin ogreden; Bayram Barış BUYUK*

09:45–10:00 **The Effects Of Radiotherapy On The Middle Ear And The Vestibular System In Head-Neck Cancers**

Head and Neck Oncology · Remarkable Presentation *Sinem Kara Peker; Bayram Barış BUYUK*

10:45–11:15 **Defects Where The Pectoralis Major Flap Can Be Used In Head And Neck Cancers**

Head and Neck Oncology · Instructional Course *Şükrü Aydın; sahin ogreden*

11:15–11:45 **Updates In The Management Of N0 Neck In Head And Neck Squamous Cell Cancers**

Head and Neck Oncology · Instructional Course *Aylin Eryılmaz; Abdulvahap Akyigit*

11:45–12:45 **Sentinel Lymph Node Excision For Oral Cavity Cancer**

Head and Neck Oncology · Round Table *Erim Pamuk; Büşra Kaplan; Oğuz Kuşcu*

HEAD N NECK 1 - ICC 3B/01

Istanbul Congress Center

Sunday, 13 September 2026

07:00–07:30 **Stem Cells In Cochlear Cells Regeneration**

Audiology · Keynote Lecture *Masato Fujioka; Erdogan Bulut*

07:30–08:00 **Immunological Frontiers In ENT: Biologics, Immuno-Oncology & Biomarkers**

Head and Neck Oncology · Expert Discussion *Krzysztof Piersiala; Tim Efthymios Kyrodimos*

08:00–08:30 **Use Of Local Flaps To Prevent Pharyngocutenous Fistula After Total Laryngectomy**

Head and Neck Oncology · Instructional Course *Togay Müderris; Murat Ulusan*

08:30–09:00 **Near Total Laryngectomy For Advanced Laryngeal Cancers: Istanbul University Experience**

Head and Neck Oncology · Keynote Lecture *Murat Ulusan; Togay Müderris*

09:00–09:30 **Quick And Versatile Flaps In Head And Neck Reconstruction**

Head and Neck Oncology · Keynote Lecture *IOANNIS CHATZIIOANNOU; Papouliakos Sotirios*

09:30–10:00 **Impact Of Combined C-MYC Oncogene Amplification/Overexpression On Laryngeal Squamous Cell Carcinoma And Review Of Biomarkers In Laryngeal Squamous Cell Carcinoma**

Head and Neck Oncology · Instructional Course *Papouliakos Sotirios; IOANNIS CHATZIIOANNOU*

10:45–11:45 **Parotid Abscesses: A Multidisciplinary Approach For Optimal Management.**

Head and Neck Oncology · Continental or International Societies Sessions *Antonino Maniaci; Matthew White; Salvatore Lavalle; Alperen Vural; Eric Levi; Peng; Han*

11:45–12:45 **Oncologic Reconstruction Of The Hypopharynx: Techniques, Updates, And Patient Quality Of Life**

Head and Neck Oncology · Panel Presentation *Davide Di Santo; Todor Popov; Stanislav Yordanov*

HEARING AIDS

ICC - B3 Floor - 3B/02

Wednesday, 9 September 2026

14:00–15:30 **Minimal Test Battery For Middle-Ear Assessment Across The Lifespan: Integrating Wideband Acoustic Immittance, ASR, OAE**
Hearing Aids · Instructional Course *Navid Shahnaz; Hatice Seyra ERBEK*

15:30–16:00 **Future Vision Of Hearing Therapeutics: From Early Intervention To Comprehensive Rehabilitation**
Hearing Aids · Keynote Lecture *Mehmet İlhan Şahin; Camille Rochmann*

16:30–17:00 **Bone Conduction Hearing Aids – What We Can Learn From Research In Daily Routine**
Hearing Aids · Keynote Lecture *Christof Roosli; Hatice Seyra ERBEK*

17:00–17:30 **Understanding Hearing And Vestibular Function Through Bayesian Brain Theory: From Perception To Adaptation**
Hearing Aids · Keynote Lecture *Bulent Şerbetçioğlu; Bülent Gündüz*

17:30–17:50 **OTC Hearing Aids: Evolution, Current Evidence, and Real-World Use**
Hearing Aids · Remarkable Presentation *Hatice Seyra ERBEK; Berna Deniz KUNTMAN*

17:50–18:00 **Perceived Stigma, Hearing Aid Outcomes, Health-Related Quality Of Life**
Hearing Aids · Remarkable Presentation *Asuman Küçüköner; Ömer Küçüköner; Deniz Uğur Cengiz*

Thursday, 10 September 2026

07:40–08:00 **SCL -90-R Phychological Symptoms Screening Test And Body Image Scaling In Patients Using Hearing Aids**
Hearing Aids · Remarkable Presentation *Deniz Uğur Cengiz; TUĞÇE GÜL ÇAĞLAR; Muhammed Ensar Ölekli*

08:00–08:30 **Hearing Aids And Spatial Hearing- Current Challenges And Future Directions**
Hearing Aids · Instructional Course *Talha Çögen; Günay KIRKIM*

08:30–09:00 **Climate Change, Migration, And Hearing Healthcare: Challenges In Access And Device Continuity Across Borders**
Hearing Aids · Instructional Course *Hatice Seyra ERBEK; Sanja Spiric*

09:00–09:30 **Artificial Intelligence And The Next Generation Of Hearing Technologies**
Hearing Aids · Keynote Lecture *Achin Bhowmik; Hatice Seyra ERBEK*

09:30–10:00 **Bimodal Hearing Rehabilitation: Integrating Cochlear Implants And Hearing Aids**
Hearing Aids · Instructional Course *Mohammed Shadid; Enis Alpin Güneri*

10:45–11:15 **How To Predict Hearing Aid Outcomes Using AI**
Hearing Aids · Keynote Lecture *Bernard Fraysse; Erdogan Bulut*

11:15–11:45 **Bridging Hearing Loss And Cognition: The ECHHO Program And Beyond**
Hearing Aids · Keynote Lecture *Meral Didem Türkyılmaz; Stefan Launer*

11:45–12:15 **Cognitive Effects Of Hearing Aid Use In Geriatric Individuals**
Hearing Aids · Instructional Course *Meral Didem Türkyılmaz; Sanja Spiric*

12:15–12:45 **Artıfıcıal Intelligence In Medicine And Technological Tools For Neurosciences**
Hearing Aids · Keynote Lecture *Michael Tong; Bulent Şerbetçioğlu*

14:00–15:30 **The World Health Organisation Make Listening Safe Initiative: Standards, Implementation, And Future Directions**
Hearing Aids · Panel Presentation *Mark Laureyns; Carolina Der; Christian Hugonnet; Amarilis Menendez*

15:30–16:00 **Objective Vs Subjective Methods In Cochlear Implant Programming**
Hearing Aids · Keynote Lecture *Mohammed Shadid; Betül Çiçek Çınar*

16:30–17:00 **Impact Of Wearing Hearing Aids On Cognitive Abilities And Subjective Tinnitus In Patients With Sensorineural Hearing Loss**
Hearing Aids · Instructional Course *Andro Košec; Bülent Gündüz*

17:00–17:30 **Revising Implantable Hearing Devices: Principes For Converting A Percutaneous To Transcutaneous Bone Conducting**
Hearing Aids · Keynote Lecture *Douglas D. Backous; Bülent Gündüz*

Friday, 11 September 2026

07:30–07:45 **Comparison Of Satisfaction And ACT Scores In Hearing Aid Users With And Without Bluetooth Features**
Hearing Aids · Remarkable Presentation *Leyla Türe; Özlem Ertuğrul; Celil Göcer*

07:45–08:00 **Hearing Difficulties, Outcomes Of Hearing Aids In People Above 80 Years Of Age**
Hearing Aids · Remarkable Presentation *Fatih Recai Kablan; TUĞÇE GÜL ÇAĞLAR; Celil Göcer*

08:00–08:15 **Assessment Of Audiological Findings And Neurodevelopmental Characteristics In Children With Suspected Hearing Loss: Preliminary Results**
Hearing Aids · Notable Abstract *Meryem Mutlu; İbrahim Özcan; M. Özgür Avinçsal*

08:15–08:40 **Decision-Making In Pediatric Minimal-To-Mild Hearing Loss: Diagnostic Challenges And Hearing Aid Fitting Strategies**
Hearing Aids · Remarkable Presentation *Merve Torun Topçu; M. Özgür Avinçsal*

08:40–09:10 **Beyond Speech Perception: Auditory Localization And Spatial Hearing In Hearing Aid Users**
Hearing Aids · Instructional Course *Erva Değirmenci Uzun; M. Özgür Avinçsal*

09:10–09:30 **Hearing Aids From Past To Present**
Hearing Aids · Keynote Lecture *Fulya Özer; Hatice Seyra ERBEK*

09:30–10:00 **ENT Perspective In Pediatric Hearing Loss And Amplification**
Hearing Aids · Keynote Lecture *M. Özgür Avinçsal; Yüksel Olgun*

10:45–11:15 **Why ENT Should Be Involved In Who ICOPE Program**
Hearing Aids · Keynote Lecture *Bernard Fraysse; Ayça Çiprut*

11:15–11:40 **Speech In Noise: From Neural Mechanisms To Smart Hearing Aids**
Hearing Aids · Keynote Lecture *Ayberk Aydın Tunç; Mustafa Karabulut*

11:40–11:55 **Expanding Horizons In CROS Technologies: Patient-Centered Approaches And Real-World Effectiveness**
Hearing Aids · Remarkable Presentation *Ahmet Ovacık; Günay KIRKIM*

11:55–12:25 **Northwest Hearing Alliance: A Model For Global Access To Quality Hearing Care**
Hearing Aids · Keynote Lecture *Douglas D. Backous; Bulent Şerbetçioğlu*

12:25–12:45 **Compression And Auditory Fatigue: Speech Vs. Music**
Hearing Aids · Remarkable Presentation *Mustafa Yüksel*

14:00–14:30 **Hearing Screening For Children Beyond The Newborn Period: CGHH Global Survey**
Hearing Aids · Keynote Lecture *Teresa Ching; Levent Olgun*

14:30–15:00 **Auracast: Discover A New World Of Listening Experiences**
Hearing Aids · Keynote Lecture *Hatice Seyra ERBEK; Miguel Angel Aranda De Toro*

15:00–15:30 **Modern Approaches To Pediatric Amplification**
Hearing Aids · Keynote Lecture *Gaziz Tufatulin; Bahar çolpan*

15:30–16:00 **The Importance Of Hearing In Developing Countries, Overcoming Resistance To Hearing Aids, And Normalizing The Use Of Hearing Aids**
Hearing Aids · Keynote Lecture *Nyilo Purnami; Turgut Karlıdağ*

16:30–16:50 **Computational Audiology In Hearing Aid**
Hearing Aids · Keynote Lecture *Hurol Erisci; Betül Çiçek Çınar*

16:50–17:10 **Community-Based Universal Newborn Hearing Screening Integrated With Primary Health Care Services In East Java Indonesia**
Hearing Aids · Keynote Lecture *Nyilo Purnami; Mehmet YARALI*

17:10–17:30 **Cochlear Implant Electrode Selection For Revision Cases And Unusual Cochlear Anatomy**
Hearing Aids · Keynote Lecture *Evren Hizal; Douglas D. Backous*

17:30–17:45 **Technology Anxiety And Social Appearance Anxiety As Predictors Of Hearing Aid Outcomes**
Hearing Aids · Notable Abstract *Selim Sermed Erbek; Berna Deniz KUNTMAN*

17:45–18:00 **Pediatric Mild Hearing Loss: Diagnosis and Intervention**
Hearing Aids · Keynote Lecture *Serpil Mungan Durankaya; Selim Sermed Erbek*

Saturday, 12 September 2026

07:00–07:10 **The Role Of Audiogram Configuration In Sound Intolerance Among Patients Undergoing Hearing Aid Fitting**
Hearing Aids · Remarkable Presentation *Ömer Küçüköner; Ercan Karababa*

07:10–07:20 **Predictors Of Hearing Aid Outcomes**
Hearing Aids · Remarkable Presentation *Leyla Türe; TUĞÇE GÜL ÇAĞLAR; Ercan Karababa*

07:20–07:35 **Small Signs, Big Impact Hearing Loss In Children**
Hearing Aids · Remarkable Presentation *Rümeysa Ölçenoğlu; Ercan Karababa*

07:35–08:00 **Exploring Effectiveness, User Satisfaction, And Real-World Outcome**

Hearing Aids · Instructional Course *Furkan Büyükkal; Serpil Mungan Durankaya*

08:00–08:30 **Hearing Aid Use In The Geriatric And Pediatric Population**

Hearing Aids · Remarkable Presentation *Ceren Tombuloğlu; Serpil Mungan Durankaya; Begüm Bayram Açıkgöz*

08:30–09:00 **Towards Better Sound Tolerance: Hearing Aid Protocols In Tinnitus And Hyperacusis**

Hearing Aids · Keynote Lecture *Murat Erinç; Mustafa Yüksel*

09:00–09:30 **Middle Ear Assessment**

Hearing Aids · Keynote Lecture *Johann Oswald; Fakih Cihat Eravcı*

09:30–10:00 **EVALUATION OF HEARING AID SATISFACTION AND PERFORMANCE IN THE GERIATRIC POPULATION**

Hearing Aids · Keynote Lecture *Cem Özer; Fakih Cihat Eravcı*

10:45–11:15 **Beyond The Cochlea: The Hearing Aid As A Vestibular-Cognitive Prosthesis.**

Hearing Aids · Keynote Lecture *Hesham Kozou; Ayça Çiprut*

11:15–12:45 **Hearing Care Today And Tomorrow**

Hearing Aids · Panel Presentation *Stefan Launer; Hatice Seyra ERBEK; Raffael Schmitt; Raphael Koning*

14:00–14:30 **A Multisensory Clinical Perspective On Auditory, Vestibular, And Oculomotor Function**

Hearing Aids · Remarkable Presentation *Gokce SAYGI UYSAL; Selim Sermed Erbek*

14:30–15:00 **Neuroplasticity For Otolaryngologists: Understanding The Adaptive Brain**

Hearing Aids · Instructional Course *Bulent Şerbetçioğlu; Bülent Gündüz*

15:00–16:00 **Vestibular Function, Presbystasis, And Fall Prevention: The Role Of Hearing Aid Use**

Hearing Aids · Panel Presentation *Hatice Seyra ERBEK; Deniz Uğur Cengiz; Sümeyye Kapusızoğlu; Sanem Can; Sarıoğlu; Büşra Mazooğlu*

16:30–17:00 **From Screening To Prevention: 10 Years Of Neonatal Hearing Screening And Children's Hearing Protection Strategies In Hungary**

Hearing Aids · Keynote Lecture *Anita Gáborján; Gulce Kirazli*

17:00–17:20 **From Perceived Hearing Handicap To Hearing Aid Satisfaction**

Hearing Aids · Remarkable Presentation *Elif Öğün; Asuman Feda Bayrak*

17:20–17:45 **When To Consider Hearing Aid Use In Auditory Neuropathy Spectrum Disorder**

Hearing Aids · Remarkable Presentation *Tuğba Yılmaz; Çağıl Gökdoğan*

17:45–18:05 **Advances In Hearing Rehabilitation: Integrating Modern Hearing Technologies**

Hearing Aids · Remarkable Presentation *Çağıl Gökdoğan*

HEARING IMPLANT 1

ICC - B2 Floor - Üsküdar 3

Wednesday, 9 September 2026

14:00–14:30 **Minimal -Invasive Cochlear Implantation**
Cochlear Implants and implantable devices · Instructional Course *Ercole Di Martino; Emre Ocak*

14:30–15:30 **The Role Of Vestibular Assessment In Pediatric Cochlear Implantation: Clinical Impact And Emerging Surgical Techniques**
Cochlear Implants and implantable devices · Instructional Course *Salma Jbyeh, MD; Wiener Vacher sylvette R.*

15:30–16:00 **Bilateral Cochlear Implantation: Simultaneous Or Sequential? Surgical Point Of View**
Cochlear Implants and implantable devices · Instructional Course *Omer Afsin Ozmen; Kadir Serkan Orhan*

16:30–17:30 **Intraoperative And Postoperative Radiological Modalities After Implantation**
Cochlear Implants and implantable devices · Panel Presentation *Mehmet Çelik; Nithreen Mohammed Said Abdelsalam Hussein; Yutaka TAKUMI;; Yahya Güldiken; Adriana Neagos; Ergin Eroğlu*

Thursday, 10 September 2026

07:15–07:45 **Cochlear Implantation In Patients With CHARGE Syndrome**
Cochlear Implants and implantable devices · Keynote Lecture *Khassan Diab; Michel Mondain*

07:45–08:45 **CI In Late Prelingual Hearing Loss**
Cochlear Implants and implantable devices · Panel Presentation *Esra YÜCEL; Elif Baysal; Yıldırım Bayazıt; Jan Boucek; Michel Mondain*

08:45–10:00 **Robotic CI Surgery**
Cochlear Implants and implantable devices · Panel Presentation *Natalie Loundon; Joseph Chen; Wolf Dieter Baumgartner; Marco Caversaccio; Vedat; Topsakal; Huan Jia; Joachim Michael Müller*

10:45–11:15 **Genetical Basis Of Hearing Loss**
Cochlear Implants and implantable devices · Keynote Lecture *Mustafa Tekin; Shin-ichi Usami*

11:15–12:15 **Genetic Treatment Strategies For Hearing Loss**
Cochlear Implants and implantable devices · Panel Presentation *Akira Ishiyama; Chen-Chi Wu; Shin-ichi Usami; Emre Ocak; Mustafa Tekin*

12:15–12:45 **DIFFICULT SURGICAL COCHLEAR IMPLANT CASES**
Cochlear Implants and implantable devices · Instructional Course *Maurizio Falcioni; Thomas Lenarz*

14:00–15:00 **Adult Cochlear Implantation: Bridging The Gap Between Clinical Evidence And Real-World Access**
Cochlear Implants and implantable devices · Panel Presentation *Oleg Borysenko; Carlos Cenjor; Juan Manuel García Gómez; Hồng Anh Lê;; Abdulrahman Hagr; Domenico Cuda*

15:00–16:00 **Genetic Screening For Sensorineural Hearing Loss: When And To Whom**
Cochlear Implants and implantable devices · Panel Presentation *Mustafa Tekin; Radka Kremlíková Pourová; Akira Ishiyama; Chen-Chi Wu*

16:30–17:00 **Cochlear Implantation: Surgical Concept, Special Cases, Precision Surgery, Tricks And Pitfalls**
Cochlear Implants and implantable devices · Instructional Course *Thomas Lenarz; Mario Emilio Zernotti*

17:00–17:30 **Bone Conduction Devices**
Cochlear Implants and implantable devices · Instructional Course *Mario Emilio Zernotti; Thomas Lenarz*

17:30–17:50 **Master Of Video Session -Bonebridge And Soundbridge Surgery In Children With High Grade Microtia**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Francoise Denoyelle; Mehmet Çelik*

Friday, 11 September 2026

07:00–08:00 **BRING YOUR OWN CASE: MEET THE EXPERTS**
Cochlear Implants and implantable devices · Controversies *Said Sönmez; Armağan İncesulu; Sunil Narayan Dutt; Doğan Çakan*

08:00–08:30 **Restoring Sound, Preserving Mind: Cochlear Implants And Cognitive Health In Older Adult**
Cochlear Implants and implantable devices · Keynote Lecture *Isabelle Mosnier; Levent Olgun*

08:30–09:30 **CI In Elderly Patients**
Cochlear Implants and implantable devices · Panel Presentation *Rasim Yılmazer; Kristen Rak; Heidi Olze; Levent Olgun; Isabelle Mosnier*

09:30–10:00 **Robotic Surgery In Cochlear Implantation In Children**
Cochlear Implants and implantable devices · Instructional Course *Antonio Della Volpe; Levent Olgun*

10:45–11:15 **Anatomical And Radiological Features Of Inner Ear Malformations**

Cochlear Implants and implantable devices · Keynote Lecture *Levent Sennaroğlu; Isabelle Mosnier*

11:15–12:45 **Management Of Inner Ear Malformation**

Cochlear Implants and implantable devices · Round Table *Levent Sennaroğlu; Adriana Neagos; Hiroshi Yamazaki; Demir Bajin; Isabelle; Mosnier; Joshua Chen; Saumitra Shah*

14:00–14:30 **Innovations In Cochlear Implants: Precision And Performance**

Cochlear Implants and implantable devices · Keynote Lecture *Angel Ramos de Miguel; Milan Profant*

14:30–16:00 **Electrode Choice In CI**

Cochlear Implants and implantable devices · Panel Presentation *Thomas Lenarz; Mario Emilio Zernotti; Rob Briggs; Adrien A. Eshraghi; Milan; Profant*

16:30–18:00 **Complications In CI**

Cochlear Implants and implantable devices · Panel Presentation *Daniel Lee; Abdulmonem Al Shaikh; Dan Cristian Gheorghe; Ahmad Daneshi;; Ossama Hamid; Enis Alpin Güneri; Sunil Narayan Dutt*

Saturday, 12 September 2026

07:00–07:30 **3D Temporal Bone Model Dissection Course**

Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Melikşah Çakır; Fakih Cihat Eravcı*

07:30–08:30 **APSCI Board Panel**

Cochlear Implants and implantable devices · Panel Presentation *Enis Alpin Güneri; Mohan Kameswaran; Rob Briggs; Akira Ishiyama; Chen-Chi Wu;; Shin-ichi Usami; Norio Yamamoto; Hao Wu; Jong Woo Chung*

08:30–10:00 **Difficult CI Surgery**

Cochlear Implants and implantable devices · Panel Presentation *Ali Eftekharian; Luminita Radulescu; Chunfu Dai; Khassan Diab; Rob Briggs; Jong; Woo Chung*

10:45–11:15 **Auditory Implants - Where Are We Today And Where Do We Go?**

Cochlear Implants and implantable devices · Keynote Lecture *Thomas Lenarz; Chunfu Dai*

11:15–12:45 **Revision CI Surgery And Reimplantation**

Cochlear Implants and implantable devices · Panel Presentation *Levent Olgun; Violeta Necula; Michel Mondain; Byung Yoon Choi; Il Joon Moon;; Hiroshi Yamazaki*

14:00–15:00 **CI in Multi-handicapped Children**

Cochlear Implants and implantable devices · Panel Presentation *Adrien A. Eshraghi; Harukazu Hiraumi; Özlem İçöz; Rasim Yılmazer; Dan Jiang*

15:00–15:30 **Management Of Challenging Cases in Cochlear Implantation I: Inner Ear Malformations & Meningitis**

Cochlear Implants and implantable devices · Instructional Course *Levent Sennaroğlu; Andrzej Zarowski; Thomas Klenzner*

15:30–16:00 **Management Of Challenging Cases in Cochlear Implantation II : Chronic Ear Disease and Otosclerosis**

Cochlear Implants and implantable devices · Instructional Course *Levent Sennaroğlu; Andrzej Zarowski; Thomas Klenzner*

16:30–17:30 **Challenging CI Indication**

Cochlear Implants and implantable devices · Panel Presentation *Özgür Yiğit; Maryam Sahwan; Mohamed Elshazly; Thomas Nikolopoulos; Jafri; Kuthubutheen; Adrien A. Eshraghi*

17:30–18:00 **Robotic-Assisted Cochlear Implant Insertion**

Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Evan Cumpston; Levent Sennaroğlu*

HEARING IMPLANT 2

ICC - B3 Floor - 3B/70

Wednesday, 9 September 2026

14:30–15:00 **Active Bone Conduction & Middle Ear Implants: When, Which One & What's Trending?**
Cochlear Implants and implantable devices · Instructional Course *Joseph Manjaly; Giuseppe Nicolò Frau*

15:00–15:30 **Middle Ear Implants In Mixed Hearing Loss, Their Role Based On Long Term Results.**
Cochlear Implants and implantable devices · Instructional Course *Giuseppe Nicolò Frau; Miguel Sá Breda*

15:30–16:00 **Bonebridge Implantation In The Middle Fossa For Paediatric Cases**
Cochlear Implants and implantable devices · Instructional Course *Miguel Sá Breda; Joseph Manjaly*

16:30–17:00 **Vaccination Of CI**
Cochlear Implants and implantable devices · Panel Presentation *Armağan İncesulu; Manolya Kara; İrfan Devranoğlu*

17:00–17:15 **Suprafascial Placement Of Receiver Coil Of The Cochlear Implant To Avoid Thick Temporal Scalp In Adults**
Cochlear Implants and implantable devices · Remarkable Presentation *Orhan Ozturan; İrfan Devranoğlu*

17:15–17:30 **Electroacoustic Stimulation (Hybrid Implant)**
Cochlear Implants and implantable devices · Remarkable Presentation *Işılay Öz; İrfan Devranoğlu*

17:30–18:00 **Preoperative Workup In Pediatric Cochlear Implantation: Why It Matters?**
Cochlear Implants and implantable devices · Keynote Lecture *Marija Dokoska; Giuseppe Nicolò Frau*

Thursday, 10 September 2026

07:15–07:45 **Optimizing CI Outcomes In Children With Congenital Hearing Loss**
Cochlear Implants and implantable devices · Keynote Lecture *Teresa Ching; Levent Olgun*

08:00–08:45 **CI Surgery With Monitoring And/Or Image Guidance**
Cochlear Implants and implantable devices · Controversies *KARKAS Alexandre; Nithreen Said; Andrzej Zarowski*

08:45–10:00 **Hearing Preservation During CI**
Cochlear Implants and implantable devices · Panel Presentation *Abdelaziz Raji; Artur Lorens; Piotr Henryk Skarzynski; Secaattin Gülşen; Levent; Olgun; Stefan K. Plontke; Simon I Angeli*

10:45–11:15 **CI In Retrocochlear Hearing Loss**
Cochlear Implants and implantable devices · Keynote Lecture *Luis Lassaletta; Hao Wu*

11:15–12:45 **CI In Vestibular Schwannoma**
Cochlear Implants and implantable devices · Panel Presentation *Thomas Klenzner; In Seok Moon; Levent Naci Özlüoğlu; Hao Wu*

14:00–15:00 **Long Term Results Of Implantable Hearing Aids**
Cochlear Implants and implantable devices · Panel Presentation *Mario Emilio Zernotti; Sunil Narayan Dutt; Abdullah Dalgic; Chen-Chi Wu;; SCHMERBER Sébastien; Raquel Manrique Huarte*

15:00–16:00 **Management Of Far Advanced Otosclerosis**
Cochlear Implants and implantable devices · Controversies *Demir Bajin; Beldan Polat; Domenico Cuda; Jawwad Ahmad*

16:30–17:00 **Surgical Anatomy Of The Inner Ear. Clinical Applications**
Cochlear Implants and implantable devices · Instructional Course *Manuel Jesús Manrique Rodríguez; Yutaka TAKUMI*

17:00–18:00 **Bring Your Own Case: Meet The Experts**
Cochlear Implants and implantable devices · Controversies *Emine Deniz Gözen; Selcuk Mulazimoglu; Vedat Topsakal; Yutaka TAKUMI*

Friday, 11 September 2026

07:00–08:15 **Bone Anchored Hearing Aids: Different Modalities**
Cochlear Implants and implantable devices · Panel Presentation *Milan Profant; P. Vijaya Krishnan; Miguel Sá Breda; Jaydip Ray; Beldan Polat; Jiří; Skřivan; Douglas D. Backous*

08:15–08:45 **Effect Of Baseline Stimulation On Vestibular Responses In Human Vestibular Implant Recipients**
Cochlear Implants and implantable devices · Keynote Lecture *Raymond van de Berg; Müzeyyen Yildirim Baylan*

08:45–09:30 **Programming Hearing Implant: New Techniques And New Strategies**
Cochlear Implants and implantable devices · Panel Presentation *Charles Limb; Abdullah Asma; Merve Ozbal Batuk*

10:45–11:15 **A Novel Bone Conduction Device**
Cochlear Implants and implantable devices · Keynote Lecture *Norio Yamamoto; Elif Baysal*

11:15–12:45 **Implantable Solution For Conductive And Mixed Hearing Loss**

Cochlear Implants and implantable devices · Panel Presentation *Farid Alzharani; Giuseppe Nicolò Frau; Miguel Sá Breda; John Martin Hempel; Emel; Tahir; Norio Yamamoto*

14:00–15:00 **Surgical Aspects Of Vestibular Implantation**

Cochlear Implants and implantable devices · Panel Presentation *Nils Guinand; Manuel Jesús Manrique Rodríguez; Andrzej Zarowski*

15:00–15:45 **CI In Very Young Children**

Cochlear Implants and implantable devices · Controversies *Gonca Sennaroğlu; Jiří Skřivan; Simon I Angeli*

15:45–16:00 **A Rare Case: Severe Otalgia In The Late Stages Of CI**

Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Erdem Atalay Çetinkaya; Mehmet Çelik*

16:30–17:00 **Atypical Cases Of Cochlear Implantation**

Cochlear Implants and implantable devices · Keynote Lecture *Miguel Sá Breda; Hiroshi Yamazaki*

17:30–18:00 **Surgical Removal Of Intracochlear Inner Ear Schwannomas With Cochlear Implantation And Preservation Of Vestibular Receptor Function**

Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Stefan K. Plontke; Hiroshi Yamazaki*

Saturday, 12 September 2026

07:30–08:30 **Inner Ear Abnormalities: Personalised Approach To Difficult Cases**

Cochlear Implants and implantable devices · Panel Presentation *Sanja Spiric; Omer Afsin Ozmen; Laila Telmesani*

08:30–10:00 **Otitis Media And CI Surgery**

Cochlear Implants and implantable devices · Panel Presentation *Fatthi Baki; Sady Selaimen; Yüksel Olgun; Omer Afsin Ozmen*

10:45–11:15 **Hearing Restoration In NF2 Patients**

Cochlear Implants and implantable devices · Keynote Lecture *Hao Wu; Sady Selaimen*

11:15–12:45 **Auditory Brainstem Implantation**

Cochlear Implants and implantable devices · Round Table *Mohan Kameswaran; Michael Tong; Hao Wu; Gonca Sennaroğlu; Ing Ping Tang;; Shakeel Saeed; Sady Selaimen*

14:00–15:00 **Electrode Malposition: How To Manage It?**

Cochlear Implants and implantable devices · Panel Presentation *Çağlar Batman; Betül Çiçek Çınar; Nicolas Verhaert; Mariam Aljehani*

15:00–16:00 **Late Surgical Problems In CI**

Cochlear Implants and implantable devices · Panel Presentation *Nicolas Verhaert; Ulku Tuncer; Daniele Marchioni; Kadir Serkan Orhan; Simon I; Angeli*

16:30–17:30 **Bring Your Own Case: Meet The Expert**

Cochlear Implants and implantable devices · Expert Discussion *Onur İsmi; Daniele Marchioni; Simon I Angeli; Işılay Öz*

17:30–17:45 **Kissing Cochlea: An Extreme Inner Ear Malformation, Novel Surgical Approach Via Cystic Vestibule**

Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Secaattin Gülşen; Beldan Polat*

17:45–18:00 **“Surgical Considerations And Challenges Of Cochlear Implantation In Far-Advanced Otosclerosis”**

Cochlear Implants and implantable devices · Master of Surgery Video Presentation *İlker Akyıldız; Beldan Polat*

HEARING IMPLANT 3

ICC - B3 Floor - 3B/66

Wednesday, 9 September 2026

14:00–15:00 **Cortical Auditory Evoked Potentials And Neural Plasticity Across Hearing Devices**
Cochlear Implants and implantable devices · Round Table *Wafaa El Kholy; Andy Beynon; Mario Cebulla; Shehata-Dieler, Wafaa; Eyyup KARA*

15:00–15:30 **Music Perception In Cochlear Implant Users**
Cochlear Implants and implantable devices · Keynote Lecture *Ayça Çiprut; Dayse Tavora-Vieira*

15:30–16:00 **Single-Sided Deafness: Are We Achieving Long-Term Success With Cochlear Implantation?**
Cochlear Implants and implantable devices · Keynote Lecture *Ayça Çiprut; Dayse Tavora-Vieira*

16:30–17:30 **Rehabilitation Strategies In CMV Related Hearing Loss**
Cochlear Implants and implantable devices · Panel Presentation *Francesca Forli; Nazan Dalgic; Mehmet Ziya Özüer; Pelin Kocdor*

Thursday, 10 September 2026

07:15–07:45 **MASTER OF SURGERY VIDEO SESSION- 2**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Ergin Eroğlu; Erkan Karatas; Ulku Tuncer*

07:45–08:45 **Longitudinal Speech And Language Outcomes Of Children With Auditory Neuropathy**
Cochlear Implants and implantable devices · Panel Presentation *Ayça Çiprut; George Tavartkiladze; Teresa Ching; Mehmet YARALI; Wafaa El Kholy;; Homood Almutairi*

08:45–10:00 **Imaging In CI**
Cochlear Implants and implantable devices · Panel Presentation *Laila Telmesani; Yutaka TAKUMI; Mahmoud Mandour; Badr Eldin Mostafa; Nozomu; Matsumoto; Vanessa Tan Yee Jueen; Levent Sennaroğlu; Luminita Radulescu*

10:45–11:15 **Approach To Asymetrical Hearing Loss**
Cochlear Implants and implantable devices · Keynote Lecture *Ahmet Atas*

11:15–12:45 **Cochlear Implantation In SSD And Asymmetrical Hearing Loss**
Cochlear Implants and implantable devices · Panel Presentation *Manuel Jesús Manrique Rodríguez; Antonio Della Volpe; Italo Cantore; Ahmet Atas;; Artur Lorens*

14:00–14:45 **Cochlear Implantation: Strategies For Maximizing Patient Outcomes**
Cochlear Implants and implantable devices · Panel Presentation *Sarah Mowry; Maura Cosetti; Michael Hoa; Teresa Ching*

14:45–15:05 **Management Of Infectious Complications In Cochlear Implant Recipient**
Cochlear Implants and implantable devices · Remarkable Presentation *Recep Karamert; İlker Burak Arslan*

15:05–15:35 **Implementation Of The Med-EL Otodrive: Results From The Canadian Health Care System**
Cochlear Implants and implantable devices · Instructional Course *Vincent Lin; OZGUR SURMELIOGLU*

16:30–17:15 **CI In Meniere's Disease**
Cochlear Implants and implantable devices · Panel Presentation *Recep Karamert; Badr Eldin Mostafa; Chen-Chi Wu*

17:15–18:00 **Beyond The Circuit. Electrode Impedance As A Biomarker For Intracochlear Health**
Cochlear Implants and implantable devices · Round Table *Dalia Hassan; Yassin Abdelsamad; Hannes Maier; Dayse Tavora-Vieira; Ellen; Andries*

Friday, 11 September 2026

07:00–07:20 **Master Of Video Session- Retrofacial Approach In CI**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Rasim Yılmazer; Abdullah Dalgic*

07:20–07:40 **Master Of Video Session- CSF Otorrhea During CI**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Müzeyyen Yildirim Baylan; Abdullah Dalgic*

07:40–08:00 **Master Of Video Session-Complication Of CI**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Abdullah Dalgic; Özcan Öztürk*

08:00–08:20 **Master Of Video Session- CI In IP3**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Abdullah Dalgic; Joshua Chen*

08:20–08:50 **Vestibular Problems After CI**
Cochlear Implants and implantable devices · Keynote Lecture *Wiener Vacher sylvette R.; Demir Bajin*

08:50–09:10 **Vertigo and Postural Instability in Children with CI & ABI**
Cochlear Implants and implantable devices · Remarkable Presentation *Wiener Vacher sylvette R.; Görkem Ertuğrul*

09:10–09:30 **How Does Cochlear Implantation Affect Five Vestibular End-Organ Functions**
Cochlear Implants and implantable devices · Remarkable Presentation *muhammed dağkıran; Wiener Vacher sylvette R.*

09:30–10:00 **Cochlear Ossification**
Cochlear Implants and implantable devices · Keynote Lecture *Maurizio Falcioni; Mario Emilio Zernotti*

10:45–11:15 **New Frontiers In CI And Middle Ear Active Implants**
Cochlear Implants and implantable devices · Keynote Lecture *Enis Alpin Güneri; Marco Mandala*

11:15–12:15 **Totally Implantable Cochlear Implant**
Cochlear Implants and implantable devices · International Symposia *Joachim Michael Müller; Huan Jia; Marco Mandala; Rob Briggs*

12:15–12:45 **Paediatric Auditory Brainstem Implantation: Patient Selection, Surgical Challenges And Management Of Complications**
Cochlear Implants and implantable devices · Keynote Lecture *Dan Jiang; Marco Mandala*

14:00–15:30 **Management Of Hypoplastic Cochlear Nerve**
Cochlear Implants and implantable devices · Panel Presentation *Saumitra Shah; Bee See Goh; Hakan Tutar; Mehmet Ziya Özüer; FABIO ANDRE; SELAIMEN; Mohan Kameswaran; Jaydip Ray*

15:30–16:00 **Transtympanic Electrically Evoked Auditory Brainstem Response (TTEABR) For Cochlear Implant Candidacy Evaluation**
Cochlear Implants and implantable devices · Keynote Lecture *Sunil Narayan Dutt; Jaydip Ray*

16:30–17:30 **LIVING GUIDELINES IN COCHLEAR IMPLANTATION IN ADULTS**
Cochlear Implants and implantable devices · Panel Presentation *Angel Ramos de Macias; Domenico Cuda; OZGUR SURMELIOGLU; Abdulrahman; Hagr; Fazıl Necdet Ardıç*

17:30–17:45 **Cochlear Implantation In A Patient With A Temporal Bone Fracture.**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *OZGUR SURMELIOGLU; Bahar çolpan*

17:45–18:00 **Cochlear Implantation: Surgical Practice And Clinical Considerations**
Cochlear Implants and implantable devices · Master of Surgery Video Presentation *Sibel Alicura Tokgöz; OZGUR SURMELIOGLU*

Saturday, 12 September 2026

07:00–07:30 **Pulsatile Tinnitus Surgery**
Otology/Neurotology · Instructional Course *Doğan Çakan; Ana Jotic*

08:00–09:00 **Tinnitus And Cochlear Implantation**
Cochlear Implants and implantable devices · Panel Presentation *Andrzej Zarowski; Shi Nae Park; Muhammad Sohail Awan; Eyyup KARA*

09:00–10:00 **How Life Goes For Implanties In Long Term**
Cochlear Implants and implantable devices · Panel Presentation *Pa-Chun Wang; Ahmet Alperen Akbulut; Sercan Çıkrıkcı; Esra YÜCEL; MEHMET; AKDAG*

10:45–11:15 **Humanitarian Cochlear Implant**
Cochlear Implants and implantable devices · Keynote Lecture *Abdulrahman Hagr; Tayyar Kalcıoğlu*

11:15–12:45 **Problems In Emerging Nations In CI**
Cochlear Implants and implantable devices · Panel Presentation *Daniela González Casas; Mutlaq AlSihan; Milan Dusan Stankovic; Badr Eldin; Mostafa; Daniele DE SIATI*

14:00–15:15 **Cochlear Implant Program In Balkan And Central Asian Countries**
Cochlear Implants and implantable devices · Panel Presentation *Tayyar Kalcıoğlu; Aigul Medeulova; Nozima Nadjmuddinova; Munar Beishenova;; Nenad Arsovic; Cem Uzun; Zebo Karimova*

15:15–15:35 **Revision Of CI In Chronic Otitis Media**
Cochlear Implants and implantable devices · Remarkable Presentation *MEHMET AKDAG; Levent Olgun*

15:35–15:55 **Management Of Hereditary Hearing Loss; Cochlear Implantation, Gene Therapy, And The Emerging Sequencing Dilemma**
Cochlear Implants and implantable devices · Remarkable Presentation *Ayşe Pelin Yiğider; Levent Olgun*

16:30–17:00 **Trauma In Cochlear Implantation: New Development On Biosensing And Imaging**
Cochlear Implants and implantable devices · Keynote Lecture *Nicolas Verhaert; Shi Nae Park*

17:00–17:30 **ABI In Adults**
Cochlear Implants and implantable devices · Keynote Lecture *Khassan Diab; Shi Nae Park*

17:30–18:00 **Electrically Evoked Auditory Late Respose is a Novel Method for Cochlear Implant Programming**
Cochlear Implants and implantable devices · Remarkable Presentation *Rışvan Deniz; Ahmet Atas*

HUM+ TRVERSE+GLOBAL 2

ICC - B3 Floor - 3B/10

Wednesday, 9 September 2026

14:00–15:00 **Simulation Education In Lmics: What Works And What Is Needed To Build The Global Surgical Workforce?**
Global Outreach (Regional or ENT related Organizations Symposia) · Panel Presentation *Cody Messick; Joshua Wiedermann; Taseer Din; David Zopf*

15:00–16:00 **Airway Foreign Body Removal Challenges And Solutions To Instrument Access**
Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Cody Messick; Taseer Din; Tarika Srinivasan; Victoria Cress*

16:30–17:30 **Tip Sutures**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Ender İnci; Adrian M Agius; Ihsan Ceceli; Seçkin Ulusoy*

17:30–18:00 **Surgical Otologic Training In Africa**
Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Benghalem Abdelhamid; Murad Mutlu*

Thursday, 10 September 2026

07:00–07:30 **Should Every Surgeon Have A Coach? Rethinking Excellence, Performance, And Professional Growth**
Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Sam Daniel; Emre Ocak*

07:30–08:00 **SurgSchool: A New Standard In Surgical Training Through Mobile And On-Demand Learning.**
Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *José Carlos Casqueiro*

08:30–09:30 **Otolaryngology Training**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Tamer Abou-Elsaad; Cüneyt Orhan Kara; Camilla Carroll; Aysenur MERIC HAFIZ;; Hülya Eyigör; Taran Tatla*

09:30–10:00 **IFOS World Survey On Cancer Care**
Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Nicolas Fakhry; Merve Mutlu Çekim*

10:45–11:45 **Surgical Interventions For Paranasal Sinus Tumours**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Fikret Kasapoglu; Ghassan Alokby; İrfan Umay Tenekecioğlu; Răzvan Hainăroșie;; Alfred Aga*

11:45–12:45 **Emerging Trends And Innovations In Obstructive Sleep Apnea Management**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Zerrin Özergin Coşkun; Ahmed Bahgat; Ethem İlhan; Mustafa İbas; Mario Milkov*

14:00–15:00 **From Burden To Relief: Frontal Sinus Surgery**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Islam Herzallah; Apostolos Karligkiotis; Togay Müderris; Richard Harvey*

15:00–16:00 **Innovative Grafts In Rhinoplasty**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Sureyya Seneldir; Ahmet Koder*

16:30–17:30 **Cochlear Implant In Low Resource Countries: How To Build -Up A CI Program?**
Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Abdelaziz Raji; Murad Mutlu*

Friday, 11 September 2026

07:30–08:00 **Therapeutic Education For Children With Severe Bilateral Vestibular Loss: Supporting Families And Daily Care**
Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Salma Jbyeh, MD; Nizamettin Burak Avcı*

08:00–09:00 **Modern Approaches In Rhinoplasty**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Sureyya Seneldir; Pedro Pablo Villarroel; Cristina Maria Goanta; Yelda Ceren Orhan*

09:00–10:00 **Neural Dynamics Of Swallowing: Current Approaches To Assessment And Treatment**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Müge Müzeyyen Çiyiltepe; Melih Çekinmez*

10:45–11:45 **History And Evolution Of Medicine**
Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Hesham Negm; Ulugbek Khassanov*

11:45–12:45 **Artificial Intelligence -Writing Scientific Articles: Practical And Ethical Features**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Taner Kemal Erdağ; Ozlem Onerci Celebi; NURAY BAYAR MULUK; Ömer Necati; Develioglu*

14:00–15:00 **Management Of Voice-Related Gender Dysphoria**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Seher Sirin; Guilherme Simas Do Amaral Catani; İsmail Koçak*

15:00–16:00 **Artificial Intelligence In ORL**

Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Emrah Gündüz; Noel Ayoub; Fakih Cihat Eravcı; Bahaeddin ERAVCI; Selis G. GUVEN;; Nahla Gomaa*

16:30–17:30 **Dizziness: New Insights**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Merve Mutlu Çekim; Fatih Çekim; Emrehan Dereköy; Haşmet Yeğin; Sefa Dereköy*

Saturday, 12 September 2026

07:00–07:30 **Key Stages In Scientific Article Writing**

Transverse activities (Innovation, Basic Research, Education) · Instructional Course *NURAY BAYAR MULUK; Cemal Cingi; Ömer Necati Develioglu*

07:30–08:00 **CHAT GPT & CO.: Harnessing Large Language Models In Otolaryngology**

Transverse activities (Innovation, Basic Research, Education) · Instructional Course *alberto maria saibene; Kemal Kef*

08:00–10:00 **Panel Presentation**

Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Sevval Karadag; Ilter Denizoglu; Erdogan Bulut; Tobias Moser; Jennifer GOODALL;; Fatemeh Makouei; Fakih Cihat Eravcı; Pelin Yildiz; Steven Goudy; Cristina Maria; Goanta; Raiyan Chowdhury; Ramil Hashimli; Cemal Cingi; Halil Erdem Özel*

10:45–11:45 **Pediatric ENT Problems**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Jean Baptiste Lecanu; Vincent Cousins; Ostap Orishchak; Doreen Naku; Mom; Thierry*

11:45–12:45 **Advances In The Laryngeal Treatment Of Chronic Cough From The American Academy Of Otolaryngology-Head & Neck Surgery**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Stephanie Misono; Nausheen Jamal; Daniel Fink; Kathleen Tibbetts*

14:00–15:00 **“From The Classroom To The Operating Room: Postgraduate Education For Sustainable ORL-HNS Surgery**

Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Camilla Carroll; Phui Yee Wong; Nahla Gomaa*

15:00–16:00 **New Horizons In Phonosurgery: Air Injection And Transillumination For Vocal Fold Mucosa**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Seher Sirin; Zeynep Alkan; İsmail Koçak*

16:30–17:30 **Endoscopic Tympanoplasty**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Sven Beckmann; Furkan Kaya; Utku Mete*

17:30–18:00 **Anatomical And Cultural Considerations In Tip Plasty: An Individualized Approach Across Ethnicities**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Yunus Emre Topan; Akif Abakay*

HUM+TRVERSE+GLOBAL 1

ICC - B3 Floor - 3B/11

Wednesday, 9 September 2026

14:00–14:30 **From Idea To Medical Device: How To Do It.**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Ilter Denizoglu; Erdogan Bulut*

14:30–15:00 **Voice: As Medical Landmark**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Yusuf Kemal Kemaloğlu; Ilter Denizoglu*

15:00–16:00 **Variations In Ethnic Rhinoplasty**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Seçkin Ulusoy; Ahmet Arslanoğlu; Andrew Winkler; Gabriela Kopacheva -Barsova*

16:30–17:00 **The Rise Of Rhinology In Sub-Saharan Africa: A Tanzanian Experience**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Mustafa İbas*

17:00–18:00 **Overview Of Head And Neck Cancer Surgeries Worldwide**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Görkem Eskiizmir; Ehab Hanna; Egehan Salepci; Koichi Omori; Vincent Vander; Poorten*

Thursday, 10 September 2026

07:00–07:30 **The Journal Of Colleges Of Medicne JCMSA: A Model For Sharing Research From Low And Middle Income Countries (Lmics)**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Johannes Fagan; Emrehan Dereköy*

07:30–08:30 **Head And Neck Cancer: How To Manage Depending On Resource Availability?**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Johannes Fagan; Nicolas Fakhry; Koichi Omori; Manole Felicia; Mark Zafereo; Melek; Kezban Gürbüz*

08:30–09:30 **Brazilian Perspectives In Otorhinolaryngology: Guidelines, Innovation, And Access To Advanced Care**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Wilma Terezinha Anselmo Lima; André Alencar; FABRIZIO RICCI ROMANO; Arthur; Castilho*

09:30–10:00 **Transverse Activities (Innovation, Basic Research, Education) Notable Abstracts**

Notable Abstracts · Notable Abstract *Erdogan Bulut*

10:45–11:15 **Enhancing Clinical Outcomes Through Integrated Management: CFTR ENT Algorithm For Evaluating Otorhinolaryngological Manifestations In Cystic Fibrosis**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Zacharias Kalentakis; Kemal Kef*

11:15–11:45 **The Global Journey Of IFOS Outreach: Milestones, Impact And The Road Ahead**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Mom Thierry; Cemal Cingi*

11:45–12:15 **Development Of Injectable Caha-Based Implants For Vocal Fold Regeneration**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Dinara Toguzbayeva; Recep Yagiz*

12:15–12:45 **Neoadjuvant Chemotherapy In Hypopharyngeal Cancer**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Pen-Yuan Chu; Mom Thierry*

14:00–15:00 **Innovative Inner Ear**

Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Bernard Fraysse; Mehmet İlhan Şahin; Adrien A. Eshraghi; Emre Ocak; Recep Yagiz*

15:00–16:00 **The Genetic Pathways Of Head And Neck Cancer**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Elif Ersoy Callioglu; SEDA TÜRKOĞLU BABAKURBAN; Fatih Tetik; Hakkı Caner İNAN*

16:30–17:00 **Hearing Screening and hearing aid rehabilitation in low-resource countries**

Global Outreach (Regional or ENT related Organizations Symposia) · Expert Discussion

17:00–17:30 **Structural Approach To The Nasal Vault In External Rhinoplasty**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Halis Ünlü; Seçkin Ulusoy*

Friday, 11 September 2026

07:00–08:00 **Extended Endoscopic Approaches In Latin America: Decision-Making Through Real Cases**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Jolie Anna Crespo Chanis; Luis Fernando Macias-Valle; Oswaldo A Henriquez;; Andre Felippu*

08:00–08:30 **Mobile Health (Mhealth) In Voice Acoustics**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Buse Cetinkaya; Ilter Denizoglu*

08:30–09:00 **IFOS Educational Courses Around The World**

Global Outreach (Regional or ENT related Organizations Symposia) · Expert Discussion *Bernard Fraysse; Angel Ramos de Macias; Cemal Cingi*

09:00–10:00 **Patent Processes In Medical Practice**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Ugur Yalciner; Ilter Denizoglu; Erdogan Bulut*

10:45–11:15 **Mastering Sialorrhea: Advances In Surgical Management**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Orhan Ozturan; Halis Ünlü*

11:15–11:45 **Three Pillars Of Surgical Teaching: Cadavers, Live Surgery, And 3D Technology**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Seçkin Ulusoy; Halis Ünlü*

11:45–12:45 **Training And Certification In Subspecialties In Otorhinolaryngology**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Hülya Eyigör; Ilter Denizoglu*

14:00–15:00 **Innovative Approaches And Key Findings In The Inner Ear**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Erdogan Bulut; Furkan Büyükkal; Nizamettin Burak Avcı; Ilknur Tasdemir Gursen;; Fatma Nur Komur; Begum Arda; Nagehan Gumusel Bulut*

15:00–16:00 **Global Perspectives On The Management Of Thyroid Malignancies And Local Practices**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Gregory W. Randolph; Johannes Fagan; Levent Soylu; Mustafa Kürşat Gökcan; Che-; Wei Wu; Giuseppe Mercante; Luiz P. Kowalski*

17:30–17:45 **Ethnic And Racial Perspectives In Modern Rhinoplasty**

Global Outreach (Regional or ENT related Organizations Symposia) · Remarkable Presentation *Serkan Bariskan; Utku Kubilay*

17:45–18:00 **Nasal Valve Surgery**

Global Outreach (Regional or ENT related Organizations Symposia) · Remarkable Presentation *Utku Kubilay; Serkan Bariskan*

Saturday, 12 September 2026

07:00–08:00 **Update On Noise Induced Hearing Loss**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Amarilis Menendez; Augusto Peñaranda; Maryna Biletska*

08:00–09:00 **Chronic Rhinosinusitis Treatment**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Jeffrey Bedrosian; Edwin Liyombo; Hussain Alrand; Erdi Özdemir; Cemal Cingi*

09:00–10:00 **Innovations In Otolaryngology: From Airway Management To Minimally Invasive Sialendoscopy**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Zafer Ciftci; Giovanni Cammaroto; Nesrettin Fatih Turgut; Kemal Kef*

10:45–11:45 **Mirko Tos Ear & Hearing Research And Innovation**

Transverse activities (Innovation, Basic Research, Education) · Round Table *Cem Uzun; İbrahim Hızalan; Adrien A. Eshraghi; Emre Ocak; Erdogan Bulut; Ahmet; Atas; Suat Turgut; Mario Milkov*

11:45–12:45 **Grafting In Rhinoplasty**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Cemal Cingi; Nar Maya Thapa; Suzuki Masanobu; Pedro Pablo Villarroel; Ihsan; Ceceli*

14:00–14:30 **Pan African Endoscopic Ear Surgeons Federation: Then And Now.**

Global Outreach (Regional or ENT related Organizations Symposia) · Keynote Lecture *Waleed Moneir; Akif Abakay*

14:30–15:00 **From Idea To Patent-Process Procedures**

Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Senem Kayahan*

15:00–16:00 **Pre-Biologic Treatment In Recurrent Nasal Polyposis: Optimizing Maximal Conventional Therapy**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Jeffrey Bedrosian; Leila Essakali; Cemal Cingi; Christopher Roxbury*

16:30–17:30 **Artificial Intelligence In Otolaryngology: Hype, Hope, And Clinical Translation**

Transverse activities (Innovation, Basic Research, Education) · International Symposia *Noel Ayoub; Pa-Chun Wang; Konstantina M. Stankovic*

ICC - MAIN ENTRANCE

Istanbul Congress Center

Wednesday, 9 September 2026

17:30–18:30 **Opening Cocktail 17:30-18.30**

Ceremony · Opening Ceremony

LARYNGOLOGY 1

ICC - B2 Floor - Emirgan 2

Wednesday, 9 September 2026

14:00–15:00 **Biophsiological Assessment of the VoiceAssessment Of Voice**
Laryngology · Continental or International Societies Sessions *James Phillip Thomas; Gamze Yesilli Puzella; Maral Yeşilyurt; Safiye Giran Örtekin*

15:00–15:30 **Transnasal Oesophagoscopy**
Laryngology · Instructional Course *Kate Heathcote; Remzi Dogan*

15:30–16:00 **Sulcus: Challenges And Treatment**
Laryngology · Instructional Course *Taner Yılmaz; Remzi Dogan*

16:30–17:30 **ELS Research Session**
Laryngology · Continental or International Societies Sessions *Necati Enver; Christoph Arens; Cesare Piazza*

17:30–18:00 **Optimizing Outcomes In Laser Laryngeal Surgery In The OR**
Laryngology · Instructional Course *marc Remacle; Necati Enver*

Thursday, 10 September 2026

07:30–08:30 **TLM: Beyond T1 Larynx**
Laryngology · Panel Presentation *Andrew J McWhorter; Daniel Fink; Viorel Zainea; Kamil Hakan Kaya; Çağatay Oysu*

08:30–09:00 **High Resolution Pharyngeal Manometry: When, Whom Why?**
Laryngology · Instructional Course *Chadwan Al Yaghchi; Leman Veziroğlu Birdane*

09:00–09:30 **Precision In Laryngeal Injections**
Laryngology · Controversies *yakubu karagama; Faisal Zagzoog; Meltem Demirdağ Çevikkan*

09:30–10:00 **Unilateral Vocal Fold Paralysis Management: What Have We Learned In The Past 25 Years?**
Laryngology · Keynote Lecture *Al Merati; Hakan Birkent*

10:45–11:15 **Management Of Vocal Cord Conctact Granulomas: Surgery, Therapy, Or Both?**
Laryngology · Controversies *Esra Özcebe; Hamdi Hakan Coşkun; Kristel Kalling*

11:15–11:45 **Voice Esthetics**
Laryngology · Keynote Lecture *Necati Enver; İsmail Koçak*

11:45–12:15 **New Technique Of Epiglottic Mucosal Free Graft For Treating Laryngeal Stenosis And Vocal Fold Reconstruction**
Laryngology · Keynote Lecture *Hyung Tae Kim; Meltem Akpınar*

12:15–12:45 **Contact Granuloma**
Laryngology · Keynote Lecture *Harun Cansız; Taner Yılmaz*

14:00–15:00 **Laryngoscopy Versus Electromyography**
Phoniatrics · Panel Presentation *James Phillip Thomas; Gerhard Föster; Selmin Karatayli Ozgursoy*

15:00–16:00 **Treatment Of Dysplasia: Surgery And Follow-Up**
Laryngology · Controversies *Anca Barbu; Nupur Kapoor Nerurkar; Sibel Yıldırım Moral; Selmin Karatayli; Ozgursoy; Karen Kost*

16:30–17:30 **Laryngeal Dystonia And Tremor**
Laryngology · Round Table *James Phillip Thomas; KAYHAN OZTURK; Nurullah Türe; Shiying Hey*

17:30–18:00 **Role Of Flexible Endoscopy In The Upper Aerodigestive :Practical Tips And Tricks**
Laryngology · Instructional Course *Christoph Arens; Zafer Ciftci*

Friday, 11 September 2026

07:00–07:30 **Profile Of Injured Singers: Expectations And Insights**
Laryngology · Keynote Lecture *Lesley Childs; SEVTAP AKBULUT*

07:30–08:00 **Chronic Cough: A Systematic Approach**
Laryngology · Instructional Course *Nausheen Jamal; SEVTAP AKBULUT*

08:00–09:00 **Retrograde Cricopharyngeus Muscle Disfunction**
Laryngology · Panel Presentation *SEVTAP AKBULUT; Markus Hess; yakubu karagama*

09:00–10:00 **Treatment Of Reinkes Edema**
Laryngology · Panel Presentation *İsmail Koçak; Peak Woo; Ceki Paltura*

10:45–11:15 **Unilateral Vocal Fold Paralysis: Timing For Treatment - Evidences**
Laryngology · Keynote Lecture *Geraldo Druck Sant Anna; Ramil Hashimli*

11:15–11:45 **Head And Neck Oncology Notable Abstracts 2**

Notable Abstracts · Notable Abstract *Şefik Hoşal*

11:45–12:45 **Understanding Larynx**

Laryngology · Panel Presentation *Hazem Saleh; TSUYOSHI KOJIMA; Ramil Hashimli; Lise CREVIER BUCHMAN*

14:00–15:00 **Pushing The Limits Of Office Procedures Of Larynx**

Laryngology · Panel Presentation *Lucian Sulica; R. Jun Lin; Hakan Birkent; Norazila Abdul Rahim; Necati Enver; NIK; FARIZA HUSNA NIK HASSAN*

15:00–15:30 **Pharyngocutaneous Fistula After Laryngectomy – Pectoralis Major Flap, Yes Or No?**

Head and Neck Oncology · Instructional Course *Robert Šifrer; Kerem Ozturk*

15:30–16:00 **Idiopathic Subglottic Stenosis: Change Of Therapeutic Paradigms?**

Laryngology · Instructional Course *Ozan Tüysüz; Guardmond Ajasllari*

16:30–17:30 **Unilateral Vocal Fold Paralysis — From Early To Late Management**

Laryngology · Round Table *Marina Mat Baki; Wonjae CHA; Anastasios Maniakas; Markus Blaurock*

17:30–18:00 **Real-Time Light-Guided Vocal Fold Injection: Clinical Experience And Technical Pearls And Pitfalls**

Laryngology · Instructional Course *Wonjae CHA; İlhan Topaloğlu*

Saturday, 12 September 2026

07:00–08:00 **Management Of Challenging Cases In Laryngology**

Laryngology · International Symposia *Z. Çiler Büyükatalay Yaldız; Ilter Denizoglu; Engin Başer*

08:00–08:30 **Optimizing Results In Office-Based Laryngological Procedures**

Laryngology · Instructional Course *Ozan Tüysüz; Anastasios Hantzakos*

08:30–09:00 **Laser Treatments Of Benign Lesions In Clinics**

Laryngology · Instructional Course *Mursalin M. Anis; Ozan Tüysüz*

09:00–09:30 **New Tools For Dysphagia Management In Head And Neck Cancer**

Laryngology · Keynote Lecture *Jacqui Allen; Esin Özlem Atmış*

09:30–10:00 **Voice Masculinization**

Laryngology · Expert Discussion *İsmail Koçak; Kursat Yelken*

10:45–11:15 **Chronic Cough: Diagnostic And Treatment Enigma**

Laryngology · Keynote Lecture *Karuna Dewan; Ismail Kocak*

11:15–12:15 **Practical Management Of Laryngopharyngeal Reflux Disease**

Laryngology · Panel Presentation *Jerome LECHIEN; Dinara Toguzbayeva; Mehmet Ekrem Zorlu*

12:15–12:45 **Non-Selective Reinnervation Vs Medialization: What To Do?**

Laryngology · Controversies *Kate Heathcote; jean paul marie*

14:00–15:00 **Challenges In Managing Pediatric Voice Disorders**

Laryngology · Round Table *Nurcan Alpüran Kocabıyık; Ozlem Onerci Celebi; saime sağıroglu*

15:00–16:00 **Voice Feminization And Gender-Affirming Surgery: Current Trends**

Laryngology · Round Table *marc Remacle; Kursat Yelken; Markus Hess; Hakan Birkent*

16:30–17:30 **Arytenoid Adduction: Tips And Tricks**

Laryngology · Panel Presentation *Taner Yılmaz; TETSUJI SANUKI; Al Merati*

17:30–18:00 **Laryngeal Neuropathy-Globus, Cough**

Laryngology · Instructional Course *Inna Husain; Ismail Kocak*

LARYNGOLOGY 2

ICC - B3 Floor - 3B/09

Wednesday, 9 September 2026

14:00–14:30 **Laryngology In 2026: Standard Of Care And State Of The Art**
Laryngology · Keynote Lecture *Elisabeth Sjogren; Kursat Yelken*

14:30–15:00 **Office Based Laryngeal Laser Applications**
Laryngology · Instructional Course *Markus Hess; Ferhan Öz*

15:00–15:30 **Lateral Cricoarytenoid Injuries – The Missed Nerve Impairments**
Laryngology · Keynote Lecture *James Phillip Thomas; Ferhan Öz*

15:30–16:00 **Vocal Fold Cysts- Tread With Cautioni**
Laryngology · Keynote Lecture *Nupur Kapoor Nerurkar; Ferhan Öz*

16:30–17:30 **Complex Laryngeal Pathologies**
Laryngology · Panel Presentation *Amanda Hu; John-Helge Heimdal; A. Volkan Sunter*

17:30–18:00 **Office Based EMG Guided Botulinum Toxin Injection In SD**
Laryngology · Instructional Course *Marie Mailly; Leman Veziroğlu Birdane*

Thursday, 10 September 2026

07:00–07:30 **Otolaryngology Litigation And Clinical Standards: Insights From An Expert Witness**
Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Fahmy Fayez Fahmy*

07:30–08:00 **Laryngology Notable Abstracts**
Notable Abstracts · Notable Abstract *Kursat Yelken*

08:00–09:00 **Anterior Commissure: From Anatomy To Surgery**
Laryngology · Round Table *Ahmet Mutlu; Malgorzata Wierzbicka; Taner Yılmaz*

09:00–10:00 **Evolution Of Surgical Techniques In Early Laryngeal Cancer, From Open To Endoscopic Techniques**
Laryngology · Round Table *Cesare Piazza; Meltem Akpınar; Mehmet Düzlü; Sefa İncaz*

10:45–11:45 **Non-Invasive Neuromodulation in Neuro-Laryngology: From Peripheral Stimulation to Cortical Modulation.**
Laryngology · Panel Presentation *Hirohito Umeno; Bengu Cobanoglu; Oğuzhan Katar; Nurcan Alpüran Kocabıyık;; Ozan Tüysüz*

11:45–12:45 **Emerging Therapies For Unilateral Vocal Fold Paralysis**
Laryngology · Round Table *yakubu karagama; Meltem Demirdağ Çevikkan; Philippe Schultz*

14:00–14:30 **NBI And Laryngeal Imaging**
Laryngology · Expert Discussion *Nupur Kapoor Nerurkar; Yo Kishimoto*

14:30–15:30 **Laryngo-Tracheal Trauma**
Laryngology · Panel Presentation *HASBELLAOUI Mokhtar; Ayşegül Batıoğlu Karaaltın*

15:30–16:00 **Clinical Dilemmas In Diagnosing And Treating Voice Disorders**
Laryngology · Round Table *Ozlem Onerci Celebi; Rukiye Özçelik Erdem; Fazilet Altın*

16:30–17:30 **Zenker's Diverticulum: Spectrum Of Treatment**
Laryngology · Expert Discussion *Andrew J McWhorter; Daniel Fink; Al Merati; Brianna Crawley*

17:30–18:00 **Stroboscopy: Mastering Advanced Imaging For Diagnosis**
Laryngology · Instructional Course *Guillermo Campos; Ozlem Onerci Celebi*

Friday, 11 September 2026

07:30–08:00 **Laryngeal Papillamatosis: Treatment Modalities**
Laryngology · Keynote Lecture *Ferhan Öz*

08:00–09:00 **AI In Laryngology: Opportunities And Challenges**
Laryngology · Panel Presentation *alberto paderno; Ebru Karakaya Gojayev; Banu Atalay Erdogan; Mehmet Akif Kılıç*

09:00–10:00 **Management Of Bilateral Vf Paralysis**
Laryngology · Round Table *Kishore Sandu; Alfred Aga; Chadwan Al Yaghchi; Serap Şahin Önder*

10:45–11:15 **Laryngotracheal Stenosis In The Adult Patient**
Laryngology · Keynote Lecture *Guri Sandhu; Harun Cansız*

11:15–12:15 **Phonomicrosurgery From Basic To Advanced Cases**
Laryngology · Panel Presentation *Elisabeth Sjogren; Nupur Kapoor Nerurkar; Markus Hess; Peak Woo; Geraldo Druck; Sant Anna; Ahmed Geneid*

12:15–12:45 **Medialization Laryngoplasty: How Far Should We Push?**
Laryngology · Controversies *Ahmed Geneid; Ferhan Öz*

14:00–15:00 **Transoral Surgery of the Larynx**
Laryngology · Round Table *Hirohito Umeno; Ayşegül Batıoğlu Karaaltın; Daniel Fink; Andrew J McWhorter*

15:00–15:30 **Beyond The Needle: Lasting Voice Restoration Via Type 2 Thyroplasty In Adductor Spasmodic Dysphonia**
Laryngology · Master of Surgery Video Presentation *TETSUJI SANUKI; Kursat Yelken*

15:30–16:00 **Microlaryngeal Surgery: Tips And Tricks For Better Outcomes**
Laryngology · Round Table *Kursat Yelken; Lucian Sulica; Emel Çadallı Tatar*

16:30–17:30 **Developing Standards For Phonosurgery In Elite Vocalists**
Laryngology · Panel Presentation *Nupur Kapoor Nerurkar; Reinaldo Yazaki; Lucian Sulica; İsmail Koçak*

17:30–17:45 **Modern Approaches To The Formation Of A Cannula-Free Tracheostomy And Their Clinical Efficiency**
Head and Neck Oncology · Remarkable Presentation *Alfisa Orozalieva; Bengu Cobanoglu*

17:45–18:00 **Surgical Management Of A Massive Goiter: Operative Video Lecture**
Head and Neck Oncology · Remarkable Presentation *Ibrahim Salih Gecer; Bengu Cobanoglu*

Saturday, 12 September 2026

07:00–08:00 **Treatment Of Early Staged Larynx Cancer**
Laryngology · Panel Presentation *Milan Dusan Stankovic; Selçuk Güneş; Damira Maktybaeva*

08:00–08:30 **Laryngeal Selective Reinnervation**
Laryngology · Keynote Lecture *jean paul marie; Kate Heathcote*

08:30–09:30 **Challenges Airway Surgery**
Laryngology · Round Table *Guri Sandhu; Karen Kost; Yoichiro Sugiyama*

09:30–10:00 **How To Decide Between Office -Based And OR Procedures In Benign Vocal Fold Surgery**
Laryngology · Keynote Lecture *marc Remacle; Ferhan Öz*

10:45–11:15 **Traditional And Innovative Applications Of Laryngeal Electromyography**
Laryngology · Keynote Lecture *Amanda Hu; Arzubetul Duran*

11:15–12:15 **Voice And Swallowing Rehabilitation Post-Laryngeal Cancer Treatments**
Laryngology · Panel Presentation *Sefa İncaz; Arzubetul Duran; Bayram Barış BUYUK; felat toprak*

12:15–12:45 **Voice Rest Or Early Vocal Rehabilitation – What Does Evidence Suggest?**
Laryngology · Controversies *Aude Lagier; Arzubetul Duran*

14:00–15:00 **RRP Current Management And Future Directions**
Laryngology · Panel Presentation *Alfred Aga; Fatih Öner; Malgorzata Wierzbicka; Joanna Jackowska; Karen Kost*

15:00–16:00 **Management Of Tracheal And Subglottic Stenosis**
Laryngology · Round Table *Prashanth.N; Soumitra Ghosh; R. Jun Lin; Özgül Gergin; worood husain*

16:30–17:30 **Optimizing Vocal Outcomes In Early Glottic Cancer**
Laryngology · Panel Presentation *marc Remacle; Hamdi Hakan Coşkun; Christoph Arens*

17:30–18:00 **Platelet Rich Plasma Treatment For Vocal Fold Pathology**
Laryngology · Instructional Course *Jacqui Allen; H Hakan Coşkun*

OTOLOGY 1

ICC - B2 Floor - Harbiye Auditorium

Wednesday, 9 September 2026

14:00–15:00 **Regenerative Delivery Methods To The Inner Ear**
Otology/Neurotology · Panel Presentation *Judith Kempfle; Marlan Hansen; Charles Limb; Yilai Shu; Marcello Rivolta; Tayfun; Kirazlı*

15:00–15:30 **Delivery To The Inner Ear**
Otology/Neurotology · Keynote Lecture *Ghizlene LAHLOU; Tayfun Kirazlı*

15:30–16:00 **Tips And Pitfalls Of Canal Wall Reconstruction In Canal-Wall-Down Mastoidectomy.**
Otology/Neurotology · Instructional Course *Simon I Angeli; Tayfun Kirazlı*

18:05–18:20 **Welcome Reception 17:30-18:30**
Ceremony · Opening Ceremony

18:20–18:35 **Opening Ceremony 18:30-20:15**
Ceremony · Opening Ceremony

Thursday, 10 September 2026

07:00–07:30 **Robotics And Ear**
Otology/Neurotology · Keynote Lecture *Marco Caversaccio*

07:30–08:00 **Evidence Based Treatment Of Sudden Sensorineural Hearing Loss (ISSNHL)**
Otology/Neurotology · Instructional Course *Stefan K. Plontke; Marco Caversaccio*

08:00–08:30 **Surgical Anatomy Of The Inner Ear**
Otology/Neurotology · Instructional Course *Manuel Jesús Manrique Rodríguez; Marco Caversaccio*

08:30–09:00 **Beyond "See One, Do One, Teach One". Rethinking How We Train Ear Surgeons.**
Otology/Neurotology · Keynote Lecture *Daniele BERNARDESCHI; Ilka Naumann*

09:00–10:00 **Otosclerosis**
Otology/Neurotology · Round Table *Robert Jan Pauw; Daniele BERNARDESCHI; Nicola Quaranta; SCHMERBER Sébastien*

10:45–11:45 **Current Management Strategies For Vestibular Schwannoma**
Otology/Neurotology · Round Table *Walter Kutz; Romain Kania; Zdenek Fik; Trung Le; Khassan Diab*

11:45–12:15 **Diagnosis And Treatment Of Sensorineural Hearing Loss Using An Ultrafine Otoendoscope**
Otology/Neurotology · Instructional Course *SHO KANZAKI; Bernard Fraysse*

12:15–12:45 **Controversies In The Diagnosis And The Management Of Otosclerosis**
Otology/Neurotology · Keynote Lecture *Bernard Fraysse*

13:00–14:00 **Industry Sponsored Session**
Industrial · Satellitte Symposium *Adi Nilson; Brian Kaplan; Angel Ramos de Miguel; Andrzej Zarowski*

14:30–15:00 **Management Of Solitary Vestibular Schwannoma: What Did We Learn From The Last Century?**
Otology/Neurotology · Keynote Lecture *Daniele BERNARDESCHI*

15:00–16:00 **Vestibular Schwannoma**
Otology/Neurotology · Round Table *Stefan K. Plontke; Konstantina M. Stankovic; Benghalem Abdelhamid*

16:30–17:00 **Facial Nerve Outcome In Vestibular Schwannoma: A Change In Paradigm**
Otology/Neurotology · Keynote Lecture *Miguel Arístegui*

17:00–18:00 **Reimagining Otologic Practice Through Technology**
Otology/Neurotology · Panel Presentation *Pa-Chun Wang; Huan Jia; Konstantina M. Stankovic; Jong Woo Chung*

Friday, 11 September 2026

07:00–07:30 **Types of Tympanoplasty: From Classification to Clinical Practice**
Otology/Neurotology · Keynote Lecture *İrfan Devranoğlu*

07:30–08:00 **Surgery For Temporal Bone And Lateral Skull Base Malignant Tumors**
Otology/Neurotology · Instructional Course *Chunfu Dai; Milan Dusan Stankovic*

08:00–08:30 **Surgical Innovations In Management Of Paraganglioma In The Jugular Foramen**
Otology/Neurotology · Keynote Lecture *Chunfu Dai*

08:30–09:00 **The Business Of American Medicine: How To Thrive In Practice**
Otology/Neurotology · Keynote Lecture *Gene Brown; Milan Dusan Stankovic*

09:00–10:00 **Temporal Bone And Skull Base Tumors**

Otology/Neurotology · Round Table *Milan Dusan Stankovic; Hakan Tutar; Maniu Alma Aurelia; Daniele Marchioni; Mete; İşeri; Yang-Sun Cho*

10:45–11:15 **Otology Notable Abstracts 1**

Notable Abstracts · Notable Abstract *Tayfun Kirazlı; Evren Hizal*

11:15–12:45 **Hearing Implant Notable Abstracts**

Notable Abstracts · Notable Abstract *Kadir Serkan Orhan; Evren Hizal*

14:00–14:30 **Surgical Decision And Techniques In Tympano-Jugular Paraganglioma**

Otology/Neurotology · Instructional Course *Enrico Piccirillo; Maurizio Falcioni*

14:30–15:00 **Skull Base Surgery**

Otology/Neurotology · Keynote Lecture *Marc Bassim; Enrico Piccirillo*

15:00–16:00 **Management Of Temporal Bone And External Auditory Canal Tumors**

Otology/Neurotology · Panel Presentation *Khassan Diab; Vincent Lin; Md. Harun Ar Rashid Talukder; Enrico Piccirillo; Jong; Woo Chung*

16:30–17:30 **Temporal Bone Tumors: Fudan Perspective**

Otology/Neurotology · Panel Presentation *Chunfu Dai; Yibo Zhang; Feitian Li; Bingbin Xie*

17:30–18:00 **Subtotal Petrosectomy**

Otology/Neurotology · Instructional Course *Chunfu Dai; Maurizio Falcioni*

18:30–19:00 **Gala Dinner in Çırağan Palace Kempinski Bosphorus 18:30-23:00 requires additional ticket**

Ceremony · Closing Ceremony

Saturday, 12 September 2026

07:00–07:30 **Otosclerosis Updated Management Protocol**

Otology/Neurotology · Instructional Course *Evren Hizal*

07:30–08:00 **Stapes Surgery: Rules & Hints**

Otology/Neurotology · Instructional Course *Robert Vincent; Evren Hizal*

08:00–08:30 **Otosclerosis: From The Lab To The Clinical Set**

Otology/Neurotology · Instructional Course *Sady Selaimen; Evren Hizal*

08:30–09:30 **Otosclerosis Surgery: Standardization, Pitfalls And Pearls**

Otology/Neurotology · Round Table *Romain Kania; Thomas Nikolopoulos; Payal Mukherjee; Maniu Alma Aurelia; Mehmet; Ziya Özüer*

09:30–10:00 **How To Perform Minimally Traumatic Stapes Surgery**

Otology/Neurotology · Instructional Course *Ahmad Alamadi; Romain Kania*

10:45–11:45 **Preoperative Assessment And Imaging Strategies In Otosclerosis**

Otology/Neurotology · Panel Presentation *Nazım Korkut; Christof Roosli; DANIELE DE SETA; Onur Çelik*

11:45–12:45 **Otosclerosis Surgery: Functional Outcomes And Evolving Techniques**

Otology/Neurotology · Panel Presentation *Fazıl Necdet Ardıç; Alejandro Harguindey Antolí-Candela; Maniu Alma Aurelia;; Kristen Rak*

14:00–15:00 **Revision Stapedotomy And Advanced Otosclerosis: Managing Failures And Measuring Success**

Otology/Neurotology · Panel Presentation *Robert Vincent; Eugenijus Lesinskas; Alimohamad Asghari; Marija Dokoska;; Secaattin Gülşen*

15:00–16:00 **Standardization Of Stapedial Surgery In Otosclerosis**

Otology/Neurotology · Round Table *Simon Schams; OSMAN NURİ ÖZGİRGİN; Robert Vincent; Petar Rouev*

16:30–17:00 **Development Of Objective And Quantifiable Hearing Improvement Surgery Using Intraoperative Measurement Device And Surgical Database Of Ossicular Mobility**

Otology/Neurotology · Instructional Course *SHO KANZAKI*

17:00–17:30 **Otoplasty: The Versatile Technique**

Otology/Neurotology · Instructional Course *SHO KANZAKI*

17:30–18:00 **Otitis Media With ANCA-Associated Vasculitis (OMAAV)**

Otology/Neurotology · Keynote Lecture *YUKA MORITA; SHO KANZAKI*

18:00–18:30 **Closing Ceremony**

Ceremony · Closing Ceremony

OTOLOGY 2

ICC - B2 Floor - Beylerbeyi 1

Wednesday, 9 September 2026

14:00–14:30 **Indications And Results Of Bone Anchored Hearing Aids**
Otology/Neurotology · Instructional Course *Giampietro Ricci; Luca D'Ascanio; Armağan İncesulu*

14:30–15:00 **Treatment Of Far-Advanced Otosclerosis**
Otology/Neurotology · Instructional Course *Luca D'Ascanio; Giampietro Ricci; Armağan İncesulu*

15:00–15:30 **Hearing Preservation And Cochlear Implantation In Vestibular Schwannoma Management**
Otology/Neurotology · Instructional Course *Mia Miller; Armağan İncesulu*

15:30–15:45 **Classification And Surgical Management Of Tympanosclerosis**
Otology/Neurotology · Remarkable Presentation *Vijayendra Honnurappa; Armağan İncesulu*

16:30–17:00 **Petrous Bone Cholesteatoma: Diagnosis, Surgical Management And Outcomes Of Primary And Residual Disease**
Otology/Neurotology · Keynote Lecture *Filippo Di Lella; Giulia Bertoli; Tayfun Kirazlı*

17:00–17:30 **Surgical Anatomy Of The Temporal Bone**
Otology/Neurotology · Instructional Course *Tayfun Kirazlı; Asım Aslan*

17:30–18:00 **Cadaveric Temporal Bone Surgical Dissection: Step By Step**
Otology/Neurotology · Instructional Course *Emine Deniz Gözen; Tayfun Kirazlı*

Thursday, 10 September 2026

07:00–07:30 **Minimally Invasive Surgical Techniques For Ossicular Reconstruction. Indications, Techniques & Results**
Otology/Neurotology · Instructional Course *Robert Vincent; Armağan İncesulu*

07:30–08:00 **Conductive Hearing Loss: Tympanoplasty, Hearing Aid Or Implantable Devices?**
Otology/Neurotology · Instructional Course *Mark Praetorius; Armağan İncesulu*

08:00–08:30 **Endoscopic Vs. Microscopic Stapes Surgery**
Otology/Neurotology · Instructional Course *Hüseyin Dere; Armağan İncesulu*

08:30–09:00 **Management Of Middle Ear Ossicular Chain Anomalies**
Otology/Neurotology · Instructional Course *Armağan İncesulu*

09:00–10:00 **Ossicular Reconstruction**
Otology/Neurotology · Panel Presentation *Marcus Neudert; Onur Çelik; Nobuhiro Hakuba; Sefa Dereköy; Daniela Ribeiro*

10:45–11:45 **Ossiculoplasty**
Otology/Neurotology · Panel Presentation *İbrahim Erdim; Milan Dusan Stankovic; Tallat Najeeb; Milan Profant; Arzu; TATLIPINAR; Turgut Karlıdağ*

11:45–12:45 **Management of Conductive Hearing Loss**
Otology/Neurotology · Panel Presentation *Kadir Serkan Orhan; Hong Ju Park; Romain Kania; Ahmed Samanody; Turgut; Karlıdağ; Yüksel Olgun; Ediz Yorgancılar*

14:00–14:30 **Immunology Of The Ear**
Otology/Neurotology · Keynote Lecture *Evren Hizal*

14:30–15:30 **Sudden Hearing Loss**
Otology/Neurotology · Panel Presentation *Seiji Kakehata; Iman Ibrahim; Evren Hizal; Fulya Özer*

15:30–16:00 **Congenital CMV Infection: Early Diagnosis, Hearing Loss, Cochlear Implant**
Otology/Neurotology · Keynote Lecture *Francesca Forli; Evren Hizal*

16:30–17:00 **Comprehensive Management Of Facial Paralysis After Skull Base Surgery**
Otology/Neurotology · Instructional Course *Luis Lassaletta; Vincent Van Rompaey*

17:00–17:30 **Disease-Modifying Therapies In Sensorineural Hearing Loss**
Otology/Neurotology · Keynote Lecture *Vincent Van Rompaey*

17:30–18:00 **Single-Sided Deafness In Children: What To Do?**
Otology/Neurotology · Instructional Course *Franco Trabalzini; Vincent Van Rompaey*

Friday, 11 September 2026

07:00–07:30 **Middle Ear Basic Research: A New Pathogenesis Of Cholesteatoma**
Otology/Neurotology · Instructional Course *TOMOMI YAMAMOTO-FUKUDA; Badr Eldin Mostafa*

07:30–08:00 **Management Of Petrous Bone Cholesteatoma: The Gruppo Otologico Experience**
Otology/Neurotology · Keynote Lecture *Enrico Piccirillo; Badr Eldin Mostafa*

08:00–08:30 **Cholesteatoma : All You Need To Know**
Otology/Neurotology · Instructional Course *Badr Eldin Mostafa*

08:30–09:30 **Cholesteatoma: From Pathophysiology To Clinical Management**
Otology/Neurotology · Round Table *OSMAN NURİ ÖZGİRGİN; Andrzej Zarowski; Manuel Jesús Manrique Rodríguez*

09:30–10:00 **Petrous Bone Cholesteatoma: How To Reduce Recidivism?**
Otology/Neurotology · Keynote Lecture *Khassan Diab; OSMAN NURİ ÖZGİRGİN*

10:45–11:45 **Cholesteatoma: Optimizing Surgical Management**
Otology/Neurotology · Panel Presentation *Daniele BERNARDESCHI; Wenyan Li; Vafa Panahian; Kazuhisa Yamamoto; YUKA; MORITA*

11:45–12:45 **Cholesteatoma Challenges: Innovative Approaches**
Otology/Neurotology · Panel Presentation *Mohamed Badr-El-Dine; Mehmet Murat Günay; Fazıl Necdet Ardıç; Şemsettin; Okuyucu; Jong Woo Chung; Daniele BERNARDESCHI*

14:00–15:00 **Mastering Cholesteatoma Surgery: Tips & Tricks**
Otology/Neurotology · Panel Presentation *Michael Gluth; Maniu Alma Aurelia; Elif Baysal; Banzamit Makhlouf; Mete İşeri; Neil; Donnelly*

15:00–16:00 **Cholesteatoma: Surgical Challenges And Patient Outcomes**
Otology/Neurotology · Panel Presentation *Neil Donnelly; Christof Roosli; Kemal Görür; Müzeyyen Yildirim Baylan; Sergey; Kosyakov*

16:30–17:30 **Cholesteatoma Surgery: From Mastoidectomy To Complication Management**
Otology/Neurotology · Panel Presentation *Mihael Ries; Petar Rouev; Dragana Simić; İlker Akyıldız; Andrzej Zarowski*

17:30–18:00 **Comparison Of Obliteration Techniques In Cholesteatoma Surgery**
Otology/Neurotology · Instructional Course *Andrzej Zarowski*

Saturday, 12 September 2026

07:30–08:00 **Modern Imaging In Cochlear Implantation - From Bench To Bedside**
Otology/Neurotology · Keynote Lecture *Kristen Rak*

08:00–09:00 **Tympanoplasty: Grafts and regenerative strategies**
Otology/Neurotology · Panel Presentation *Tayfun Kirazlı; SHINICHI KANEMARU; Vafa Panahian; Özgür Yiğit; Madina; Zheenbekova*

09:00–10:00 **Management Of Facial Nerve Paralysis**
Otology/Neurotology · Panel Presentation *Milan Dusan Stankovic; Isa Kaya; Onur İsmi; Dragoslava Djerić; Marco Bonali*

10:45–11:45 **Advanced Visualization In Otologic Surgery: The Expanding Role Of The Exoscope**
Otology/Neurotology · Panel Presentation *Tsukasa ITO; Sheng Zhou; Yasuhiro Tanaka; Shintaroh Amano; Chikako Shinkawa*

11:45–12:45 **Tympanoplasty: Pearls, Pitfalls, And Challenging Situations**
Otology/Neurotology · Round Table *Cem Uzun; Dragana Simić; Aziz Mustafa; Yibo Zhang; Banzamit Makhlouf; Asım; Aslan*

14:00–15:00 **Tympanoplasty: Techniques, Approaches, And Outcomes**
Otology/Neurotology · Panel Presentation *Alejandro Harguindey Antolí-Candela; Dragana Simić; Burak Mustafa TAŞ; Luana-; Maria Gherasie; İsmail Aytaç*

15:00–16:00 **Intraoperative Monitoring In Otologic Surgery**
Otology/Neurotology · Round Table *Gul Acar; Huan Jia; Ediz Yorgancılar*

16:30–17:30 **Imaging In Otology And Neurotology**
Otology/Neurotology · Panel Presentation *Norio Yamamoto; Henrique Furlan Pauna; Mariko Kasuga*

17:30–18:00 **Mastoid Obliteration In Chronic Otitis Surgery**
Otology/Neurotology · Instructional Course *Mihael Ries; Norio Yamamoto*

OTOLOGY 3

ICC - B3 Floor - 3B/58

Wednesday, 9 September 2026

14:00–14:30 **Tinnitus**
Otology/Neurotology · Instructional Course *Gregory J. Basura; Evren Hizal*

14:30–15:00 **Objectifying A Subjective Problem: Using Functional Near-Infrared Spectroscopy To Map Human Tinnitus**
Otology/Neurotology · Instructional Course *Gregory J. Basura; Evren Hizal*

15:00–15:30 **Idiopathic CSF Hypotension, The Forgotten Diagnosis**
Otology/Neurotology · Keynote Lecture *Fahmy Fayez Fahmy; Evren Hizal*

15:30–16:00 **When The Ear Speaks First: Hearing Loss As An Early Indicator Of Systemic Pathology**
Otology/Neurotology · Keynote Lecture *Ilka Naumann; Evren Hizal*

16:30–17:00 **Infectious Risk Factors In Congenital Hearing Loss**
Otology/Neurotology · Instructional Course *Laura Maria De Luca; Evren Hizal*

17:00–17:30 **Classification And Surgical Management Of Attic Retraction Pockets**
Otology/Neurotology · Instructional Course *Evren Hizal; Vijayendra Honnurappa*

17:30–18:00 **Single Side Deafness: How To Make A Decision?**
Otology/Neurotology · Instructional Course *Mohamed Mahtar; Evren Hizal*

Thursday, 10 September 2026

07:00–07:30 **Inner Ear Regeneration Therapy**
Otology/Neurotology · Instructional Course *Manuel Jesús Manrique Rodríguez*

07:30–08:00 **Stem Cells In Otology**
Otology/Neurotology · Keynote Lecture *Marcello Rivolta; Mustafa Tekin*

08:00–09:00 **Genetics And Hearing Loss**
Otology/Neurotology · Panel Presentation *Mustafa Tekin; Lukas Varga; Raquel Manrique Huarte; Georgios Korres; Hideki; Mutai*

09:00–10:00 **Innovative Inner Ear Therapies For Hearing Loss: Current Status**
Otology/Neurotology · Panel Presentation *Michael Hoa; Vincent Van Rompaey; Yilai Shu; Judith Kempfle*

10:45–11:45 **Advances In Inner Ear Therapeutics (American Academy Of Otolaryngology)**
Otology/Neurotology · International Symposia *Wade Chien; Konstantina M. Stankovic; Michael Hoa; Alan G. Cheng; Natalie; Loundon*

11:45–12:45 **Regenerative Therapy in Middle and Inner Ear Disorders**
Otology/Neurotology · Panel Presentation *Konstantina M. Stankovic; Judith Kempfle; SHINICHI KANEMARU; Wade Chien*

14:00–14:30 **Stem Cells In Cochlear Cells Regeneration**
Otology/Neurotology · Instructional Course *Takayuki Okano*

14:30–15:00 **Network In The Genetic Diagnosis Of Hypoacusia**
Otology/Neurotology · Instructional Course *Sebastian Picciafuoco; Takayuki Okano*

15:00–15:30 **Gene Therapy With AAV-Hotof For Autosomal Recessive Deafness**
Otology/Neurotology · Keynote Lecture *Yilai Shu; Takayuki Okano*

15:30–16:00 **Modiifed Radical Mastoidectomy Reconstruction/ Rehabilitation**
Otology/Neurotology · Keynote Lecture *Shane Anderson; Takayuki Okano*

16:30–17:30 **Drug Delivery To The Inner Ear**
Otology/Neurotology · Panel Presentation *Akira Ishiyama; Stefan K. Plontke; Sebastian Picciafuoco; Trung Le*

Friday, 11 September 2026

07:00–07:30 **Revision Atresiaplasty**
Otology/Neurotology · Keynote Lecture *Yang-Sun Cho; Tatsuya Yamasoba*

07:30–08:00 **Surgery For External Ear Canal Atresia Or Stenosis**
Otology/Neurotology · Instructional Course *Tatsuya Yamasoba*

08:00–08:30 **Microbiata Of The Middle Ear**
Otology/Neurotology · Keynote Lecture *Luigina Romani; Tatsuya Yamasoba*

08:30–09:30 **External Ear Canal**
Otology/Neurotology · Round Table *Rinor Ajeti; Mehmet Murat Günay; Yukiko Iino; Sady Selaimen*

09:30–10:00 **Pointers And Pitfalls In Chronic Ear Surgery**
Otology/Neurotology · Instructional Course *Sady Selaimen*

10:45–11:15 **Diagnosis And Management Of Spontaneous CSF Leaks: A Comprehensive Approach**
Otology/Neurotology · Instructional Course *Walter Kutz*

11:15–11:45 **Strategy Guide For Meningoencephalic Herniation**
Otology/Neurotology · Instructional Course *Miguel Arístegui; Walter Kutz*

11:45–12:45 **Cerebrospinal Fluid Leakage And Encephalocele In The Lateral Skull Base**
Otology/Neurotology · Round Table *Walter Kutz; Michael Hoa; Hans Thomeer; Senem Kurt Dizdar; Alex Bien*

14:00–14:30 **Third Window Anomalies And Otic Dehiscences**
Otology/Neurotology · Keynote Lecture *Eugen Constant Ionescu*

14:30–15:00 **Keratosis Obturans - A Disease More Aggressive Than Cholesteatoma**
Otology/Neurotology · Keynote Lecture *Vijayendra Honnurappa; Eugen Constant Ionescu*

15:00–16:00 **Otosclerosis**
Otology/Neurotology · Panel Presentation *Dirk Beutner; Vedat Topsakal; Santiago A. Arauz; Eugen Constant Ionescu; Piotr; Henryk Skarzynski*

16:30–17:00 **Cochlear Immunology**
Otology/Neurotology · Instructional Course *Agnieszka Szczepek; Sarah Mowry*

Saturday, 12 September 2026

07:00–07:30 **What's Next In Otopathology? Toward Better Patient Outcomes**
Otology/Neurotology · Instructional Course *Sebahattin Cureoglu*

07:30–08:00 **Unlocking Otopathology: A Digital Library For Otology Research**
Otology/Neurotology · Instructional Course *Sebahattin Cureoglu*

08:00–08:30 **From Lab To Clinic: Otopathology In Meniere's Disease And Otosclerosis**
Otology/Neurotology · Keynote Lecture *Sebahattin Cureoglu*

08:30–09:00 **Lessons Learned From +1800 Balloon Dilations Of The Eustachian Tube In Local Anesthesia**
Otology/Neurotology · Instructional Course *Martin Nue Møller; Ercole Di Martino*

09:00–10:00 **Eustachian Tube Pathologies**
Otology/Neurotology · Panel Presentation *Ercole Di Martino; maryam yaghoobi; Nesibe Gül Yüksel Aslıer; NOOR DINA HASHIM*

10:45–11:45 **Surgical Management Of Eustachian Tube Pathologies**
Otology/Neurotology · Panel Presentation *Cuneyt M. Alper; Yusif Hajiyev; Erkan Karatas; Sergey Kosyakov*

11:45–12:45 **Complications Of Otitis Media**
Otology/Neurotology · Round Table *Ann Hermansson; Sibel Alicura Tokgöz; SARA AGHALAR; SUELA SALLAVACI*

14:00–14:30 **Acute Mastoiditis In Children**
Otology/Neurotology · Expert Discussion *Gheorghe Iovanescu; Işılay Öz; Çiğdem Kalaycık*

14:30–15:00 **Endoscopic Transoral, Endoscopic Transnazal And Lateral Skull Base Approaches To Infratemporal Fossa**
Otology/Neurotology · Keynote Lecture *Mete İşeri*

15:00–16:00 **Diagnosis And Management Of Pediatric Conductive Hearing Loss**
Otology/Neurotology · Panel Presentation *Wenyan Li; Jie Zhang; Wei Wang; Bo Li*

16:30–17:30 **Middle Ear Ventilation (Attic Mucosal Folds And Ventilation Pathways)**
Otology/Neurotology · Round Table *Yukiko Iino; Erdem Atalay Çetinkaya; Ediz Yorgancılar; Franco Trabalzini*

17:30–18:00 **Mastoiditis In Children: Management And Treatment**
Otology/Neurotology · Instructional Course *Franco Trabalzini*

OTOLOGY 4

Hilton - Connie 2

Wednesday, 9 September 2026

14:00–14:30 **Cadaveric Endoscopic Temporal Bone Dissection**
Otology/Neurotology · Instructional Course *Ediz Yorgancılar; Daniele Marchioni*

14:30–15:00 **Endoscopic Anatomy Of The Ear**
Otology/Neurotology · Keynote Lecture *Ediz Yorgancılar*

15:00–15:30 **Fifteen Years Of Endoscopic Ear Surgery: Lessons Learned And Evolving Standards**
Otology/Neurotology · Keynote Lecture *José Carlos Casqueiro; Ediz Yorgancılar*

15:30–16:00 **A Novel Continuous Irrigating Mode For Endoscopic Ear Surgery**
Otology/Neurotology · Instructional Course *Hua Liao; Ediz Yorgancılar*

16:30–17:00 **Set Up And Instruments In Endoscopic Ear Surgery**
Otology/Neurotology · Keynote Lecture *Ediz Yorgancılar; Enis Alpin Güneri*

17:00–17:30 **The Tympanoplasty Journey: From Pure Endoscopic To Combined Micro-Endoscopic Techniques**
Otology/Neurotology · Keynote Lecture *Enis Alpin Güneri*

17:30–18:00 **The Tips And Tricks Of Pediatric Endoscopic Ear Surgery**
Otology/Neurotology · Keynote Lecture *Davide Soloperto; Enis Alpin Güneri*

Thursday, 10 September 2026

07:00–07:30 **Endoscopic Ear Surgery**
Otology/Neurotology · Keynote Lecture *Daniel Lee*

07:30–08:00 **How Endoscopic Ear Surgery Is Reshaping The Otology Landscape**
Otology/Neurotology · Keynote Lecture *Mohamed Badr-El-Dine; Daniel Lee*

08:00–09:00 **Mastering The Skills Of Transcanal Endoscopic Ear Surgery (TEES): Strategies For Skill Development And Assessment**
Otology/Neurotology · Round Table *Seiji Kakehata; Kishiko Sunami; Tsukasa ITO; Kunio Mizutari; Daniel Lee*

09:00–10:00 **Tips And Techniques In Transcanal Endoscopic Ear Surgery (TEES)**
Otology/Neurotology · Panel Presentation *Seiji Kakehata; Suetaka Nishiike; Yu Matsumoto; Daniele Marchioni*

10:45–11:45 **Advanced Applications: Cutting Edge In Transcanal Endoscopic Ear Surgery (TEES)**
Otology/Neurotology · Panel Presentation *Seiji Kakehata; Kishiko Sunami; Suetaka Nishiike; Tsukasa ITO; Rintaro Kawaguchi;; Saki Takihata; Kunio Mizutari*

11:45–12:15 **Tips And Tricks In Endoscopic Ear Surgery**
Otology/Neurotology · Keynote Lecture *Mustafa Kapadia*

12:15–12:45 **Endoscopic Management Of Attic Cholesteatoma**
Otology/Neurotology · Keynote Lecture *Mustafa Kapadia; Jong Woo Chung*

14:00–15:00 **Endoscopic Tympanoplasty**
Otology/Neurotology · Panel Presentation *Romain Kania; Robert Jan Pauw; Afruz Masimova; Resul Arjin Öksüz; Gözde Günay*

15:00–15:30 **Risk Factors For Cholesteatoma Recurrence In Endoscopic Ear Surgery**
Otology/Neurotology · Keynote Lecture *Lau Tsz Lun; Celil Göcer*

15:30–16:00 **Avoiding Complications In Endoscopic Ear Surgery**
Otology/Neurotology · Instructional Course *Celil Göcer*

16:30–17:30 **Total Vs. Assistant Endoscopic Ear Surgery In Cholesteatoma**
Otology/Neurotology · Round Table *Abdelrahman Ezzat Ibrahim; Burak Ulkumen; Maky Hafidh; Ahmed Allam; Giulia; Bertoli*

17:30–18:00 **Endoscopes And Microscopes In Otology & Neurotology: From Conflict To Harmony.**
Otology/Neurotology · Instructional Course *Waleed Moneir; Abdelrahman Ezzat Ibrahim*

Friday, 11 September 2026

07:00–07:30 **Innovation: Next-Generation Techniques In Innovative Endoscopic Ear Surgery~Efficacy Of Image-Guided Percutaneous Endoscopic Ear Surgery**
Otology/Neurotology · Instructional Course *Seiji Kakehata; Masaya Uchida; Ryusuke Hori; In Seok Moon*

07:30–08:00 **Endoscopic Stapedectomy, Evidence Based Outcomes**
Otology/Neurotology · Keynote Lecture *Abdelrahman Ezzat Ibrahim; Seiji Kakehata*

08:00–08:30 **Endoscopic Stapes Surgery: Pearls And Pitfalls**
Otology/Neurotology · Keynote Lecture *Brandon Isaacson; Seiji Kakehata*

08:30–09:30 **New Aspects In Endoscopic Ear Surgery (Underwater, Laser)**
Otology/Neurotology · Panel Presentation *Gokce Tanyeri Toker; Selcuk Mulazimoglu; Enis Alpin Güneri; Ediz Yorgancılar*

09:30–10:00 **Endoscopic Ear Surgery And Ossiculoplasty**
Otology/Neurotology · Instructional Course *Ahmad Daneshi; Miguel Sá Breda*

10:45–11:45 **Recognition And Management Of The Unusual Petrous Apex Disease: A Case-Based Interactive Approach**
Otology/Neurotology · Panel Presentation *Maura Cosetti; Ann Jay; Elizabeth H. Toh; Michael Hoa; Sarah Mowry*

11:45–12:45 **Limits Of Totally Endoscopic Ear Surgery**
Otology/Neurotology · Panel Presentation *Ali Özdek; Secaattin Gülşen; Ahmad Daneshi; Tankut Uzun; Esra Kavaz Uştu; Ediz; Yorgancılar*

14:00–14:30 **Retraction Pockets In Children: Should They Always Be Treated With Surgery?**
Otology/Neurotology · Instructional Course *Franco Trabalzini; İbrahim Hızalan*

14:30–15:00 **Endoscopic Lateral Skullbase Surgery: Extension Of EES Beyond Middle Ear**
Otology/Neurotology · Keynote Lecture *Daniele Marchioni; In Seok Moon*

15:00–16:00 **Recognition And Management Of Unusual Facial Nerve: A Case-Based Interactive Approach**
Otology/Neurotology · Panel Presentation *Sarah Mowry; Maura Cosetti; Angela Peng; Ann Jay; Pete Weber*

16:30–17:30 **Hearing Care And Healthy Aging**
Transverse activities (Innovation, Basic Research, Education) · Round Table *Bernard Fraysse; Fabian Auberger; Manuel Jesús Manrique Rodríguez; Nicholas; Reed*

17:30–17:45 **Intratympanic Steroid Injection In The Treatment Of Sudden Sensorineural Hearing Loss – A Systematic Review**
Otology/Neurotology · Remarkable Presentation *Shatha Yahya Alqahtani; Bernard Fraysse*

17:45–18:00 **Transmastoid Facial Nerve Decompression With Intact Ossicular Chain Preservation**
Otology/Neurotology · Remarkable Presentation *Redallah-larbi ABADA; Bernard Fraysse*

Saturday, 12 September 2026

07:00–07:30 **Endoscopic Ear Surgery: From Basics To Underwater Surgery**
Otology/Neurotology · Instructional Course *Selcuk Mulazimoglu; Ahmad Daneshi*

07:30–08:30 **Endoscopic Surgery Of Middle Ear Tumors**
Otology/Neurotology · Round Table *Brandon Isaacson; Vedat Topsakal; OZGUR SURMELIOGLU; Raymond Ngo; Kadir; Serkan Orhan*

08:30–09:00 **Endoscopic Underwater Facial Nerve Decompression In Cholesteatoma Surgery**
Otology/Neurotology · Instructional Course *Ahmad Daneshi*

09:00–10:00 **Tympanoplasty: Hearing Preservation And Modern Approaches**
Otology/Neurotology · Round Table *Bülent Satar; Nadir Yıldırım; Adriana Neagos; Irina Arechvo; Maky Hafidh*

10:45–11:45 **The Modern Day Management Of Chronic Otitis Media/Cholesteatoma: Combining European And American Perspectives Over A Half-Century Of Combined Experience**
Otology/Neurotology · Keynote Lecture *KARKAS Alexandre; Yaşar Çokkeser*

11:45–12:15 **Endoscopic Transpromontorial Appraoch To IAC & Endoscopic Approach For Traumatic And Neoplastic Facial Nerve Lesions**
Otology/Neurotology · Instructional Course *Daniele Marchioni; Yaşar Çokkeser*

12:15–12:45 **Surgical Management Of Internal Auditory Canal Lesions**
Otology/Neurotology · Keynote Lecture *Khassan Diab; Daniele Marchioni*

14:00–15:00 **Optogenetic Hearing Restoration**
Transverse activities (Innovation, Basic Research, Education) · Panel Presentation *Tobias Moser; Kathrin Kusch; Rachael Richardson; Nazempour, Roya*

15:00–16:00 **Pan-American Otorhinolaryngology-HNS Association: Discussion Of Difficult Cases Of Cholesteatoma**
Otology/Neurotology · International Symposia *Sady Selaimen; Angel Ramos de Macias; Douglas D. Backous; Gabriel Charlone;; Miguel Arístegui*

16:30–17:00 **Otology Notable Abstracts 3**
Notable Abstracts · Notable Abstract *Mete İşeri*

17:00–17:40 **Otology Notable Abstracts 4**
Notable Abstracts · Notable Abstract *Çiğdem Kalaycık*

OTOLOGY 5

ICC - B3 Floor - 3B/62

Wednesday, 9 September 2026

14:00–14:30 **Dawn of A New Era in Middle Ear Surgery: Tympanic Membrane Regeneration Therapy**
Otology/Neurotology · Keynote Lecture *SHINICHI KANEMARU; Vinay Vijayendra*

14:30–15:00 **VII Heaven - The Joy Of Facial Nerve Surgery**
Otology/Neurotology · Instructional Course *Vinay Vijayendra*

15:30–16:00 **New Paradigm In The Management Of Microtia - Aural Atresia**
Otology/Neurotology · Instructional Course *Mario Emilio Zernotti; Vinay Vijayendra*

Thursday, 10 September 2026

07:00–07:30 **Middle Ear Cholesteatoma Complications: 25-Year Of Personal Experience**
Otology/Neurotology · Keynote Lecture *Aziz Mustafa*

07:30–08:00 **Head And Neck Paragangliomas: Contemporary Management Guided By Risk–Benefit Evaluation**
Otology/Neurotology · Keynote Lecture *Romain Kania; Jeroen Jansen; Aziz Mustafa*

08:00–08:30 **Cholesteatoma Surgery: Tailor Made Approach**
Otology/Neurotology · Keynote Lecture *Miguel Sá Breda; Aziz Mustafa*

08:30–09:00 **Advancements In Endoscopic Surgery For Middle Ear Cholesteatoma With Semicircular Canal Fistula: Surgical Strategy And Outcomes**
Otology/Neurotology · Keynote Lecture *Yibo Zhang; Aziz Mustafa*

09:00–09:30 **Diagnosis And Management Of Complexities And Complications In Temporal Bone Surgery**
Otology/Neurotology · Keynote Lecture *Filippo Di Lella*

09:30–10:00 **Extended Modified Bondy Mastoidectomy: A Hearing-Preserving Technique For Epitympanic Cholesteatoma With Medial Extension To The Ossicles**
Otology/Neurotology · Instructional Course *Kanu Lal Saha; Filippo Di Lella*

10:45–11:45 **Otologic Problems Of Divers**
Otology/Neurotology · Round Table *Cem Uzun; Selin Gamze Sümen; Luca de Campora; Mario Milkov*

11:45–12:15 **Advanced Cholesteatoma Of The Middle Ear**
Otology/Neurotology · Keynote Lecture *Maniu Alma Aurelia*

12:15–12:45 **Single-Stage Tympanoplasty For Middle Ear And Mastoid Cholesteatoma: Surgical Technique**
Otology/Neurotology · Instructional Course *DANIELE DE SETA; Maniu Alma Aurelia*

14:00–15:00 **Endoscopic Middle Ear Surgery**
Otology/Neurotology · Round Table *Ali Özdek; muhammed dağkıran; Yavuz Gündoğdu; Demir Bajin; Arunachalam Iyer;; Selçuk Arslan*

15:00–15:30 **Eustachian Tube Function Assessment And Testing For Balloon Dilation: Complex To Simple**
Otology/Neurotology · Instructional Course *Cuneyt M. Alper; İsmet Bayramoglu*

15:30–15:40 **Surgical Management Of Intracanalicular Vestibular Schwannoma**
Otology/Neurotology · Master of Surgery Video Presentation *Anup Singh; İsmet Bayramoglu*

15:40–15:50 **Transotic Approach For Multifocal Intravestibulocochlear And Intracranial Vestibular Schwannoma**
Otology/Neurotology · Master of Surgery Video Presentation *Nicola Quaranta; İsmet Bayramoglu*

15:50–16:00 **Endoscope Assisted Vestibular Schwannoma Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *İsmet Bayramoglu*

16:30–16:40 **Endoscopic Transtympanic Tympanoplasty Without Tympanomeatal Flap**
Otology/Neurotology · Master of Surgery Video Presentation *Abdullah Belada; isa dagli*

16:40–16:50 **Concurrent Congenital Cholesteatoma And Cholesterol Granuloma – A Rare Entity**
Otology/Neurotology · Master of Surgery Video Presentation *Vinay Vijayendra; isa dagli*

16:50–17:00 **Conductive Hearing Loss**
Otology/Neurotology · Master of Surgery Video Presentation *isa dagli*

17:00–17:10 **Grafts In Tympanoplasty**
Otology/Neurotology · Master of Surgery Video Presentation *Şemsettin Okuyucu; isa dagli*

17:10–17:20 **Surgical Management Of Petrous Bone Cholesteatoma**
Otology/Neurotology · Master of Surgery Video Presentation *Alessia Rubini; isa dagli*

17:20–17:30 **Translabyrinthine Approach And Simultaneous Cochlear Implantation In Vestibular Schwannoma**
Otology/Neurotology · Master of Surgery Video Presentation *Alessia Rubini; isa dagli*

17:30–17:40 **Transpromontorial Approach To IAC: A Step By Step Guide**
Otology/Neurotology · Master of Surgery Video Presentation *Daniele Marchioni; isa dagli*

17:40–17:50 **Middle Cranial Fossa Repair Of Cerebrospinal Fluid Leak With Bone Cement**
Otology/Neurotology · Master of Surgery Video Presentation *Evan Cumpston; isa dagli*

17:50–18:00 **Transcanal Endoscopic Management Of Middle Ear Paragangliomas**
Otology/Neurotology · Master of Surgery Video Presentation *OZGUR SURMELIOGLU; isa dagli*

Friday, 11 September 2026

07:00–07:30 **Vestibular Schwannoma And Simultaneous Cochlear Implant: Indications And New Prospectives**
Otology/Neurotology · Instructional Course *Robert Jan Pauw; Enrico Piccirillo*

07:30–08:00 **Mastoid Obliteration In Cholesteatoma Surgery: Rationale, Surgical Technique And Outcomes**
Otology/Neurotology · Instructional Course *Robert Jan Pauw*

08:00–08:30 **Stapes Surgery: Review How To Do It Safely**
Otology/Neurotology · Instructional Course *Tawfiq Khurayzi; Robert Jan Pauw*

08:30–09:00 **Revision Surgery With Obliteration After Canal Wall Down Mastoidectomy**
Otology/Neurotology · Instructional Course *Eugenijus Lesinskas*

09:00–09:30 **The Mastoid Obliteration Technique In Cholesteatoma**
Otology/Neurotology · Instructional Course *Hans Thomeer; Eugenijus Lesinskas*

09:30–10:00 **Microbiome Of The Ear**
Otology/Neurotology · Keynote Lecture *Eugenijus Lesinskas*

10:45–11:15 **Hearing Restoration In NF2 Patients**
Otology/Neurotology · Keynote Lecture *İbrahim Hızalan; Hao Wu*

11:15–11:45 **Otitis Media**
Otology/Neurotology · Expert Discussion *Haytham Kubba; İbrahim Hızalan; Charlotte M. Chiong*

11:45–12:15 **Tympanosclerosis Surgery**
Otology/Neurotology · Keynote Lecture *Ali Özdek; İbrahim Hızalan*

12:15–12:45 **Endoscopic Ear Surgery In Lateral Skull Base**
Otology/Neurotology · Keynote Lecture *Daniele Marchioni; Marco Bonali*

14:00–15:00 **Artificial Intelligence In Otology And Neurotology**
Otology/Neurotology · Round Table *Mühlfay Gheorghe; Cristian Norbert Ionescu; Horváth Karin Ursula*

15:00–16:00 **Endoscopic Stapes Surgery (EES)**
Otology/Neurotology · Panel Presentation *Ahmad Daneshi; Euan Murugasu; Marco Bonali*

16:30–16:40 **Tympanojugular Paraganglioma: Our Experience Of 46 Cases**
Otology/Neurotology · Master of Surgery Video Presentation *Boudjenah Farid; Jong Woo Chung*

16:40–16:50 **The Management Of Advanced Malignancies In The External Auditory Canal And Temporal Bone**
Otology/Neurotology · Master of Surgery Video Presentation *Jong Woo Chung*

16:50–17:00 **Temporal Bone Paraganglioma Resection Through Endoscopic Transcanal Approach: Video Illustration Of Critical Surgical Points**
Otology/Neurotology · Master of Surgery Video Presentation *Romain Kania; Jong Woo Chung*

17:00–17:10 **Canal Wall Down Tympanoplasty With Mastoid Obliteration Using Bone Pate Plate For Canal Wall Reconstruction In Cholesteatoma Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *Yutaka Yamamoto; Jong Woo Chung*

17:10–17:20 **Outcomes Of The Canal Wall Down Mastoidectomy In The Management Of Middle Ear Cholesteatoma**
Otology/Neurotology · Master of Surgery Video Presentation *Houssem Eddine Bouraba; Jong Woo Chung*

17:20–17:30 **Facial Nerve Reanimation**
Otology/Neurotology · Master of Surgery Video Presentation *Houssem Eddine Bouraba; Jong Woo Chung*

17:30–17:40 **Endoscopic Ear Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *Müzeyyen Yildirim Baylan; Jong Woo Chung*

17:40–17:50 **Cholesteatoma Surgery: A Visual Review Of Endoscopic And Microscopic Surgical Techniques**
Otology/Neurotology · Master of Surgery Video Presentation *Mehmet İlhan Şahin; Jong Woo Chung*

17:50–18:00 **Stapedectomy In Patients With Dehiscent And Prolapsed Facial Nerve**
Otology/Neurotology · Master of Surgery Video Presentation *EROL SENTURK; Jong Woo Chung*

Saturday, 12 September 2026

07:00–08:00 **Endoscopic Management Of Advanced Cholesteatoma**

Otology/Neurotology · Panel Presentation *Kadir Serkan Orhan; Hakan Tutar; Mohamed Badr-El-Dine; Walter Kutz; Daniele; Marchioni*

08:00–09:00 **Cholesteatoma Surgery: Advances And Future Perspectives In The Southeast Europe**

Otology/Neurotology · International Symposia *Ana Jotic; Andro Košec; Marija Dokoska*

09:00–10:00 **Research Outcomes In Cholesteatoma**

Otology/Neurotology · International Symposia *Samantha Anne; Arunachalam Iyer; Paul Merkus; Manuela Fina; François Simon*

10:45–11:45 **Advances In Cholesteatoma: New Insights From Experimental Models And Clinical Studies**

Otology/Neurotology · International Symposia *Albert Park; TOMOMI YAMAMOTO-FUKUDA; Naotaro Akiyama; Chisei Satoh; Yi-; Chun Carol Liu; Gabriel Dunya*

11:45–12:45 **Symposium Of The Society Of Polish Otorhinolaryngologists, Phoniatrists, And Audiologists**

Otology/Neurotology · International Symposia *Javier Gavilan; Artur Lorens; Mario Emilio Zernotti; Piotr Henryk Skarzynski*

14:00–15:00 **Hearing Restoration - Mediterranean Society Of Otology And Audiology (MSOA)**

Otology/Neurotology · International Symposia *Badr Eldin Mostafa; Antonio Della Volpe; Saba Battelino; Ayça Çiprut; Armağan; İncesulu*

15:00–15:30 **Intratympanic Medication For Tinnitus**

Otology/Neurotology · Keynote Lecture

15:30–16:00 **Ear & Hearing Care And Neonatal Hearing Screening Program In A Developing Country: Limitations And Way Forward**

Otology/Neurotology · Keynote Lecture *Md Abul Hasnat Joarder*

16:30–16:40 **Management Of Intraoperative Complications In Otosclerosis Surgery**

Otology/Neurotology · Master of Surgery Video Presentation *Emine Deniz Gözen; Müzeyyen Yildirim Baylan*

16:40–16:50 **Revision stapedotomy: Piston dislocation and re-obliteration of the footplate**

Otology/Neurotology · Master of Surgery Video Presentation *Hüsamettin Yaşar; Müzeyyen Yildirim Baylan*

16:50–17:00 **Surgical Management Of Otosclerosis: Technique, Precision, And Audiological Results**

Otology/Neurotology · Master of Surgery Video Presentation *İlker Akyıldız; Müzeyyen Yildirim Baylan*

17:00–17:10 **Otosclerosis**

Otology/Neurotology · Master of Surgery Video Presentation *Müzeyyen Yildirim Baylan*

17:10–17:20 **Endoscope-Assisted Middle Fossa Approach For Cranial Base Cholesteatoma**

Otology/Neurotology · Master of Surgery Video Presentation *Selcuk Mulazimoglu; Müzeyyen Yildirim Baylan*

17:30–18:00 **The New Concept Of Mastoid Sinus**

Otology/Neurotology · Instructional Course *Mühlfay Gheorghe; Mete İşeri*

OTOLOGY 6

ICC - B3 Floor - 3B/65

Thursday, 10 September 2026

07:00–07:30 **Canal Wall Reconstruction Tympanoplasty**
Otology/Neurotology · Instructional Course *Burhan Dadaş*

07:30–08:00 **Considerations For Stapes Surgery In The Next Generation**
Otology/Neurotology · Instructional Course *Joseph Manjaly; Burhan Dadaş*

08:00–08:30 **Tinnitus In Daily ENT Practice: What Works, For Whom, And Why — A Personalized Approach**
Otology/Neurotology · Instructional Course *Ljiljana Cvorovic; Burhan Dadaş*

08:30–09:00 **Stress Hormones And Auditory Synaptic Plasticity: Sex-Specific Mechanisms At The Inner Hair Cell Synapse**
Otology/Neurotology · Keynote Lecture *Agnieszka Szczepek; Burhan Dadaş*

09:00–09:15 **Diagnosis And Management Of Comorbid Conditions In Spontaneous Cerebrospinal Fluid Leak Patients**
Otology/Neurotology · Remarkable Presentation *Evan Cumpston*

09:15–09:30 **Endaural Mastoid Surgery. When And Why?**
Otology/Neurotology · Remarkable Presentation *Fozilkhon Usmonkhonov; Evan Cumpston*

09:30–09:45 **Epitympanotomy - An Important Tool In Every Surgeon's Arsenal**
Otology/Neurotology · Remarkable Presentation *Vinay Vijayendra; Evan Cumpston*

09:45–10:00 **Impact Of Chorda Tympani Morhology On Taste Function After Stapedectomy: A New Classification.**
Otology/Neurotology · Remarkable Presentation *Waleed Moneir; Evan Cumpston*

10:45–11:45 **Stapedotomy: Raising Points Of Contention.**
Otology/Neurotology · Panel Presentation *Waleed Moneir; Yazid Laziben; Abdussalam Jahan*

11:45–12:15 **Roadblocks Enroute A Successful Stapedotomy**
Otology/Neurotology · Instructional Course *Vinay Vijayendra; Waleed Moneir*

12:15–12:45 **Gymnastics Around The Stapes - How To Score A Perfect 10i**
Otology/Neurotology · Keynote Lecture *Vijayendra Honnurappa; Waleed Moneir*

14:00–14:30 **Composite Multi-Fractured Osteoperiosteal Flap (Uçar Flap) For Canal Wall Reconstruction And Mastoid Obliteration: Multicenter Surgical Outcomes**
Otology/Neurotology · Instructional Course *Cevat Uçar; Abdulkadir Özgür; Hitendra Prakash Singh; Vijayendra Honnurappa*

14:30–15:00 **Congenital Cholesteatoma – Classification And Surgical Management**
Otology/Neurotology · Instructional Course *Vijayendra Honnurappa*

15:00–15:30 **Combined Approach Tympanoplasty With Selective Epitympanic Partial Obliteration**
Otology/Neurotology · Instructional Course *Codruta Neumann; Vijayendra Honnurappa*

15:30–16:00 **Otology Notable Abstracts 2**
Notable Abstracts · Notable Abstract *Cevat Uçar*

16:30–17:00 **Tympanoplasty: Why Is A 'Simple' Surgery Not Always Successful?**
Otology/Neurotology · Instructional Course *FABIO ANDRE SELAIMEN; In Seok Moon*

17:00–18:00 **Diagnostic Tools And Decision Making In Eustachian Dysfunction**
Otology/Neurotology · Panel Presentation *Cuneyt M. Alper; OSMAN NURİ ÖZGİRGİN; Marta Sandoval; Vikas Agrawal; In Seok; Moon*

Friday, 11 September 2026

07:00–07:15 **Hyaluronic Acid Gel In Middle Ear Surgery: From Stapedotomy Sealant To Tympanoplasty Packing**
Otology/Neurotology · Remarkable Presentation

07:15–07:30 **Mastoid Obliteration In CWDM: Allograft Bone, Silicone Blocks, Amniotic Membrane, Temporalis Fascia**
Otology/Neurotology · Remarkable Presentation

07:30–08:00 **Diagnostic Issues And Challenges In Hereditary Hearing Loss**
Otology/Neurotology · Instructional Course *Lukas Varga*

08:00–08:30 **Actual Indications For VEMP Use In Clinical ENT Practice**
Otology/Neurotology · Keynote Lecture *Ana Carolina Binetti*

08:30–08:45 **Secondary Mastoid Obliteration For Problematic Mastoid Cavities- Challenges Of Hearing Rehabilitation. Passive Middle Ear Implants And Bone Conduction Devices Choice.**
Otology/Neurotology · Remarkable Presentation *Codruta Neumann; Hüseyin Dere*

08:45–09:00 **Skull Base Osteomyelitis**
Otology/Neurotology · Remarkable Presentation *Fatma Ceyda Akın Öçal; Hüseyin Dere*

09:00–09:30 **The Importance Of The Vestibular System And Structure Preservation – Assessing Function With Objective Testing Prior To Cochlear Implantation**
Otology/Neurotology · Keynote Lecture *Jafri Kuthubutheen; Hüseyin Dere*

09:30–10:00 **Radiological Diagnosis Of Middle Ear Pathologies**
Otology/Neurotology · Instructional Course *Enrico Piccirillo; Hüseyin Dere*

10:45–11:15 **Management Of Eustachian Tube Pathology**
Otology/Neurotology · Keynote Lecture *Holger Sudhoff*

11:15–12:15 **Long Term Outcomes for Eustachian Tube Balloon Dilation**
Otology/Neurotology · Panel Presentation *Holger Sudhoff; Çağlar Batman; Juha Tapio Silvola; In Seok Moon*

12:15–12:45 **Say Goodbye To Cavity Problemsi**
Otology/Neurotology · Instructional Course *Vijayendra Honnurappa; Holger Sudhoff*

14:00–15:00 **Pediatric Eustachian Balloon Tuboplasty**
Otology/Neurotology · Panel Presentation *Çağlar Batman; Holger Sudhoff; Cuneyt M. Alper*

15:00–15:15 **Retrospective Analysis Of Type 3 Tympanoplasties**
Otology/Neurotology · Remarkable Presentation *Arsenii Skupchenko; Çağlar Batman*

15:15–15:30 **My Experience In Surgical Treatment Of Adhesive Otitis Media**
Otology/Neurotology · Remarkable Presentation *Çağlar Batman*

15:30–16:00 **Development Of An Innovative App For The Diagnosis And Treatment Of Tinnitus Using Sound Therapy**
Otology/Neurotology · Instructional Course *CARLOS CUILTY SILLER; Çağlar Batman*

16:30–17:00 **Surgical Management Of Unrecovered Bell's Palsy**
Otology/Neurotology · Instructional Course *Vijayendra Honnurappa; Fatih Celenk*

17:00–17:10 **Attic Cholesteatoma Endoscopic Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *Fatih Mutlu; Fatih Celenk*

17:10–17:20 **Outcome Of Endoscopic Facial Nerve Decompression For Traumatic Facial Nerve Injury**
Otology/Neurotology · Master of Surgery Video Presentation *Mohd Sazafi; Fatih Celenk*

17:20–17:30 **Endoscopic Ear Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *Fatih Celenk*

17:30–17:40 **Expanding the Role of Diode Laser in Endoscopic Middle Ear Surgery: Three Clinical Applications**
Otology/Neurotology · Master of Surgery Video Presentation *Bilal Sizer; Fatih Celenk*

17:40–17:50 **Underwater Endoscopic Ear Surgery**
Otology/Neurotology · Master of Surgery Video Presentation *Gokce Tanyeri Toker; Fatih Celenk*

17:50–18:00 **Extended Approach In Cerebellar Cholesteatoma**
Otology/Neurotology · Master of Surgery Video Presentation *Fatih Celenk*

Saturday, 12 September 2026

07:30–07:45 **Modulating ATOH1 And POU4F3 Pathways To Enhance Hair Cell Regeneration And Inhibit Ferroptosis In Cochlear Support Cells**
Otology/Neurotology · Remarkable Presentation *Yu Rong; Vinay Vijayendra*

07:45–08:00 **Transcanal Facial Nerve Decompression For Treatment Of Traumatic Facial Nerve Palsy**
Otology/Neurotology · Remarkable Presentation *Vinay Vijayendra*

08:00–09:00 **Proms In Otology**
Otology/Neurotology · Panel Presentation *Paul Merkus; Emel Tahir; Tahmina Arzomand*

09:00–09:30 **Intracranial Complications Secondary To Chronic Otitis Media**
Otology/Neurotology · Instructional Course *Gabriel Charlone; Hernan Goldsztein*

09:30–10:00 **Shifting Paradigms In Treatment Of Skull Base Osteomyelitis**
Otology/Neurotology · Keynote Lecture *Gabriel Charlone; Bini Faizal*

10:45–11:15 **Cochleovestibular Screening Of The Elder Population As The Next Steps In Development Of Vestibulology Servise In Uzbekistan**
Otology/Neurotology · Keynote Lecture *Alex Bien; Karimova Nargiza Abdullayevna*

11:15–11:45 **Mastoid Obliteration For Middle Ear Cholesteatoma Surgery**
Otology/Neurotology · Keynote Lecture *Alex Bien; Banzamit Makhlouf*

11:45–12:15 **Evaluation And Management Of Pulsatile Tinnitus**

Otology/Neurotology · Instructional Course *Alex Bien*

12:15–12:45 **Intratemporal Facial Nerve Grafting: Techniques & Outcomes**

Otology/Neurotology · Instructional Course *Alex Bien*

14:00–15:00 **British Egyptian Medical Association: Section Of Otolaryngology**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Fahmy Fayez Fahmy; Atef Elkholy; Rana Tahoun; Ossama Hamid; Mohammed Salem;; Ahmed Allam*

15:00–15:30 **Regenerative Medicine In ENT: Bridging The Gap Between Laboratory Research And Clinical Reality**

Transverse activities (Innovation, Basic Research, Education) · Keynote Lecture *Mikhail Svistushkin*

15:30–16:00 **Surgical Ergonomics Across the Career Span: A Practical, Skills- Based Workshop for Otolaryngologists**

Transverse activities (Innovation, Basic Research, Education) · Instructional Course *Smriti Nayan; Ercan Akbay*

16:30–17:30 **Dealing With Cholesteatomas: Open Techniques/ Canal Wall Down Techniques/ Endoscopic Ear Surgery**

Global Outreach (Regional or ENT related Organizations Symposia) · Round Table *Jean Baptiste Lecanu; Fırat Onur; Derya Cebeci*

17:30–18:00 **Voices From The Field: Female Surgeons In Lmics On Training, Culture, And Research**

Transverse activities (Innovation, Basic Research, Education) · Controversies *Amina Seguya; Merry Sebelik, MD, FACS, MAMSE*

PED OTOLARYNGOL 1

ICC - B2 Floor - Beylerbeyi 2

Wednesday, 9 September 2026

14:15–14:30 **Pediatric Otitis Media Complications**
Pediatric Otolaryngology · Remarkable Presentation *Selin Üstün Bezgin; Oğuzhan Katar*

14:30–15:00 **Olfaction In Children**
Pediatric Otolaryngology · Instructional Course *Giulio Cesare Passali; Ljiljana Jovancevic; Mariaconsiglia Santantonio; Oğuzhan; Katar*

15:00–15:30 **Foreign Bodies Of The Esophagus In Children - Our Experiences**
Pediatric Otolaryngology · Keynote Lecture *Oğuzhan Katar*

15:30–16:00 **The Use Of Navigation In Paediatric Skull Base Surgery**
Pediatric Otolaryngology · Instructional Course *Sunil Sharma; Oğuzhan Katar; Grace Khong*

16:30–17:30 **Pediatric Cholesteatoma Follow-Up, Why Is It Different Than Adult?**
Pediatric Otolaryngology · International Symposia *François Simon; Mohamad A. EL Bitar; Manuela Fina; Sarp Saraç; Ignacio Javier; Fernandez*

17:30–18:00 **“Decision-Making In The Management Of Adenotonsillar Hypertrophy: The Pediatric Otolaryngologist’s Perspective On Surgical Indications”**
Pediatric Otolaryngology · Keynote Lecture *Victoria Demarchi; Erdinç Aydın*

Thursday, 10 September 2026

07:00–07:30 **Intracapsular Tonsillectomy And Endoscopic Adenoidectomy Using Coblation**
Pediatric Otolaryngology · Instructional Course *Leonel Luis; Sinan Atmaca*

07:30–09:00 **Congenital Laryngeal And Tracheal Disorders**
Pediatric Otolaryngology · International Symposia *Mike Rutter; Talal Al-khatib; Wei-Chung HSU; Briac Thierry; Michael Kuo*

09:00–10:00 **Cervical And Facial Congenital Cysts**
Pediatric Otolaryngology · Round Table *Benjamin Hartley; Sinan Atmaca; Iman Almashharawi; Eric Levi; Randa Al Barazi;; François Simon*

10:45–11:15 **Management Of Inhaled Foreign Bodies**
Pediatric Otolaryngology · Keynote Lecture *Nikolaus Wolter; Mai Nasser*

11:15–11:45 **Open Surgery For Laryngeal Stenosis**
Pediatric Otolaryngology · Keynote Lecture *Kishore Sandu; David White*

11:45–12:15 **Feeding Problems And Their Management**
Pediatric Otolaryngology · Keynote Lecture *Hannah Burns; Sinan Atmaca*

12:15–12:45 **EXIT And Intrauterine Procedures**
Pediatric Otolaryngology · Keynote Lecture *Luv Javia; Salma Alsheibani*

14:00–15:30 **Management Of Residual OSA After T And A**
Pediatric Otolaryngology · International Symposia *Maria Pia Villa; Wei-Chung HSU; Sheng Zhou; Fırat Tevetoğlu*

15:30–16:00 **Neck Check: Navigating Chronic Paediatric Cervical Lymphadenopathy**
Pediatric Otolaryngology · Keynote Lecture *Kate Stephenson*

16:30–17:00 **Pediatric Otitis Media In The Primary ENT Sector In Denmark**
Pediatric Otolaryngology · Keynote Lecture *kim werther; Fırat Tevetoğlu*

17:00–18:00 **Pediatric Chronic Rhinosinusitis: A Pan American Association Clinical Consensus**
Pediatric Otolaryngology · International Symposia *Hassan H. Ramadan; Tania Sih; Jivianne Lee; José Lubianca; Jaqueline Alvarado;; Pablo Stolovitzky*

Friday, 11 September 2026

07:00–07:30 **Pediatric Cervicofacial Atypical Mycobacterial Lymphadenitis: Rethinking The Management**
Pediatric Otolaryngology · Controversies *Ömer Faruk Ünal; Joshua Wiedermann*

07:30–08:30 **PEDIATRIC EAR SURGERY**
Pediatric Otolaryngology · Instructional Course *Iman Almashharawi; Luis Lassaletta; Daniela Carvalho; Ömer Faruk Ünal*

08:30–10:00 **Future Of Pediatric ENT**
Pediatric Otolaryngology · International Symposia *Alan T Cheng; Colin Barber; Carlton Zdanski; Christopher Hartnick; Romain Luscan;; Sanjay Parikh; Daniela Carvalho*

10:45–11:15 **What Is Happening To Otitis Media?**
Pediatric Otolaryngology · Keynote Lecture *Taner Kemal Erdağ; Ann Hermansson*

11:15–12:15 **Surgery For Pediatric Voice Problems**
Pediatric Otolaryngology · Round Table *Scott Rickert; Gresham Richter; Pierre Fayoux; Marshall Smith; Pamela Mudd;; Özgül Gergin*

12:15–12:30 **Rational Pharmacotherapy Of Adenoid Hypertrophy In Young Children**
Pediatric Otolaryngology · Remarkable Presentation *Özgül Gergin*

12:30–12:45 **Recurrent Acute Otitis Media In Children**
Pediatric Otolaryngology · Remarkable Presentation *Özgül Gergin*

14:00–15:00 **Decision Making In Difficult Airway Cases**
Pediatric Otolaryngology · Round Table *Ahmed El-Sobki; David White; Özgül Gergin; Bas Pullens; Talal Al-khatib; Thushitha; Kunanandam; Steven Sobol*

15:00–16:00 **Pediatric Otolaryngology Training And Practice In Different Parts Of The World**
Pediatric Otolaryngology · Panel Presentation *Hannah Burns; Tomislav Baudoin; Hugo Rodriguez; Shazia Peer; Steven Sobol*

16:30–17:30 **Cochlear Implant**
Pediatric Otolaryngology · Round Table *Natalie Loundon; David Chi; Levent Sennaroğlu; Huan Jia; Nils Guinand; Piotr; Henryk Skarzynski*

17:30–18:00 **Biologic Therapy In Paediatric Chronic Rhinosinusitis**
Pediatric Otolaryngology · Keynote Lecture *Sheng Zhou; Özgül Gergin*

Saturday, 12 September 2026

07:00–07:30 **Journey To Sound: Advancing Early Diagnosis And Cochlear Implantation In Children**
Pediatric Otolaryngology · Master of Surgery Video Presentation *Munar Beishenova; Ömer Faruk Çalım*

07:30–08:00 **Hemangiomas In Otorhinolaryngology Practice: Diagnostic And Therapeutic Experiences**
Pediatric Otolaryngology · Keynote Lecture *Ahmet Kızılay; Ömer Faruk Çalım*

08:00–08:30 **Thyroglossal Duct Cyst Surgery**
Pediatric Otolaryngology · Instructional Course *Mehmet Düzlü; Ömer Faruk Çalım*

08:30–09:00 **Disruptive Use Of Mobile Applications And ICT In International Teaching And Learning**
Pediatric Otolaryngology · Keynote Lecture *RICARDO DE HOYOS; Luisa Maria Bellussi*

09:00–10:00 **The Case I Want To Forget About.**
Pediatric Otolaryngology · Panel Presentation *Ömer Faruk Çalım; Serap Şahin Önder; Brian Reilly; Dan Cristian Gheorghe; R.; Önder Günaydın*

10:45–11:45 **Juvenile Angiofibroma Management Of Residual Disease**
Pediatric Otolaryngology · Round Table *François Simon; Nikolaus Wolter; Romain Luscan; Marco Ferrari*

11:45–12:00 **Airway Management On Burned Children**
Pediatric Otolaryngology · Keynote Lecture *Yusif Hajiyev; Erdinç Aydın*

12:00–12:30 **The Evolution Of Airway Balloon Dilation**
Pediatric Otolaryngology · Keynote Lecture *Mike Rutter; Erdinç Aydın*

12:30–12:45 **Septal Perforation In Children**
Pediatric Otolaryngology · Remarkable Presentation *Yuri Rusetskiy; Erdinç Aydın*

14:00–15:00 **Skull Base Management In The Child**
Pediatric Otolaryngology · International Symposia *François Simon; Paresh Pramod Naik; Vincent Couloigner; Grace Khong*

15:00–15:30 **Endoscopic Management Of Bilateral Vocal Fold Inmobility In Children**
Pediatric Otolaryngology · Instructional Course *Andrés Alvo; Mehmet Ada*

15:30–16:00 **Alternative Approach For Adenoidectomy**
Pediatric Otolaryngology · Keynote Lecture *lütfi barlas aydoğan; Mehmet Ada*

16:30–17:00 **Challenging Pediatric Airway Lesions: Cysts And Tumors Requiring Surgical Intervention**
Pediatric Otolaryngology · Keynote Lecture *Taner Kemal Erdağ; Selin Üstün Bezgin*

17:00–17:30 **Volumetric Assessment Silent Sinus Sindrom Surgery In Children**
Pediatric Otolaryngology · Remarkable Presentation *Yuri Rusetskiy; Selin Üstün Bezgin*

PED OTOLARYNGOL 2

ICC - B3 Floor - 3B/45

Wednesday, 9 September 2026

14:00–14:30 **Aesthetic And Functional Surgery For Microtia And Atresia**
Pediatric Otolaryngology · Keynote Lecture *Myung-Whan Suh; Yuce Islamoglu*

14:30–15:00 **Ankyloglossia: What Is The Science?**
Pediatric Otolaryngology · Controversies *Anna H. Messner; Yuce Islamoglu*

15:00–16:00 **Update On Difficult Cases**
Pediatric Otolaryngology · Panel Presentation *Amarilis Menendez; Victoria Demarchi; Tania Sih; Brian Reilly*

16:30–17:00 **Ventilation Tube – History And Present**
Pediatric Otolaryngology · Keynote Lecture *Gheorghe Iovanescu; Erdinç Aydın*

17:00–18:00 **DIAGNOSTIC WORK-UP OF PEDIATRIC OSAS**
Pediatric Otolaryngology · Round Table *Vincent Couloigner; Derek Lam*

Thursday, 10 September 2026

07:00–07:30 **EXIT [Ex Utero Intrapartum Treatment] Procedure**
Pediatric Otolaryngology · Keynote Lecture *Murthy Panchala; Serap Şahin Önder*

07:30–08:30 **LARYNGOMALACIA**
Pediatric Otolaryngology · Instructional Course *Taher Valka; Isaac Okyeremah Kofi Barnor; Ömer Faruk Çalım; Yusif Hajiyev;; Haytham Kubba*

08:30–09:00 **Pediatric Eustachian Tube Dilation: Our Experience And Lessons Learned.**
Pediatric Otolaryngology · Instructional Course *Shraddha Mukerji; Taner Kemal Erdağ*

09:00–10:00 **Solid Neck Masses**
Pediatric Otolaryngology · Panel Presentation *George H Zalzal; Rudolf Hagen; Ken Kazahaya; Vincent Couloigner; Taner Kemal; Erdağ; Ömer Faruk Ünal*

10:45–11:15 **Natural Evolution Of OSA In Children And Adolescents**
Pediatric Otolaryngology · Keynote Lecture *Luisa Maria Bellussi; Sanjay Parikh*

11:15–12:15 **T&A Surgery Instructional Course**
Pediatric Otolaryngology · Instructional Course *Michael Kuo; Emily Boss; Seçkin Ulualp; Nicolas Guertler; Sam Daniel*

12:15–12:30 **Partial Tonsillectomy: Surgical Technique, Case-Based Ev,Idence, And Long-Term Outcomes.**
Pediatric Otolaryngology · Remarkable Presentation *Alper Şenkal; Serap Şahin Önder*

12:30–12:45 **Coblation Adenoidectomy**
Pediatric Otolaryngology · Master of Surgery Video Presentation *Yavuz Selim Yıldırım; Serap Şahin Önder*

14:00–14:30 **Gene Therapy For Pediatric Hearing Loss**
Pediatric Otolaryngology · Keynote Lecture *Natalie Loundon; Alper Şenkal*

14:30–15:00 **Managing Complicated And Non-Complicated Acute Sinusitis In Children**
Pediatric Otolaryngology · Keynote Lecture *Erdinç Aydın; Soham Roy*

15:00–15:30 **Diagnosis And Treatment Of Laryngeal Cleft**
Pediatric Otolaryngology · Keynote Lecture *Ömer Faruk Ünal; Mike Rutter*

15:30–16:00 **Laryngeal Papillomatosis**
Pediatric Otolaryngology · Keynote Lecture *Craig Derkay; Pamela Mudd*

16:30–17:00 **Tracheotomy In Infant**
Pediatric Otolaryngology · Keynote Lecture *Sumeyra Doluoglu; Alper Şenkal*

17:00–18:00 **Pediatric Obstructive Sleep Apnea Worldwide: Critical Issues And New Perspectives**
Pediatric Otolaryngology · Round Table *Luisa Maria Bellussi; Maria Pia Villa; Archwin Tanphaichitr; Marisa Santos*

Friday, 11 September 2026

07:00–07:30 **Tonsillectomy Or Tonsillotomy For Recurrent Acute Tonsillitis?**
Pediatric Otolaryngology · Keynote Lecture *Tejs Ehlers Klug; Ozan Gökler*

07:30–08:00 **Microtia Repair**
Pediatric Otolaryngology · Keynote Lecture *Yi-Chun Carol Liu; Ozan Gökler*

08:00–08:30 **Management Of Ear Atresia**
Pediatric Otolaryngology · Keynote Lecture *Francoise Denoyelle*

08:30–09:00 **Teaching Pediatric Ear Surgery: Tips And Tricks**
Pediatric Otolaryngology · Keynote Lecture *Taner Kemal Erdağ; Cuneyt M. Alper*

09:00–10:00 **Congenital Obstruction Of The Nose**
Pediatric Otolaryngology · Round Table *Grace Khong; Stephan Hackenberg; Dilyana Vicheva; Anna H. Messner; Tolga; Kandoğan*

10:45–11:15 **Contemporary Management Of Paediatric Drooling**
Pediatric Otolaryngology · Keynote Lecture *Eric Levi; Ozan Gökler*

11:15–11:45 **Pediatric Rhinosinusitis – A New Concepts For Treatment**
Pediatric Otolaryngology · Keynote Lecture *Dilyana Vicheva; Ozan Gökler*

11:45–12:45 **Airway Surgery Tricks That I Have Learned From My Mentors**
Pediatric Otolaryngology · Round Table *Michelle Wyatt; Tawakir Kamani; Ozan Gökler; Vikash K. Modi; Tolga Kandoğan;; Shazia Peer*

14:00–15:00 **PEDIATRIC TRACHEOSTOMY**
Pediatric Otolaryngology · Panel Presentation *Gheorghe Iovanescu; Marilena Trozzi; Kishore Sandu; Romain Luscan; Tawakir; Kamani*

15:00–16:00 **Nasal And Sinus Masses In Children**
Pediatric Otolaryngology · International Symposia *Marco Ferrari; Paresh Pramod Naik; Hassan H. Ramadan; Grace Khong; Gheorghe; Iovanescu*

17:00–17:30 **Minimally Invasive Bone Anchored Hearing Implants - MIPS, MONO, MOSIA**
Pediatric Otolaryngology · Keynote Lecture *Sam Daniel; R. Önder Günaydın*

17:30–18:00 **DECISION MAKING IN DIFFICULT AIRWAY CASES**
Pediatric Otolaryngology · Keynote Lecture *Steven Sobol; R. Önder Günaydın*

Saturday, 12 September 2026

07:00–07:30 **“Mytrach” A Smart Phone Application Improves Safety And Quality Of Life For Children On Tracheostomy**
Pediatric Otolaryngology · Remarkable Presentation *Danah Alrusayyis; Özgül Gergin*

07:30–08:00 **MANAGEMENT OF THYROID CANCER IN CHILDREN**
Pediatric Otolaryngology · Controversies *Daniel Chelius; Jeffrey P. Simons; Özgül Gergin*

08:00–09:00 **ENT Manifestations Of CF In Children - An Update**
Pediatric Otolaryngology · International Symposia *Nicolien van der poel; Kim Van Hoorenbeeck; Anneclaire Vroegop; alberto maria; saibene*

09:00–09:30 **Innovative Pediatric Airway Medicine/Surgery In The Last 20 Years.**
Pediatric Otolaryngology · Keynote Lecture *Alan T Cheng; Ömer Faruk Ünal*

09:30–10:00 **Principles Of Cannula And Stoma Care With Family Education In Pediatric Tracheostomy:An ENT Approach**
Pediatric Otolaryngology · Keynote Lecture *Büşra Ünsal; Özgül Gergin*

10:45–11:45 **The Ten Seconds That Matter: Operative Decision Making In Pediatric Head And Neck Surgery**
Pediatric Otolaryngology · International Symposia *Daniel Chelius; Jeffrey P. Simons; Kara D Meister; Kara Prickett; Ömer Faruk Ünal*

11:45–12:15 **Pott's Puffy Tumor**
Pediatric Otolaryngology · Instructional Course *Nicolien van der poel; alberto maria saibene; Ömer Faruk Ünal*

12:15–12:45 **How Knowledge Of Infant Mental Health Can Improve Your Surgical Practice.**
Pediatric Otolaryngology · Keynote Lecture *Eric Levi; Ömer Faruk Ünal*

14:00–14:30 **A Novel Multimodal Strategy For Pediatric Sialorrhea: Sequential Botulinum Toxin-A And Duct Ligation**
Pediatric Otolaryngology · Instructional Course *Ömer Faruk Çalım; Orhan Ozturan*

14:30–15:00 **Surgical Treatment Of Rhabdomyosarcoma**
Pediatric Otolaryngology · Keynote Lecture *Romain Luscan; Tolga Kandoğan*

15:00–15:30 **An Exploratory View Of Clinical Aspects In Chronic Rhinosinusitis In Children**
Pediatric Otolaryngology · Keynote Lecture *Manole Felicia; Tolga Kandoğan*

15:30–16:00 **Emerging Insights Into Cochlear Implantation For Unilateral Hearing Loss In Children**
Pediatric Otolaryngology · Keynote Lecture *Samantha Anne; David Chi; Tolga Kandoğan*

16:30–17:00 **Bizact Pediatric Tonsillectomy**
Pediatric Otolaryngology · Instructional Course *RICARDO DE HOYOS; CARLOS CUILTY SILLER*

17:00–18:00 **Management Of Unilateral Hearing Loss In Children: A Global Perspective**
Pediatric Otolaryngology · Round Table *Samantha Anne; François Simon; Daniela Carvalho; Albert Park*

PHON 4 + SWALLOWING

ICC - B3 Floor - 3B/36

Wednesday, 9 September 2026

14:00–15:00 **Swallowing Assessment-1**

Phoniatrics · Instructional Course *Emine Elif Altuntaş; Ali Bayram; saime sağıroglu; Tuba Doğan Karataş*

15:00–16:00 **Swallowing Assessment-2**

Phoniatrics · Panel Presentation *daniele farneti; Arzubetul Duran; Emine Elif Altuntaş; Ebru Karakaya Gojayev*

16:30–17:30 **Occupational Voice**

Phoniatrics · Panel Presentation *Emine Elif Altuntaş; Silvia Capobianco; catherine cantor cutiva; carlos manzano;; Pasquale Bottalico*

Thursday, 10 September 2026

08:30–09:00 **Instrumental Assessment Of Dysphagia In Adults**

Phoniatrics · Instructional Course *daniele farneti; carlos manzano*

09:00–10:00 **Reclaiming Voice After Head & Neck Cancer: Multidisciplinary Pathways To Long-Term Functional Recovery**

Phoniatrics · Panel Presentation *Gamze Yesilli Puzella; Francesco Bussu; Fatma Şentürk*

10:45–11:15 **Lasers In Pediatric Airway - Update 2025**

Phoniatrics · Keynote Lecture *Kishore Sandu; Tolga Kandoğan*

11:15–11:45 **Instrumental Swallowing Assessment In Children: Fiberoptic Or Fluoroscopic**

Swallowing · Instructional Course *Mariam Shadi; Güleser Saylam*

11:45–12:45 **Developing Cochlear Implantation Program In South East Europe**

Phoniatrics · Panel Presentation *Nenad Arsovic; Celil Göcer; Gabor Polony; Fuad Brkic; Saba Battelino; Mihael Ries;; Ruminita Radulescu*

14:00–15:00 **Pediatric Dysphagia**

Phoniatrics · Panel Presentation *Ana Danic Hadzibegovic; Daša Gluvajić; Tamer Abou-Elsaad; daniele farneti; reham; abdelwakil ibrahim; Christian Aaron Mejia Arista*

15:00–16:00 **From Neural Pathways To Swallowing: Insights Into Neurogenic Dysphagia**

Phoniatrics · Panel Presentation *KAYHAN OZTURK; virginie woisard; Paola Diaz Borrego; rodica muresan*

16:30–17:00 **Neuroplasticity-Based Dysphagia Rehabilitation: Bridging Research And Practice**

Phoniatrics · Instructional Course *mohamed farahat; Ozan Bağış Özgürsoy*

17:00–17:30 **Dysphagia In Head And Neck Cancer, Management Protocol And Patients' Journey**

Phoniatrics · Keynote Lecture *Justin Roe; Engin Dursun*

17:30–18:00 **New Office-Based Injectables**

Phoniatrics · Keynote Lecture *Peak Woo; SEVTAP AKBULUT*

Friday, 11 September 2026

07:00–07:30 **Updates On Management Of Chronic Cough**

Phoniatrics · Keynote Lecture *Jonathan Bock; Taner Yılmaz*

07:30–08:30 **Surgical Treatment In Bilateral Vocal Fold Paralysis**

Phoniatrics · Panel Presentation *Mustafa Aslıer; Sami Rouadi; Taner Yılmaz; Dinara Toguzbayeva; Güleser Saylam*

08:30–09:30 **Oropharyngeal Dysphagia**

Swallowing · Panel Presentation *Ana Danic Hadzibegovic; Miroslav Tedla; samit majumdar; Mariam Shadi; Shiying; Hey*

09:30–10:00 **Swallowing Disorders In Systemic Diseases: Multimodal Evaluation And Case-Based Approach**

Swallowing · Instructional Course *Emel Tahir*

10:45–11:15 **Evaluation And Management Of Complex Pharyngoesophageal Segment Dysfunction**

Swallowing · Keynote Lecture *Maggie Kuhn; Z. Çiler Büyükatalay Yaldız*

11:15–11:45 **Comprehensive Assessment Of Pediatric Dysphagia In Children With Disabilities: Clinical Approaches For ENT And Speech-Language Pathologists**

Swallowing · Instructional Course *Z. Çiler Büyükatalay Yaldız; Özge Selen AVCI CAN*

11:45–12:15 **Swallowing Computed Tomography And Extended Reality System In Swallowing Evaluation**

Swallowing · Instructional Course *Rumi Ueha; Z. Çiler Büyükatalay Yaldız*

12:15–12:45 **Phoniatry Notable Abstracts**

Notable Abstracts · Notable Abstract *Z. Çiler Büyükatalay Yaldız*

14:00–15:00 **Rehabilitation Methods For Swallowing Disorders**

Swallowing · Panel Presentation *Müge Müzeyyen Çiyiltepe; Melda Kunduk*

15:00–15:30 **Restoring The Swallow: Surgical Solutions For Neurological Dysphagia**

Swallowing · Keynote Lecture *ALEXANDROS DELIDIS; Emel Çadallı Tatar*

15:30–16:00 **FEES In Dysphagia Management: A Practical Guide For Clinicians**

Swallowing · Instructional Course *Sibel Alicura Tokgöz; Emel Tahir*

16:30–17:30 **Assessment And Management Of Pediatric Swallowing Disorders, State Of The Art**

Swallowing · Panel Presentation *Gayem Köprücü; Tamer Abou-Elsaad; Ozan Bağış Özgürsoy*

17:30–18:00 **Tailored Aspiration Prevention Surgery For Severe Dysphagia To Improve Quality Of Life**

Swallowing · Instructional Course *Rumi Ueha; Ozan Bağış Özgürsoy*

Saturday, 12 September 2026

07:00–07:30 **Platelet-Rich Plasma Injections Into The Olfactory Clefts Of Patients With Olfactory Dysfunction: An Updated Clinical Practice**

Swallowing · Keynote Lecture *Jerome LECHIEN; Zara Patel*

07:30–08:00 **Electrical Stimulation Therapy For Dysphagia**

Swallowing · Keynote Lecture *Yoichiro Sugiyama; Emel Çadallı Tatar*

08:00–08:30 **What's New In Pediatric Swallowing Assessment: Innovations And Future Direction**

Swallowing · Instructional Course *Jeyasakthy Saniasiaya; Emel Çadallı Tatar*

08:30–10:00 **Swallowing Head And Neck Cancer: From Prevention To Treatment**

Swallowing · Panel Presentation *Priya Krishna MD; Aliya Turyeva; Hamdi Hakan Coşkun; Özlem E Tulunay-Uğur;; Nausheen Jamal*

10:45–11:45 **Swallowing, What Is New?**

Swallowing · Round Table *Al Merati; Emel Tahir; Özlem E Tulunay-Uğur; Jacqui Allen*

11:45–12:45 **The Artistic Voice And Voice Measures**

Phoniatrics · Panel Presentation *Mette Pedersen; Ramon Hernandez-Villoria; Reinaldo Yazaki; alberto paderno;; valentina camesasca*

14:00–15:00 **Salivary Control Disorders**

Swallowing · Panel Presentation *KAYHAN OZTURK; Ömer Erdur; Elif Ayanoğlu Aksoy; Dinara Toguzbayeva; Ercan; Akbay*

15:00–15:30 **Differential Diagnosis Of Upper Esophageal Sphincter Disorders And Their Surgical And Behavioral Treatment**

Swallowing · Keynote Lecture *Daniel Fink; Melda Kunduk; Andrew J McWhorter*

15:30–16:00 **Geriatric Dysphagia: How To Manage.**

Swallowing · Keynote Lecture *Özlem E Tulunay-Uğur; Selmin Karatayli Ozgursoy*

17:00–17:30 **AI Role In Assessment And Intervention Of Dysphagia.**

Swallowing · Keynote Lecture *Tamer Abou-Elsaad; Haldun Oguz*

PHONIATRICS 1

ICC - B2 Floor - Emirgan 1

Wednesday, 9 September 2026

14:00–15:30 **Updates On Laryngeal Imaging Techniques**

Phoniatrics · Instructional Course *Ana Danic Hadzibegovic; tamer mesellam; Robert Šifrer; Mette Pedersen; Ahmed; Mohamed Refaat Salam; Emine Elif Altuntas*

15:30–16:00 **Office Vs OR For Preneoplastic Conditions And Laryngeal Papilloma**

Phoniatrics · Keynote Lecture *Haldun Oguz; samit majumdar; Bengu Cobanoglu*

16:30–17:30 **Pediatric Laryngeal Disorders**

Phoniatrics · Panel Presentation *Nikolay Sapundzhiev; Stefan Mattheis; Romain Luscan; SEDA TÜRKOĞLU; BABAKURBAN; Lora Nikiforova*

17:30–18:00 **Singing Endoscopy**

Phoniatrics · Keynote Lecture *SEVTAP AKBULUT; Haldun Oguz*

Thursday, 10 September 2026

07:00–08:00 **Objective Voice Evaluation**

Phoniatrics · Panel Presentation *Philipp P. Caffier; jorg bohlender; Michael.Fuchs; Hyung Tae Kim; virgilijus Ulozas*

08:00–09:30 **Assessment, Office-Based And Endolaryngeal Approach For Unilateral Vocal Fold Immobilty**

Phoniatrics · Panel Presentation *Camille Finck; James Phillip Thomas; Ilter Denizoglu; Jonathan Bock; Wonjae CHA;; Aude Lagier; Oğuzhan Katar; Ömer Bayır*

09:30–10:00 **Challenges Affecting ENT And Phoniatrics Practice In Underpriviliged World**

Phoniatrics · Panel Presentation *Jerome LECHIEN; Sophie Gitonga; Kristel Kalling*

10:45–12:45 **Recurrent Respiratory Papillomatosis: A New Horizon For An Old Disease**

Phoniatrics · Panel Presentation *simon best; Seth Pransky; Daša Gluvajić; Shiying Hey; Hanna Klimza; Vasiliki; Triantafillou; Sara Pai*

14:00–14:30 **Freeing The Jaw And Root Of Tongue In Voice Therapy**

Phoniatrics · Instructional Course *Rehab Awad; Gamze Yesilli Puzella*

15:00–15:30 **Applications Of Custom Gpts In Voice Assessment And Management**

Phoniatrics · Instructional Course *Khalid MALKI; Bengu Cobanoglu*

15:30–16:00 **Speech & Language Therapy**

Phoniatrics · Panel Presentation *Oğuzhan Katar; Emine Elif Altuntaş; Mehbube Tuncer*

16:30–17:30 **Current Concepts In Vocal Fold Paralysis**

Phoniatrics · Instructional Course *reham abdelwakil ibrahim; Hazem Saleh; Seher Sirin*

17:30–18:00 **Radiation-Induced Dysphagia In Head And Neck Cancer**

Phoniatrics · Expert Discussion *Yoshihiko Kumai; Oğuzhan Katar*

Friday, 11 September 2026

07:00–08:00 **Management Of Rheumatological Manifestations In Larynx**

Phoniatrics · Panel Presentation *Viktoria Shilenkova; irina osipava; Aliya Turyeva; Ramil Hashimli*

08:00–09:00 **Session Of The Ototoxicity Working Group Of The German-Indonesian Society For Medicine**

Phoniatrics · Panel Presentation *Antoinette am Zehnhoff-Dinnesen; Tri Juda Airlangga Hardjoprawito; Milanka; Drenovak; Anna Katharina Rohlfs; Celil Göcer*

09:00–10:00 **Istanbul Consensus: Consensus Statement About Retrograde Cricopharyngeal Dysfunction (R-CPD) Definition And Mangement**

Phoniatrics · Panel Presentation *Jerome LECHIEN; yakubu karagama; SEVTAP AKBULUT; Tom Carroll; Ahmed Geneid*

10:45–11:45 **Surgical Management Of Unilateral Vocal Cord Immobility**

Phoniatrics · Panel Presentation *Shiying Hey; Marina Mat Baki; jean paul marie; yakubu karagama; Gerd Fabian Volk*

11:45–12:15 **Visual Neurolaryngology**

Phoniatrics · Keynote Lecture *James Phillip Thomas; Shiying Hey; Gerd Fabian Volk*

12:15–12:45 **Superior Laryngeal Nerve Injury - Why Thyroid Surgeons Should Document The Highest Pitch Before And After Surgery**

Phoniatrics · Keynote Lecture *James Phillip Thomas; Nurullah Türe*

14:00–15:00 **Laryngeal Dystonia – Challenges And Pitfalls In Diagnostics And Treatment**

Phoniatrics · Panel Presentation *Danijela Dragičević; yakubu karagama; Tolga Kandoğan*

15:00–15:30 **Surgical Treatment (Primarily Reinnervation) For Adductor Laryngeal Dystonia/Spasmodic Dysphonia**

Phoniatrics · Keynote Lecture *Joel Blumin*

15:30–16:00 **Phono-Surgical Considerations For Optimal Outcome In Professional Singers.**

Laryngology · Instructional Course *Peak Woo; Necati Enver*

16:30–17:30 **Weighting Oncological And Functional Outcomes In Laryngeal Oncology. Comparing Total Laryngectomy With Surgical And Non Surgical Laryngeal Preservation**

Phoniatrics · Panel Presentation *Jacopo galli; Jens Peter Klussmann; Johannes Rijken; Francesco Bussu; Arzubetul; Duran*

17:30–18:00 **Functional Dysphagia, Diagnosis And Management. Tips And Tricks.**

Phoniatrics · Instructional Course *Rehab Awad; Ozan Gökdoğan*

Saturday, 12 September 2026

07:00–08:00 **Physiological Features And Phoniatric Aspects Of Traditional Singing Across The Turkic World: Problems And Solutions**

Phoniatrics · Panel Presentation *Haldun Oguz; Ramil Hashimli; kamil suleymanov; Dinara Toguzbayeva; Gavkhar; Haydarova; Aliya Turyeva; Alfisa Orozalieva*

08:00–08:30 **In Office Laser/Steroid Injection For Professional Voice Pathologies**

Phoniatrics · Keynote Lecture *Jennifer Anderson; Bengu Cobanoglu*

08:30–09:00 **Endoscopic CO2-Laser Zenker's Diverticulo(S)Tomy**

Swallowing · Instructional Course *Roland Giger*

09:00–10:00 **High Technology In Laryngeal Surgery**

Phoniatrics · Panel Presentation *Ahmed Geneid; Sachin Gandhi; Güleser Saylam*

10:45–11:15 **Laryngopharyngeal Reflux (LPR): Disease Of The 21St Century**

Phoniatrics · Keynote Lecture *Tomislav Baudoin; Haldun Oguz*

11:15–12:45 **Optimising Outcomes In Gender Affirming Laryngeal Surgery**

Phoniatrics · Panel Presentation *Chadwan Al Yaghchi; brian nuyen; Katherine C. Yung; peter tomassen; James; Phillip Thomas; Elad Azizli; Engin Dursun*

14:00–16:00 **Brainstorming In The Swallowing Universe**

Phoniatrics · Panel Presentation *Gabriela Guerra; Mariam Shadi; Ramon Hernandez-Villoria; Yoshihiko Kumai;; mohamed farahat; Ahmed Mohamed Refaat Salam; Ana Penezic; Pedro Malave*

16:30–17:30 **The Great Debate: Surgical Approaches To Zenker's Diverticulum**

Phoniatrics · Panel Presentation *Robbi Kupfer; Ozan Bağış Özgürsoy; Maggie Kuhn; Brianna Crawley*

17:30–18:00 **Laryngeal Framework Surgery: Endoscopic Mucosal Graft To Close Glottic Gap After Laser Cordectomy**

Laryngology · Keynote Lecture *Erwan de Mones*

PHONIATRICS 2

ICC - B3 Floor - 3B/29

Wednesday, 9 September 2026

14:00–14:30 **Laryngeal Biomechanics In Mugham Singing: Endoscopic Insights And Clinical Implications**
Phoniatrics · Remarkable Presentation *Ramil Hashimli; Kristel Kalling*

14:30–15:00 **From Free Text To Real World Evidence Standardizing Voice Care Data In ENT Clinics (APD Voice)**
Phoniatrics · Instructional Course *Kristel Kalling; Ramil Hashimli*

15:00–16:00 **Beyond White Light: The Promise, Pitfalls, And Future Of NBI In Early Laryngeal Cancer Detection**
Phoniatrics · Panel Presentation *Hazem Saleh; Christoph Arens; Wioletta Pietruszewska; Hakan Birkent; ichiro; tateya*

16:30–18:00 **Voice Evolution Across The Lifespan — Pediatric, Pubertal, Menopausal, And Elderly Voice**
Phoniatrics · Panel Presentation *Ceki Paltura; Engin Dursun; Ralph Haddad; Ana Penezic; Sibel Yıldırım Moral*

Thursday, 10 September 2026

07:00–08:00 **Voice Rehabilitation**
Phoniatrics · Panel Presentation *carlos manzano; Ilter Denizoglu; Gamze Yesilli Puzella; Afaq Abbasova*

08:00–08:30 **Tracheostomy-Free Laryngeal Surgery For Anticipated Difficult Airways Using High-Flow Oxygenation**
Phoniatrics · Keynote Lecture *Seong Keun Kwon; Hamdi Hakan Coşkun*

08:30–09:00 **Management Of Cricopharyngeal Muscle Disorders In OR And Office**
Phoniatrics · Keynote Lecture *Ahmed Geneid; Haldun Oguz*

09:00–10:00 **Fundamentals Of Vocal Health And Management Of Functional Voice Problems**
Phoniatrics · Instructional Course *Sanja Krejovic; Saliha Kuşoğlu Atalay; Rania Malhem*

10:45–11:45 **Voice Disorders In Systemic And Rheumatological Diseases**
Phoniatrics · Expert Discussion *Ebru Karakaya Gojayev; Alper Şenkal; A. Volkan Sunter*

11:45–12:45 **Auditory Feedback In Phoniatrics**
Phoniatrics · Expert Discussion *Mustafa Yüksel; Bülent Gündüz; Pasquale Bottalico*

14:00–15:00 **From European And American Consensus To The IFOS Guidelines For Managing Laryngopharyngeal Reflux Disease**
Phoniatrics · Panel Presentation *Jerome LECHIEN; Inna Husain; Maria Rosaria Barillari; Emel Çadallı Tatar*

15:00–16:00 **Evidence Based Management Of Oropharyngeal Dysphagia**
Phoniatrics · Panel Presentation *samit majumdar; Miroslav Tedla; Ahmed Geneid; Mariam Shadi; Justin Roe*

16:30–17:30 **Functional Endoscopic Evaluation Of Swallowing**
Phoniatrics · Instructional Course *Ana Danic Hadzibegovic; Tamer Abou-Elsaad; Emine Elif Altuntaş*

17:30–18:00 **The Art Of Botulinum Toxin Injection In Laryngology: Indications, Dosing Dilemmas, Pitfalls, And Techniques**
Phoniatrics · Instructional Course *reham abdelwakil ibrahim; Esma Altan; Afaq Abbasova*

Friday, 11 September 2026

07:00–08:00 **Relationship Between Normal Or Impaired Hearing And Accurate Singing In Singers Of All Ages**
Phoniatrics · Panel Presentation *SUELA SALLAVACI; Dusan Milisavljevic; dugagjin spanca; Ahmet Atas; Mario; Milkov; Arzubetul Duran*

08:00–08:30 **Biomechanical Vocal Transnasal Flexible Evaluation To Plan & Choose The Voice Therapy Exercises: How To Perform It.**
Phoniatrics · Keynote Lecture *Reinaldo Yazaki; Engin Dursun*

08:30–09:00 **Challenging Cases Of Hearing Loss: Diagnostic Strategies And Multidisciplinary Approaches**
Phoniatrics · Instructional Course *Austeja Peceliuniene; Irina Arechvo; Armağan İncesulu*

09:00–10:00 **Reflux And Hoarseness**
Phoniatrics · Panel Presentation *James Phillip Thomas; Markus Hess; Maria Rosaria Barillari; A. Volkan Sunter*

10:45–12:15 **From The Operating Room To The Office**
Phoniatrics · Panel Presentation *Karen Kost; Jennifer Anderson; marc Remacle; Joel Blumin; Rehab Awad; Ferhan Öz*

12:15–12:45 **Longterm Follow-Up In Subglottic Stenosis: Does ILSI Affect Surgery Free Interval? Results In 90 Patients Over 20 Years.**
Phoniatrics · Keynote Lecture *Jennifer Anderson; Mustafa Gerek*

14:00–15:00 **Vocal Fold Scars And Aging : A Room For Regenerative Medicine?**

Phoniatrics · Panel Presentation *Chadwan Al Yaghchi; Peak Woo; Ralph Haddad; Emel Çadallı Tatar; Shigeru Hirano*

15:00–16:00 **Keynote: The Various Faces Of Laryngeal Spasmi**

Phoniatrics · Keynote Lecture *Nasser Kotby; Metin Onerci*

16:30–17:30 **Chronic Cough**

Phoniatrics · Panel Presentation *Ahmed Geneid; Inna Husain; Jacqui Allen; Shiying Hey*

17:30–18:00 **Voice Assessment And Interpretation (Acoustic Voice Analysis- Glottal Inverse Filtering-Biomechanical Analysis)**

Phoniatrics · Instructional Course *Ramon Hernandez-Villoria; Gabriela Guerra; Austeja Peceliuniene; Isabel Cardoso*

Saturday, 12 September 2026

07:00–07:30 **Thyroidectomy Complications And Management**

Phoniatrics · Keynote Lecture *Mirjana Gnjatic; Güleser Saylam; Engin Dursun*

07:30–08:00 **Working With The Singers: The Collaborative Work Between Therapy And Vocal Rehabilitation.**

Phoniatrics · Instructional Course *Rehab Awad; Michael vickers; Mario Milkov*

08:00–09:00 **Russian Experience Of Surgical Treatment And Rehabilitation Of Patients With Different Pathologies Of The Larynx**

Phoniatrics · Panel Presentation *natalia chuchueva; kamila magomedova; ismail guseynov; Semih Yazla; Ekaterina; Osipenko*

09:00–10:00 **Vocal Fold Paresis. When I Couldn't Get The Patient's Voice Back**

Phoniatrics · Panel Presentation *Viktoria Shilenkova; Andrey Shilenkov; Dinara Toguzbayeva; Shoira; Makhmadaminova; Irina Evomaa*

10:45–11:45 **Therapeutic Approach For Unilateral Vocal Fold Paralysis**

Phoniatrics · Panel Presentation *Seong Keun Kwon; Peak Woo; Markus Hess; ichiro tateya*

11:45–12:45 **Thyroplasty**

Phoniatrics · Panel Presentation *Taner Yılmaz; Ahmed Geneid; Semih Yazla; Sachin Gandhi*

14:00–15:30 **Rehabilitation Of Voice And Breathing Functions In Patients With Bilateral Paresis And Paralysis Of The Larynx**

Phoniatrics · Panel Presentation *Robert Peter Kesmarszky; kamila magomedova; Ramil Hashimli; mawaddah azman;; Hamdi Hakan Coşkun; Ekaterina Osipenko*

15:30–16:00 **Adding Laryngeal Reinnervation To Your Practice**

Phoniatrics · Instructional Course *Joel Blumin; Mustafa Aslıer*

16:30–18:00 **The Accent Method Of Voice Therapy**

Phoniatrics · Instructional Course *Nasser Kotby; Aliaa Khidr*

PHONIATRICS 3

Hilton - Liz

Wednesday, 9 September 2026

14:00–15:00 **Latest Data On The Global Status Of Newborn Hearing Screening, WHO Tracer Indicator For Progress In Ear N Hearing Care**

Phoniatrics · Panel Presentation *Katrin Neumann; Carolina Der; Hung THAI-VAN; Sebastian Cozma; Ramon; Hernandez-Villoria; Celil Göcer; Nadia kamal*

15:00–16:00 **Evaluation And Consequences Of Hearing Loss In Childhood**

Phoniatrics · Panel Presentation *Ali Özdek; Adrien A. Eshraghi; Tayyar Kalcıoğlu; Merve Ozbal Batuk; Soumit; Dasgupta; Mariam Ghazi AlSaeed*

16:30–17:00 **Transnasal Esophagoscopy**

Swallowing · Instructional Course *yakubu karagama; Elif Ayanoğlu Aksoy*

17:00–17:30 **Nasal Resonance Disorders: Diagnosis, Surgical Management, And Speech Therapy**

Phoniatrics · Instructional Course *Mehmet Akif Kılıç; Semih Yazla*

17:30–18:00 **Feedback Mechanisms In Voice And Speech: From Physiology To Therapy**

Phoniatrics · Keynote Lecture *Mehmet Akif Kılıç; saime sağıroglu*

Thursday, 10 September 2026

07:00–08:30 **Physiology And Pathology Of The Organs Of The Head And Neck**

Phoniatrics · Panel Presentation *Ramon Hernandez-Villoria; ıgor kastyro; Anton Kovalenko; svetlana dragunova;; renas ali; vasiliy samsonov; polina mikhalskaia*

08:30–10:00 **Benign Vocal Fold Lesions: Comprehensive Management; Surgical, Non-Surgical, Medical Treatment Modalities**

Phoniatrics · Panel Presentation *reham abdelwakil ibrahim; Ekaterina Putkaradze; A. Volkan Sunter; Nadhirah Mohd; Shakri; Bengu Cobanoglu; Esma Altan; Selmin Karatayli Ozgursoy; Maryam Ali; AlQaydi; Engin Dursun*

10:45–11:45 **Can AI Outperform Humans In Voice Assessment?**

Phoniatrics · Panel Presentation *Khalid MALKI; kamil suleymanov; valentina camesasca; Mette Pedersen; Ramon; Hernandez-Villoria; alberto paderno*

11:45–12:45 **Laryngeal Manifestations Of Autoimmune Diseases**

Phoniatrics · Expert Discussion *Inna Husain; Jacqui Allen; Oğuzhan Katar*

14:00–15:00 **Tracheostomy Practices & Protocols**

Phoniatrics · Panel Presentation *Soumitra Ghosh; arpit sharma; Gautam Khaund; Manju Issac; Seher Sirin*

15:00–16:00 **Diagnosis And Treatment Of Reflux: What Is Coming**

Phoniatrics · Panel Presentation *Nikki Johnston; Jacqui Allen; Tom Carroll; Jerome LECHIEN; Inna Husain; tamer; mesellam*

16:30–17:30 **Advances In Tracheal Regeneration: Emerging Strategies And Translational Insights**

Phoniatrics · Panel Presentation *Seong Keun Kwon; Tendy Chiang; Briac Thierry; Yo Kishimoto; Mehmet Hakan; Korkmaz*

17:30–18:00 **Ermergency & Elective Tracheotomy**

Phoniatrics · Instructional Course *Hazem Saleh; Mehmet Hakan Korkmaz; Engin Dursun*

Friday, 11 September 2026

07:00–08:00 **Non-Invasive Methods Of Voice Assessment And Intervention [Venezuelan Society Of Phoniatrics]**

Phoniatrics · Panel Presentation *Ramon Hernandez-Villoria; Gabriela Guerra; Pedro Malave; Esma Altan*

08:00–09:00 **Challenges In Early Diagnosis Of Syndromic Hearing Loss**

Phoniatrics · Panel Presentation *Nadia kamal; Hosnova Dagmar; Iman Sadek; Ranjisth Rajeswaran; Ali Özdek*

09:00–10:00 **Management Of Single-Sided Deafness**

Phoniatrics · Panel Presentation *Jan Boucek; Petra Kalitova; Vladmir Koucky; Z. Çiler Büyükatalay Yaldız*

10:45–11:45 **Voice-Related Biomarkers For Clinical Praxis**

Phoniatrics · Panel Presentation *Mette Pedersen; valentina camesasca; alberto paderno; Ramon Hernandez-Villoria;; Samantha Mairesse*

11:45–12:45 **Tracheotomy: The UEP Swallowing Committee Position Paper**

Phoniatrics · Panel Presentation *daniele farneti; Mariam Shadi; Miroslav Tedla; mohamed farahat; reham abdelwakil; ibrahim*

14:00–15:00 **Effective Treatment Approaches For Auditory Processing Disorders And Listening Difficulties In Children**

Phoniatrics · Panel Presentation *Meral Didem Türkyılmaz; Katrin Neumann; Amélie Hesping; Stefan Launer; Ramon; Hernandez-Villoria; Wafaa El Kholy*

15:00–15:30 **Cochlear Implantation And Time As A Factor For Indicator**

Phoniatrics · Instructional Course *Jan Boucek; Petra Kalitova; Nenad Arsovic*

15:30–16:00 **Tinnitus: Current Concepts And Management**

Phoniatrics · Instructional Course *Austeja Peceliuniene; Irina Arechvo; Fuad Brkic*

16:30–18:00 **Solutions For Airway Problems**

Phoniatrics · Panel Presentation *Esma Altan; Shoira Makhmadaminova; Soumitra Ghosh; Taner Yılmaz*

Saturday, 12 September 2026

07:00–08:00 **Treatment Approaches In Laryngeal Cancer**

Laryngology · Panel Presentation *Mark Zafereo; Alirio Mijares Brinez; Rogerio A. Dedivitis; Luiz P. Kowalski; Gabriel; Damiano; Paul Boettiger*

08:00–09:00 **Voice Deepening**

Phoniatrics · Panel Presentation *Chadwan Al Yaghchi; Kursat Yelken; Nupur Kapoor Nerurkar; brian nuyen; Hakan; Birkent*

09:00–10:00 **Vocal Training In Professional Voice Users**

Phoniatrics · Panel Presentation *Aliaa Khidr; Rehab Awad; Z. Çiler Büyükatalay Yaldız; Saliha Kuşoğlu Atalay; Baiba; Trinite*

10:45–11:45 **Multidisciplinary Approach To Managing Singers Following Phonosurgery**

Phoniatrics · Panel Presentation *Rehab Awad; Michael vickers; Miroslav Tedla; Sean Fang*

11:45–12:45 **Potentially Cancerous Lesions Of The Vocal Folds**

Phoniatrics · Panel Presentation *Camille Finck; Emel Çadallı Tatar; Sermin Can*

14:00–14:30 **Phoniatrician In The Artistic Voice: Office, Backstage-Onstage, Operating Room**

Phoniatrics · Keynote Lecture *Reinaldo Yazaki; Haldun Oguz*

14:30–15:30 **From Scalpel To Speech: A Difficult Road In Advanced Laryngeal Cancer**

Phoniatrics · Panel Presentation *Francesco Bussu; Bengu Cobanoglu; Jacopo galli*

15:30–16:00 **Strategies To Manage Chemoradiation-Associated Dysphagia**

Swallowing · Keynote Lecture *Nausheen Jamal*

16:30–17:00 **Union Of European Phoniatricians - Young Phoniatricians Committee**

Phoniatrics · Instructional Course *Sibel Yıldırım Moral; Haldun Oguz*

17:00–18:00 **Functional Management Of Tracheostomy In ICU And Post-ICU Patients**

Phoniatrics · Panel Presentation *Aude Lagier; Ana Danic Hadzibegovic; Chadwan Al Yaghchi; Mariam Shadi*

RHINOLOGY 1

ICC - B2 Floor - Beyazıt

Wednesday, 9 September 2026

14:00–14:30 **New Classifications In Sinus Surgery**
Rhinology · Keynote Lecture *Ramon Moreno Luna; Rodolfo Nazar*

14:30–15:00 **How to avoid complications of FESS Before it's too late: Cadaver and Navigation Guidance**
Rhinology · Keynote Lecture *Reda Kamel; Burçay Tellioğlu*

15:00–16:00 **Primary Sinus Surgery For CRS: What's New In The Past Five Years?**
Rhinology · Round Table *FABRIZIO RICCI ROMANO; Oswaldo A Henriquez; Luis Fernando Macias-Valle;; Rodolfo Nazar; Amin Javer; Julio Heinichen; Ramon Moreno Luna*

16:30–17:00 **Science-Based And Nature-Aligned Concepts In Modern Rhinosinusitis**
Rhinology · Keynote Lecture *Desiderio Passali; Meryem Nesil Keles Türel*

17:00–18:00 **Office Based Rhinologic Procedures**
Rhinology · Round Table *Sarah K. Wise; Ashutosh Kacker; Murugappan Ramanathan; Edward McCoul; Pablo; Stolovitzky; Erich Voigt; Meryem Nesil Keles Türel*

Thursday, 10 September 2026

07:00–07:30 **Functional Endoscopic Sinus Surgery: The Graz School**
Rhinology · Instructional Course *Axel Wolf; Gerd Wolf*

07:30–08:00 **Tips And Trics For Safe And Effective Frontal Sinus Surgery**
Rhinology · Instructional Course

08:00–09:00 **Challenges In Biological Therapy In 2026**
Rhinology · Round Table *Chae-Seo Rhee; Joseph Han; Anna Sophie Hoffmann; Kasper Aenaes; Gerd Wolf*

09:00–09:30 **Transorbital Endoscopic Skull Base Surgery: Current Trends And Limitations 2026**
Rhinology · Keynote Lecture *Darlene Lubbe*

09:30–10:00 **Evidence, Controversies, And Themes In Skull Base Reconstruction: Insights From Literature And Experts**
Rhinology · Keynote Lecture *Edward Kuan*

10:45–12:15 **Type 2 Crswnp In 2026: Global Variations And Decision-Making Process In The Era Of Biologics**
Rhinology · International Symposia *Joseph Han; FABRIZIO RICCI ROMANO; Richard Harvey; Klaus Stelter; Chae-Seo; Rhee*

12:15–12:45 **How Do We Measure Disease Control In CRS (And Why We Need To)**
Rhinology · Keynote Lecture *Ahmad R. Sedaghat; Enes Yiğit*

14:00–15:30 **Complications In Endoscopic Sinus And Skull Base Surgery**
Rhinology · International Symposia *Cem Meco; Dong-Young Kim; Ali Al Amri; Camilo R. Van Strahlen; Jan Plzak; Edward; Kuan*

15:30–16:00 **Silent Sinus Syndrome: What To Know? How To Treat?**
Rhinology · Instructional Course *Nicholas BuSaba; Marco Velimir Grgic; John M DelGaudio*

16:30–18:00 **Rethinking Empty Nose Syndrome: Identifying Risk, Respond To Patient Concers And Continue Effective Surgery**
Rhinology · International Symposia *Richard Harvey; Dana Crosby; Edward McCoul; John R. Craig; Jae Hwan Kwon; Sue; Jean Mun; Nicholas BuSaba*

Friday, 11 September 2026

07:00–07:30 **Nasal Vestibule Carcinoma: Update On Treatment Strategies**
Rhinology · Instructional Course *Francesco Bussu; Togay Müderris*

07:30–08:00 **Sinonasal Melanoma Tratment Update**
Rhinology · Instructional Course *Robbie Woods; Togay Müderris; Wojciech Mydlarz*

08:00–09:00 **Contemporary Evidence In Sinonasal Malignancy Treatment 2026**
Rhinology · International Symposia *Edward Kuan; Ehab Hanna; Ian Witterick; Ameet Singh; Cem Meco*

09:00–09:30 **Future Directions In Management Of Sinonasal Malignancies**
Rhinology · Keynote Lecture *Ehab Hanna; Cem Meco*

09:30–10:00 **Strategies For Skull Base Reconstruction**
Rhinology · Keynote Lecture *Jean Anderson Eloy; Cem Meco*

10:45–11:45 **Histology Based Multimodal Treatment Concepts Of Sinonasal Malignancies**

Rhinology · Round Table *Marco Ferrari; Alperen Vural; Ian Witterick; Christian von Buchwald; CODRUT; SARAFOLEANU; Robbie Woods*

11:45–12:45 **Nasopharyngeal Carcinoma: 2026 Update On Management**

Rhinology · International Symposia *Michael Tong; Zhaohui Shi; Sheng Po Hao; Ing Ping Tang; Robbie Woods*

13:00–14:00 **Industry Sponsored Session**

Industrial · Satellitte Symposium

14:00–14:30 **Frontal Sinus Surgery: Are We Truly At The Summit, Or Still Climbing?**

Rhinology · Keynote Lecture *Anshul Sama; Suat Turgut*

14:30–16:00 **Frontal Sinus Surgery – The Last Frontier**

Rhinology · International Symposia *Anshul Sama; Suat Turgut; James Palmer; Mario Turri-Zanoni; Jean Anderson Eloy*

16:30–17:30 **Biologics & Smell In Crswnp: Dupilumab, Tezepelumab, Beyond**

Rhinology · Round Table *Richard Harvey; Zara Patel; Brent Senior; Jivianne Lee; Asim Kaytaz*

17:30–18:00 **Should We Reduce Dosing Frequency In Biologic Responders: Pros And Cons?**

Rhinology · Instructional Course *Valerie Hox; David Liu; Asim Kaytaz*

Saturday, 12 September 2026

07:00–07:30 **Using High-End Technology In Rhinology And Skull Base Surgery: Innovations And Future Directions**

Rhinology · Instructional Course *Wojciech Mydlarz; Stefan Mattheis; Chae-Seo Rhee; Petr Schalek*

07:30–08:00 **The Role Of Induction Chemotherapy In The Management Of Sinonasal Cancers: Current Concepts**

Rhinology · Keynote Lecture *Mario Turri-Zanoni; Petr Schalek*

08:00–09:00 **Revision Sinus Surgery**

Rhinology · Round Table *Michael G. Stewart; Raluca Grigore; Teoman Dal; Pavol Surda; Rodolfo Nazar; Metin; Yılmaz*

09:00–09:30 **Revision Frontal Sinus Surgery**

Rhinology · Keynote Lecture *Stil Kountakis; Metin Onerci*

09:30–10:00 **Rhinologic Strategies In Primary Ciliary Dyskinesia And Cystic Fibrosis: Optimizing Airway Health And Surgical Care**

Rhinology · Keynote Lecture *Brent Senior; Metin Onerci*

10:45–12:15 **Transorbital Approaches – Present And Future**

Rhinology · International Symposia *Darlene Lubbe; Hazan Basak; Tae-Bin Won; Cem Meco*

12:15–12:45 **Quality Of Life And Nasal Function Measurement: Current Stand In 2026**

Rhinology · Keynote Lecture *Michael G. Stewart; Cem Meco*

14:00–15:30 **Management Of Orbital, Skull Base And Maxilla Involvement In Sinonasal Malignancies**

Rhinology · International Symposia *Ehab Hanna; Marco Ferrari; Christian Betz; Ian Witterick; Erdem Eren; Cem Saka*

15:30–16:00 **Technology And Robotics In Rhinologic Surgery 2026**

Rhinology · Controversies *Tomislav Baudoin; Raewyn Campbell; Stefan Mattheis; Cem Saka*

16:30–17:30 **Overcoming Difficulties In Frontal Sinus Surgery**

Rhinology · Round Table *Brad Woodworth; Shazada Ahmed; Ozan Altuntaş; Yaşar Çokkeser*

17:30–18:00 **Adenoid Cystic Carcinoma Of The Sinonasal Cavity: Current Standarts And Evolving Advances In 2026**

Rhinology · Instructional Course *Frank Rikki Canevari; Alberto Schreiber; Wojciech Mydlarz; Suha Beton*

RHINOLOGY 2

Hilton - Grace II

Wednesday, 9 September 2026

14:30–15:30 **CRS Outcomes And Disease Control – Are We Doing Well?**
Rhinology · International Symposia *Ahmad R. Sedaghat; David Liu; Özden Savaş; Islam Herzallah*

16:30–18:00 **Rhinology Free Paper 15**
Rhinology · Free Paper Session *Yalcin Alimoglu*

Thursday, 10 September 2026

07:00–07:30 **Personalized Surgical Strategies In Revision Frontal Sinus Surgery: Anatomy And Pathology-Driven Decision Making**
Rhinology · Instructional Course *Mario Turri-Zanoni; Shazada Ahmed*

07:30–08:00 **Running A Modern Smell Clinic?**
Rhinology · Instructional Course *Carl Philpott; Antje Welge Lussen; Claudia Lill*

08:00–09:00 **Inferior Turbinate Surgery: What Are The Best Treatment Options In 2026?**
Rhinology · Round Table *Anders Cervin; Claudia Lill; Sergey Gorbunov; Mohsen Naraghi; Gabriela Kopacheva; -Barsova; Carl Philpott*

09:00–09:30 **Olfaction: Exploring The Neuroscience Behind The Sense Of Smell**
Rhinology · Keynote Lecture *Giulio Cesare Passali; Sabri Uslu*

09:30–10:00 **Optimizing Management Of CRS With NP Balancing Biologis And Surgery**
Rhinology · Keynote Lecture *Claire Hopkins; Sabri Uslu*

10:45–11:45 **Management Of Recalcitrant CRS**
Rhinology · Round Table *Jivianne Lee; Hussam Elbosraty; Meryem Nesil Keles Türel; Amin Javer; Claire; Hopkins*

11:45–12:15 **Scarred, Leaking, And Bleeding: A Survival Guide To Endoscopic Skull Base Complications**
Rhinology · Instructional Course *Apostolos Karligkiotis; Uygar DEMIR*

12:15–12:45 **Optic Nerve Decompression**
Rhinology · Keynote Lecture *Sandeep Bansal; Uygar DEMIR*

14:00–14:30 **Panamerican Association Of Otorhinolaryngology: Minimally Invasive Procedures To Treat Nasal Airway Obstruction Secondary To Nasal Valve Collapse**
Rhinology · Instructional Course *Pablo Stolovitzky; Alper Tutkun*

14:30–16:00 **Biological Therapy For Severe Sinusitis With Nasal Polyposis: Lights And Shadows**
Rhinology · International Symposia *Desiderio Passali; CODRUT SARAFOLEANU; Sergey Karpishchenko; Giulio Cesare; Passali; Pongsakorn Tantilipikorn; FABRIZIO RICCI ROMANO*

16:30–17:30 **Endoscopic Pituitary Surgery – Global Perspective From High To Low Resource Settings**
Rhinology · Round Table *Mohammadsadegh Zabihidan; Emrah Celtikci; CODRUT SARAFOLEANU; Julio; Heinichen*

17:30–18:00 **Quality Of Life After Skull Base Surgery: Are We Doing Well?**
Rhinology · Instructional Course *David Liu; CODRUT SARAFOLEANU; Julio Heinichen*

Friday, 11 September 2026

07:00–07:30 **Treatable Traits In Chronic Rhinosinusitis**
Rhinology · Instructional Course *Jonathan Yip; Leigh Sowerby; Christopher J Chin; Cem Saka*

07:30–08:00 **Contemporary Management Of Fibroosseous Lesions**
Rhinology · Keynote Lecture *Sergey Karpishchenko; Lütfü Şeneldir*

08:00–09:00 **Allergic Fungal Rhinosinusitis: Summary Of A National Institutes Of Health Multidisciplinary Workshop**
Rhinology · Round Table *Hassan H. Ramadan; Ashutosh Kacker; Kent Lam; Do Yeon Cho*

09:00–09:30 **Transorbital Neuroendoscopic Surgery For Sphenoid Wing Meningiomas**
Rhinology · Instructional Course *M.Melih Şahin; Emrah Celtikci*

09:30–10:00 **Odontogenic Sinusitis: From Teeth To The Sinuses And Beyond**
Rhinology · Instructional Course *alberto maria saibene; John R. Craig; Marta Kwiatkowska; Petr Kocum; Ozan; Özdemir*

10:45–11:15 **Central Compartment Atopic Disease: Advances In Understanding Its Phenotype**
Rhinology · Instructional Course *John M DelGaudio; Ramon Moreno Luna; Oswaldo A Henriquez; Lütfü Şeneldir*

11:15–11:45 **Septal Perforations Repair: Improving Results**
Rhinology · Keynote Lecture *Rodolfo Nazar; Lütfü Şeneldir*

11:45–12:45 **Transorbital Surgery: Challenging Cases**

Rhinology · Round Table *Pavol Surda; Dana Crosby; Chris Dhepnorrarat; Zeina Korban; Hatice Sema Başak*

14:00–14:30 **Facial Pain**

Rhinology · Keynote Lecture *Adrian M Agius; Selim Sermed Erbek*

14:30–16:00 **Real World Evidence In Biological Therapy For Crswnp: Current Status In 2026**

Rhinology · International Symposia *Jan Vodička; Dana Crosby; Syed Ahamed Peer Mohamed; Carl Philpott; Daniel Lupoi*

16:30–17:30 **Challenges In Epistaxis Management**

Rhinology · Round Table *CODRUT SARAFOLEANU; Olga Romanova; Alper Ceylan*

17:30–18:00 **Baloon Sinuplasty In 2026**

Rhinology · Instructional Course *Martin Nue Møller*

Saturday, 12 September 2026

07:00–07:30 **Scar Wars: Landmark Orientation And Strategies To Prevent Restenosis In Endoscopic Revision Sinus Surgery**

Rhinology · Instructional Course *Apostolos Karligkiotis; Cem Saka*

07:30–08:00 **Sphenoid Sinus Lateral Recess Spontaneous CSF Leak Management**

Rhinology · Instructional Course *Cem Saka*

08:00–09:00 **Managing Traumatic CSF Leaks Of The Anterior Skull Base: Challenging Cases**

Rhinology · Round Table *Frank Rikki Canevari; Özgür Kemal; Ashok Rokade; John M DelGaudio; Eliza Brozek; Madry*

09:00–10:00 **Sphenoid Sinus Surgery: Tailored Approaches From Basics To Advanced Techniques**

Rhinology · Round Table *Hussain Al Baharna; Suha Beton; Shazada Ahmed; Elif Ayanoğlu Aksoy*

10:45–11:45 **Perioperative And Postoperative Management Of CRS: Current Practice And Controversies**

Rhinology · International Symposia *Eliza Brozek Madry; Ray Kim; Aleksandra Aleksic; Raewyn Campbell; İbrahim; Çukurova*

11:45–12:45 **Fungal Sinusits: The Surviving Factor**

Rhinology · International Symposia *Julio Heinichen; NORASNIEDA MD SHUKRI; Şenol Çomoglu; Reda Kamel; İbrahim; Çukurova*

14:00–14:30 **Ergonomics In Rhinology - What You Need To Know And Do To Avoid A Painful Career And Early Retirement**

Rhinology · Keynote Lecture *Raewyn Campbell; Özgür Kemal*

14:30–16:00 **Olfactory Neuroblastoma: Currents Advances In Diagnosis And Treatment**

Rhinology · International Symposia *CORINNA LEVINE; Noel Ayoub; Murugappan Ramanathan; Davide Mattavelli;; Ludovic de Gabory; Nyall London; Özgür Kemal*

16:30–17:30 **Endoscopic Sinus Surgery: Tips And Tricks That Has Proven Their Value For Safe Surgery**

Rhinology · Round Table *Meryem Nesil Keles Türel; Asim Kaytaz; Oguz Ogretmenoglu; Hatice Sema Başak;; Suha Beton*

17:30–18:00 **Comprehensıve Management Of Inverted Papillomas**

Rhinology · Instructional Course *Kenzo Tsuzuki; Samy Elwany; Seth Brown; Asim Kaytaz*

RHINOLOGY 3

Hilton - Connie 1

Wednesday, 9 September 2026

14:00–14:30 **Endoscopic Pitituary Surgery: How To Establish Effective Colloboration With Neurosurgeons?**
Rhinology · Instructional Course *Ashok Rokade; Laura Van Gerven*

14:30–15:30 **Reconstruction Of The Anterior Skull Base: Lessons Learned**
Rhinology · International Symposia *Laura Van Gerven; Pavol Surda; Theodore A. Schuman; M.Melih Şahin; Ashok; Rokade*

15:30–16:00 **Endoscopic DCR: Different Techniques And Controversies**
Rhinology · Instructional Course *Puya Dehgani-Mobaraki; Islam Herzallah; Mohsen Naraghi*

16:30–17:00 **Patient-Tailored Management Of Recalcitrant Chronic Rhinosinusitis**
Rhinology · Instructional Course *Islam Herzallah; Kristine Smith; Günter HAFIZ*

17:00–18:00 **External Vs Endoscopic Approaches For Sinonasal Malignancies: Which One And When For Optimal Management?**
Rhinology · Round Table *Martin Jurlina; Zsolt Bella; Günter HAFIZ; Kristine Smith*

Thursday, 10 September 2026

07:00–07:30 **Transnasal Access To Pituitary Tumors**
Rhinology · Instructional Course *Julio Heinichen; Ana Krizmanić Mikolčević*

07:30–08:00 **Reconstruction Of The Defects Of The Nose: Strategies From Simple To Complex**
Rhinology · Instructional Course *Emre Vural; Isa Kaya; Ana Krizmanić Mikolčević*

08:00–09:00 **Orbital And Optic Nerve Decompression: When And How?**
Rhinology · Round Table *Serdar özer; Yu Hosokawa; Ashutosh Kacker; Emre Vural*

09:00–09:30 **Odontogenic/Postimplantation Maxillary Sinusitis**
Rhinology · Keynote Lecture *Andrey Lopatin; Zahide Mine Yazici*

09:30–10:00 **The Potential Role Of The Microbiome In The Pathogenesis Of Nasal Tumors: A Comprehensive Review**
Rhinology · Keynote Lecture *Gianluca Bellocchi; Julio Heinichen*

10:45–11:45 **Restoring Smell: Proven And Emerging Therapies**
Rhinology · International Symposia *Zara Patel; Jan Vodička; Rumi Sekine; Aytug Altundag; Apostolos Karligkiotis*

14:00–14:30 **Local And Regional Flaps In Endoscopic Sinus Surgery: Surgical Techniques And Tips&Tricks**
Rhinology · Instructional Course *Carlo Conti; Alessandro Vinciguerra; Serdar özer*

14:30–15:00 **The Role Of Artificial Intelligence-Driven Personalized Hand-Gesture Non-Invasive Contactless ORL Surgery In Virtual Reality Environments**
Rhinology · Keynote Lecture *IVICA KLAPAN; Serdar özer*

15:00–16:00 **When Septal Perforation Repair Fails**
Rhinology · Panel Presentation *John R. Craig; Leigh Sowerby; Jose M. Villacampa; Richard Harvey; Gediz Murat; Serin*

16:30–17:30 **TSOHNS (Taiwan Society Of Otolaryngology, Head & Neck Surgery) And TRS (Taiwan Rhinology Society) Rhinology Symposium For IFOS 2026**
Rhinology · Round Table *Carlson Ying-Piao Wang; Ming Ying Lan; Chih-Jaan Tai; M.Melih Şahin*

17:30–18:00 **Avoid Complication In Endoscopic Sinus Surgery**
Rhinology · Instructional Course *Bilge Türk*

Friday, 11 September 2026

07:00–07:30 **Vidian And Posterior Nasal Neurectomy: Different Techniques From Trans-Turbinate Endoscopic Corridor To Trans PPF**
Rhinology · Instructional Course *Kangga chandra adi surya; Joseph Han; Gediz Murat Serin*

07:30–08:00 **Emerging Biological Therapies For Uncontrolled CRS With Nasal Polyps**
Rhinology · Keynote Lecture *Joseph Han; Gediz Murat Serin*

08:00–09:00 **Managing Difficult Nasal Airway: Increasing Function Through Septum And Turbinate Surgery**
Rhinology · International Symposia *Ramon Moreno Luna; Erdogan Gultekin; Jose M. Villacampa; Gediz Murat Serin;; Seth Brown; İsmail Topçu*

09:00–09:30 **Complete En Bloc Resection In More Than 50 Benign Tumors**
Rhinology · Keynote Lecture *GUILLERMO SANJUAN DE MORETA; Wolfgang Luxenberger*

09:30–10:00 **AI In Rhinology**

Rhinology · Keynote Lecture *Ludovic de Gabory; Wolfgang Luxenberger*

10:45–11:15 **Diagnosis And Management Of Traumatic Skull Base Defects**

Rhinology · Keynote Lecture *Cem Meco; Hatice Sema Başak*

11:15–11:45 **Completeness Of Surgery Index: Defining Path For Optimizing Success**

Rhinology · Keynote Lecture *James Palmer; Hatice Sema Başak*

11:45–12:45 **CEORL-HNS Update On Benign Sinonasal Tumors**

Rhinology · Round Table *Jan Plzak; Tomislav Baudoin; Bostjan Lanisnik; Christian Betz; Benjamin Verillaud;; Cem Meco*

14:00–17:30 **IFOS General Assembly**

Ceremony · Opening Ceremony *Özgür Yiğit*

Saturday, 12 September 2026

07:00–07:30 **Endoscopic CSF Leak Closure: Techiques For Success**

Rhinology · Instructional Course *Sinan Dheyauldeen; Asli Sahin Yilmaz; Ceren Gunel; Uygar DEMIR*

07:30–08:00 **How To Navigate Without A Navigator? Anatomical Variation Analysis, Imaging Checklist For Safe Surgery And How To Avoid Ethmoidal Arteries**

Rhinology · Instructional Course *Rashid Al Abri; Zacharias Kalentakis; Uygar DEMIR*

08:00–09:00 **Eusica/Insica Brain Round Table: Advancing The Sinonasal Tumor Management Through Collaboration**

Rhinology · Round Table *Mario Turri-Zanoni; Benjamin Verillaud; Nyall London; Robbie Woods; Hazan Basak*

09:00–10:00 **Mastering Inverted Papillomas: Tailored Strategies And Surgical Challenges In The Endoscopic Era**

Rhinology · International Symposia *Ing Ping Tang; Uygar DEMIR; Yvonne Chan; Apostolos Karligkiotis; Sinan; Dheyauldeen*

10:45–12:15 **Inferior Turbinates Hypertrophy: What To Do?**

Rhinology · International Symposia *Desiderio Passali; Ulugbek Khassanov; CODRUT SARAFOLEANU; Rashid Al Abri;; Erich Voigt; Răzvan Hainăroșie; Marco Piemonte; Mario Milkov*

12:15–12:45 **Prımary Frontal Sınus Surgery: Importance Of Intact Bulla Technique**

Rhinology · Keynote Lecture *Suat Turgut; Răzvan Hainăroșie; Catalina Voiosu*

14:00–15:00 **Optimal Flaps, Materials And Techniques In Dural Defect Closure: How To Secure Watertight Closure Everytime?**

Rhinology · Round Table *Leylya Omerova; Martin Jurlina; Bilge Türk; Ashutosh Kacker; Oguz Ogretmenoglu*

15:00–16:00 **Ensuring Safety In Endoscopic Surgery Of Pterygopalatine Fossa And Beyond**

Rhinology · International Symposia *Bostjan Lanisnik; Gülpembe Bozkurt; Alberto Schreiber; Oguz Ogretmenoglu*

16:30–17:30 **Recalcitant Chronic Sinuistis: Diagnostic And Therapeutic Challenges In The Post-Surgical Patient**

Rhinology · Round Table *Marilene B. Wang, MD; Zara Patel; Edward McCoul; David Conley; John M; DelGaudio; Brent Senior*

RHINOLOGY 4

ICC - B3 Floor - 3B/13

Wednesday, 9 September 2026

14:30–15:30 **The Future Of Clinical Olfactory Testing**

Rhinology · International Symposia *Rumi Sekine; MARCO AURELIO FORNAZIERI; Rosalinda Pieruzzini; Aytug Altundag;; Nagihan Bilal*

15:30–16:00 **How To Stay Safe In Endoscopic Sinus Surgery**

Rhinology · Instructional Course *Semih Sütay; Ibrahim Sayin*

16:30–17:00 **Utility Of Endonasal Endoscopic Approach In Sinonasal SCC**

Rhinology · Instructional Course *Melis Demirag Evman; Ömer Göktuğ Tüfekçi; Togay Müderris; Hazan Basak*

17:00–18:00 **Rhinology Practice In African Developing Countries**

Rhinology · Round Table *Sharfi Ahmed; Edwin Liyombo; Darlene Lubbe; Hazan Basak*

Thursday, 10 September 2026

07:00–07:30 **"One Airway, One Team: The Role Of Multidisciplinary Care In Optimizing Biologic Therapy For Chronic Rhinosinusitis"**

Rhinology · Keynote Lecture *Janan Al Abduwani; Selin Ünsaler*

07:30–08:00 **Nasal Mucosa Immunity: COVID-19 To Environmental And Infectious Challenges**

Rhinology · Instructional Course *Selin Ünsaler*

08:00–09:00 **The maxillary sinus as a corridor to the orbit**

Rhinology · Round Table *Giovanni Felisati; Selin Ünsaler; John R. Craig; Remo Accorona; Andre Sousa; Machado; Marco Velimir Grgic; Jose M. Villacampa*

09:00–09:30 **Managing CSF Leaks: Essentials From Diagnosis To Treatment**

Rhinology · Instructional Course *Özden Savaş*

09:30–10:00 **Choanal Atresia Repair**

Rhinology · Instructional Course *Axel Wolf; Özden Savaş*

10:45–11:45 **Eozinophilic Rhinosinusitis: Japanese Experience In Immunotyping And Treatment**

Rhinology · International Symposia *Kenji Kondo; Kenzo Tsuzuki; Mitsuhiro OKANO; Marco Velimir Grgic*

11:45–12:30 **Anti-Aging Medicine Of Otolaryngology In Japan**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Kenji Kondo; Shigeru Hirano; Koichiro Wasano; Tatsuya Yamasoba; İrfan Kaygusuz*

12:30–12:45 **Endoscopic Resection Of Juvenile Nasopharyngeal Angiofibroma Without Preoperative Embolization**

Rhinology · Remarkable Presentation *Azizbek Uzokov; Marco Velimir Grgic*

14:00–14:30 **Setting Up Your Biologics Service In Rhinology**

Rhinology · Instructional Course

14:30–15:30 **Post-Viral Anosmia To Parosmia Rehab**

Rhinology · International Symposia *Antje Welge Lussen; Aytug Altundag; Carl Philpott; Anda Gata*

15:30–16:00 **Corticotherapy Based Medical Treatment Of Nasal Polipozis**

Rhinology · Instructional Course *Bulent Topuz; Meltem Akpınar; Tuba Bayindir; Chae-Seo Rhee*

16:30–17:30 **The Vision Of Olfaction Across The World**

Rhinology · Round Table *Giulio Cesare Passali; Mariaconsiglia Santantonio; Jerome LECHIEN; Kivanc; Gunhan; Bilge Türk*

17:30–18:00 **Endoscopic Frontal Sinus Surgery: From Basic To Complex**

Rhinology · Instructional Course *Emel Çadallı Tatar; Fikret Kasapoglu; Mehmet Ali Çetin; BERNA USLU COSKUN*

Friday, 11 September 2026

07:00–07:30 **Closing The Septal Perforation: A Spectrum Of Surgical Techniques**

Rhinology · Instructional Course *Benyamin Rahmaty; Georgiy A. Polev; Deniz Hancı; Elif Ayanoğlu Aksoy*

07:30–08:00 **New Innovations In Office-Based Rhinology**

Rhinology · Instructional Course *Shazada Ahmed; Elif Ayanoğlu Aksoy*

08:00–09:00 **Avoiding Complications In Endoscopic Sinus Surgery**

Rhinology · Round Table *RAUF YÜCEL ANADOLU; Ramiza Ramza Ramli; Fadlullah Aksoy*

09:00–10:00 **Integrating Technology In Endoscopic Sinus Surgery**

Rhinology · International Symposia *Marco Caversaccio; Sergey Karpishchenko; Agnieszka Strembosz; Paresh Pramod; Naik; Teoman Dal*

10:45–11:45 **Japanese ORL-HNS Society Update On Rhinology**

Rhinology · Round Table *Kenji Kondo; Nobuyoshi Otori; Nobuo Ohta; Tetsuya Terada*

11:45–12:15 **Centripetal Endoscopic Sinus Surgery**

Rhinology · Keynote Lecture *Andre Felippu; Ana Krizmanić Mikolčević*

12:15–12:45 **Chronic Sinonasal Inflammation And Mucoceles As A Comorbidity Of Benign Sinonasal Tumors: How To Manage**

Rhinology · Instructional Course *Aleksandar Peric; Michail Katotomichelakis; Ana Krizmanić Mikolčević*

14:00–15:00 **Canadian Society Round Table - Oral Corticosteroid Stewardship In CRS: Are We Ready To Change?**

Rhinology · Round Table *Yvonne Chan; Ian Witterick; Daniel Lee; Christopher J Chin; Leigh Sowerby;; Jonathan Yip*

15:00–16:00 **Sinus Surgery In The Era Of Biologics**

Rhinology · International Symposia *Cenk Ecevit; Kasper Aenaes; Yvonne Chan; Mohamad Chaaban; Melis Demirag; Evman*

16:30–17:30 **Pediatric Endoscopic Skull Base Surgery: Overcoming The Challenges And Improving Outcomes**

Rhinology · Round Table *Abdullah AlBader; Gokmen Kahilogullari; Suha Beton; Nikolaus Wolter; Hakan Kara;; Grace Khong*

17:30–18:00 **Outcomes And Adverse Prognostic Factors In Sinonasal Intestinal Type Adenocarcinoma (ITAC)**

Rhinology · Instructional Course *Carmine Prizio; Niccolò Mevio; Hakan Kara*

Saturday, 12 September 2026

07:00–07:30 **Sinonasal Fibroosseous Lesions: Difficulties And Their Solutions In Surgical Management**

Rhinology · Instructional Course *Mariam Mella; Domen Vozel*

07:30–08:00 **Endoscopic DCR: A Step By Step Guide**

Rhinology · Instructional Course *Burak Ulkumen; Mümtaz Taner Torun; İbrahim Çukurova; Domen Vozel*

08:00–08:30 **Understanding Drug-Induced Effects Of Systemic Medications On Nasal Function: Urological Medications And Beyond**

Rhinology · Instructional Course *Muhammet Fatih Gökmen; Chae-Seo Rhee; Mümtaz Taner Torun*

08:30–09:30 **New Perspectives In Chronic Sinusitis**

Rhinology · Instructional Course *Jan Vodička; Jan Plzak; Petr Schalek; Martin Kaňa; Lenka Čábalová; Mümtaz Taner; Torun*

09:30–10:00 **Skull Base Reconstruction: Which Material When And Why?**

Rhinology · Instructional Course *Domen Vozel; Mümtaz Taner Torun*

10:45–11:45 **Management Of Septal Perforations: Strategies And Techniques**

Rhinology · Round Table *Serdar özer; Mohsen Naraghi; Yuri Rusetskiy; Muhammet Fatih Gökmen; Deniz; Hancı*

11:45–12:45 **Diagnosis And Management Of Facial Pain Of Rhinogenic And Non- Rhinogenic Origin**

Rhinology · Round Table *Adrian M Agius; Farah Dayana Zahedi; Eliza Brozek Madry; Zahide Mine Yazici;; Muhammet Fatih Gökmen*

14:00–15:00 **The Romanian ENT Head And Neck Society Session**

Rhinology · Round Table *Adriana Neagos; Mühlfay Gheorghe; Răzvan Hainărosie; CODRUT SARAFOLEANU;; Nicolae Balica; Raluca Grigore; Dragos Palade*

15:00–16:00 **Academy Assembly (By Invitation Only)**

Ceremony · Continental or International Societies Sessions *George Tavartkiladze*

16:30–17:00 **Achieving Adequate Hemostais During Sinonasal And Skull Base Surgery**

Rhinology · Instructional Course *Luis Fernando Macias-Valle; Chih-Jaan Tai; Yetkin Zeki YILMAZ*

RHINOLOGY 5 + ALLERGY

ICC - B2 Floor Yıldız 1

Wednesday, 9 September 2026

14:00–14:30 **PRECISION MOLECULAR DIAGNOSIS OF ALLERGIC RHINITIS FOR PERSONALISED MANAGEMENT**
Allergy · Keynote Lecture *Hideyuki Kawauchi; İlknur Haberal Can*

14:30–15:30 **CURRENT AND FUTURE DIRECTIONS IN PEDIATRIC ALLERGIC RHINITIS**
Allergy · International Symposia *Mitsuhiro OKANO; William Reisacher; Elshan Aghayev; Riaz Seedat*

15:30–15:45 **Revision Endoscopic Endonasal Frontal Sinus Surgery After Open Access**
Rhinology · Remarkable Presentation *Elisabeth Bolozneva; Cenk Ecevit*

15:45–16:00 **Holistic Approach To Crswnp Patients: MDT Clinic Experience At A Tertiary Hospital**
Rhinology · Remarkable Presentation *OMAR ABU SULIMAN; Cenk Ecevit*

16:30–17:30 **NONALLERGIC RHINITIS-CHALLENGES IN DIAGNOSIS AND TREATMENT**
Allergy · Round Table *Cenk Ecevit; Mustafa Kemal ADALI*

17:30–18:00 **Surgery For Nasal Allegy And Posterior Nasal Neurectomy**
Rhinology · Keynote Lecture *Ahilasamy Nagalingeswaran; Mustafa Kemal ADALI*

Thursday, 10 September 2026

07:30–08:00 **PRECISION DIAGNOSIS OF RHINITIS**
Allergy · Instructional Course *Pongsakorn Tantilipikorn; Mustafa Kemal ADALI*

08:00–09:00 **LOCAL ALLERGIC RHINITIS**
Allergy · Round Table *Luisa Maria Bellussi; Kivanc Gunhan; Bulent Topuz; Meltem Akpınar*

09:00–09:30 **SKIN PRICK TEST**
Allergy · Instructional Course *Müge Özcan; Bulent Topuz; ŞEYDA AKBAL ÇUFALI*

09:30–10:00 **CURRENT AND FUTURE DIRECTIONS IN GERIATRIC RHINITIS**
Allergy · Keynote Lecture *Jayant Pinto; Asli Sahin Yilmaz*

10:45–11:15 **EPITHELIAL BARRIER HYPOTHESIS: NONCOMMUNICABLE DISEASE**
Allergy · Keynote Lecture *Cezmi Akdis; Cemal Cingi*

11:15–12:15 **ADVANCES IN ALLERGEN IMMUNOTHERAPY FOR OTORHINOLARYNGOLOGISTS**
Allergy · International Symposia *Pongsakorn Tantilipikorn; Ralph Mösges; Daiju Sakurai; BERNA USLU COSKUN*

12:15–12:45 **European Board Examination In ORL & HNS**
Rhinology · International Symposia *Cem Meco; Marcus Neudert; Wolfgang Luxenberger*

14:00–15:00 **Endoscopic Skull Base Reconstruction - What Is Evidence Based?**
Rhinology · International Symposia *Cem Saka; Saleh Mohebbi; Domen Vozel; Mehmet Ali Çetin*

15:00–16:00 **Endoscopic Sinus Surgery- The Brazilian Experience**
Rhinology · Controversies *Eduardo Macoto Kosugi; Wilma Terezinha Anselmo Lima; Miguel Tepedino; Edwin; Tamashiro; Mehmet Ali Çetin*

16:30–17:30 **Chronic Rhinosinusitis With Nasal Polyps: The Brazilian Way For Assessing And Treating Medically**
Rhinology · Expert Discussion *Fabiana Valera; FABRIZIO RICCI ROMANO; MARCO AURELIO FORNAZIERI; Wilma; Terezinha Anselmo Lima; Zahide Mine Yazici*

17:30–18:00 **American Austrian Foundation Salzburg Cornell Medical Seminar Alumni**
Rhinology · Continental or International Societies Sessions *Cem Meco; Michael G. Stewart*

Friday, 11 September 2026

07:00–07:30 **Rhinosinusitis: New Therapies; Surgery Versus Biologicals For Crswnp; Relationship With GER**
Rhinology · Instructional Course *Francesco Maria Passali; Scasso Felice; Şenol Çomoglu*

07:30–08:00 **Pediatric Allergy, Rhinology And Sleep Medicine**
Rhinology · Instructional Course *Maria Pia Villa; Marilena Trozzi; Şenol Çomoglu*

08:00–09:00 **Challenges In Management Of Jnas**
Rhinology · Round Table *Ahilasamy Nagalingeswaran; Şenol Çomoglu; GUILLERMO SANJUAN DE MORETA;; Gabriela Kopacheva; Aliaa Khidr*

09:00–10:00 **NEW TRENDS IN DIAGNOSTIC AND TREATMENT OF OLFACTORY DISORDERS**
Rhinology · Panel Presentation *Rosalinda Pieruzzini; Adriana Izquierdo; Adelaida Bock; Sophie Mwendwa*

10:45–11:45 **Immune-Mediated Sinonasal Disorders: From Vasculitis To Igg4- Disease**
Rhinology · International Symposia *Cecilia Ahlström Emanuelsson; Nicholas BuSaba; Erdem Eren; Rosalinda Pieruzzini*

11:45–12:45 **Complications Of Acute Sinusitis: Current Facts And Practice**
Rhinology · International Symposia *Ceren Gunel; Dilyana Vicheva; SARA AGHALAR; Rosalinda Pieruzzini*

14:00–14:30 **INTRALYMPHATIC IMMUNOTHERAPY**
Allergy · Keynote Lecture *Tetsuya Terada; Bulent Topuz*

14:30–15:30 **SURGICAL TREATMENT OF ALLERGIC RHINORRHEA AND CONGESTION**
Allergy · International Symposia *Sarah K. Wise; Asli Sahin Yilmaz; Carlson Ying-Piao Wang; Tuba Bayindir; Zukhrob; Sobirzhonovi Matmurotov*

15:30–16:00 **Component-Resolved Diagnosis For Otorhinolaryngologists**
Allergy · Instructional Course *Müge Özcan; Nurcan Yurtsever Kum*

16:30–17:30 **CENTRAL COMPARTMENT ATOPIC DISEASE**
Allergy · Round Table *Islam Herzallah; İlknur Haberal Can; Olavo Mion; Zahide Mine Yazici*

Saturday, 12 September 2026

07:00–07:30 **Restoring Olfactory Function: Lessons From Biologics**
Rhinology · Instructional Course *Müge Özcan*

07:30–08:00 **IMMUNOTHERAPY UPDATE 2025**
Allergy · Instructional Course *William Reisacher; Müge Özcan*

08:00–08:30 **LEVERAGING ARTIFICIAL INTELLIGENCE IN ALLERGY AND IMMUNOLOGY: INNOVATIONS IN DIAGNOSIS AND TREATMENT**
Allergy · Instructional Course *Anisa Daftari; Müge Özcan*

08:30–09:30 **Pharmacotherapy Of Allergic Rhinitis**
Allergy · International Symposia *Chung-Han Hsin; Sunita Chhapola Shukla; Yoshiaki Kitamura; Bulent Topuz; Adile; Berna Dursun; Safiye Giran Örtekin*

09:30–10:00 **AI IN THE DIAGNOSIS AND MANAGEMENT OF ALLERGIC DISEASES**
Allergy · Keynote Lecture *Olavo Mion; BERNA USLU COSKUN*

10:45–11:45 **ALLERGIC FUNGAL RHINOSINUSITIS**
Allergy · Round Table *Meryem Nesil Keles Türel; Tuba Bayindir; Hakan Kara; Elvan Onan*

11:45–12:15 **BIOLOGICS IN ALLERGIC RHINITIS , WHAT CHANGED IN TREATMENT**
Allergy · Keynote Lecture *Valerie Hox; Cenk Ecevit*

12:15–12:45 **Allegic Rhinitis Immunotherapy And Intranasal Vaccines: An Update From Japan**
Rhinology · Instructional Course *Takashi Hirano; Masafumi Sakashita; Yoshiaki Kitamura; Nobuyoshi Otori*

14:00–14:30 **Multidiscipilinary Orbital Surgery: Together Avoiding Pitfalls For Success**
Rhinology · Keynote Lecture *Pongsakorn Tantilipikorn; Zahide Mine Yazici*

14:30–15:00 **Multidiscipilinary Orbital Surgery: Together Avoiding Pitfalls For Success**
Rhinology · Keynote Lecture *Zahide Mine Yazici*

15:00–15:30 **Minimally Invasive Sinus Surgery: My Experience**
Rhinology · Keynote Lecture *Kuljit Singh; Zahide Mine Yazici*

15:30–16:00 **Complete Surgical Management Of The Maxillary Sinus: From Middle Antrostomy To The Prelacrimal Approach**
Rhinology · Instructional Course *Jose M. Villacampa; Scasso Felice; Bülent Öcal; Zahide Mine Yazici*

16:30–17:30 **Clinical Aspects Of Diagnosing And Managing Smell And Taste Disorders: Case Discussions**
Rhinology · Round Table *Christian A. Mueller; Bertold Renner; IORDANIS KONSTANTINIDIS; Aytug Altundag;; Leylya Omerova*

17:30–18:00 **Tips And Trics In Lacrimal Patrhway Surgery**
Rhinology · Instructional Course *Gonzalo Díaz Tapia; Leylya Omerova*

RHINOLOGY 6

ICC - B3 Floor - 3B/37

Wednesday, 9 September 2026

14:00–15:00 **Nasal Airway Management In Pediatric Patients**

Rhinology · Round Table *Raewyn Campbell; Khaled Mohamed Bofares; Talal Abdulla; Yong Ju Jang; Cenk; Ecevit*

15:00–16:00 **Global Overview Of Skull Base Surgery**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Benjamin Verillaud; Alperen Vural; Skander Kedous; Kachorn Seresirikachorn; Nina; Wenda; Nadim KHOUEIR*

16:30–17:30 **Endoscopic Management Of Intranasal Benign Tumours**

Global Outreach (Regional or ENT related Organizations Symposia) · International Symposia *Khaled Mohamed Bofares*

Thursday, 10 September 2026

07:00–08:30 **Rhinology Notable Abstracts 2**

Notable Abstracts · Notable Abstract *Cem Meco; RAUF YÜCEL ANADOLU*

08:30–08:45 **Cost Effectiveness Of Therapies For Crswnp**

Rhinology · Remarkable Presentation *Islam Herzallah; Erdem Eren*

08:45–09:00 **Can Sinonasal Diagnostics Be Changed?**

Rhinology · Remarkable Presentation *Marko Velepič; Erdem Eren*

09:00–10:00 **Acute Sinusitis: 2026 Update**

Rhinology · Round Table *Yvonne Chan; Ann Hermansson; Jaqueline Alvarado; Firas Kassem; Ljiljana; Jovancevic; Fikret Kasapoglu*

10:45–10:55 **Endoscopic Repair Of CSF Leak: A Minimally Invasive Skull Base Approach**

Rhinology · Master of Surgery Video Presentation *Mohammadsadegh Zabihidan; M.Melih Şahin*

10:55–11:05 **Traumatic CSF Leakage In A Patient 6-Year-Old And Cystic Fibrosis.**

Rhinology · Master of Surgery Video Presentation *Kerem Kökoğlu; M.Melih Şahin*

11:05–11:15 **Endoscopic Endonasal Repair Of Spontaneous Ethmoid Roof Meningoencephalocele**

Rhinology · Master of Surgery Video Presentation *Kent Lam; M.Melih Şahin*

11:15–11:25 **Endoscopic Endonasal Drainage Of Petrous Apex Cholesterol Granuloma**

Rhinology · Master of Surgery Video Presentation *Kent Lam; Melis Demirag Evman*

11:25–11:35 **Utility Of Contralateral Hadad Flap For Sphenoid Sinus CSF Leak Repair**

Rhinology · Master of Surgery Video Presentation *Yuri Rusetskiy; Melis Demirag Evman*

11:35–11:45 **Surgical Management Of Pituitary Adenomas: A Video-Based Educational Approach**

Rhinology · Master of Surgery Video Presentation *Mohammadsadegh Zabihidan; Melis Demirag Evman*

11:45–12:15 **Surgical Staging of Inverted Papilloma: 30 Years Experience**

Rhinology · Keynote Lecture *Reda Kamel; Melis Demirag Evman*

12:15–12:45 **Spectrum Of Endoscopic Procedures For Management Of Orbital Rhabomyosracomas**

Rhinology · Keynote Lecture *Remon Bazak; Melis Demirag Evman*

14:00–15:00 **Spontaneous CSF Leak Management - Challenges**

Rhinology · International Symposia *Brad Woodworth; Edward Chih-Jaan Tai; Shazada Ahmed; Osman Bahadır; Alper; Ceylan*

15:00–16:00 **Invasive Fungal Sinusitis: Challenges And Choices**

Rhinology · Round Table *Amin Javer; Uzdan Uz; Jure Urbancic; Shirin Irani; Alper Ceylan*

16:30–17:30 **Rhinology Notable Abstracts 1**

Notable Abstracts · Notable Abstract *Serdar özer*

18:00–18:30 **Yo-IFOS Quiz**

Yo-IFOS (Young IFOS) · Instructional Course *Daniele DE SIATI*

Friday, 11 September 2026

07:00–07:30 **Strategies For Maintaining Long-Term Patency: The Role Of Drain Placement In Frontal Sinus Surgery**

Rhinology · Instructional Course *Abdullah Ozdem; orhan Asya; Ceren Gunel*

07:30–08:00 **Video Session 2**

Rhinology · Instructional Course *Kerem Kökoğlu; Ceren Gunel*

08:00–08:15 **Endoscopic Endoneurosurgery - Optimizing Outcomes Through Multidisciplinary Colloboration**

Rhinology · Remarkable Presentation *Emrah Celtikci; Ceren Gunel*

08:15–08:30 **The Modern Paradigm For CSF Leak Management: Diagnostic Algorithms And Surgical Techniques**
Rhinology · Remarkable Presentation *Laura Van Gerven; Ceren Gunel*

08:30–08:40 **Endoscopic Transnasal Vidian Neurectomy And Pterygopalatine Fossa Anatomy**
Rhinology · Master of Surgery Video Presentation *Ercan Akbay; Enes Yiğit*

08:40–08:50 **Nose And Paranasal Sinus Surgery**
Rhinology · Master of Surgery Video Presentation *Enes Yiğit*

08:50–09:00 **Mucosal Preserving Turbinate Surgery**
Rhinology · Master of Surgery Video Presentation *Mohsen Naraghi; Enes Yiğit*

09:00–09:10 **Repair Of Septal Perforation By Inferior Meatal Flaps**
Rhinology · Master of Surgery Video Presentation *Mohsen Naraghi; Ana Krizmanić Mikolčević*

09:10–09:20 **Endoscopic Septal Perforation Repair Techniques**
Rhinology · Master of Surgery Video Presentation *Melis Demirag Evman; Ana Krizmanić Mikolčević*

09:20–09:30 **Endoscopic Tension-Free Locking Suture Technique For Nasal Septal Perforation Repair: A Novel Minimally Invasive Approach**
Rhinology · Master of Surgery Video Presentation *Benyamin Rahmaty; Ana Krizmanić Mikolčević*

09:30–09:40 **Endoscopic And Combined Surgical Management Of Frontoethmoid Osteomas: Techniques And Outcomes**
Rhinology · Master of Surgery Video Presentation *orhan Asya; Hakan Kara*

09:40–09:50 **Management Of Odontogenic Cysts**
Rhinology · Master of Surgery Video Presentation *orhan Asya; Gediz Murat Serin*

10:45–11:00 **Prelacrimal Approach To Maxillary Sinus**
Rhinology · Remarkable Presentation *Farhad Arbabzadeh; Cüneyt Orhan Kara*

11:00–11:15 **Management Of Internal Carotid Artery Injury During Endoscopic Surgery**
Rhinology · Remarkable Presentation *Shirin Irani; Cüneyt Orhan Kara*

11:15–11:30 **The Potential Of Endoscopic Transoral Approach To Skull Base**
Rhinology · Remarkable Presentation *Sevil Nasirmohtaram; Cüneyt Orhan Kara*

11:30–11:45 **The Ideal Surgical Corridor For Endoscopic Transsphenoidal Surgery: A Single-Center Experience Of 6,000 Cases**
Rhinology · Remarkable Presentation *Cüneyt Orhan Kara*

11:45–12:00 **Umbilical Graft For CSF Repair**
Rhinology · Remarkable Presentation *Hadi Samimi Ardestani.; Cüneyt Orhan Kara*

12:00–12:15 **AI For Automated CT Analysis And Surgical Planning In ESS**
Rhinology · Remarkable Presentation *Cüneyt Orhan Kara*

12:15–12:30 **Odontogenic Maxillary Sinusitis**
Rhinology · Remarkable Presentation *Hamidreza Bagheri; Cüneyt Orhan Kara*

12:30–12:45 **Endoscopic Surgical Management Of Spontaneous CSF Rhinorrhea - Findings Based On Our Institutional Policy Framework**
Rhinology · Remarkable Presentation *Cüneyt Orhan Kara*

14:00–14:15 **Rehabilitation Of Postviral Olfactory Disfunction**
Rhinology · Remarkable Presentation *Anastasia Varvyanskaya; Erdem Mengi*

14:15–14:30 **Endoscopic DSR**
Rhinology · Remarkable Presentation *Erdem Mengi; Semra Külekçi Öztürk*

14:30–14:45 **Middle Turbinate Management In FESS And Rhinoplasty**
Rhinology · Remarkable Presentation *Maryam Roomiani; Erdem Mengi*

14:45–15:00 **Special Indications And Contraindications In Septoplasty**
Rhinology · Remarkable Presentation *Lütfü Şeneldir; Erdem Mengi*

15:00–15:10 **Surgery For Refractory Allergic Rhinitis**
Rhinology · Master of Surgery Video Presentation *Ali Dogan Aydinbelge; Hakan Kara*

15:10–15:20 **Endoscopic Stentless Dacryocystorhinostomy How We Do It, A Single Center 20 Years Experience**
Rhinology · Master of Surgery Video Presentation *REN HUI LO; Hakan Kara*

15:20–15:30 **Steps In Osteotomy During Open Rhinoplasty**
Rhinology · Master of Surgery Video Presentation *İsmail Salcan; Hakan Kara*

15:30–15:40 **Management of Septal Perforation**
Rhinology · Remarkable Presentation *Gediz Murat Serin; Hakan Kara*

16:30–17:30 **Young IFOS General Assembly**

Ceremony · Opening Ceremony

Saturday, 12 September 2026

08:10–08:50 **Endoscopic Approach To Maxillary Sinus Disorders**

Rhinology · Instructional Course *Nagihan Bilal; Afruz Masimova; Aytug Altundag*

09:00–10:00 **Artificial Intelligence And Machine Learning In Rhinology**

Rhinology · International Symposia *Ibrahim Sayin; Ludovic de Gabory; Semih Sütay*

10:45–12:15 **Rhinology Free Papers 30**

Rhinology · Free Paper Session *NURAY BAYAR MULUK*

15:00–16:00 **Otolaryngology Competency Assessment: Guiding The Future Of Otolaryngology**

Transverse activities (Innovation, Basic Research, Education) · International Symposia *Sonya Malekzadeh; Jenny X. Chen; Kelly Malloy*

SIALENDOSCOPY

ICC - B3 Floor - 3B/06

Thursday, 10 September 2026

07:00–08:00 **Sialendoscopy Journal Club (Up-To-Date Ongoing Research Discussion)**
Sialendoscopy · Expert Discussion *MICHAEL KOCH; Pasquale Capaccio; Cengiz Ozcan; Higino Steck*

08:00–09:00 **Salivary Stones: A General Outline**
Sialendoscopy · Round Table *Luca de Campora; Ela Araz Server; Hesham Yusuf Ali Alrayyes; Gabriela; Robaskewicz Pascoto; Jeong Kyu KIm; Milind Navalakhe*

09:00–10:00 **Treatment Options For Sialolithiasis**
Sialendoscopy · Round Table *Z. Çiler Büyükatalay Yaldız; Emad Magdy; Pasquale Capaccio; mark marzouk;; Aleksandar Aničin; Trevor Hackman; Gabriela Robaskewicz Pascoto*

10:45–11:15 **Endoscopic-Assisted Approaches In The ISWL-Era And Their Current Role In A Treatment Algorithm For Sialolithiasis**
Sialendoscopy · Keynote Lecture *MICHAEL KOCH; Pasquale Capaccio*

11:15–11:45 **Beyond sialendoscopy: management of the patient and duct post procedure**
Sialendoscopy · Keynote Lecture *Trevor Hackman*

11:45–12:45 **Intraductal Pneumatic Lithotripsy for Giant Salivary Stones (≥15 mm): Technical Challenges, Practical Tips, and Clinical Outcomes**
Sialendoscopy · Round Table *MICHAEL KOCH; Ela Araz Server; Necdet Özçelik; Atilla Şengör; Bülent Evren Erkul*

14:00–14:30 **Sialendoscopy. Holmium Laser Lithotripsy Versus Pneumatic Lithotripsy In Salivary Gland Stones**
Sialendoscopy · Keynote Lecture *Suleyman Ozdemir; Giulianno Molina de Melo*

14:30–15:30 **Intraductal treatment of salivary stones: How I do it?**
Sialendoscopy · Round Table *Atilla Şengör; Varun Rai; Bini Faizal; Torti Florinda; Luca de Campora; Hesham Yusuf; Ali Alrayyes; Osama Hamarneh; Trevor Hackman*

15:30–16:00 **Pediatric Sialendoscopy: Diagnostic And Therapeutic Management From Strictures To Stones**
Sialendoscopy · Instructional Course *Jeffrey Dorrity; mark marzouk*

16:30–17:30 **Issues Related To The Papilla And The Duct Itself**
Sialendoscopy · Panel Presentation *Ela Araz Server; Aleksandar Aničin; Suleyman Ozdemir; Mohamed Fawzy Fathalla;; Varun Rai; Alvaro Sánchez Barrueco*

17:30–18:00 **Papillotomy Or Not?**
Sialendoscopy · Controversies *Torti Florinda; Necdet Özçelik; Gabriela Robaskewicz Pascoto; Varun Rai; Carlos; Cenjor; Rashid Al Abri*

Friday, 11 September 2026

07:00–08:00 **Sialendoscopy Free Paper**
Sialendoscopy · Free Paper Session *Necdet Özçelik; Barry Schaitkin; mark marzouk; Rashid Al Abri*

08:00–09:30 **Sialendoscopy Experiences Around The World**
Sialendoscopy · Panel Presentation *Emad Magdy; Torti Florinda; Maryam Sahwan; Sümbül BAYRAKTAR GÜZELDAĞ;; Osama Hamarneh; Higino Steck; Nesrettin Fatih Turgut; Saleh Mohebbi; Arista; Nachane; Talal Abdulla; Giulianno Molina de Melo; Purushotman Ramasamy*

09:30–10:00 **Starting Sialendoscopy In A Developing Country: Unique Challenges And Achievementsi**
Sialendoscopy · Keynote Lecture *Emad Magdy; Giulianno Molina de Melo*

10:45–11:45 **Parotid Stones**
Sialendoscopy · Round Table *Barry Schaitkin; Salma Alsheibani; Selin Ünsaler; Pasquale Capaccio; Carlos; Chiesa-Estomba; Bülent Evren Erkul; Irena Ivković*

11:45–12:45 **Submandibular Stones**
Sialendoscopy · Round Table *Higino Steck; Pasquale Capaccio; mark marzouk; Mahmoud Seif-Elnasr; Ahmed; Elbana; Cengiz Ozcan; Varun Rai; Irena Ivković*

14:00–14:30 **Managing Parotid Sialolithiasis: Challenges, Decision Points, And A Practical Algorithm**
Sialendoscopy · Keynote Lecture *Z. Çiler Büyükatalay Yaldız; mark marzouk*

14:30–15:30 **Sialendoscopy For Non-Lithiasic Diseases**
Sialendoscopy · Panel Presentation *Carlos Saga; Alvaro Sánchez Barrueco; Giulianno Molina de Melo; mark marzouk;; Sam Daniel; Rahmatullah Wais Rahmati; Jolie Chang*

15:30–16:00 **Juvenile Recurrent Parotitis (JRP)**

Sialendoscopy · Instructional Course *Irena Ivković; Al Wiaam Al Balushi; mark marzouk*

16:30–17:00 **Non-Stone Indications For Sialendoscopy**

Sialendoscopy · Keynote Lecture *Barry Schaitkin; Mahmoud Seif-Elnasr*

17:00–18:00 **Ductal And Parenchymal Non-Lithiasic Diseases And Sialendoscopy**

Sialendoscopy · Panel Presentation *Gabriela Robaskewicz Pascoto; Higino Steck; Hatem Kooli; Bini Faizal; Mahmoud; Seif-Elnasr; Rashid Al Abri; Milind Navalakhe*

Saturday, 12 September 2026

07:00–08:00 **MEET THE EXPERTS - Scientific Future In Sialendoscopy**

Sialendoscopy · Panel Presentation *Ela Araz Server; Gabriela Robaskewicz Pascoto; Evelyne Kalyoussef; Milind; Navalakhe*

08:00–09:00 **Complications & Management**

Sialendoscopy · Round Table *Salma Alsheibani; Bülent Evren Erkul; Mahmoud Seif-Elnasr; Jeong Kyu KIm;; Ahmed Beshir; Emad Magdy*

09:00–09:30 **Complications Of Sialendoscopy And Their Management**

Sialendoscopy · Keynote Lecture *Pasquale Capaccio; Jeong Kyu KIm*

09:30–10:00 **Robotics In The Near Future Of Sialendoscopy**

Sialendoscopy · Controversies *Pasquale Capaccio; mark marzouk; Jeong Kyu KIm*

10:45–11:45 **Miscellenous topics**

Sialendoscopy · Round Table *Jeong Kyu KIm; Hatem Kooli; Evelyne Kalyoussef; Suleyman Ozdemir; Bini Faizal;; Mazin Merdad*

11:45–12:15 **Office Sialendoscopy managment of complication**

Sialendoscopy · Controversies *Gokhan Altin; Carlos Saga; Trevor Hackman; Hatem Kooli; Rahmatullah Wais; Rahmati*

12:15–12:45 **Sialendoscopy 2026 Year In Review**

Sialendoscopy · Keynote Lecture *Hatem Kooli; Evelyne Kalyoussef*

14:00–15:00 **Future Directions And Recent Innovations**

Sialendoscopy · Round Table *Nihal Seden Boyoğlu; Gabriela Robaskewicz Pascoto; Hesham Yusuf Ali Alrayyes;; Saleh Mohebbi; Rashid Al Abri*

15:00–16:00 **Establishment Of A New Sialendoscopy Group: IFOS Sialendoscopy Group (ISG)**

Sialendoscopy · Round Table *Mazhar Çelikoyar; Suleyman Ozdemir; Emad Magdy; mark marzouk; Gabriela; Robaskewicz Pascoto; Rashid Al Abri; MICHAEL KOCH; Saleh Mohebbi*

16:30–18:00 **SIALOVID (Sialendoscopy Video) Competition**

Sialendoscopy · International Symposia *Hesham Yusuf Ali Alrayyes; Rashid Al Abri*

Sunday, 13 September 2026

07:00–08:00 **Sialendoscopy Scopes & Instruments: Handling, Sterilization & Care**

Sialendoscopy · Expert Discussion *Suleyman Ozdemir; Emad Magdy; Tarek Najjar; Atilla Şengör*

08:00–09:30 **Sialendoscopy Training Models, Simulators And Courses**

Sialendoscopy · International Symposia *MICHAEL KOCH; Mazhar Çelikoyar; Gabriela Robaskewicz Pascoto; Emad Magdy;; Pasquale Capaccio; Salma Alsheibani; Mohamed Fawzy Fathalla*

09:30–10:00 **Gland Removal In The Era Of Sialendosopy: Does It Is Still Exist?**

Sialendoscopy · Controversies *MICHAEL KOCH; mark marzouk; Aleksandar Aničin; Salma Alsheibani*

10:45–12:30 **Live Sialendoscopy Demonstration**

Sialendoscopy · International Symposia *Osama Hamarneh; Mazhar Çelikoyar; Suleyman Ozdemir; Gabriela Robaskewicz; Pascoto; mark marzouk; Emad Magdy; Rashid Al Abri; Selin Ünsaler*

12:30–12:45 **Closing Remarks**

Sialendoscopy · Remarkable Presentation *Suleyman Ozdemir*

SLEEP

Hilton - Grace I

Wednesday, 9 September 2026

14:00–14:30 **Why Do We Treat A Snoring Patient?**
Sleep Medicine · Keynote Lecture *Joachim T. Maurer; Mustafa Gerek*

14:30–15:30 **Phenotypes/Endotypes What Causes OSA?**
Sleep Medicine · Panel Presentation *Rahul Modi; Murat Ozcan; Ewa Olszewska*

16:30–17:00 **Obstructive Sleep Apnoea: From Dickens To Davinci And Beyond**
Sleep Medicine · Keynote Lecture *Bhik Kotecha; Ozan Bağış Özgürsoy*

17:00–17:30 **Patient Is Snoring, What's Next? (Diagnostics, Sleep Studies, CPAP Treatment)**
Sleep Medicine · Expert Discussion *Shailesh Khode; Supawan Laohasiriwong*

17:30–18:00 **DRUG INDUCED SLEEP ENDOSCOPY TO IMPROVE DECISIONS IN OBSTRUCTIVE SLEEP APNEA**
Sleep Medicine · Instructional Course *Jaime Sanabria; Murat Toprak*

Thursday, 10 September 2026

07:15–07:45 **Preservation And Conservative Techniques For Palatal Surgery**
Sleep Medicine · Expert Discussion *Mohamed Abdelwahab; Hesham Yusuf Ali Alrayyes; Metin Yılmaz*

07:45–08:15 **Anterior Septal Reconstruction Variants**
Sleep Medicine · Instructional Course *Mohamed Abdelwahab; Ozan Bağış Özgürsoy*

08:15–08:45 **Is The Nose Essential To Treat In OSA?**
Sleep Medicine · Controversies *Vikas Agrawal; Konstantinos Chaidas*

08:45–09:15 **Why Sleep Surgery- How Lasting Is The Treatment?**
Sleep Medicine · Keynote Lecture *Daniel Jira; Edilson Zancanella*

09:15–09:30 **CPAP Therapy: First Steps And Practical Essentials For The Sleep Surgeon**
Sleep Medicine · Expert Discussion *Cíntia Felicio Adriano Rosa; Clarissa Delpizzo Castagno*

09:30–09:45 **Palatal Collapse In OSA Explained In 3D**
Sleep Medicine · Expert Discussion *Vikas Agrawal; Kivanc Gunhan*

09:45–10:00 **Adaptation To CPAP As A Form Of Treatment For OSA, In A Private Medical Practice**
Sleep Medicine · Remarkable Presentation *Clarissa Delpizzo Castagno; Kivanc Gunhan*

10:45–11:45 **Snore No More? Myths And Realities Of Surgical Success**
Sleep Medicine · Round Table *Jesper Bille; Jolie Anna Crespo Chanis; Chu Qin Phua*

11:45–12:15 **Sleep Apnea Treatment Metrics- Mean Disease Alleviation**
Sleep Medicine · Keynote Lecture *Ozan Bağış Özgürsoy; Olivier Vanderveken*

12:15–12:45 **Drug Induced Sleep Endsocopy From A To Z**
Sleep Medicine · Instructional Course *Cenk Ecevit; Anand Raju*

14:00–15:00 **Drug-Induced Sleep Endoscopy**
Sleep Medicine · Panel Presentation *Anna Bonsembiante; Shrinivas Kishore Sistla; Seçil Bahar Dal; RAUF YÜCEL; ANADOLU*

15:00–16:00 **Palatoplasty Around The World Different Techniques For Palatal/Pharyngoplasty Surgery**
Sleep Medicine · Panel Presentation *Ryan Nord; Andrea De Vito; Ordival Augusto Rosa; Sandeep Bansal; Ryan Chin Taw; Cheong; Jessica Schwarts; Giovanni Cammaroto*

16:30–17:00 **Wearable Technology / AI Technology In OSA**
Sleep Medicine · Keynote Lecture *Karl Hoermann; Mario Milkov*

17:00–18:00 **How To Manage OSA In Complicated Pediatric Patients**
Sleep Medicine · Panel Presentation *P. Vijaya Krishnan; Erdinç Aydın*

Friday, 11 September 2026

07:30–08:00 **Airway Restoration Beyond Surgery: Rethinking Surgical Goals And Multimodal Strategy Selection**
Sleep Medicine · Expert Discussion *Carolina Ferraz de Paula Soares*

08:00–09:30 **Complications Of Sleep Apnea Surgery - How To Manage Them**
Sleep Medicine · Panel Presentation *Mustafa Gerek; Ahmed Bahgat; Nicholas BuSaba; Giovanni Cammaroto*

09:30–10:00 **Should Sleep Apnea Be Treated?**
Sleep Medicine · Controversies *Shintaro Chiba; Rodolfo Lugo Saldaña; Jolie Chang*

10:45–12:15 **Consensus In Tongue Base, Hypopharyngeal And Supraglottic Surgery In OSA**

Sleep Medicine · Panel Presentation *Ewa Olszewska; Andrea De Vito; Olivier Vanderveken; Joachim T. Maurer; Ryan Chin; Taw Cheong; Anand Raju*

12:15–12:45 **Exponential Sleep Medicine: When AI Predicts, Lasers Cure, Patients Thrive**

Sleep Medicine · Expert Discussion *Graciela Pepe; Christoph Janott; Konstantinos Chaidas*

14:00–15:00 **Sleep Surgery In Turkiye (Pharyngoplasty, TORS, Maxillomandibular Advancement)**

Sleep Medicine · Panel Presentation *Fatma Tülin Kayhan; Metin Yılmaz; Murat Timur Akçam; Sabit Kunter Berkay; Şerifoğlu*

15:00–16:00 **Skeletal Surgery In OSA**

Sleep Medicine · Panel Presentation *Micheal Hutz; Thomas Fleury; Badr Ibrahim; Graciela Pepe*

16:30–17:30 **New Frontiers In Neurostimulation**

Sleep Medicine · Panel Presentation *Clemens Heiser; Maria Suurna*

17:30–18:00 **Snoring Approach- Update For 2026**

Sleep Medicine · Instructional Course *Fabio Tadeu Moura Lorenzetti; Danilo Sguillar; Edilson Zancanella; Murat Timur; Akçam*

Saturday, 12 September 2026

07:30–08:00 **Sleep Medicine Notable Abstracts**

Notable Abstracts · Notable Abstract *Ozan Bağış Özgürsoy*

08:00–08:30 **Young IFOS Notable Abstracts**

Notable Abstracts · Notable Abstract *Alperen Vural*

08:30–09:30 **Sleep Medicine In Turkiye**

Sleep Medicine · Panel Presentation *RAUF YÜCEL ANADOLU; Secil Akyildiz; Hande ARSLAN; Murat Karaman; Buğra; Subaşı*

09:45–10:00 **Smart Phone Based Application For Positional OSA**

Sleep Medicine · Remarkable Presentation *Nuntigar Sonsuwan; Metin Yılmaz*

10:45–11:15 **Effects Of Sleep Apnea On Neurocognitive Development In Children**

Sleep Medicine · Keynote Lecture *Konomi Ikeda; Ozan Bağış Özgürsoy*

11:15–11:45 **T&A Vs Palatal Expansion In Pediatric OSA**

Sleep Medicine · Controversies *Konomi Ikeda; Shrinivas Kishore Sistla*

11:45–12:45 **Pediatric DISE And How To Guide The Treatment Beyond T&A**

Sleep Medicine · Panel Presentation *Derek Lam; Christopher Hartnick; Alius Ruxandra Oana*

14:00–14:30 **Aging Effect On Airway During Sleep**

Sleep Medicine · Keynote Lecture *Carolina Ferraz de Paula Soares; Selmin Karatayli Ozgursoy*

14:30–15:00 **Single Stage All Level Vs Multistage Surgery**

Sleep Medicine · Controversies

15:00–15:30 **Myofascial Therapy. To Treat Or Not To Treat Tongue Ties (Ankyloglossia)?**

Sleep Medicine · Controversies *Matej Delakorda; Erin Kirkham; Ahmet Ural*

15:30–16:00 **Does Treating Sleep Apnea Early In Adults Prevent Long Term Health Problems?**

Sleep Medicine · Controversies *Yi Cai; Clement, C. H. Lin*

16:30–17:30 **Identifying And Managing Comorbid Sleep Conditions: Insomnia, Central Apnea, Excessive Daytime Sleepiness**

Sleep Medicine · Panel Presentation *Megan Durr; Yi Cai; Denise L Alvarenga*

17:30–18:00 **Upper Airway Resitance Syndrome**

Sleep Medicine · Keynote Lecture *Ani Papian; Kivanc Gunhan*

YOUNG IFOS 1

ICC - B3 Floor - 3B/63

Wednesday, 9 September 2026

14:00–15:30 **Cochlear Implantation**
Yo-IFOS (Young IFOS) · Panel Presentation *Cristina Blebea; François Simon; Ahmed Aldhafeeri; Fida Abdulaziz Almuhawas;; Emine Deniz Gözen; Mukhlisa Abdukamilova*

15:30–16:00 **Applications Of AI In Rhinology**
Yo-IFOS (Young IFOS) · Keynote Lecture *Laura Van Gerven; Fırat Tevetoğlu*

16:30–17:00 **From Basic Research To Translational, From Translational To The Field**
Yo-IFOS (Young IFOS) · Expert Discussion *Tony Eskander; Mehmet İlhan Şahin*

17:00–17:30 **Otolaryngology Postgraduate Examinations : How To Prepare**
Yo-IFOS (Young IFOS) · Instructional Course *Nagihan Bilal; Fahmy Fayez Fahmy*

17:30–18:00 **Pediatric Tracheotomy**
Yo-IFOS (Young IFOS) · Instructional Course *Randa Al Barazi; Begum Bahar Yılmaz; Mehmet Ekrem Zorlu*

Thursday, 10 September 2026

07:00–08:00 **What Would You Do? – Clinical Case Review: ENT Emergencies And Common Disorders**
Yo-IFOS (Young IFOS) · Panel Presentation *Ana Penezic; Fırat Tevetoğlu; Burak Çelik; Çağrı Becerik; Öykü İzel ONARAN*

08:00–09:00 **Technology & Innovation**
Yo-IFOS (Young IFOS) · Round Table *Michele Cassano; Giannicola Ianella; Eleonora Maria Consiglia Trecca; Bayram Barış; BUYUK; Muhammed Sefa Uyar; Ayşegül Batıoğlu Karaaltın*

09:00–09:30 **Beyond Usher Syndrome: Genetic Disorders Associated With Sensorineural Hearing Loss And Visual Impairment. Differential Diagnosis And Multidisciplinary Management**
Yo-IFOS (Young IFOS) · Keynote Lecture *Fazilet Altın; Maria Rosaria Barillari*

09:30–10:00 **Innovation In Medical Robotics**
Yo-IFOS (Young IFOS) · Keynote Lecture *Jason Y K Chan; Alperen Vural*

10:45–11:30 **How To Write A Scientific Paper (P)**
Yo-IFOS (Young IFOS) · Panel Presentation *Yilai Shu; Jerome LECHIEN; Ali Bayram*

11:30–12:15 **Global Fellowship Training: Insights From Around The World**
Yo-IFOS (Young IFOS) · Round Table *Paresh Pramod Naik; Pavol Surda; Wai Tsz CHANG*

12:15–12:45 **BC Hearing Devices: Clinical Indications And Practical Insights**
Yo-IFOS (Young IFOS) · Keynote Lecture *Eleonora Maria Consiglia Trecca; Ceren Karaçaylı*

14:00–15:00 **Benign Vocal Fold Lesions & Phonosurgery**
Yo-IFOS (Young IFOS) · Expert Discussion *Ozlem Onerci Celebi; Mursalin M. Anis; Ahmet Mutlu; Aurora Ka Yue Tam*

15:00–16:00 **Laryngeal Cancer: A Comprehensive Overview Panel**
Yo-IFOS (Young IFOS) · Panel Presentation *Ömer Bayır; Matthew White; Yetkin Zeki YILMAZ; Enis Ozyar; Christina Sauter;; Demet Etit*

16:30–17:30 **Why Functional Audio-Vestibular Testing Matters: Engaging The Next Generation Of Otolaryngologists And Building Global Collaboration**
Yo-IFOS (Young IFOS) · Round Table *Salma Jbyeh, MD; Josine Widdershoven; Gülin Gökçen Kesici; Daniele DE SIATI;; Jeyasakthy Saniasiaya; Alfarghal Mohamad; Jacob Brodsky*

17:30–18:00 **Contemporary Management Of Choanal Atresia**
Yo-IFOS (Young IFOS) · Instructional Course *Lina Woods; Ozan Gökler; Utku Mete*

Friday, 11 September 2026

07:00–08:00 **How To Develop A Career In ORL**
Yo-IFOS (Young IFOS) · Round Table *Amin Javer; Tony Eskander; Warren Mullings; Anastasios Maniakas; Hazan Basak*

08:00–09:00 **Future Of Otolaryngology**
Yo-IFOS (Young IFOS) · Expert Discussion *Daniele DE SIATI; Antonino Maniaci*

09:00–10:00 **Sinonasal Malignant Tumors**
Yo-IFOS (Young IFOS) · Panel Presentation *Benjamin Verillaud; Marco Ferrari; Suha Beton; Uygar DEMIR*

10:45–12:15 **Women In ORL**
Yo-IFOS (Young IFOS) · International Symposia *Zara Patel; Maryana Cherkes; Eleonora Maria Consiglia Trecca; Nicolien van der; poel; Anneclaire Vroegop; Irina Arechvo; Armağan İncesulu*

12:15–12:45 **Targeted Therapy In The Management Of Thyroid Cancer**
Yo-IFOS (Young IFOS) · Keynote Lecture *Mark Zafereo; Murat Yener*

14:00–15:00 **DCR Surgery, Indications, Techniques And Tips For Optimizing Outcome**
Yo-IFOS (Young IFOS) · Panel Presentation *Remo Accorona; Haissan Iftikhar; Melis Demirag Evman; Hazan Basak*

15:00–15:30 **Real-World Deployment Of Artificial Intelligence In Otolaryngology – Head & Neck Surgery**
Yo-IFOS (Young IFOS) · Keynote Lecture *Daniel Lee; Doğan Çakan*

15:30–16:00 **How To Use Large Language Models For Daily ENT Practice**
Yo-IFOS (Young IFOS) · Instructional Course *alberto maria saibene; Doğan Çakan*

16:30–17:30 **Young Indian Academy OHNS Session**
Yo-IFOS (Young IFOS) · International Symposia *Sreenivas Kamath Kasaragod; Rajika Ramkrishnan; Anup Singh; Tamer Bayoumi; Ebaied*

17:30–18:00 **Endoscopic Ear Surgery**
Yo-IFOS (Young IFOS) · Instructional Course *Doğan Çakan; Khalid Al Zaabi*

Saturday, 12 September 2026

07:00–07:45 **The Keys To Establishing A Successful Residency Program**
Yo-IFOS (Young IFOS) · Round Table *Jason Ohlstein; Ozlem Onerci Celebi; Bülent Öcal; Hesham Behzad; Gozde Orhan; Kubat*

08:00–08:30 **Fundamentals Of The Facelift: Anatomy, Techniques, And Evolution**
Yo-IFOS (Young IFOS) · Instructional Course *Vedat Taş; Sevinc Bayrak*

08:30–08:45 **My Experience with Coblation Plasma–Assisted Adenotonsillar Surgery**
Pediatric Otolaryngology · Master of Surgery Video Presentation *DUYGU ERDEM*

09:30–10:00 **The Otospace Group - Ear And Gravity**
Yo-IFOS (Young IFOS) · Keynote Lecture *Daniele DE SIATI; Serdal Celik*

10:45–11:15 **Management Of Recurrent Nasopharyngeal Carcinoma: From Diagnosis To Potential Complications**
Yo-IFOS (Young IFOS) · Expert Discussion *Çağrı Becerik; Mario Turri-Zanoni; Apostolos Karligkiotis; Jacopo Zocchi*

11:15–12:30 **Thyroid Surgery: How To Perform Safe Surgery? Key Points**
Yo-IFOS (Young IFOS) · Panel Presentation *Ömer Bayır; Güleser Saylam; Mehmet Hakan Korkmaz; eray uzunoğlu; Ersoy Doğan*

12:30–12:45 **Clinical Experience with Hypoglossal Nerve Stimulation in Patients with Obstructive Sleep Apnoea**
Yo-IFOS (Young IFOS) · Remarkable Presentation *Jan-Niklas Kuschel; Seçil Bahar Dal*

14:00–14:30 **Simultaneous Total Joint Replacement And Orthognathic Surgery**
Yo-IFOS (Young IFOS) · Keynote Lecture *Erol Cansiz; Alperen Vural*

14:30–15:00 **Malpraxis And Legal Issues In ORL**
Yo-IFOS (Young IFOS) · Keynote Lecture *Jean Anderson Eloy; Suha Beton*

15:00–15:30 **The Evolving Role Of FESS In Managing Pediatric Sinonasal Disease**
Yo-IFOS (Young IFOS) · Instructional Course *Öykü İzel ONARAN; Hazan Basak; Marella Reale*

15:30–16:00 **Management Of Malignant Otitis Externa**
Yo-IFOS (Young IFOS) · Controversies *Khalid Al Zaabi; Ahmet Mutlu*

17:00–18:00 **Application Of Artificial Intelligence In Otolaryngology Resident Training**
Yo-IFOS (Young IFOS) · Round Table *Sermin Can; Alper Özdemir; Ferhat Deniz; Banu Öksüz Ok; Ahmet Furkan Kürüm;; Resul Arjin Öksüz; ilayda Baykan Kendir*

Nasopharyngeal Oncocytic Metaplasia With Complete Resolution Under Allergy-Targeted Medical Management

AYBERK YENİKALE[1], **ORHAN ASYA**[1]

[1]*MARMARA UNIVERSITY*

BACKGROUND & AIM

Nasopharyngeal oncocytic metaplasia is an uncommon entity that may present as an incidental finding or with symptoms such as nasal obstruction and Eustachian tube dysfunction. Oncocytes are large epithelial cells characterized by abundant eosinophilic granular cytoplasm resulting from mitochondrial proliferation. To date, regression following conservative medical therapy has not been clearly documented in the literature. This report presents a case of newly developed nasopharyngeal oncocytic metaplasia and highlights the potential role of conservative medical management as a viable treatment approach.

MATERIAL & METHODS

Clinical, radiologic, and endoscopic data were retrospectively reviewed from institutional records. Following identification of a newly emerged nasopharyngeal nodular lesion during routine postoperative follow-up, punch biopsy was performed and histopathological analysis was conducted using conventional hematoxylin–eosin staining.

After histological confirmation of oncocytic metaplasia, conservative medical management consisting of intranasal corticosteroids and oral leukotriene receptor antagonist plus antihistamine therapy was initiated. Endoscopic examinations were conducted at two- and four-month intervals to document lesion evolution.

RESULTS

Histopathological examination confirmed nasopharyngeal oncocytic metaplasia. Following initiation of intranasal corticosteroid therapy combined with oral levocetirizine and montelukast, progressive regression of the lesion was observed. At the two-month follow-up, partial endoscopic regression was noted, and complete resolution was documented by the fourth month. No recurrence was detected during subsequent follow-up examinations. The patient's nasal symptoms also improved significantly under medical therapy, and no surgical intervention was required.

CONCLUSIONS

Oncocytic metaplasia is histologically characterized by eosinophilic, mitochondria-rich epithelial cells. Advanced age and smoking are established risk factors, while local mucosal irritation may also contribute to its development. In this case, potential etiological factors included age, smoking history, allergic mucosal inflammation, and prior turbinate radiofrequency ablation. Given its predominance in elderly patients, surgical excision under general anesthesia may carry avoidable risks. The observed regression following anti-allergic therapy suggests a possible inflammatory component in lesion persistence. Conservative medical management may therefore be considered before surgical intervention in selected cases.

Trial For The Development Of A Standardized Extract Of Japanese Cypress Pollen

Shusuke Akachi[1], **Kengo Kanai**[1], **Aiko Oka**[1], **Hideaki Kouzaki**[2], **Takeshi Shimizu**[2], **Takaya Higaki**[3], **Mizuo Ando**[4], **Kojiro Hirano**[5], **Isao Suzaki**[5], **Minoru Gotoh**[6], **Kimihiro Okubo**[6], **Mitsuhiro Okano**[1]

[1]*International University of Health and Welfare School of Medicine;* [2]*Shiga University of Medical Science;* [3]*Kawasaki Medical School General Medical Center;* [4]*Okayama University School of Medicine;* [5]*Showa Medical University School of Medicine;* [6]*Nippon Medical School*

BACKGROUND & AIM

Japanese cedar pollinosis (JCP) is the most prevalent seasonal allergic rhinitis in Japan. Many JCP patients are also sensitized to Japanese cypress pollen (JCyP), and their symptoms become exacerbated and prolonged during the JCyP dispersal period after JCP. To date, there have been no reports on the development of JCyP-specific allergen immunotherapy. For the future development of a JCyP-specific skin test and immunotherapy, we sought to develop a reference extract for future standardization of JCyP extract.

MATERIAL & METHODS

A 1:20 antigen extract (Lot AA) was prepared from JCyP grains by the glycerin extraction method. The protein and allergen concentrations in the extract were determined. After confirming its safety, 3-fold serially diluted solutions of JCyP extract were prepared from Lot AA. The average threshold dilution eliciting a positive response in the intradermal skin test was determined among Japanese subjects with serum JCyP-specific IgE class of 2 or higher.

RESULTS

The protein concentration in Lot AA was 4.7 mg/mL, and the allergen concentration was 18.8 µg/mL for Cha o 1 and 1.1 µg/mL for Cha o 3. In total, 85 individuals were registered for this study and finally, 55 subjects were left for the analysis. A total of 45 individuals (81.8%) showed reactions to the extract diluted up to a maximum of 729-fold, with a mean threshold dilution of 1,131-fold. No serious adverse events were observed at any of the tested dilutions.

CONCLUSIONS

The results showed that Lot AA of JCyP extract exhibited in vivo allergic potency and was safe. Thus, it may be useful as a future standardized antigen of JCyP or a reference antigen for standardizing other JCyP extracts for the diagnosis and treatment of JCyP pollinosis.

KEYWORDS

Japanese cedar pollinosis (JCP), Japanese cypress pollen (JCyP), A 1:20 antigen extract (Lot AA)

OP-003

Innovative Immunotherapy For Patients With Allergic Rhinitis -Basic Concept And Updated Clinical Situation

Tetsuya Terada[2], **Hisashi Iizasa**[1], **Fumio Takaiwa**[3]

[1]*Department of Microbiology, Faculty of Medicine, Shimane University, Matsue city, JAPAN;* [2]*Department of Otorhinolaryngology, Osaka Medical University3, Osaka, Japan;* [3]*National Institute of Agrobiological Sciences, Ministry of Agriculture4, Tsukuba, Japan*

BACKGROUND & AIM

I would like to address you informations on the future coming antigen-specific immunotherapy, from standpoints of mucosal route of immunotherapy (sublingual or per os), regional intralymphatic IT, so called, ILIT, and high dose of allergenic epitopes delivery system.

MATERIAL & METHODS

Our consensus on clinical efficacy of on-going Immunotherapy SCIT or SLIT are as follows: 1. SCIT or SLIT is effective for responder (>50%), 2. It takes long enough for patients to feel satisfactory (> 6 months), 3. Clinical experience indicates that adverse events could be the case but not so serious for patients, 4. However, we should be still aware of anaphylactic reactions in rarely some cases. Therefore, we need to seek for more effective and safer methods. Promising future immunotherapy might be achieved by those possible vaccine methods and delivery routes, such as new vaccines, novel adjuvants and new ways of administration, per os, Intralymphatic, and so on, to pursue efficacy and safetyness.

RESULTS

Most recently, ILIT have been employed and reported from these groups worldwide as less time-consuming cost-effective method rather than SLIT. Zelaska, Hylander, and Terada performed their clinical trials, employing MAT fusion Feld vaccine, birch pollen, ceder pollen extracts. As promising routes of allergen delivery, we have devoted our much research time to clarify mechanism of SLIT or per os administration and its clinical efficacy, by using murine allergic rhinitis model and we participated with transgenic(Tg) rice seed project, which started 2005 by the Ministry of Agriculture, Japanese Government. Our responsibility has been to see the clinical effect of These Tg-rice containing ceder pollen allergenic T-cell epitopes in murine

cedar pollinosis model, which is our original one. I would like to introduce you the details of our experimental data in the murine cedar pollinosis model.

CONCLUSIONS

Our conclusion and discussion proposed is as follows: 1. Hypoallergenic products or modified agents should be prepared by modern molecular technologies, because those have an important future role, especially in pediatric patients, to avoid adverse-events. 2. Introduction route of vaccine (allergenic peptides) can be newly classified and evaluated by a mechanism of action and clinical data such as SCIT, SLIT, ILIT, and OIT. 3. Reliable biomarkers should be found to predict efficacy beforehand and evaluation of treatment afterward. Unmet needs could be as the early intervention (prophylactic treatment, or maternal immunization) to avoid allergic status after birth.

immunotherapy, allergic rhinitis, SCIT, SLIT, ELIT

OP-004

Evaluation Of The Effect Of Intranasal Botulinum Toxin A Treatment On Olfactory Functions In Patients With Allergic Rhinitis

Aleyna Şivetoğlu[1], **Hüseyin Işık**[1], **Duygu Erdem**[1], **Deniz Baklacı**[1], **Ergin Bilgin**[1]

[1]*Department of Otorhinolaryngology, Zonguldak Bülent Ecevit University Faculty of Medicine*

BACKGROUND & AIM

Allergic rhinitis (AR) is a chronic, IgE-mediated inflammatory disease affecting 10–40% of the population. Beyond nasal symptoms, AR impairs olfaction in 20–40% of patients through mucosal congestion and eosinophilic inflammation. Standard treatments—intranasal corticosteroids and antihistamines—fail to achieve adequate control in a significant subset of patients. Botulinum Toxin A (BTX-A) represents a promising alternative, reducing rhinorrhea and modulating inflammatory mediators such Substance P. However, its effect on olfactory function remains poorly characterized. This study aims to evaluate the impact of intranasal BTX-A on olfaction in moderate-to-severe AR patients refractory to standard therapy, using the Sniffin' Sticks 12-item identification test.

MATERIAL & METHODS

This retrospective chart review was conducted at the Department of Otorhinolaryngology, Zonguldak Bülent Ecevit University. Data from 30 adult patients diagnosed with moderate-to-severe allergic rhinitis per ARIA criteria between June–December 2025 were analyzed.

Inclusion criteria: age ≥18 years; TNSS ≥6; resistance to standard therapy (intranasal corticosteroids + oral antihistamines); complete pre- and post-treatment olfactory test records. Exclusion criteria: active upper respiratory infection, acute sinusitis, nasal polyposis, severe septal deviation, prior head trauma/neurological disease, or pregnancy/lactation.

All eligible patients received intranasal abobotulinumtoxinA (Dysport®) 80 U total, distributed as 20 U per inferior and middle turbinate bilaterally.

Olfactory function was assessed at baseline and at one month post-injection using the Sniffin' Sticks 12-item odor identification test (score 0–12). Demographic data, COVID-19 history, smoking status, TNSS, RQLQ scores, and allergen sensitization profiles were retrospectively extracted from medical records

RESULTS

Mean patient age was 32.7 ± 8.5 years; 53.3% were female. The most common allergens were cat epithelium, dog epithelium, grass pollen, and dust mites.

Sniffin' Sticks scores improved significantly from 9.67 ± 1.06 at baseline to 10.53 ± 0.90 at month one (Δ = +0.87; paired t-test, $t = -4.07$, $p = 0.0003$). TNSS declined from 8.10 ± 2.09 to 4.17 ± 2.78 ($t = 5.97$, $p < 0.001$), and RQLQ from 95.03 ± 33.23 to 45.03 ± 30.00 (Δ = −50.00; $t = 6.90$, $p < 0.001$). Olfactory improvement did not differ by sex, COVID-19 history, or smoking status.

Spearman correlation revealed a significant negative association between olfactory gain and TNSS reduction ($r = -0.441$, $p = 0.015$), indicating that greater nasal symptom improvement corresponded with better olfactory recovery. The correlation between olfactory change and RQLQ reduction approached but did not reach significance ($r = -0.312$, $p = 0.093$).

CONCLUSIONS

In patients with refractory moderate-to-severe allergic rhinitis, intranasal BTX-A application appears to reduce nasal symptom burden and may contribute to improvements in quality of life. The observed gains in olfactory scores could potentially be related to reduction in nasal congestion and inflammatory mediators, which may allow better access of odor molecules to the olfactory epithelium. These preliminary observations suggest that BTX-A may be a worthwhile consideration in refractory AR management; however, given the retrospective design and limited sample size, findings should be interpreted cautiously. Further prospective, controlled studies with larger cohorts and longer follow-up are needed to draw definitive conclusions.

Sometimes You Just Need To Keep On Track With The Guidelines: An Uncommon Side-Effect Of Tonsils' Enlargement Following Oral Immunotherapy.

ALEXIOS VARDOUNIOTIS[1], **IOANNIS PAPADAKIS**[4], **ILIAS LAPOUSIS**[3], **KONSTANTINOS BALLAS**[2]

[1]*St Mary's NHS Treatment Center, Portsmouth, UK;* [2]*Communitas ENT Clinics, NHS, Croydon, UK;* [3]*Interbalkan European Medical Center, Thessaloniki, Greece;* [4]*Private Practice, Herakleion, Greece*

BACKGROUND & AIM

A 6-year-old female patient presented with chronic rhinitis perennially and was tested positive in the prick test for House Dust Mites (HDM) - Dermatophagoides pteronyssinus 6mm, Dermatophagoides farinae ≥5 mm. Her symptoms included morning sneezing, stuffy nose, conjunctivitis and occasionally shortness of breath when playing in her room, additionally causing sleep disturbances, impairment at school and eventually affecting quality of life.

No improvement was seen 3 months after mite avoidance measures were taken (mite-reducing measures encasing, lowering interior humidity levels). Nasal rinsing and steroid sprays as well as oral anti-histamines marginally improved her symptoms.

MATERIAL & METHODS

She was referred from her pediatrician to an allergist that begun treatment with tablets of oral immunotherapy for allergic rhinitis to HDM. 6 months afterwards she had gradually begun to complain of difficulty in breathing though the mouth and her parents reported snoring that previously did not exist, added to difficulties in eating and drinking.

Follow up ENT examination revealed tonsils grade III without infection and of benign and symmetrical appearance. Blood counts were normal as was her remaining physical examination as the child did not have any notable lymphadenopathy. Ultrasound examination of the abdomen was negative as well.

RESULTS

Even though immunotherapy tablets have been proposed as treatment through international guidelines for HDM in children, the specific brand had indications for "adolescents and adults (12 – 65 years) for persistent moderate to severe house dust mite (HDM) allergic rhinitis despite use of symptom-relieving medication". Additionally, the product monograph master template indicated "Swelling of the tonsils" as an uncommon adverse event -in means of between 0,1% - 1% of patients (more than 1 in 1000 but less than 1 in 100).

Treatment was paused and gradually in the following 3 months the tonsils are decreasing back to their initial size, following the resolution of symptoms and drastic improvement to the patient's condition.

CONCLUSIONS

Despite how rare a complication as the aforementioned might be; after excluding all other possible causes, it remains the most likely underlying pathology.

At the time the patient and family are discussing more orthodox regimens of treatment.

Diagnostic Accuracy Of The Score For Allergic Rhinitis (SFAR) Compared With Skin Prick Testing

Müslüm AYRAL[1], **Enes SIRMA**[1], **Siraç IRMAK**[1]

[1]*Gazi Yaşargil Training and Research Hospital, Department of Otorhinolaryngology, Head and Neck Surgery*

BACKGROUND & AIM

Allergic rhinitis is a common condition requiring accurate and practical diagnostic tools. The Score for Allergic Rhinitis (SFAR) is a simple questionnaire-based tool; however, its diagnostic performance compared to skin prick testing remains to be further validated. To evaluate the diagnostic accuracy of the SFAR questionnaire in predicting allergic sensitization using skin prick testing as the reference standard.

MATERIAL & METHODS

This cross-sectional diagnostic accuracy study included 180 patients who underwent skin prick testing for suspected allergic rhinitis. Skin prick test positivity was defined as the presence of at least one positive allergen reaction. SFAR scores were calculated for all participants, and a cut-off value of ≥7 was used to define allergic rhinitis. Diagnostic performance was assessed using sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and receiver operating characteristic (ROC) curve analysis.

RESULTS

Among the 180 participants, 118 (65.6%) were skin prick test positive. SFAR scores were significantly higher in the prick-positive group. Using a cut-off value of ≥7, SFAR demonstrated a sensitivity of 89.8% and a specificity of 80.6%. The PPV and NPV were 89.8% and 80.6%, respectively. The overall diagnostic accuracy was 86.7%. ROC analysis revealed an area under the curve (AUC) of 0.91, indicating excellent discriminative ability.

CONCLUSIONS

The SFAR questionnaire demonstrates high diagnostic accuracy in identifying allergic sensitization compared with skin prick testing. With excellent sensitivity and good specificity, SFAR may serve as a reliable and practical screening tool in clinical settings, particularly where access to allergy testing is limited.

OP-007

EVALUATION OF THE CORRELATION BETWEEN INTERLEUKIN LEVELS AND NASAL POTENTIAL DIFFERENCE IN CHRONIC RHINOSINUSITIS WITH NASAL POLYPS: A CONTROLLED STUDY

İSMAİL KAYGISIZ[1], **MEHMET ALTAN**[2], **BERK DURAN**[3], **HÜSEYİN BOZKURT**[4], **ÖZGÜR YİĞİT**[1]

[1]*University of Health Sciences Istanbul Training and Research Hospital Otorhinolaryngology Clinic;* [2]*Cerrahpaşa Faculty of Medicine, Department of Physiology;* [3]*University of Health Sciences Istanbul Training and Research Hospital, Department of Biochemistry;* [4]*University of Health Sciences Istanbul Training and Research Hospital, Department of Radiology*

BACKGROUND & AIM

To reveal the relationship between basal nasal potential difference measurement and Th2-mediated interleukin levels in patients with chronic rhinosinusitis with nasal polyps.

MATERIAL & METHODS

This study was designed as a prospective controlled clinical trial. Twenty patients diagnosed with chronic rhinosinusitis with nasal polyps (study group) who were indicated for functional endoscopic sinus surgery (FESS) and 20 patients planned for septoplasty (control group) due to septal deviation based on physical examination were included in the study. Basal nasal potential difference measurements were performed on the study group and control group before surgery. Venous blood samples were also taken to measure serum Interleukin 4, 5, and 13 (IL-4, 5, 13). FESS was performed on the study group, while septoplasty was performed on the control group. On postoperative month 1, basal nasal potential difference measurements and serum interleukin measurements were repeated in both groups. Clinical and radiological findings were evaluated preoperatively using the Lund Mackay score and Lund Kennedy score.

RESULTS

The study included 20 patients with chronic rhinosinusitis with nasal polyps and 20 patients with septal deviation. A statistically significant relationship was found between preoperative basal nasal potential difference measurements and IL-5 levels, while no significant relationship was observed with IL-4 and IL-13. Although preoperative basal nasal potential difference measurements showed more negative values in the patient group, this difference was not statistically significant. A significant relationship was found between preoperative Lund-Mackay scores and IL-4 and IL-13 in the patient group, but no significant relationship was found with IL-5. No significant relationship was observed between preoperative Lund-Kennedy scores and interleukin values.

CONCLUSIONS

In this study, patients with chronic rhinosinusitis with nasal polyps were found to have lower nasal potential values compared to the control group. A relationship was specifically demonstrated between IL-5 and nasal potential difference. Although these findings suggest an association between epithelial dysfunction and IL-5 levels, further comprehensive studies are warranted.

OP-008

The Effect Of PRF Application After Inferior Turbinate Radiofrequency On Wound Healing And Complications: A Comparative Study With Furacin Ointment

Hayder Al FARJAWEE[1], **ERAY UZUNOĞLU**[1]

[1]*Bakirçay University Faculty of Medicine*

BACKGROUND & AIM

Inferior turbinate hypertrophy is one of the most common causes of chronic nasal obstruction. Although radiofrequency (RF) reduction is a mucosa-preserving technique with low complication rates, postoperative crusting and delayed mucosal recovery remain clinical concerns. Platelet-rich fibrin (PRF), an autologous second-generation platelet concentrate, provides sustained release of growth factors that promote tissue regeneration. This study aimed to evaluate whether PRF application after inferior turbinate RF improves wound healing, reduces postoperative crusting, and enhances patient-reported outcomes.

MATERIAL & METHODS

This retrospective split-nose study was conducted at Çiğli Training and Research Hospital, İzmir. Patients undergoing inferior turbinate RF were included. PRF was applied to one inferior turbinate, while the contralateral side served as control. Although power analysis suggested 50 patients, 39 met inclusion criteria and were analyzed. Crusting severity at postoperative week 1

was graded (none–severe) and compared using Bowker and McNemar tests. Symptom severity and quality of life were assessed using SNOT-22 and VAS scores at baseline, week 1, and month 1. Paired t-tests and Wilcoxon signed-rank tests were used for within-patient comparisons. Subgroup analyses evaluated sex, smoking, allergy history, prior surgery, and repeat RF status.

RESULTS

Thirty-nine patients (mean age 42.1±12.1 years; 51.3% male) were analyzed. At postoperative week 1, crusting severity was significantly lower on the PRF-treated side (χ^2=13.45, p=0.009), with 56.4% demonstrating reduced crusting compared with the control side. SNOT-22 scores significantly improved from baseline to week 1 (p=0.0109) and further at month 1 ($p=4.3\times10^{-7}$). VAS scores showed marked reduction at week 1 ($p=1.46\times10^{-7}$) and month 1 ($p=9.68\times10^{-12}$). Improvements were consistent across subgroups. Patients with allergy showed greater SNOT-22 reduction at month 1 (p=0.034), though interpretation is limited by small sample size.

CONCLUSIONS

PRF application following inferior turbinate RF significantly reduces early postoperative crusting and improves patient-reported symptom scores. These findings suggest that PRF may enhance mucosal healing and accelerate functional recovery after turbinate RF. Prospective randomized studies with larger cohorts are needed to validate these results.

OP-009

Intralymphatic Allergen Immunotherapy In Grass Pollen Allergy: Current Insights And Clinical Perspectives

Elshan Aghayev

BACKGROUND & AIM

Grass pollen allergy is one of the most prevalent causes of seasonal allergic rhinitis worldwide, significantly impacting patient quality of life. Allergen-specific immunotherapy (AIT) remains the only disease-modifying treatment, but traditional subcutaneous (SCIT) and sublingual (SLIT) routes require long treatment durations and suffer from poor adherence. Intralymphatic immunotherapy (ILIT) is a novel route that involves direct injection of allergens into lymph nodes, offering the potential for rapid and sustained immunological tolerance with minimal dosing.

MATERIAL & METHODS

A prospective, multi-center, open-label clinical trial was conducted to evaluate the efficacy, safety, tolerability, and immunological outcomes of intralymphatic immunotherapy (ILIT) with a standardized grass pollen allergen extract in adult patients with moderate to severe seasonal allergic rhinitis. Participants received three ultrasound-guided intralymphatic injections of a standardized grass pollen allergen extract, administered into a groin lymph node at four-week intervals (weeks 0, 4, and 8). Injections were performed under sterile conditions using high-resolution ultrasonography for accurate needle placement.

RESULTS

Our clinical study involved three ultrasound-guided injections at four-week intervals and demonstrated that ILIT with grass pollen extract reduces rhinoconjunctivitis symptoms and medication use, with effects persisting at least 2 years after therapy.

CONCLUSIONS

ILIT represents a promising and efficient alternative to conventional immunotherapy in grass pollen allergy. Its short duration, favorable safety profile, and long-lasting effects make it especially attractive for improving patient compliance. However, standardized protocols, broader indications and different allergens, and further long-term, large-scale studies are still needed to fully integrate ILIT into clinical practice guidelines.

OP-010

Efficacy Of Sublingual Immunotherapy With Japanese Cedar Pollen For Cypress Pollinosis In Real-World Settings

Ihsan Gunduz[1], **Aiko Oka**[1], **Kengo Kanai**[1], **Ryo Takagi**[1], **Maki Akamatsu**[1], **Akiho Shibata**[1], **Tomoaki Shirakawa**[1], **Mitsuhiro Okano**[1]

[1]*International University of Health and Welfare Narita Hospital*

BACKGROUND & AIM

It remains unclear whether allergen immunotherapy with Japanese cedar pollen extract is effective for Japanese cypress pollinosis in real-world settings. This study investigated the Japan-wide prevalence of cypress pollinosis, the efficacy of cedar

sublingual immunotherapy (SLIT) on cypress pollinosis, the role of serum specific IgE levels in pollinosis, and patients' interest in the development of cypress SLIT.

MATERIAL & METHODS

A cross-sectional, multicenter study using self-administered questionnaires was conducted in regions of Japan where cedar and cypress pollen dispersal is prevalent. This study included patients aged 5 to 69 years who received cedar SLIT in 2023. Data were collected from 31 facilities of Amesara ENT Clinic, Arao Internal Medicine and Otolaryngology, Azusawa ENT Clinic, Bamba ENT Clinic, Chofu Ekimae ENT Clinic, Fukushima Clinic, Hama ENT Clinic, Hidamari Clinic, Hyo ENT Clinic, Ikeda ENT Clinic, Kumanomidou ENT Clinic, Kosugi ENT Clinic, Masuda ENT Clinic, Minna-no-kodomo Allergy Clinic, Makinohara Nanohana ENT Clinic, Mie ENT Clinic, Mimura Clinic, Miyako Clinic, Nagakura ENT Allergy Clinic, Niitsu Clinic, Oizumigakuen ENT Clinic, Okawa ENT Clinic, Oyama Nakamaru Clinic, Sakaguchi ENT Clinic, Shiratsuchi ENT Clinic, Tokuda Family Clinic, Tokuriki ENT Clinic, Terada Allergy Kodomo Clinic, Yasuda Clinic, Yuta Clinic, International University of Health and Welfare Narita Hospital.

RESULTS

Out of 2,597 participants analyzed, 84.5% experienced pollinosis symptoms during the cypress season prior to receiving cedar SLIT. Among these patients, 40.2% felt that cedar SLIT was less effective during the cypress season than during the cedar season. The longer patients received cedar SLIT, the greater the inefficacy perceived during the cypress versus the cedar season. No significant differences were reported for IgE levels to cedar and cypress between patients reporting either high or less efficacy for the cedar SLIT during cypress season. Interest in cypress SLIT was seen in 78.4% of these patients.

CONCLUSIONS

Although there is a bias based on regional distribution, cedar SLIT has induced a limited efficacy on cypress pollinosis in real-world settings, suggesting a need for the development of cypress SLIT.

OP-011

Real-Life Practice In The Medical Treatment Of Allergic Rhinitis: A Nationwide Survey Of Physician Decision-Making

Simge Ipek Yildiz[1], **Cuneyt Orhan Kara**[1], **Bulent Topuz**[1]

[1]*Pamukkale University Faculty of Medicine, Department of Otorhinolaryngology, Denizli, Türkiye*

BACKGROUND & AIM

Allergic rhinitis is managed by physicians from different specialties, and treatment decisions may vary in real-life practice. This study aimed to evaluate real-life medical treatment patterns in allergic rhinitis and to identify key factors influencing physician decision-making, including education, clinical experience, and guideline use.

MATERIAL & METHODS

A cross-sectional web-based survey consisting of 16 questions was conducted among otorhinolaryngologists and primary care physicians. The survey assessed treatment preferences, use of educational and guideline resources, concerns about adverse effects, and mask recommendations. Group comparisons were performed using chi-square analysis.

RESULTS

A total of 183 physicians participated. Disease severity (88.1%), dominant symptom (60.3%), and drug efficacy (49.7%) were the main factors influencing treatment decisions. The most common reference source was knowledge gained during residency (64.5%), while ARIA guideline use was 44.3% and significantly higher among otorhinolaryngologists ($p < 0.05$). Oral antihistamines and intranasal corticosteroids were the most preferred first-line treatments. Leukotriene receptor antagonists were among the most frequently preferred second-line treatments in cases of inadequate response (50.8%). Immunotherapy was recommended by 18.6% of physicians. Decongestants were also commonly used (57.6%). Systemic corticosteroids were the most frequently avoided drugs due to adverse effect concerns (75.3%). Additionally, 45.4% of physicians did not recommend mask use.

CONCLUSIONS

Real-life management of allergic rhinitis is largely driven by symptom profile and clinical experience rather than strict adherence to guideline algorithms. The frequent use of leukotriene receptor antagonists and relatively low immunotherapy recommendation rates suggest that individualized clinical priorities play a central role in treatment decision-making.

OP-012

Increased Listening Effort In Chronic Tinnitus Despite Comparable Audiometric And DPOAE Findings

Samet KILIÇ[1], **Büşra Nur ESER**[2]

[1]*Trakya University, Faculty of Health Sciences, Audiology Department;* [2]*Istanbul Medipol University Graduate School of Health Sciences - Istanbul Medipol University Faculty of Health Sciences Audiology Department*

BACKGROUND & AIM

Chronic subjective tinnitus is often accompanied by speech-in-noise difficulties despite normal conventional audiometric thresholds. These complaints may reflect increased cognitive load during listening rather than reduced audibility alone. This study aimed to evaluate listening effort in adults with chronic tinnitus using an individualized dual-task speech-in-noise paradigm, while also examining tinnitus burden, extended high-frequency hearing, and distortion-product otoacoustic emission findings.

MATERIAL & METHODS

This controlled cross-sectional study included 37 adults with chronic subjective tinnitus and normal conventional audiometric thresholds ≤20 dB hearing level, as well as 37 age-matched normal-hearing controls. All participants underwent conventional pure-tone audiometry, extended high-frequency audiometry, and distortion-product otoacoustic emission testing at 1, 3, 4, 6, and 8 kHz. Tinnitus burden was assessed using the Tinnitus Handicap Inventory. Speech reception threshold was determined using the Turkish Matrix Sentence Test. Three individualized signal-to-noise ratio conditions were calculated relative to each participant's speech reception threshold: −3, 0, and +3 dB. Listening effort was assessed using a dual-task paradigm, with median reaction time of the secondary task as the primary outcome. Data were analyzed using mixed analysis of variance and Bonferroni-adjusted comparisons.

RESULTS

Speech recognition performance did not differ significantly between groups across signal-to-noise ratio conditions, $p = 0.284$. Extended high-frequency thresholds and distortion-product otoacoustic emission responses at 1, 3, 4, 6, and 8 kHz were also comparable between groups, all $p > 0.05$. However, the tinnitus group showed longer reaction times than controls at −3 dB, 856 ± 124 versus 708 ± 110 ms; 0 dB, 781 ± 118 versus 642 ± 103 ms; and +3 dB, 704 ± 105 versus 582 ± 97 ms. Mixed analysis of variance revealed significant main effects of Group, $F(1,72) = 14.62$, $p < 0.001$, and signal-to-noise ratio, $F(2,144) = 31.48$, $p < 0.001$. The Group × signal-to-noise ratio interaction was not significant, $p = 0.301$.

CONCLUSIONS

Adults with chronic tinnitus demonstrated increased listening effort despite comparable conventional audiometry, extended high-frequency hearing, distortion-product otoacoustic emission findings, and speech recognition performance. These findings suggest that tinnitus-related listening difficulties may reflect increased cognitive-auditory load not captured by threshold-based or outer hair cell measures alone. Dual-task listening-effort assessment may add clinically meaningful information to tinnitus evaluation and counseling.

Usage Of Personal Listening Devices And Awareness Of Safety Precautions Among Tertiary Students In UDS

Raymond Abi[1]

[1]*University for Development Studies*

BACKGROUND & AIM

The increasing prevalence of Personal Listening Devices (PLDs) among tertiary students raises concerns regarding their auditory health. This study investigated the usage patterns and awareness of safety precautions associated with PLDs among students at the University for Development Studies (UDS).

MATERIAL & METHODS

The study was conducted among students at University for Development Studies, Ghana. A cross-sectional design was employed through a multi-stage sampling method where 477 participants were surveyed through a structured questionnaire. The study evaluated personal listening devices (PLDs) usage and awareness of safety precautions and was then analyzed using Stata version to determine frequencies and proportions, and Chi-square tests to determine associations between socio-demographic factors with PLD usage and awareness of safety precautions.

RESULTS

The findings revealed a high prevalence of PLD usage (93.5%) with the majority using in-ear earphones (74.6%). Majority of respondents were aware that listening to content through your PLD for a prolonged time can contribute to hearing loss (89.5%). Most of the respondents knew that using PLDs less than sixty minutes is the safest duration (69.8%). Most respondents were aware that high volume on PLDs causes hearing loss (87.6%) with most aware 60% is the safest volume limit (73%). Overall, majority of respondents had a good awareness level (56.4%) of the safety about PLDs. There was a significant association between students' faculty affiliation and their awareness levels [chi=10.96, p-value=0.012].

CONCLUSIONS

The study showed a high prevalence of PLDs usage among the students of UDS with most of the students aware of the safety precautions needed while using their PLDs.

Video Ocular Counter-Roll Responses In Individuals With Benign Paroxysmal Positional Vertigo : Preliminary Findings

Nizamettin Burak Avcı[1]

[1]*Trakya University, Faculty of Health Sciences, Audiology Department, Edirne, Türkiye*

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is the most common pathology of the peripheral vestibular system and is closely related to the functional integrity of the otolith organs, especially the utricle. Ocular counter-roll (OCR) is a reflex in which both eyes are rotated in the opposite direction in response to tilting the head in the frontal plane, and this response is largely regulated by utricle. Given the association between BPPV and utricle, this study aimed to evaluate video OCR (vOCR) responses in individuals diagnosed with BPPV in comparison with healthy controls.

MATERIAL & METHODS

This study was conducted using a cross-sectional design. The study included individuals aged 23–40 years (n = 10; 7F, 3M) diagnosed with unilateral posterior canal canalitis (BPPV) confirmed by positional test, and age- and gender-matched healthy controls (n = 10; 6F, 4M). vOCR measurement was performed by recording eye position responses with a 30° head tilt to the right and left via a videonystagmography system. The Mann-Whitney U test was used for intergroup comparisons, and the Wilcoxon test was used for comparisons of the affected and unaffected sides.

RESULTS

In the BPPV group, the degree of static vOCR eye position was found to be statistically significantly lower compared to the control group (6.75° ± 0° for control, 3.88° ± 1.75° for BPPV; p = 0.002). The asymmetry rate was higher in the BPPV group (0.20) compared to the control group (0.03) (p = 0.015). Six participants in the study group had left posterior canal involvement, while four had right posterior canal involvement. The degree of static vOCR eye position on the affected ear side (4.00° ± 2.00°) was found to be lower in BPPV patients compared to the unaffected side (5.00° ± 2.00°) (p=0.029).

CONCLUSIONS

The preliminary findings suggest that BPPV is not limited to canal pathology but can also measurably affect otolithic function. vOCR stands out as a non-invasive and feasible clinical tool that can contribute to the assessment of utricular function in BPPV. Confirmation of these results with larger samples is important for the integration of vOCR into BPPV protocols.

Occupational Auditory Health: A Multi-Center Cross-Sectional Analysis Of Noise-Induced Hearing Loss Among Hospital Food Service Personnel

REN HUI LO[1,2], **NIK ADILAH NIK OTHMAN**[2], **MOHD KHAIRI MD DAUD**[2]

[1]*Ministry of Health, Malaysia;* [2]*Department of Otorhinolaryngology-Head & Neck Surgery, School of Medical Sciences,, University of Science, Malaysia*

BACKGROUND & AIM

Excessive noise exposure leading to hearing loss is a recognized health hazard. While industrial environments have historically been the focus of noise studies, hospital kitchens represent a significant, yet often overlooked, source of acoustic pollution. Prolonged exposure in these settings may pose a substantial risk to staff. This is one of the largest multi-center studies in Malaysia evaluating the prevalence of noise-induced hearing loss (NIHL) among hospital kitchen personnel compared to other healthcare staff. Our aim is to evaluate noise hazards in hospital kitchens, establish foundational occupational health rights, and promote proactive hearing protection awareness among staff.

MATERIAL & METHODS

Utilizing a descriptive cross-sectional approach, this study evaluated kitchen staff from five hospitals in Malaysia. Comparisons were made with a cohort of non-kitchen personnel, specifically administrative and clinical staff. Following a mandatory 48-hour noise-free interval, subjects underwent clinical assessment via pro forma, otoscopy, and pure tone audiometry within a controlled soundproof setting.

RESULTS

A total of 245 hospital employees participated in this study, comprising 123 kitchen staff and 122 non-kitchen personnel. Kitchen workers exhibited a significantly higher rate of hearing impairment (54.3%) than their counterparts (27.0%). Audiometric dips were primarily localized at 6 kHz, followed by 4 kHz and 3 kHz. Furthermore, the duration of employment (years of service) differed significantly based on the severity of hearing loss ($p = 0.010$).

CONCLUSIONS

The findings indicate that noise levels within hospital kitchens constitute a significant occupational hazard. A positive correlation was observed between the duration of employment and the severity of hearing impairment among kitchen personnel. Consequently, we recommend the mandatory implementation of hearing protective equipments for all staff operating in these environments.

Development And Adaptation Of Kyrgyz Speech Tests For Pediatric Hearing Assessment

Shirin Zhumabaeva[1], **Anastasiia Naimanova**[2]

[1]*The National Center of Maternity and Childhood Welfare;* [2]*I. Arabaev Kyrgyz State University*

BACKGROUND & AIM

The absence of standardized speech audiometry materials in the Kyrgyz language limits accurate hearing assessment in Kyrgyz-speaking children. The aim of this study was to develop and adapt linguistically and perceptually balanced speech tests for pediatric audiological evaluation in the Kyrgyz language and to assess their reliability in children with normal hearing.

MATERIAL & METHODS

The project was conducted within the framework of the JICA mini-grant program from January to March 2025. During the first stage, Kyrgyz-language speech audiometry materials were developed for pediatric hearing assessment, including monosyllabic, disyllabic, multisyllabic, dichotic, and binaural alternating speech test tables. Word selection was based on phonetic balance, syllable structure, word frequency, part-of-speech distribution, and psycholinguistic factors, including priming effects. Test lists were balanced according to acoustic and phonetic characteristics of the Kyrgyz language. During the second stage, the reliability and perceptual balance of the tests were evaluated in 112 children aged 3–16 years with normal hearing. Testing was performed in a quiet environment with background noise below 65 dB, and all participants underwent audiometric examination confirming normal hearing. Following revision of selected words, additional validation was

conducted in 20 children. The final version demonstrated stable perceptual balance and high reliability for pediatric speech audiometry.

RESULTS

Initial testing demonstrated high perceptual reliability of the developed speech materials. Minor errors were identified in the reproduction of two individual words by a small number of participants. Following linguistic revision and replacement of these words, repeated testing in the supplementary group showed no reproduction errors. The final test lists demonstrated stable perceptual balance and consistency across age groups.

CONCLUSIONS

The developed Kyrgyz-language speech audiometry materials represent a reliable and linguistically validated tool for pediatric hearing assessment. These tests may improve accessibility and accuracy of speech audiometry for Kyrgyz-speaking children in clinical audiology practice.

Associations Of Body Mass Index And Physical Activity With Balance Performance In Healthy Young Adults

Sıdıka CESUR COSKUN[1], **Melike SİMSEK**[1], **Ayşegül CAKMAK**[1], **Bahar ABDALLA**[1], **Yusuf KANSU**[1]

[1]*Department of Audiology, Faculty of Health Sciences, Istanbul Medeniyet University, Istanbul, Türkiye*

BACKGROUND & AIM

Body mass index (BMI) may influence postural control; however, evidence regarding its association with balance performance in healthy young adults, particularly those with low BMI, remains limited. This study aimed to investigate the associations of BMI categories and physical activity (PA) levels with static postural control and dynamic balance performance in healthy young adults.

MATERIAL & METHODS

This cross-sectional study included 76 healthy university students (mean age: 21.8±1.4 years). Participants were categorized as underweight (n=10), normal-weight (n=53), or overweight (n=13) according to BMI. Balance was assessed using the Fukuda Stepping Test, Tandem Walking Test, Modified Clinical Test of Sensory Interaction on Balance (mCTSIB), Limits of Stability (LOS), and Rhythmic Weight Shift (RWS) tests. PA was assessed using the Physical Activity Scale-2. Group differences were analyzed using the Kruskal–Wallis test with Bonferroni-adjusted post-hoc comparisons, and associations were examined using Spearman correlation analysis.

RESULTS

Significant differences among BMI groups were observed across all mCTSIB conditions ($p=0.005–0.015$) and the composite score ($p<0.001$). Postural sway was highest in the underweight group and lowest in the overweight group. The median composite sway velocity was 0.72°/s, 0.58°/s, and 0.47°/s in the underweight, normal-weight, and overweight groups, respectively. BMI was negatively correlated with all mCTSIB parameters, with the strongest association observed for the composite sway velocity ($r=−0.444$, $p<0.001$). No significant differences were found among BMI groups in LOS or RWS parameters (all $p>0.05$). BMI was positively correlated with RWS anterior-posterior velocity ($r=0.250$, $p=0.030$). PA was associated with selected dynamic balance parameters, including LOS endpoint excursion ($r=−0.341$, $p=0.003$) and RWS mediolateral velocity ($r=0.355$, $p=0.002$).

CONCLUSIONS

Lower BMI was associated with greater postural sway, particularly under challenging sensory conditions, whereas dynamic balance performance did not differ significantly across BMI groups. PA was associated with selected dynamic balance parameters, suggesting that BMI and PA may be related to different aspects of balance performance in healthy young adults. These findings highlight the potential value of considering both BMI and PA when evaluating postural control and balance performance in this population.

IMPACT OF PROLONGED ELECTRONIC DEVICE USE ON AUDITORY PROCESSING DISORDER

MSc.Israa Yousuf Afadar[3], **Dr.safa Alqudah**[1,2], **Dr.Mohammed Al-Harbi**[2]

[1]*Isabel University;* [2]*Taibah University - Medina;* [3]*Vision Medical Centre, Riyadh, Saudi Arabia; Isabel University*

BACKGROUND & AIM

The auditory system is crucial for interpreting sounds, yet individuals with Auditory Processing Disorder (APD) struggle despite normal hearing. APD affects abilities such as sound localization, temporal resolution, and speech perception in noise. The widespread use of electronic devices—including smartphones, tablets, and personal listening devices—has raised concerns

about potential impacts on cognitive and sensory functions. Excessive use has been associated with attention, memory, and language difficulties, but its effects on central auditory processing remain underexplored. This study in Riyadh, Saudi Arabia, examined whether prolonged device use affects auditory processing in both adults and children using standardized APD assessments.

MATERIAL & METHODS

This study included 160 Arabic-speaking participants with normal peripheral hearing: 100 adults (18–80 years) and 60 children (5–17 years). Inclusion required regular use of electronic devices and informed consent (guardian consent for children). Exclusion criteria included peripheral hearing loss, auditory or neurological disorders, cognitive deficits, non-Arabic speakers, children under 5, and unreliable usage reporting. Participants were divided into two groups based on daily device exposure: limited (≤5 hours/day) and overexposure (>5 hours/day).

Data collection had two stages. Stage 1: an online survey (Arabic/English) collected demographics, device usage, and scheduled appointments. Stage 2: clinical assessment included peripheral hearing evaluation and Auditory Processing Disorder (APD) tests: Gaps-in-Noise (GIN), Pitch Pattern Sequence (PPS), Duration Pattern Sequence (DPS), Masking Level Difference (MLD), and Random Gap Detection (RGDT), with stimuli presented binaurally at 50–70 dB HL using standard scoring and normative data.

Statistical analysis used descriptive statistics, Mann–Whitney U tests, and Spearman's rho correlations ($p < 0.05$).

RESULTS

A total of 160 participants completed the study: 100 adults (62.5%) and 60 children (37.5%), median age 25 years (range 8–68), with 51.3% males and 48.7% females. Median daily device use was 5.5 hours (range 2–14). Participants were divided into limited exposure (≤5 hrs/day) and overexposure (>5 hrs/day) groups, with no baseline differences in sex, usage, or hearing function.

Adults with limited exposure outperformed overexposed adults on APD tests: GIN (73.3% vs. 62.3%), PPS (96.7% vs. 81.5%), DPS (93.3% vs. 86.6%), MLD (18.0 dB vs. 12.0 dB), and RGD (11.3 ms vs. 16.3 ms), $p<0.001$, with strong bilateral correlations.

In children, deficits were more pronounced: limited users scored higher in GIN, PPS, DPS, and MLD, while overexposed users showed poorer temporal resolution (RGD), with high bilateral correlations, notably PPS ($r = 0.922$).

Prolonged device use impaired auditory processing in both groups, especially children.

CONCLUSIONS

This study demonstrates that prolonged electronic device use (>5 hrs/day) negatively impacts central auditory processing in both adults and children with normal hearing. Across APD tests, overexposed participants performed significantly worse than those with limited use. Children were more vulnerable, showing greater deficits in pitch and duration recognition, temporal resolution, and binaural interaction. Adults also exhibited reduced temporal and binaural processing. Strong bilateral correlations indicate that deficits affect the auditory system as a whole. These findings stress the importance of balanced technology use, especially during childhood, and highlight the need for awareness, clinical monitoring, and further research.

Investigation Of Hearing Aid Performance In Patients With Subjective Tinnitus

Gözde Bayramoğlu Çabuk[1], **Işık Sibel Küçükünal**[2], **Metin Yılmaz**[3]

[1]*Department of Audiology, Faculty of Medicine, Gazi University, Ankara,Turkiye;* [2]*Department of Speech and Language Therapy, Faculty of Health Sciences, Gazi University, Ankara, Türkiye;* [3]*Department of Otorhinolaryngology, Faculty of Medicine, Gazi University, Ankara, Turkiye*

BACKGROUND & AIM

Patients with tinnitus and hearing loss frequently report difficulty understanding speech, particularly in noisy environments. Hearing aids may reduce tinnitus-related distress by restoring auditory input and improving communication; however, their benefits may not be fully reflected by pure-tone thresholds alone. This study aimed to investigate changes in tinnitus handicap and speech perception in noise after six months of hearing aid use in patients with subjective tinnitus. A secondary aim was to examine whether improvements differed between the tinnitus-affected and non-tinnitus sides.

MATERIAL & METHODS

This study included 23 adults aged 18–59 years with subjective tinnitus and hearing loss who were fitted with hearing aids. All participants underwent a standard assessment protocol before hearing aid fitting and after six months of regular hearing aid use. Tinnitus-related distress was evaluated using the Tinnitus Handicap Inventory (THI). Speech perception was assessed with hearing aids using the Turkish Matrix Sentence Test in quiet and under different noise conditions. Pure-tone audiometric thresholds were also recorded. For the side-specific analysis, participants with clearly defined right- or left-sided/dominant tinnitus were evaluated by comparing performance on the tinnitus-affected and non-tinnitus sides. Relationships between changes in THI scores, speech-in-noise performance, and pure-tone thresholds were examined.

RESULTS

After six months of hearing aid use, THI scores decreased significantly, indicating a reduction in tinnitus-related handicap. Speech-in-noise performance improved significantly across the noise conditions, whereas the change in quiet was limited. In the side-specific analysis, the improvement in speech reception threshold was greater on the tinnitus-affected side, reaching approximately 4 dB, while a smaller improvement was observed on the non-tinnitus side. The reduction in THI scores was moderately associated with the improvement in Matrix test performance on the tinnitus side (Spearman's ρ = 0.51). In contrast, changes in tinnitus handicap were not significantly associated with pure-tone hearing thresholds.

CONCLUSIONS

Six months of hearing aid use was associated with reduced tinnitus handicap and improved speech-in-noise performance. The greater improvement observed on the tinnitus-affected side suggests that regular hearing aid use may provide benefits beyond amplification alone. Moreover, the relationship between THI reduction and speech-in-noise improvement—but not pure-tone thresholds—indicates that tinnitus-related improvement is more closely linked to functional listening performance than to audibility. Therefore, the clinical evaluation of hearing aid benefit in patients with tinnitus should include tinnitus-specific questionnaires and speech-in-noise testing in addition to conventional pure-tone audiometry.

CORGEE: Automatic And Objective Assessment Of Speech Intelligibility And Hearing Device Benefit In Pediatric Hearing Aid And Cochlear Implant Users

Nicolas Verhaert[1,2,3], **Tilde Van Hirtum**[4], **Loes Desmedt**[2,3,1], **Ben Somers**[4], **Benjamin Dieudonné**[4], **Sam Denys**[3,1,2], **Tom Francart**[2]

[1]University Hospitals Leuven, Department of Otorhinolaryngology, Head and Neck Surgery, Leuven, Belgium; [2]KU Leuven, Department of Neurosciences, ExpORL, Leuven, Belgium; [3]University Hospitals of Leuven, Department of Otorhinolaryngology – Head and Neck Surgery, Multidisciplinary University Center for Speech-Language Pathology and Audiology, Leuven, Belgium; [4]Brainphonics, Leuven, Belgium

BACKGROUND & AIM

Assessments of speech intelligibility provide clinically meaningful information on how children perceive and process speech in everyday listening environments and are essential for evaluating functional hearing and aided benefit. However, current methods such as speech audiometry have important limitations in vulnerable populations, particularly young children, when behavioral testing is unreliable or infeasible. Neural Speech Tracking (NST), derived from EEG responses to continuous natural speech, is a promising biomarker of auditory speech processing, quantified as alignment between cortical responses and the speech envelope. CORGEE translates NST into clinically usable software enabling real-time EEG acquisition and visualization during natural speech presentation contexts.

MATERIAL & METHODS

To date, however, NST has not been translated into a clinically usable device. CORGEE addresses this unmet need by implementing NST methodology in clinical software.

We conducted a multicenter clinical trial including 99 pediatric participants with hearing impairment (age range: 0;07 – 12;04 years), consisting of hearing aid users (N = 88) and a subgroup of cochlear implant users (N = 11). CORGEE was used to present continuous natural speech (an age-appropriate animated movie) at different stimulus intensities while simultaneously recording and processing EEG signals to derive NST outcomes in real time. Behavioral speech intelligibility scores were using standardized speech-in-quiet audiometry and compared with NST outcomes.

RESULTS

Results from both hearing aid and cochlear implant users demonstrate that CORGEE can reliably obtain NST measures in a clinical context. NST increased with increasing stimulus intensity, indicating sensitivity to speech audibility. Moreover, stronger NST was associated with higher behavioral speech intelligibility scores. In hearing aid users, CORGEE captured aided benefit objectively, with NST differences between aided and unaided conditions most pronounced at lower stimulus intensities.

CONCLUSIONS

These findings provide clinical evidence that NST, as implemented in CORGEE, reflects auditory access to speech and relates to speech intelligibility in children with hearing impairment. CORGEE may therefore serve as a feasible and clinically relevant complementary tool to behavioral speech audiometry, particularly for hard-to-test children, and may support outcome evaluation, counseling, and hearing device fitting during early auditory development.

OP-021

Postmenopausal Hormone Therapy And Risk Of Hearing Loss: A Systematic Review

Sarah Law[1], **Nia Davies**[2], **Bibek Das**[2], **Rishi Talwar**[1]

[1]Luton & Dunstable University Hospital; [2]Department of Surgery and Cancer, Imperial College London

BACKGROUND & AIM

Age-related hearing loss is common among older women and is associated with reduced quality of life, social isolation, and cognitive decline. Experimental and epidemiologic data suggest estrogen may influence auditory function, yet studies evaluating menopausal hormone replacement therapy (HRT) and hearing outcomes have reported inconsistent findings. We conducted a systematic review to synthesize the evidence and assess study quality.

MATERIAL & METHODS

EMBASE, MEDLINE, and the Cochrane Central Register of Controlled Trials were searched from inception to January 17, 2026 for studies examining hearing outcomes in postmenopausal women using HRT. Eligible designs included randomized controlled trials, cohort, cross-sectional, and case-control studies. Two reviewers independently screened studies, extracted data, and assessed risk of bias using the Newcastle-Ottawa Scale.

RESULTS

Eleven studies comprising 267,826 participants met inclusion criteria, including three prospective cohorts, seven cross-sectional studies, and one randomized controlled trial. Definitions of HRT exposure and hearing loss varied. Two large prospective cohorts reported a modestly increased risk of sensorineural hearing loss among HRT users, including a 25% higher risk in the largest cohort. One study observed a duration gradient, and another variation by age at natural menopause. Smaller audiometry-based studies reported better hearing thresholds among HRT users, particularly with estrogen-only regimens, whereas others found no association. Study quality was mixed.

CONCLUSIONS

The current evidence does not support hormone therapy for preventing hearing loss. While some smaller audiometry-based studies suggest a protective effect of estrogen-only therapy on age-related auditory decline, large cohort data indicate modest increase in hearing loss among users, with neutral or adverse effects in combined regimens. These inconsistencies are explained by heterogeneity in exposure and outcome definitions, study design differences, and residual confounding. Further robust prospective longitudinal studies using measures such as pure-tone audiometry and structured questionnaires in HRT users versus non-users are required before firm conclusions can be drawn.

OP-022

The Relationship Between Speech-In-Noise Performance And Cognitive Functions In Normal-Hearing Adults

Birgul Gumus[1]

[1]Ondokuz Mayıs University, Faculty of Health Sciences, Department of Audiology, Samsun, Turkey

BACKGROUND & AIM

Speech perception in noise depends on both auditory and cognitive processes. The aim of this study was to evaluate the speech-in-noise performance of normal-hearing adults using the Turkish Matrix Sentence Test and to investigate its relationship with global cognitive status, attention, and digit span performance.

MATERIAL & METHODS

Speech-in-noise thresholds were measured using the Turkish Matrix Sentence Test, comparing initial trial results with final Speech Reception Threshold (SRT) scores. Cognitive functions were assessed using the Mini-Mental State Examination (MMSE), and verbal working memory was evaluated with the Digit Span Test. Data were analyzed using Wilcoxon signed-rank and Pearson correlation tests.

RESULTS

The study included a cohort of normal-hearing adults with a mean age of 33.08 ± 11.49 years (range: 23.41–60.27). The median Matrix SRT scores was -7.4 dB SNR, which was significantly lower than Matrix trial score ($p < 0.001$). A strong positive correlation was found between the Matrix trial and Matrix SRT scores ($r=0.8018$, $p<0.001$). No statistically significant correlation was found between Digit Span scores and Matrix test results ($p > 0.05$). However, Matrix SRT scores showed a significant correlation with MMSE attention sub-scores and MMSE total scores ($p < 0.05$). Other cognitive sub-domains did not show significant associations with speech-in-noise performance.

CONCLUSIONS

Our findings suggest that speech-in-noise performance in normal-hearing adults is more closely associated with global cognitive status and attention than with digit span capacity. The strong correlation between trial and final SRT scores highlights the reliability of the test protocol. Furthermore, the implementation of an initial trial phase in the Matrix Sentence Test is essential to ensure measurement accuracy and to account for the procedural learning effect, even in normal-hearing populations

Exploratory Patient-Reported Burden Of Speech-In-Noise Deficit In Type 2 Diabetes From The Observational DIAMANT Study: Lived Experience And Psychosocial Impact

Camille Rochmann[1], **Zoe Kaier-Green**[2], **Eva Briand**[3], **Eric Ohayon**[4], **Florence Coste**[4], **Saïd Bekka**[3]

[1]*Cilcare, Montpellier, France;* [2]*Cilcare Inc., Lexington, USA;* [3]*Institut de Diabétologie et nutrition du centre IDNC, Mainvilliers, France;* [4]*FMR Global Health, Paris, France*

BACKGROUND & AIM

Peripheral auditory neuropathy is associated with disproportionate speech-in-noise difficulties despite near-normal audiometry. In patients with type 2 diabetes (T2D), its early manifestations often remain undiagnosed, overshadowed by competing comorbidities and neglected due to low clinical awareness. In the DIAMANT study, ~26% of participants with normal cognition demonstrated a speech-in-noise deficit despite normal standard audiogram (SIN-D), sometimes referred to as hidden hearing loss, highlighting the need to understand what these findings mean for patients in real life. This study aimed to characterize the functional, psychological, and social burden associated with SIN-D and explore patient understanding, care pathways, and expectations.

MATERIAL & METHODS

Nine adults (5 women, 4 men; ages 50-80 years) with uncontrolled T2D with normal cognition and SIN-D determined with Framatrix, previously enrolled in the DIAMANT study, were invited to a follow-up exploratory investigation. A market research-style qualitative methodology was implemented and conducted by an independent interviewer not involved in clinical assessments. Participants represented varied socio-professional backgrounds: working adults, individuals on sick leave / disability or retired persons. Each completed a structured pre-interview diary designed to promote reflection on symptom history, emotional reactions, daily difficulties, and expectations. This was followed by an in-depth ~90-minute ethnographic interview exploring symptom interpretation, perceived impact, social functioning, and interactions with healthcare professionals. A thematic analysis was applied to identify recurrent patterns and patient-reported burden dimensions.

RESULTS

Symptoms developed progressively and remained undiagnosed until DIAMANT for all participants. Most believed hearing difficulties were age-related and not linked to diabetes; a connection rarely raised by their clinicians. The central disabling complaint was speech-in-noise comprehension difficulty, frequently accompanied by listening effort and cognitive fatigue; hyperacusis and/or tinnitus added discomfort for some.

Participants described recurring daily challenges: understanding speech in restaurants, family meals, group discussions, following conversations in noisy work environments, maintaining exchanges in cars, and difficulties with soft voices, fast talkers, or overlapping speakers.

The psychological burden was substantial (embarrassment/shame, anxiety, frustration, anger, sadness, loss of confidence, feeling ill at ease). Social effects included self-exclusion, avoidance of noisy environments, isolation in multi-talker settings, reduced participation in family/community events, and, among working participants, adaptations such as teleworking or avoiding cafeteria lunches. Some felt dismissed by clinicians, while others remained in partial or complete denial, attributing difficulties to concentration or fatigue.

CONCLUSIONS

This study highlights a major psychological and social burden linked to early peripheral auditory neuropathy in type 2 diabetes, as well as significant gaps in diagnostic recognition and patient-clinician communication. Patients expressed strong expectations for symptom recognition, clearer explanations, and therapeutic options beyond hearing aids, including interest in locally administered treatments. These findings support integrating patient-centered functional endpoints and targeted Patient-reported-outcome instruments in future trials. However, the small sample size limits generalizability, and larger, more robust studies are required to confirm and extend these insights.

OP-024

Insights Into Economic, Social, And Workplace Outcomes In Hearing Device Users

Bamini Gopinath[1], **Shermin Lim**[1], **Jessica Turner**[1], **George Burlutsky**[1], **Diana Tang**[1]

[1]*Macquarie University*

BACKGROUND & AIM

Hearing impairment impairs communication, affecting social participation and relationships and workplace productivity, all essential to the well-being of adults. This study aims to determine whether social participation; interpersonal relationship

functioning; and work functioning and performance differ among adult hearing aid, cochlear implant (CI), and bimodal device users. Further, the cost effectiveness of bimodal device use versus unilateral and bilateral CI use was also determined using the same study dataset.

MATERIAL & METHODS

Cross-sectional data were drawn from the Hearing Impairment in Adults: A Longitudinal Outcomes Study (conducted during 2022-2024), which recruited 745 adults aged ≥40 years old using hearing devices from hearing centres across Australia and social media platforms. Primary outcomes included Work performance and engagement; Social Participation Restriction and Interpersonal Relationship Functioning scores. A Markov state-transition model was used to estimate costs and quality-adjusted life years (QALYs) over a lifetime horizon from the Australian healthcare system perspective.

RESULTS

After multivariate adjustment, total work performance scores were significantly higher (indicating a better outcome) among CI (2.26) and bimodal users (2.31) than hearing aid users (2.08, $p < 0.05$). Similarly, mean Utrecht Work Engagement Scale scores were higher (better outcome) in CI (4.16) and bimodal users (4.50) than hearing aid users (3.97, $p < 0.05$). Bimodal users also showed significantly higher mean Social Participation restriction scores than hearing aid users (90.0 vs. 78.3; p=0.01), and higher mean social perception scores (49.9 versus 42.3; p=0.003); differences became non-significant after adjusting for self-reported hearing performance. Bimodal users reported lower mean Interpersonal Relationship Functioning scores than hearing aid users (1.98 versus 2.25, P=0.04). Compared with unilateral CI use, bimodal device usage yielded an incremental cost of $5,032 and a QALY gain of 0.15, resulting in an ICER of $34,753 per QALY. Bimodal device usage was cost-saving versus unilateral CI use.

CONCLUSIONS

These findings suggest that bimodal device use confers meaningful vocational advantages, with higher work performance and engagement than hearing aids alone, indicating enhanced functional hearing translates into productivity gains. Although bimodal users reported greater social participation restrictions and poorer interpersonal functioning, these differences were attenuated after accounting for hearing performance, underscoring the central role of auditory capacity in social outcomes. Importantly, bimodal devices demonstrated favourable economic value, with an ICER of $34,753 per QALY versus unilateral cochlear implants and cost savings relative to bilateral implants, supporting bimodal fitting as a clinically effective and economically efficient rehabilitation strategy.

OP-025

Retrospective Comparison Of The Efficacy Of Systemic Steroid With Combined Intratympanic Steroid Injection In The Treatment Of Idiopathic Sudden Sensorineural Hearing Loss

ELİF TOPRAK[1], **ÖZLEM YÜKSEL**[2]

[1]SANCAKTEPE SEHİT PROF. DR. İLHAN VARANK RESEARCH HOSPİTAL; [2]SANCAKTEPE SEHİT PROF. DR. İLHAN VARANK RESEARCH HOSPİTAL

BACKGROUND & AIM

We aimed to retrospectively compare the audiological recovery results of patients receiving only systemic steroid therapy versus those receiving systemic steroid therapy combined with intratympanic injection for the treatment of idiopathic sudden sensorineural hearing loss (ISSNHL).

MATERIAL & METHODS

The study was conducted with a total of 80 patients who presented to the Otorhinolaryngology Clinic of Sancaktepe Şehit Prof. Dr. İlhan Varank Training and Research Hospital between April 2023 and April 2026 with a diagnosis of ISSNHL. Patients aged 18 and over who presented with sensorineural hearing loss of 30 dB or more in at least 3 consecutive frequencies that developed within less than 3 days were included in the study. Conversely, patients with bilateral hearing loss, a history of Meniere's disease, or a history of acoustic trauma were excluded from the study. Patients were divided into two groups, each consisting of 40 patients: those receiving only systemic steroid therapy (Group 1) and those receiving 3 doses of intratympanic injection in addition to systemic steroid therapy (Group 2). Treatment success was evaluated using Siegel's Criteria.

RESULTS

A homogeneous distribution was observed among the groups in terms of age, gender, and comorbidities. When comparing treatment outcomes, it was determined that hearing recovery rates were statistically significantly higher in the group receiving intratympanic injection in addition to systemic steroid therapy (Group 2) compared to the group receiving only systemic therapy (Group 1) according to Siegel's Criteria ($p<0.05$).

CONCLUSIONS

It was observed that intratympanic injection combined with systemic steroid in the treatment of ISSNHL is statistically significantly more effective on hearing recovery compared to systemic steroid therapy alone. These data support the role of

combined therapy in routine clinical practice and emphasize the importance of intratympanic injection in optimizing treatment protocols.

OP-026

Computational Audiology In Hearing Healthcare

Hürol Erişçi[1]

[1]*Erişçi Elektronik*

BACKGROUND & AIM

Advances in digital technologies, artificial intelligence, and data-driven healthcare have significantly transformed diagnostic and rehabilitative practices across medical disciplines, including audiology.

Computational audiology has emerged as a response to this transformation, integrating information technologies with traditional audiological assessment and intervention methods. This interdisciplinary field enables more precise diagnostics, personalized rehabilitation strategies, and scalable healthcare solutions.

The aim of this presentation is to define computational audiology within its historical and technological context, to illustrate its evolution from analog instrumentation to intelligent, data-driven systems, and to explore its current and potential impact on healthcare technologies.

MATERIAL & METHODS

This work is based on a conceptual and descriptive methodology. The material consists of a structured review of published scientific literature, industry reports, and historical documentation related to audiological instrumentation, digital signal processing, tele-audiology, and artificial intelligence applications in hearing healthcare.

In addition, illustrative examples from existing clinical technologies—such as smart hearing aids, automated fitting systems, remote monitoring platforms, and calibration methodologies—are used to demonstrate real-world applications of computational audiology. No original experimental data, human participants, or patient-specific information were included in this work.

RESULTS

The analysis demonstrates that computational audiology has played a critical role in enhancing diagnostic accuracy, clinical efficiency, and accessibility in hearing healthcare. Key developments include the transition to digital audiometric systems, the use of machine learning algorithms for hearing aid fitting and outcome prediction, and the implementation of tele-audiology platforms for remote assessment and follow-up.

These developments have enabled personalized hearing solutions, improved device calibration processes, and expanded access to audiological services, particularly for underserved populations. Furthermore, computational tools have supported clinicians in decision-making processes by providing data-driven insights and standardized evaluation methods.

CONCLUSIONS

Computational audiology represents a fundamental shift in the practice of audiology, moving the field toward a more data-driven, technology-integrated, and patient-centered healthcare model. Rather than replacing clinical expertise, computational approaches enhance the clinician’s ability to deliver accurate, efficient, and personalized care.

As healthcare technologies continue to evolve, the integration of computational audiology into education, clinical practice, and industry standards will become increasingly essential. Future efforts should focus on interdisciplinary collaboration, ethical use of data, and the development of standardized frameworks to ensure sustainable and equitable implementation of these technologies in audiological care.

Efficacy Of Personalized Mobile Music Therapy (Tinnimizer®) In Chronic Tinnitus Management And Clinical Predictors Of Treatment Outcomes

Murat Erinç[1], **Ayberk Aydın Tunç**[4], **Oğuz Yılmaz**[2], **Serkan Kurt**[3], **Raşit Cevizci**[5], **Mahmut Tayyar Kalcıoğlu**[6]

[1]*Department of Audiology, Istanbul Medeniyet University, Türkiye;* [2]*Department of Audiology, Bakırçay University, Türkiye;* [3]*Department of Electronics and Communications Engineering, Yıldız Technical University, Türkiye;* [4]*Department of Otorhinolaryngology–Head and Neck Surgery, Semmelweis University, Hungary;* [5]*Private Practice in Otorhinolaryngology, Istanbul, Türkiye;* [6]*Department of Otorhinolaryngology, Göztepe Prof. Dr. Süleyman Yalçın City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Chronic subjective tinnitus affects approximately 10–15% of the global adult population and is frequently associated with psychological distress and impaired quality of life. This study aims to evaluate the efficacy of Tinnimizer®, a personalized mobile application grounded in Tinnitus Retraining Therapy (TRT) principles, and to identify clinical and demographic predictors of therapeutic response.

MATERIAL & METHODS

The study followed a quasi-experimental design involving 60 participants (mean age: 56.25 ± 14.33 years) with chronic tinnitus. The intervention utilized a "mixing point" calibration protocol across seven standard frequencies to generate patient-specific therapeutic noise. Participants listened to a mix of this personalized noise and their preferred music (via YouTube Music) for at least 60 minutes daily over an 8-to-12-week period. Outcomes were measured using the Tinnitus Handicap Inventory (THI) and various Visual Analog Scales (VAS) across three sessions, with data analyzed using non-parametric statistical tests.

RESULTS

Significant improvements were observed across all primary outcome measures. THI scores decreased from a baseline of 41.87±22.05 to 22.00±14.98 by the third session ($p < 0.001$), and tinnitus discomfort scores dropped from 6.87±2.07 to 3.27±1.13 ($p < 0.001$). Secondary measures, including concentration difficulty and hearing difficulty, also showed significant long-term improvements ($p < 0.001$ and $p = 0.001$, respectively). Subgroup analyses revealed that male participants, individuals with hearing loss, and those with bilateral tinnitus demonstrated higher rates of improvement in specific parameters. Furthermore, a significant negative correlation was found between tinnitus pitch and THI score changes ($\rho = -0.470$).

CONCLUSIONS

Tinnimizer® is an effective, safe, and highly accessible digital health intervention that significantly reduces the functional and psychological burden of chronic tinnitus. The findings underscore the importance of precision medicine and personalized acoustic stimulation algorithms in optimizing tinnitus treatment outcomes.

Speech-In-Noise Deficit As A Marker Of Peripheral Auditory Neuropathy In Diabetes: Epidemiological Insights And Clinical Implications

Camille Rochmann[1], **Jérôme Nevoux**[2], **Fabrice Giraudet**[3,4], **Laura Breda**[1], **Véronique Baudoux**[1], **Frédérique Defosse**[1], **Blandine Duval**[1], **Zoe Kaier-Green**[5], **Hugo Laullier**[1], **Sylvie Pucheu**[1], **Charles Vincent**[1], **Eva Briand**[6], **Ingrid Dormeau**[6], **Pauline Gutowski**[6], **Ingrid Julier**[7], **Sophie Schuldiner**[7], **Bernadette Dijoux**[6], **Saïd Bekka**[6], **Mathieu Schué**[1]

[1]Cilcare; [2]CHU Bicêtre AP-HP; [3]UMR INSERM 1107, University Clermont Auvergne, France; [4]Institute of Hearing, Paris, France; [5]Cilcare inc; [6]Institut de Diabétologie et nutrition du centre IDNC,Mainvilliers, France; [7]CHU Carémeau, Nîmes, France

BACKGROUND & AIM

Sensorineural hearing loss (SNHL) and speech-in-noise (SIN) deficits are increasingly reported in patients with type 2 diabetes (T2D) where chronic hyperglycemia can induce i) cochlear microangiopathy; ii) oxidative stress and mitochondrial dysfunction; iii) peripheral auditory neuropathy, including cochlear synaptopathy; and iv) systemic inflammation which may alter central auditory processing.

Because no in-vivo method allows direct visualization of the cochlear structures, assessments rely on indirect functional or electrophysiological measures, which do not fully capture real-life auditory disability.

The DIAMANT study aimed to refine auditory phenotypes in participants with uncontrolled T2D and provide insight into clinically meaningful endpoints for this high-risk population.

MATERIAL & METHODS

366 participants aged 25-70 with T2D for >2 years and HbA1c >7% were recruited in a French multicenter, cross-sectional, prospective study conducted in three diabetology centers. They underwent a comprehensive battery of auditory testing: pure-tone audiometry (0.25 to 16kHz), SIN assessment using the French Matrix (Framatrix), electrocochleography (EcochG) and a cognitive screening (Montreal Cognitive Assessment (MoCA)). Participants with conductive or asymmetrical hearing loss were excluded.

Participants were classified using the standard Pure Tone Average (PTA) (0.5-4kHz) and the Framatrix score. Hearing categories were defined as: normal hearing (NH; PTA <25dB and Framatrix <-3dB), SIN deficit (SIN-D; PTA <25dB and Framatrix ≥-3dB), and hearing loss (HL; PTA ≥25 dB). Analyses were performed on the full sample and participants with preserved cognition (MoCA ≥26).

RESULTS

Among 241 participants (57.7% women, median age 60), 45.6% were classified NH, 37.3% SIN-D, and 17% HL. Mid-frequency thresholds followed age-related ISO 7029 distribution, whereas low and high frequency thresholds were below it.

After excluding those with cognitive impairment (43.2%), 137 participants remained: NH 59.8%, SIN-D 26.3%, and HL 13.9%. Audiometry revealed significant differences between NH and HL at all frequencies. NH and SIND curves overlapped at 0.25-1kHz, but SIN-D diverged at mid-to-high frequencies (≥2 kHz) and converged with HL from 8 to 16kHz.

Framatrix scores were significantly correlated with PTA, indicating SIN performance deteriorates as pure-tone sensitivity declines, and effectively distinguishes SIN-D from NH, with a median 2 dB SNR difference.

EcochG revealed significantly reduced auditory nerve response amplitude in the SIN-D group compared to the NH group. Individually, amplitude correlated with Framatrix score and mid-to-high frequency PTA, reinforcing that those assessments can identify emerging deficits.

CONCLUSIONS

DIAMANT revealed high prevalence of SIN deficit with normal standard hearing thresholds in T2D, while hearing loss prevalence was not different from the general population. Interestingly, there was a high incidence of cognitive impairment, complicating behavioral hearing assessment. It highlights a neglected population with functional deficits that escape detection. High frequency vulnerability and reduced auditory nerve response amplitudes suggest underlying peripheral auditory neuropathy when controlled for cognition.

This underscores the need for stronger multidisciplinary collaboration, universal SIN assessment in routine practice, and continued development of markers of real-life auditory disability with longitudinal data to determine sensitivity to progression or improvement.

OP-029

Assessment Of Listening Experience In University Students With Single-Sided Deafness: A Preliminary Study

İlknur Taşdemir Gürşen[1]

[1]*Trakya University Faculty of Health Sciences, Department of Audiology, Edirne, Türkiye*

BACKGROUND & AIM

Individuals with single-sided deafness (SSD) may not benefit from the advantages of binaural hearing, which may adversely affect their listening experience in everyday communication settings. University students with SSD may be particularly vulnerable in this regard, as university life inherently exposes individuals to sustained and multifaceted listening demands within acoustically and academically challenging environments, rendering listening experiences especially demanding. Therefore, this study aimed to compare the listening experience of university students with SSD and their university student peers with normal hearing in terms of listening effort (LE) and listening-related fatigue (LRF), while also examining the relationship between these two constructs.

MATERIAL & METHODS

The present study consisted of 6 university students with SSD aged 19 to 25 years and 9 university students with normal hearing aged 18 to 24 years. LE was evaluated using the dual-task paradigm, and LRF was assessed using the Brief Version of the Vanderbilt Fatigue Scale for Adults. The Mann-Whitney U test was used to compare the groups, and the Spearman correlation coefficient was employed to examine the relationship between LE and LRF.

RESULTS

University students with SSD demonstrated statistically significantly more adverse listening experience compared to their peers with normal hearing, as reflected by significantly greater LE and LRF ($p<0.001$). A moderate positive correlation was found between LE and LRF ($r_s=0.650$, $p<0.001$).

CONCLUSIONS

Despite having normal hearing in one ear, university students with SSD may experience a significantly more challenging listening experience compared to their peers with normal hearing. These findings suggest that the impact of SSD extends beyond peripheral hearing ability and may impose a considerable burden on daily communication, particularly within the demanding acoustic environment of university life. Accordingly, audiological management should adopt a more holistic approach that considers the broader listening experience alongside conventional audiometric outcomes, ensuring that intervention options are evaluated and offered in a timely and individualized manner.

OP-030

Reversible Sensorineural Hearing Loss Linked To Chronic Allergic Rhinitis

Afrim Ajeti[1]

[1]*RINO Clinic, Ferizaj, Kosovo*

BACKGROUND & AIM

Sensorineural hearing loss (SNHL) is traditionally considered irreversible. We report a case suggesting a potential link between chronic allergic rhinitis and reversible SNHL, aiming to raise clinical awareness of this underrecognized association.

MATERIAL & METHODS

A 58-year-old woman with progressive bilateral SNHL and mild but persistent nasal symptoms underwent allergy testing, audiometry, and ENT evaluation. Anti-allergic treatment included intranasal corticosteroids, oral antihistamines, and a short course of systemic corticosteroids.

RESULTS

Following targeted therapy, the patient's hearing thresholds improved markedly, with normalization in one ear and significant improvement in the other. Long-term follow-up over three years confirmed sustained auditory recovery. Allergy testing supported an atopic profile.

CONCLUSIONS

This case supports the hypothesis that chronic allergic inflammation may contribute to reversible SNHL. Allergy assessment should be considered in patients with idiopathic or progressive SNHL, and targeted anti-allergic therapy may offer a non-invasive treatment option.

Academic Progression And Family History Influence On Noise Attitudes In Speech-Language Pathology Students

Jorge Burdiles-Aguirre[1], **Jaime Crisosto-Alarcón**[1], **Patricio Castro-Salazar**[1], **Felipe Vallejos-Medina**[1]

[1]*Departamento de Ciencias de Rehabilitación en Salud. Facultad de Ciencias de la Salud y los Alimentos, Universidad del Bío-Bío. Chillán*

BACKGROUND & AIM

Recreational noise exposure is a major risk factor for noise-induced hearing loss. Attitudes toward noise are associated with preventive behaviors and may be influenced by formal audiology training as well as family experience with hearing loss. However, the relative contribution of academic progression versus family background remains unclear. We hypothesized that greater academic progression in audiology coursework would be associated with more protective attitudes toward noise, independently of family history of hearing loss.

MATERIAL & METHODS

A quantitative, cross-sectional analytical study was conducted in 203 undergraduate Speech-Language Pathology students at a university setting. Academic progression (independent variable) was classified into three levels according to completed audiology courses. Attitudes toward noise were assessed using the Youth Attitudes to Noise Scale (YANS), including total score and four factor scores (outcome measures). Family history of hearing loss and hearing aid use in the family were recorded as covariates. Due to non-normal distribution, non-parametric analyses were performed (Spearman correlation, Kruskal–Wallis with Holm adjustment, and Wilcoxon test). Effect sizes (r) were calculated. Simple and multivariable linear regression models were used to assess independent associations.

RESULTS

Academic progression showed a weak but statistically significant negative correlation with total YANS score ($\rho = -0.140$; $p = 0.046$). Significant differences were observed in Factor 2 across progression levels ($\chi^2 = 6.22$; $p = 0.045$). Multivariable regression confirmed an independent association between academic progression and total YANS score ($\beta = -0.128$; $p = 0.034$), although with low explanatory power (adjusted $R^2 = 0.009$). No significant differences were found according to family history of hearing loss or hearing aid use ($p > 0.05$; $|r| \leq 0.13$).

CONCLUSIONS

Greater academic progression in audiology is independently associated with more protective attitudes toward noise. Family background did not significantly influence attitudes. Although statistically significant, the effect size was small, suggesting that additional factors may contribute to shaping preventive attitudes toward recreational noise exposure.

OP-032

Association Of Radiological Disease Extent With Audiological And Functional Outcomes In Otosclerosis: Preliminary Findings

Zehra Hanım AKGÖZ[1], **Ergin Eroğlu**[2], **İsa Tuncay Batuk**[1], **Merve Batuk**[1]

[1]*Hacettepe Üniversitesi Sağlık Bilimleri Fakültesi;* [2]*Hacettepe Üniversitesi Kulak Burun Boğaz, Baş ve Boyun Cerrahisi Anabilim Dalı*

BACKGROUND & AIM

Otosclerosis is a progressive otodystrophy affecting the bony otic capsule, where cochlear involvement can lead to mixed or sensorineural hearing loss. This study investigated the relationship between radiological disease extent, audiological thresholds, and functional hearing performance. We hypothesized that a greater radiological disease burden would correlate with poorer hearing thresholds and reduced functional hearing.

MATERIAL & METHODS

This preliminary cross-sectional analysis included 20 ears from 13 adult patients with otosclerosis. Audiological assessment provided air-conduction and bone-conduction pure-tone averages (AC-PTA, BC-PTA), and the air-bone gap (ABG). High-resolution computed tomography (HRCT) images of the temporal bone were evaluated by an otorhinolaryngologist and categorized according to the Veillon classification and lesion extent stage (0–3). Functional hearing was quantified using the Turkish Speech, Spatial and Qualities of Hearing Scale (SSQ). Data were analyzed using Spearman's correlation, Mann–Whitney U, and Fisher's exact tests.

RESULTS

The cohort comprised 15 fenestral and 5 mixed otosclerosis ears. Lesion extent was classified as Stage 1 (n=12), Stage 2 (n=3), and Stage 3 (n=5). Median AC-PTA, BC-PTA, and ABG were 55.0 dB HL, 24.0 dB HL, and 22.0 dB, respectively. The median SSQ total score was 218.5. Moderate positive correlations between lesion stage and both AC-PTA and BC-PTA trended toward statistical significance (ρ=0.425, p=0.062; and ρ=0.434, p=0.056, respectively). No significant correlation was observed with the ABG (ρ=0.056, p=0.830). Advanced lesion stages were significantly associated with lower SSQ speech and total scores in ear-level analyses (ρ=-0.490, p=0.028; and ρ=-0.478, p=0.033). However, these specific associations lost statistical significance in patient-level sensitivity analyses (all p>0.10).

CONCLUSIONS

Preliminary findings suggest that increasing radiological disease extent in otosclerosis trends with deteriorating bone-conduction thresholds and diminished functional hearing, without a clear impact on the air-bone gap. Confirmation in larger cohorts utilizing mixed-effects modeling is warranted to robustly validate these patient-level associations.

Cochlear And Vestibulary Fuctions After Cardiopulmonary Bypass

Begüm Bahar Yılmaz[1], **Ayça Ilgın Altaner Asaroğlu**[1], **Abdussamet Asaroğlu**[1], **Selin Üstün Bezgin**[1], **Mehmed Yanartaş**[1], **Özgür Yiğit**[1]

[1]*Başakşehir Çam ve Sakura Şehir Hastanesi*

BACKGROUND & AIM

Senseurineural hearing loss (SNHL) can be driven by genetic, degenarative, infectious causes; however microvascular ischemia remains a critical acquired etiology due to the end-arterial blood supply of the inner ear. It has been reported with variable incidences in patients undergoing coronary artery bypass surgery (CABG) according to previous studies. With greater amount of hemodynamic stress, senseurineural hearing loss can potentially occur due to cochlear hypoperfusion and microembolisms. The objective of this preliminary study is to evaluate the potential association and clinical correlation of vestibular and cochlear impairment in patients undergoing CABG.

MATERIAL & METHODS

This preliminary study is conducted on 20 patients (16 male, 4 female) undergoing CABG with extracorporeal circulation in a single tertiary institution. Odiologic and vestibulary assesments has made preoperatively and postoperatively (until 1 month) with pure tone audiometry, otoacoustic emissions (TEOAE and DPOAE) and vestibulary head impulse test (VHIT). Pure tone measurements evaluated for 250,500,1000,2000, 4000 Hz frequencies. Vestibular system complaints and tinnitus evaluated using the Visual Analogue Scale (VAS) and the Tinnitus Handicap Index. Cardiopulmonary bypass surgery, cross-clamp and cardioplegia times, degree of hypothermia have been recorded.

RESULTS

Comparing pre- and post-operative pure tone average and otoaccoustic emissions, we did not find any statistically significant difference (p>0.05). Two patients has reported with tinnitus: one had newly onset after surgery, the other patient reported increase of ongoing complaints. None of the patients in the postoperative period reported hearing loss or dizziness. There was no significant difference between cross-clamp time, cardiopulmonary bypass time, hypothermia degree and any of the odiologic and vestibulary assesments.

CONCLUSIONS

Although there is no objective evidence of SNHL, the presence of tinnitus in two patients raised suspicions of cochlear involvement and suggested that this pilot study should be evaluated on a larger scale. Some studies stated that increasing the duration of the patient's stay on the cardiopulmonary bypass pump, aortic cross-clamping can affect the occurrence of hearing

loss; also significant decline in hearing thresholds predominantly observed at frequencies of 1000 Hz and above. The results of our study has not shown any objective differences; however, studies conducted on larger cohorts may provide further insight into subclinical manifestations.

OP-034

"Migraine-Associated Ageotropic HC-BPPV Represents A Hyperexcitable Vestibular Phenotype Rather Than Purely Mechanical Pathology."

Yasir Nafi, MD Audio-Vestibular Medicine.[1]

[1]*Al Emadi Hospital. Ain Shams University.*

BACKGROUND & AIM

Benign paroxysmal positional vertigo is the most common peripheral vestibular disorder. Horizontal canal BPPV accounts for 5–30% of cases. The ageotropic variant is typically attributed to cupulolithiasis, producing persistent direction-changing horizontal nystagmus. Compared to canalithiasis, it often produces: Stronger vertigo, marked nausea/vomiting, and therapeutic resistance. Migraine is increasingly recognized as a modulator of vestibular excitability, including in Vestibular migraine. However, the relationship between migraine and ageotropic HC-BPPV remains poorly characterized.

The Aim: To study the correlation betweeen migraine and Cupulolithiasis of Horizontat Semi Circular Canal.

MATERIAL & METHODS

Study Design: Retrospective single-center observational study (2020–2025). Inclusion Criteria: Clinical diagnosis of ageotropic horizontal canal BPPV, Positive supine roll test, No central lesion on MRI when performed. Exclusion Criteria: Central positional nystagmus, Demyelinating disease (e.g., Multiple sclerosis), Cerebellar stroke, Drug-induced nystagmus. Variables Collected: Age / Sex, Migraine diagnosis (ICHD-3), Presence of vomiting, Number of repositioning maneuvers required, Recurrence rate, Definition of Resistance: Persistence after ≥2 standardized repositioning maneuvers (Gufoni/Barbecue roll).

RESULTS

Results: Out of 50 patients: 30 (60%) migraine-associated, 30 (60%) severe vomiting, 20 (40%) required ≥3 repositioning sessions, MRI normal in all tested cases, No COVID correlation

CONCLUSIONS

Migraine-associated ageotropic HC-BPPV appears to represent a distinct clinical phenotype characterized by heightened autonomic response and increased resistance to repositioning maneuvers. Central sensitization and vestibulo-autonomic amplification may contribute to this presentation.

Effects Of Different Signal To Noise Ratios On Speech Discrimination And Amplitude-Latency Of The P1-N1-P2 Complex In Adult Cochlear Implant Users

Halide Çetin Kara[1]

[1]*Department of Otorhinolaryngology, Cerrahpaşa Faculty of Medicine, Istanbul University-Cerrahpaşa.*

BACKGROUND & AIM

The aim of this study is to compare the hearing performance of adult cochlear implant users in quiet and noisy environments by auditory cortical responses. Also, we aintended to detect the level of noise affecting the users.

MATERIAL & METHODS

20 subjects who have profound hearing loss in postlingual process, included in the study. Subjects were evaluated for the P1-N1-P2 complex in 3 listening situations. The phonemes of /m/, /t/, /g/ were presented first at 75dBSPL in silent environment, then with the same intensity with 75dBSPL cocktail party noise (SNR=0dB), and finally at the same intensity with 65dBSPL cocktail noise (SNR=+10dB) with appropriate loudspeaker. Speech discrimination ability was evaluated in quiet, SNR:+10dB, SNR:0dB situations. All condition was compared to each other.

RESULTS

All of the phonemes of /m/, /t/ and /g/ in silent environment with the condition of SNR=+10dB and SNR=0dB, negative correlation was observed between wave morphology and amplitudes ($p<0.001$). It was observed that the speech discrimination skill of the subjects deteriorated significantly with the increase in noise ($p<0,05$).

CONCLUSIONS

It will be beneficial to use noise canceling algorithms and arrange the environment in order to prevent the negative effects of CI users' speech understanding and cortical processes in noise.

OP-036

Use Of Artificial Intelligence Chatbots In Tinnitus Management: A Scoping Review Of Current Literature

Emine Ayça Ödemişlioğlu Aydın[1], **Elif Öğün**[2,3]

[1]*Bakırçay University, Faculty of Health Sciences, Department of Audiology, Izmir, Turkey;* [2]*Ege University, Faculty of Health Sciences, Department of Audiology, Izmir, Turkey;* [3]*Dokuz Eylül University, Department of Otorhinolaryngology, Audiology PhD Program, Izmir, Türkiye*

BACKGROUND & AIM

The increasing use of artificial intelligence (AI)-based chatbots in healthcare necessitates careful evaluation, particularly in terms of the quality and reliability of information provided in tinnitus management. In this study, it was hypothesized that AI-based chatbots provide highly accurate and clinically useful information for tinnitus management. The aim of this scoping review is to comprehensively examine the potential, limitations, and clinical applicability of AI chatbot use in tinnitus management in light of the current literature.

MATERIAL & METHODS

This study was designed as a scoping review. A literature search was conducted in PubMed, Scopus, Web of Science, and Google Scholar databases for studies published between 2010 and 2026 using the keywords “tinnitus management,” “AI chatbot,” and “AI healthcare.” Original research articles and studies evaluating AI chatbots with full texts available in English or Turkish were included. Review articles and studies involving AI applications other than chatbots were excluded. The included studies were summarized using a descriptive approach and evaluated through narrative synthesis.

RESULTS

A total of five original studies meeting the inclusion criteria were included in the evaluation. Most studies reported that ChatGPT demonstrated high levels of accuracy, relevance, and clarity in responses related to tinnitus. ChatGPT-4 exhibited more consistent performance overall, whereas ChatGPT-3.5 was reported to occasionally generate misleading or incomplete information. In comparative analyses, ChatGPT, Gemini, and Perplexity emerged as leading models in terms of accuracy; however, no significant differences were identified regarding overall information quality and reliability. Reliability rankings varied across studies. Additionally, GPT Creator-based chatbots were found to be user-friendly, although the need for personalization persists.

CONCLUSIONS

AI chatbots hold considerable potential to complement conventional patient education by providing accessible and patient-centered information in tinnitus management. Nevertheless, the limited number of available studies, methodological heterogeneity, and the absence of standardized evaluation frameworks constrain the generalizability of current findings. Further large-scale studies employing standardized methodologies are warranted to support clinical integration.

The Importance Of Validity And Cultural Compatibility In Subjective Measures

Iman Rawas[1]

[1]*king abdulaziz university*

BACKGROUND & AIM

In tinnitus management, subjective measures are used to quantify severity, effect on QoL and progression. The tinnitus handicap inventory (THI), covers a variety of tinnitus related functional domains whilst simultaneously focusing on the psychological aspects of tinnitus.

It is currently available in standard Arabic formats. It was translated and validated on a population in Lebanon. Cultural compatibility is important when using a questionnaire as cross-cultural differences may impact responses.

The aim of this study was to assess the validity and cultural compatibility of the Arabic THI on a saudi population and discuss results in relation to other widely used subjective measures

MATERIAL & METHODS

161 Arabic individuals permanently residing in Saudi Arabia with tinnitus filled out the Arabic THI questionnaire and a short field study questionnaire designed to assess the cultural appropriateness of the questionnaire.

RESULTS

Preliminary results found the questionnaire to be clear and culturally acceptable. The total scale had high internal consistency (alpha of 0.90), consistent with other reported values in the literature. The catastrophic subscale exhibited the weakest internal validity with alpha 0.64. The study finds some items to have poor correlation with the scale as a whole in our population which may warrant revision and possible ommission of these items. Handicap was significantly greater in the hearing impaired subjects

CONCLUSIONS

The THI is a valid and culturally compatible tool for the Saudi population

KEYWORDS

Tinnitus handicap index, questionnaire validation, cultural compatibility, tinnitus

OP-038

Newborn Hearing Screenings: Evaluation Of Eleven-Year Follow-Up Data From Our Reference Center Hospital

Muhammet Fatih GÖKMEN[1], **Hidayet Giray SOY**[1], **Bülent ULUSOY**[1], **Bahar ÇOLPAN**[2]

[1]*Selcuk University, Medical School, ENT Department;* [2]*Medova Hospital, ENT Department, Konya, TÜRKİYE*

BACKGROUND & AIM

Newborn hearing screenings standardized nationwide Turkey in 2008. Until 2019, screening was performed using otoacoustic emissions (OAE) for healthy infants and auditory brainstem response (ABR) for at-risk groups. Since 2019, following an announcement by the Ministry of Health, screening has been standardized using the ABR method. Infants who fail the initial screening test are re-evaluated, while those who fail twice or have risk factors undergo a clinical ABR hearing assessment. Infants diagnosed with hearing loss are placed in an auditory rehabilitation program early on, aiming to bring their speech and language development to the level of their peers.

MATERIAL & METHODS

Following local ethics committee approval, a review of the files of infants who underwent newborn hearing screening tests at our clinic between January 2015 and December 2025 was conducted. The patients' birth methods, gestational age (prematurity), birth weight, history of intensive care unit admission, external auditory canal atresia, history of meningitis, neonatal jaundice, family history of hearing loss, febrile illness, and risk factors such as Down syndrome were evaluated to determine the appropriate screening test method (otoacoustic emission or screening ABR).

RESULTS

In this study, 22,697 patients were screened, and a total of 5,044 (22.22%) infants failed the hearing screening tests. Of these 5,044 infants, only 582 (11.5%) failed the second screening test and were referred for clinical ABR testing. Of these 582 infants, 365 (62.7%) were evaluated with OAE and 217 (37.3%) with automated ABR. The vast majority of infants who failed the test did not have any risk factors, with hyperbilirubinemia (3.9%) being the most common risk factor.

CONCLUSIONS

Newborn hearing screenings have been conducted for many years in almost all regions of the world, especially in developed countries. In our country, these examinations, both OAE and ABR, have been successfully carried out for many years, and babies with hearing loss are diagnosed from birth, receiving early auditory rehabilitation to enable them to catch up with their peers in terms of language and speech skills and neurodevelopment.

hearing loss, newborn hearing screening, otoacoustic emissions, otoacoustic emissions, hyperbilirubinemia, auditory rehabilitation

OP-039

Behavioral Audiometric Methods In Children: Principles, Developmental Contexts, And Clinical Applications

Petra Šestáková[1]

[1]*Audio Fon Centr Brno, s.r.o., Brno, Czech Republic*

BACKGROUND & AIM

Behavioral audiometric methods (BAM) are considered the gold standard for assessing auditory perception in the youngest children. Behavioral observations guide key clinical decisions and subsequent therapeutic or rehabilitative steps. At our clinic, we have performed BAM, including VRA, for more than ten years, enabling reliable assessment even in children for whom objective methods alone are insufficient. Combining objective audiometry with BAM has proven highly effective in diagnosing and managing early hearing impairment.

The aim is to show how behavioral audiometric methods integrate into the care of diverse pediatric diagnostic groups and to highlight opportunities for standardizing the procedure.

MATERIAL & METHODS

This retrospective observational study analyzed 534 children examined in 2024 at a specialized pediatric audiology center. We evaluated the outcomes of behavioral audiometric methods—Behavioral Observation Audiometry (BOA), Visual Reinforcement Audiometry (VRA), and Conditioned Play Audiometry (CPA)—in relation to age, diagnosis, test success rate, and data quality.

The analysis focused on how developmentally appropriate each method was and how useful it proved in clinical practice. We also assessed result validity and test feasibility across diagnostic groups to determine the overall effectiveness of behavioral audiometry in routine pediatric hearing assessment.

RESULTS

Valid behavioral audiometric outcomes were obtained in 94.2% of the 534 assessed children. BOA proved most effective in infants under 6 months, while VRA showed the highest success rate between 6–36 months. CPA was reliably performed mainly in children above 2.5–3 years, with delayed transition observed in children with developmental disorders. Across diagnostic groups, including children with neurodevelopmental conditions and combined impairments, BAM consistently provided usable thresholds. Using behavioral and objective tests together increased diagnostic confidence, especially in borderline or unclear cases.

CONCLUSIONS

Behavioral audiometric methods represent an effective, developmentally sensitive approach for evaluating hearing in infants and young children, including those with neurodevelopmental or combined disorders. Their high success rate and strong data validity make them essential for clinical decision-making, especially when objective methods alone are insufficient. Integrating BOA, VRA and CPA into routine assessment enhances diagnostic accuracy and supports timely intervention.

OP-040

Tone Deaf By Design: Reporting Standards For Hearing Loss Conceal Crucial High Frequency Performance Gaps.

Audrey WP Kim[1], **Michael B Gluth**[2]

[1]*Ear, Nose, Throat Surgery Department, Royal Perth Hospital, Western Australia;* [2]*Ear Sciences Centre, Medical School, The University of Western Australia, Nedlands, Western Australia, Australia;* [3]*Ear Science Institute Australia, Subiaco, Western Australia, Australia*

BACKGROUND & AIM

Current American Academy of Otolaryngology–Head and Neck Surgery (AAO-HNS) guidelines assess ossiculoplasty outcomes using the four-frequency pure-tone average air–bone gap (PTA-ABG) across 500–3000 Hz. However, this metric excludes higher frequencies that are important for speech understanding and everyday communication. This study evaluated high-frequency hearing outcomes after ossiculoplasty in ears achieving excellent conventional results.

MATERIAL & METHODS

A retrospective multicenter analysis was performed using a six-institution ossiculoplasty outcomes registry. Ears reconstructed with a synthetic partial or total ossicular replacement prosthesis (PORP/TORP) and achieving a postoperative PTA-ABG ≤15 dB were included. Air–bone gaps (ABGs) and air-conduction (AC) thresholds were analyzed from 500–8000 Hz. Primary outcomes included postoperative ABG, ABG improvement, and AC improvement by frequency.

RESULTS

Among 1,484 PORP/TORP reconstructions, 499 ears met inclusion criteria. Mean follow-up was 34.4 ± 35.7 months. Bone-conduction thresholds remained stable postoperatively. Despite a mean postoperative PTA-ABG of 9.6 dB, ABG at 4000 Hz was significantly larger than ABGs at 500–3000 Hz and larger than the PTA-ABG (all $p<0.001$). More than half of ears (51.5%) demonstrated a postoperative 4000-Hz ABG ≥20 dB, while 26.7% had a 4000-Hz ABG ≥25 dB. Both ABG closure and AC improvement declined significantly at higher frequencies (all $p<0.001$).

CONCLUSIONS

Substantial high-frequency conductive deficits frequently persist after ossiculoplasty despite conventionally successful outcomes. Current reporting standards may therefore overestimate the completeness of hearing restoration and should consider incorporation of 4000 Hz into routine outcome assessment.

OP-041

Preoperative Air–Bone Gap And Disease Duration As Predictors Of Footplate Instability In Stapes Surgery: A Retrospective Cohort Study

Rita Osório[1], **Francisco Nazaré**[1], **Leandro Ribeiro**[1], **Diamantino Helena**[1], **Pedro Oliveira**[1], **Mariana Cascão**[1]

[1]*Unidade Local de Saúde Gaia e Espinho, ULSGE*

BACKGROUND & AIM

Otosclerosis is a common cause of progressive conductive hearing loss, typically treated with stapes surgery. In earlier disease stages, incomplete fixation of the stapes footplate may predispose to intraoperative instability, including floating footplate or inadvertent avulsion. We hypothesized that a smaller preoperative air–bone gap (ABG) reflects earlier disease and is associated with a higher risk of intraoperative footplate instability.

MATERIAL & METHODS

A retrospective cohort study was conducted including patients undergoing stapes surgery for suspected otosclerosis between 2014 and 2025 at a tertiary referral center. Preoperative audiometric variables, particularly ABG, were analyzed. Disease duration, defined as the interval between diagnosis and surgery, was included as an additional variable. Acoustic reflex data were not consistently available and were excluded. The primary outcome was intraoperative footplate instability, defined as conversion to stapedectomy or documented floating footplate/avulsion. Comparative analyses and logistic regression models were performed. Predictive performance was assessed using receiver operating characteristic (ROC) curves.

RESULTS

A total of 182 procedures were included, of which 32 required stapedectomy. Lower preoperative ABG was associated with stapedectomy in the overall cohort (mean 34.1 vs 38.0 dB; p=0.035), although this finding was not consistent across subgroup analyses. In logistic regression, lower ABG showed a non-significant trend toward increased risk of instability (odds ratio [OR] 0.91 per dB increase; p=0.13). Disease duration was shorter in cases with instability (2.22 vs 3.81 years), without statistical significance (p=0.216). In a combined model, both variables demonstrated non-significant trends (ABG: OR 0.89, p=0.095; duration: OR 0.70, p=0.171), with improved predictive performance (area under the curve [AUC] 0.746 vs 0.635 for ABG alone).

CONCLUSIONS

Lower preoperative ABG and shorter disease duration show consistent but non-significant associations with intraoperative footplate instability. While ABG alone has limited predictive value, combining clinical variables may improve risk stratification. These findings support a multifactorial model of surgical difficulty in otosclerosis and highlight the need for more robust predictive tools.

OP-042

Broadband Noise–Evoked Acoustic Reflex Thresholds As A Marker Of Cochlear Integrity In Individuals With Normal Audiograms

Shahnaz, N., Ph.D.[1], **Yongqing Liang, A., B.S.**[1], **Ciocca, V., Ph.D.**[1]

[1]*University of British Columbia*

BACKGROUND & AIM

The acoustic stapedius reflex (ASR) is an involuntary contraction of the stapedius muscle in response to moderate-to-high-intensity sound. Clinically, ASRs aid in the differential diagnosis of conductive, cochlear, retrocochlear, and facial-nerve disorders. Broadband noise (BBN) reflex thresholds are typically lower than pure-tone thresholds in normal-hearing ears by 20 dB, reflecting broad cochlear excitation and neural summation. This BBN advantage is reduced in sensorineural hearing loss, but its status in cochlear synaptopathy or hidden hearing loss with normal audiometric thresholds (250–8000 Hz) remains unclear. This study examined whether the BBN advantage is reduced in such ears.

MATERIAL & METHODS

ASR threshold was analyzed in three groups: normal controls, music students, and symptomatic participants. Thresholds were obtained using pure-tone and BBN elicitors. The primary outcome, AvgDiff, was defined as the average difference between pure-tone and BBN thresholds; positive values indicate the expected BBN advantage, whereas values near zero or negative indicate a reduced or absent advantage. AvgDiff was analyzed using a Bayesian random-intercept linear regression model. Study group was included as a categorical predictor (controls as the reference), with age and sex as covariates, and a participant-level random intercept was included to account for within-subject ear correlations.

RESULTS

The analytic sample included 133 ears from 67 participants: 30 ears from 15 normal controls, 22 ears from 11 music students, and 81 ears from 41 symptomatic participants. The Bayesian model estimated that symptomatic ears had an AvgDiff approximately 7.0 dB lower than controls after adjusting for age and sex and accounting for participant-level clustering. The 95% credible interval was entirely below zero, indicating a 99.3% posterior probability that symptomatic ears had a reduced BBN advantage. The music student group also showed a lower AvgDiff than controls, but the credible interval crossed zero, suggesting a possible reduction with greater uncertainty. The symptomatic group was also lower than that of music students, though the comparison was less certain. The strongest stimulus-specific effect was observed for 2000Diff, where the posterior probability of a negative effect was essentially 100%, indicating a pronounced reduction in BBN advantage at 2000 Hz.

CONCLUSIONS

Using a Bayesian random-intercept regression model, we found strong posterior evidence that symptomatic ears had lower AvgDiff than control ears, consistent with attenuation or loss of the normal BBN advantage. Frequency-specific analysis showed a greater reduction at 2000Diff compared with 500Diff, suggesting that comparing BBN thresholds with 2000 Hz pure-tone acoustic reflex thresholds may be particularly sensitive for detecting reduced BBN advantage. Overall, these findings provide preliminary evidence that reduced BBN acoustic reflex advantage reflects subtle, diffuse cochlear or auditory neural dysfunction not captured by conventional audiometry in individuals with normal hearing thresholds.

OP-043

Evaluation Of Postural Control During Active Symptoms In Individuals With Motion Sickness

Betül Özdemir Aktaş[1], **Bülent Satar**[2], **Ercan Karababa**[3]

[1]*İstanbul Nişantaşı University, Faculty of Health Sciences, Department of Speech and Language Therapy, İstanbul, Türkiye;* [2]*University of Health Sciences, Gülhane Faculty of Medicine, Department of Otorhinolaryngology, Ankara, Türkiye;* [3]*University of Health Sciences, Gülhane Faculty of Health Sciences, Department of Audiology, Ankara, Türkiye*

BACKGROUND & AIM

Motion sickness (MS) is associated with sensory conflict and may impair postural control. This study aims to evaluate the effects of rotational stimulation on postural stability using static posturography in individuals with and without MS.

MATERIAL & METHODS

This study was conducted with a total of 71 participants aged between 18 and 40 years. Thirty-five individuals diagnosed with MS according to the criteria of the Bárány Society constituted the MS group, while 36 healthy individuals formed the control group. Static posturography assessments were performed on all participants before and after rotational stimulation. Within static posturography, the Limits of Stability Test (LOS) and the Modified Clinical Test of Sensory Interaction on Balance (mCTSIB) were used. In addition, pure-tone audiometry and spontaneous nystagmus examination were conducted. Rotational stimulation was applied using a standard office chair. Participants were rotated randomly to the right and left at a rate of approximately one revolution every 3 seconds, while simultaneously being instructed to move their heads along the pitch axis (approximately 30° of flexion and extension). This protocol generated cross-coupled vestibular stimulation.

RESULTS

At baseline, no significant differences were found between groups in the LOS parameters, including reaction time, movement velocity, endpoint excursion, and maximum excursion ($p > 0.05$), whereas directional control was significantly higher in the control group ($p = 0.023$). No significant between-group differences were observed in any mCTSIB parameters at baseline ($p > 0.05$). In the post-test assessment, significant differences in favor of the control group were observed in endpoint excursion ($p = 0.008$) and directional control ($p = 0.016$) within the LOS parameters, while no significant differences were found for movement velocity or maximum excursion ($p > 0.05$). Similarly, no significant between-group differences were detected in any mCTSIB post-test parameters.

CONCLUSIONS

Cross-coupled stimulation revealed subtle impairments in specific dynamic postural control parameters in individuals with motion sickness, particularly in Limits of Stability performance, while mCTSIB outcomes remained unaffected. These findings suggest that motion sickness may selectively affect postural control mechanisms under vestibular challenge, and that LOS measures may provide complementary objective information in its evaluation.

OP-044

Investigation Of Labyrinthine And Retrolabyrinthine Effects In Patients With Migraine Using Galvanic And Acoustic Stimulated VEMP: A Preliminary Study

Melda ACAR[1], **Yeşim ORUÇ**[2], **Bengi GÜL TÜRK**[3], **Furkan ASAN**[3], **Eyyup KARA**[1], **Hasan Ahmet ÖZDOĞAN**[4]

[1]*Department of Audiology, Faculty of Health Sciences, Istanbul University-Cerrahpaşa;* [2]*Department of Audiology, Faculty of Health Sciences, Sakarya University;* [3]*Department of Neurology, Cerrahpaşa Faculty of Medicine, Istanbul University-Cerrahpaşa;* [4]*Department of Otorhinolaryngology, Cerrahpaşa Faculty of Medicine, Istanbul University-Cerrahpaşa*

BACKGROUND & AIM

The pathophysiological mechanisms linking migraine and vestibular symptoms remain incompletely understood. Several hypotheses include abnormal neural connectivity, inner ear involvement, and altered central sensory processing. Vestibular abnormalities observed in migraine patients without vertigo suggest that vestibular involvement may be masked by

compensatory mechanisms. Beyond conventional peripheral assessments, reflex-based objective measurements may help reveal this hidden dysfunction. Vestibular Evoked Myogenic Potentials (VEMP) provide reliable evaluation of vestibular reflex pathways. This study aims to investigate vestibular involvement during the interictal phase of migraine and to determine the physiological level of this involvement.

MATERIAL & METHODS

Individuals aged 18–45 years diagnosed with migraine with or without aura according to the International Classification of Headache Disorders-3 (ICHD-3) criteria were recruited irrespective of vestibular complaints. Participants had normal hearing thresholds, Type A tympanograms, and no prior vestibular diagnosis. The migraine cohort was classified according to the presence or absence of vestibular symptoms, and an age- and sex-matched healthy control group was included for comparison.All participants underwent acoustic- and galvanic-stimulated cervical VEMP (cVEMP) testing during the interictal period. Latency, amplitude, and asymmetry ratios were analyzed to evaluate peripheral otolithic responses and retrolabyrinthine vestibular conduction. The Vestibular Migraine Patient Assessment Tool and Handicap Inventory (VM-PATHI) was administered to assess self-reported vestibular symptom severity.The study was designed as a cross-sectional quantitative investigation. As of January 2026, five migraine participants and six healthy controls have been evaluated, and data collection is ongoing.

RESULTS

Preliminary comparisons between migraine participants and the age- and sex-matched healthy control group demonstrated measurable responses in both acoustic- and galvanic-stimulated cVEMP recordings. Migraine participants exhibited reduced amplitudes in both acoustic- and galvanic-stimulated cVEMP responses compared to controls, accompanied by variability in asymmetry ratios. VM-PATHI scores reflected inter-individual differences in perceived vestibular symptom severity. Variability in electrophysiological findings was observed irrespective of reported vestibular complaints, suggesting the presence of subclinical vestibular involvement in migraine patients. Due to the limited sample size, statistical significance has not yet been established, and analyses are ongoing.

CONCLUSIONS

The combined use of acoustic and galvanic VEMP testing may contribute to the differentiation of labyrinthine and retrolabyrinthine vestibular mechanisms in migraine. Preliminary findings indicate the presence of vestibular alterations during the interictal phase, even in individuals without overt vestibular symptoms. Continued data collection is expected to clarify the level of vestibular involvement and to support improved diagnostic approaches and targeted rehabilitation strategies in migraine populations.

OP-045

Hearing Difficulty, Rehabilitation Gap, And Functional Impact In The Chilean Population

Jorge Burdiles-Aguirre[1], **Jaime Crisosto-Alarcón**[1]

[1]*Departamento de Ciencias de Rehabilitación en Salud. Facultad de Ciencias de la Salud y los Alimentos, Universidad del Bío-Bío. Chillán*

BACKGROUND & AIM

Hearing loss is a growing public health concern associated with functional decline and reduced quality of life. However, the magnitude of the rehabilitation gap and its functional impact in the Chilean population have not been comprehensively described. We hypothesized that self-reported hearing difficulty would be associated with reduced functional capacity and lower psychological quality of life, and that a substantial rehabilitation gap would persist among affected individuals.

MATERIAL & METHODS

A cross-sectional study was conducted using data from the National Survey of Quality of Life and Health (ENCAVI). A total of 16,590 participants aged ≥15 years were analyzed using weighted models accounting for complex survey design. Hearing difficulty (independent variable) was defined as self-reported presence (mild, moderate, severe, or profound) versus absence. Hearing aid use and functional capacity score were assessed as outcomes. Logistic and linear regression models were performed, adjusting for age, sex, and educational level.

RESULTS

The national prevalence of hearing difficulty was 12.5% (95% confidence interval [CI] 11.7–13.3), increasing to 40.6% among individuals aged ≥75 years. Among those reporting hearing difficulty, 60.3% used hearing aids, indicating a rehabilitation gap of approximately 40%. Age was significantly associated with hearing aid use (odds ratio [OR] 1.018 per year; 95% CI 1.003–1.033; $p = 0.020$). Individuals with hearing difficulty showed greater functional impairment (mean 32.5 vs. 17.0 points; $p < 0.001$); in adjusted models, the difference remained significant (+12.6 points; $p < 0.001$). Hearing difficulty was associated with a 4.4-point reduction in psychological quality of life ($p < 0.001$), although this association lost significance after adjustment for functional capacity.

CONCLUSIONS

In Chile, hearing difficulty is associated with substantial functional impairment and reduced quality of life, alongside a significant rehabilitation gap. The psychological impact appears to be mediated by functional decline, highlighting the importance of timely auditory rehabilitation strategies.

OP-046

The Effectiveness Of Central Auditory Processing Therapy In Cochlear Implant Users: A Preliminary Study

Işık Sibel KÜÇÜKÜNAL[1], **Gözde BAYRAMOĞLU ÇABUK**[2], **Zeynep KARATÜRK**[2]

[1]Department of Speech and Language Therapy, Faculty of Health Sciences, Gazi University, Ankara, Türkiye; [2]Department of Audiology, Faculty of Medicine, Gazi University, Ankara, Türkiye

BACKGROUND & AIM

The success of Cochlear Implant (CI) surgery is closely related to postoperative auditory rehabilitation processes. In particular, higher-level Central Auditory Processing (CAP) skills, such as distinguishing speech in noisy environments and processing complex auditory stimuli, are often deficient in CI users. This preliminary study aims to evaluate the effects of a structured auditory rehabilitation programme targeting CAP on auditory performance in adult CI users.

MATERIAL & METHODS

This preliminary study used a single-group pre-test-post-test design and included four adult cochlear implant users (two males, two females; age range 28–51). Participants underwent auditory rehabilitation (temporal processing, phoneme discrimination, recognition, and multisensory integration exercises) for a total of 26 weeks, with one session per week. Audiological assessments (hearing thresholds, SRT, SD) and CAP assessments (Frequency Tone Pattern Test, Filter Word Test, Text-to-Question Response Test) were conducted before and after the intervention.

RESULTS

In audiological assessments, a downward trend in hearing thresholds was observed in all cases during the final test (5-15 dB improvement in the 125-8000 Hz range). SRT values decreased from an average of 32.5 dB in the initial test to an average of 25 dB in the final test. In CAP assessments, scores increased in all cases. Frequency Tone Pattern Test scores averaged 13.5 in the initial test and 14.3 in the final test; scores in the Text-to-Question Response Test averaged 8.8 in the initial test and 9.8 in the final test; and scores in the Filter Word Test averaged 0.8 in the initial test and 3.3 in the final test.

CONCLUSIONS

CAP therapy may improve both audiological thresholds and central auditory processing skills in adults with CI. While the decrease in hearing thresholds and SRT values reflects improvement in peripheral hearing performance, the increase in scores on the Frequency Tone Pattern, Word-in-Sentence, and Filter Word tests indicates potential development in higher-level auditory processing skills. Although the results are promising, further studies with larger samples and control groups are needed to validate and generalise the findings. The data from this preliminary study form the basis for our ongoing comprehensive research.

OP-047

Smooth Pursuit Test Findings In Patients With BPPV: A Retrospective Study

RIŞVAN DENİZ[1], **INGY AL AZEM**[3], **ÖMER MARAŞ**[4], **AHMET ATAŞ**[2], **CEM UZUN**[2]

[1]Department of Audiology, Koç University Hospital, Istanbul, Turkey; [2]Department of Otorhinolaryngology, Koç University , Istanbul, Turkey; [3]Koç University School of Medicine, Istanbul, Türkiye; [4]Koç University College of Engineering- Computer Science&Engineering , Istanbul, Türkiye

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is the most common peripheral vestibular disorder characterized by vertigo triggered by head movements. Eye movement assessment is essential for evaluation, and videonystagmography (VNG) is commonly used. The smooth pursuit test, an oculomotor component of VNG, evaluates the ability to smoothly follow a moving target. Although abnormalities are typically linked to central disorders, they may also occur in peripheral vestibular conditions. This study aims to investigate smooth pursuit parameters in BPPV patients and assess their changes following canalith repositioning maneuvers.

MATERIAL & METHODS

This retrospective study included patients aged 18 years and older who presented to the Audiology Department of Koç University Hospital between 2023 and 2025 with complaints of BPPV. Patients with additional neurological or psychiatric

disorders, as well as those outside the age criteria, were excluded. Smooth pursuit test parameters of the patients were retrospectively analyzed using videonystagmography (VNG) recordings.

RESULTS

Reduced pursuit gain values and irregular pursuit movements were observed in patients with BPPV. These alterations were found to vary according to BPPV subtypes. Following canalith repositioning maneuvers, an overall improvement trend in smooth pursuit parameters was observed; however, in some patients, the findings did not fully return to baseline levels.

CONCLUSIONS

The findings indicate that the smooth pursuit test may be affected in BPPV and that vestibular imbalance may transiently alter oculomotor control. The observed improvement after canalith repositioning maneuvers may be related to the restoration of vestibular system balance.

OP-048

P300 Latency And Speech-In-Noise Performance In Normal-Hearing Adults: A Preliminary Study

Büşra Nur Eser[1,2], **Furkan Büyükkal**[1,2], **Caner Yatmaz**[2], **Samet Kılıç**[3], **Mustafa Bülent Şerbetçioğlu**[1]

[1]*Istanbul Medipol University Faculty of Health Sciences Audiology Department;* [2]*Istanbul Medipol University Graduate School of Health Sciences;* [3]*Trakya University Faculty of Health Sciences Audiology Department*

BACKGROUND & AIM

Speech-in-noise perception relies not only on audibility but also on cortical attention, stimulus discrimination, and working memory. P300 is a cognitive auditory evoked potential that may reflect these processes. This preliminary study tested the hypothesis that poorer speech-in-noise performance would be associated with prolonged P300 latency in normal-hearing adults.

MATERIAL & METHODS

This pilot cross-sectional study included 17 adults aged 18–50 years with pure-tone averages of 25 dB hearing level or better, no neurological or psychiatric diagnosis, and no regular medication use. Speech-in-noise performance was evaluated using the Hearing in Noise Test. Adaptive testing was performed, followed by fixed signal-to-noise ratio conditions at +5, 0, and −5 dB, with speech and noise presented from 0° and fixed-test noise set at 65 dB sound pressure level. P300 responses were recorded using an Intelligent Hearing Systems Smart EP system with binaural /da/–/ba/ oddball stimuli, an 80/20 standard-to-target ratio, 40-ms stimulus duration, 1.1/s rate, and Cz–mastoid montage. P300 latency and amplitude were extracted. Friedman, Wilcoxon, and Spearman correlation analyses were used.

RESULTS

Mean P300 latency was 288 ± 56 ms, and mean P300 amplitude was 14.7 ± 7.5 µV. Hearing in Noise Test performance decreased as the listening condition became more adverse. P300 latency showed a strong negative correlation with speech-in-noise performance at 0 dB signal-to-noise ratio, indicating poorer performance with longer latency, Spearman's rho = −0.870, p = 0.002. Correlations were not significant for adaptive Hearing in Noise Test performance, rho = 0.281, p = 0.464; +5 dB signal-to-noise ratio, rho = −0.252, p = 0.513; or −5 dB signal-to-noise ratio, rho = −0.485, p = 0.186.

CONCLUSIONS

These preliminary findings suggest that P300 latency may be related to speech-in-noise performance, particularly at 0 dB signal-to-noise ratio, where auditory and cognitive demands are balanced. Larger studies with repeated P300 recordings across noise conditions are needed to confirm whether P300 can serve as an objective marker of cognitive-auditory load during speech-in-noise listening.

OP-049

Comparative Accuracy And Consistency Of Three Large Language Models In Vestibular Audiology: A Test-Retest Study

Gulce Kirazli[1], **Edanur Avunyali**[1], **Gokce Saygi Uysal**[2]

[1]*Ege University Faculty of Health Sciences Department of Audiology, Izmir-Turkiye;* [2]*Ankara Etlik City Hospital, Department of ENT, Izmir-Turkiye*

BACKGROUND & AIM

Large language models (LLMs) are increasingly used in clinical education and decision support, yet their performance in vestibular audiology remains largely unexamined. This study aimed to compare the accuracy and consistency of three contemporary LLMs on expert-validated vestibular audiology questions and to assess their temporal reliability.

MATERIAL & METHODS

This descriptive, comparative study evaluated three LLMs — ChatGPT-5o (OpenAI), Gemini (Google DeepMind), and Claude Sonnet (Anthropic) — on a 20-item vestibular audiology question bank validated by a five-expert panel (content validity ratio [CVR] ≥ 0.99). Questions spanned five clinical categories: anatomy/physiology, diagnostic tests, disease criteria, treatment/rehabilitation, and advanced test interpretation. Each model was queried twice, four weeks apart (test–retest design), yielding six independent response sets. Responses were scored on accuracy (correspondence with current evidence) and consistency (internal logical coherence) using a five-point Likert rubric by two independent expert raters blinded to model identity. Inter-rater agreement was assessed with weighted Cohen's kappa (κ) and intraclass correlation coefficient [ICC(A,1)]. Model comparisons used the Friedman test with Bonferroni-corrected Wilcoxon signed-rank post-hoc tests (adjusted $\alpha = 0.0167$). Test–retest reliability was evaluated with ICC(A,1).

RESULTS

Inter-rater agreement was substantial ($\kappa = 0.720$; ICC = 0.781). Accuracy differed significantly across models (Friedman $\chi^2(2) = 13.57$, $p = 0.001$). Claude Sonnet achieved the highest accuracy (mean ± SD: 4.29 ± 0.48), outperforming Gemini (3.77 ± 0.47; $p = 0.009$) and ChatGPT-4o (3.58 ± 0.48; $p < 0.001$); ChatGPT-4o and Gemini did not differ ($p = 0.252$). Consistency showed no significant between-model differences ($\chi^2(2) = 4.76$, $p = 0.093$; ChatGPT-4o: 4.01 ± 0.44, Gemini: 4.17 ± 0.36, Claude Sonnet: 4.41 ± 0.48). Test–retest reliability was poor for ChatGPT-4o and Gemini (ICC < 0.31), and moderate only for Claude Sonnet's consistency scores (ICC = 0.513, $p = 0.002$).

CONCLUSIONS

Claude Sonnet demonstrated superior accuracy in vestibular audiology, though none of the models achieved reliably consistent performance across time. The poor test–retest reliability of most models raises concerns about clinical dependability in this specialized domain. Standardized evaluation frameworks are essential before integrating LLMs into vestibular audiology practice.

Evaluation Of The Turkish Simplified Matrix Sentence Test - TURSIMAT

Aysun Parlak Kocabay[1], **Yasemin Bostan**[2], **Sevgi Kadıhanoğlu**[3], **Filiz Aslan**[1], **Gonca Sennaroğlu**[1], **Melanie A. Zokoll**[4,5], **Meral Didem Türkyılmaz**[1]

[1]Department of Audiology, Faculty of Health Sciences, Hacettepe University, Ankara, Turkey; [2]Audiology Unit, Hacettepe University, Ankara, Turkey; [3]Kütahya Health Sciences University, Turkey; [4]Hörzentrum Oldenburg gGmbH, Germany; [5]Cluster of Excellence "Hearing4all", Germany

BACKGROUND & AIM

The Turkish Matrix Sentence Test, TURMatrix, was developed to provide precise, internationally comparable assessments of speech intelligibility in the presence of background noise [1]. Using an adaptive procedure, the test determines the speech recognition threshold (SRT) of the patient in background noise. Since the test ideally requires participants to remember five words per sentence, individuals with impaired auditory memory may achieve poorer results that are not attributable to their hearing ability. For this reason, a shortened version of this test—the Turkish Simplified Matrix Test, consisting of 3-word pseudo-sentences (numeral, adjective, object)—was evaluated for use with school-age children.

MATERIAL & METHODS

Evaluation comprised two steps 1) verification of test list equivalence for shortened sentences 2) establishment of reference values for measuring target-SRT 50 or 80% in adults and children, the latter for different age groups. A total of 20 adult native listeners of Turkish (aged between 18 and 48 yrs., median 22 yrs), and 59/60 children (20 each for age groups of 5-6, 7-8, and 9-10 yrs.) participated in this study. All of them had normal hearing (pure-tone thresholds below or equal 15 dB HL at octave frequencies between 0.25 and 8 kHz) . Test list equivalence and reference SRTs were determined by presenting lists of pseudo-sentences and background noise monaurally through headphones. The level of the speech signal was adaptive and varied according to the word score for responses counted in the open-set response format, targeting either 20 and 80% (test list equivalence) or 20, 50 and 80% (reference SRTs).

RESULTS

1) The TURSIMAT test lists can be considered equivalent, and 2) the data for adults yielded a signal-to-noise ratio (SNR) of -7.6 dB for SRT80% and -9.5 dB for SRT50%, as well as an acceptable test-retest reliability. The SRT scores for children were lower (i.e., worse) and more variable than those for adults but improved with increasing age from -3.6 up to -5.1 dB SNR for SRT80%, and from -6.8 up to -7.8 dB SNR for SRT50%.

CONCLUSIONS

The TURSIMAT can now be used as a diagnostic tool for children.

OP-051

Development Of A Training Software To Improve Speech-In- Noise Perception In The Elderly With Noise-Induced Hearing Loss

Dr Parisa Rasouli Fard[1], **Dr Jalal Sameni**[2], **Dr Farnoush Jarollahi**[2]

[1]*Shahid Beheshti University of Medical Sceinces;* [2]*Iran University of Medical Sciences*

BACKGROUND & AIM

The incidence of noise-induced hearing loss (NIHL) is increasing rapidly worldwide. It has been shown that the long-term exposure to noise leads to permanent hearing loss. There is currently no treatment for NIHL and it is mainly managed by preventive measures. This study aimed to develop a training software to improve speech-in-noise (SIN) perception in the elderly suffering from mild-to-moderate NIHL due to temporal fine structure (TFS) damage.

MATERIAL & METHODS

This is a non-randomized clinical trial conducted on 8 older men aged 60-75 years (Mean age = 68 ± 4.5 years) with mild-to-moderate NIHL at high frequencies (43.75±6.0 dB HL) with at least for five years of work in noisy environment. They received rehabilitation using a researcher-developed training software targeted TFS for five weeks. To assess the efficiency of the training software, the signal-to-noise ratio for 50% correct scores (SNR-50%) was calculated using the word-in-noise test before and after the trial.

RESULTS

The SNR-50% improved significantly in all participants from 13±2.63 dB to 6.10±2.85 dB ($p<0.001$). In the multiple linear regression model, the rehabilitation by the training software predicted 68% of improvement in SNR-50% (coefficient of determination=0.676).

CONCLUSIONS

Rehabilitation by the training software developed based on TFS can improve SIN perception in the elderly with NIHL.

Auditory Involvement In Autosomal Dominant Alport Syndrome: A Systematic Review

Maria João Marques da Sllva[1,2], **Pedro Lisboa Gonçalves**[3,4,5], **Pedro Barros**[1,2], **Sónia Pires Martins**[1,2], **Ricardo Vaz**[1,5,6,7], **Carla Pinto Moura**[1,5,8,9]

[1]*Department of Otorhinolaryngology, São João Local Health Unit, Porto, Portugal;* [2]*Unit of Otorhinolaryngology, Department of Surgery and Physiology, Faculty of Medicine, University of Porto, Porto, Portugal;* [3]*Department of Nephrology, São João Local Health Unit, Porto, Portugal;* [4]*Unit of Nephrology, Department of Medicine, Faculty of Medicine, University of Porto, Porto, Portugal;* [5]*RISE-Health, Faculty of Medicine, University of Porto, Porto, Portugal;* [6]*Unit of Anatomy, Department of Biomedicine, Faculty of Medicine, University of Porto, Porto, Portugal;* [7]*NeuroGen Research Group, Center for Health Technology and Services Research (CINTESIS), Porto, Portugal;* [8]*Department of Genetics, São João Local Health Unit, Porto, Portugal;* [9]*Department of Genetics, Faculty of Medicine of University of Porto, Portugal*

BACKGROUND & AIM

Autosomal dominant Alport syndrome (ADAS), caused by heterozygous pathogenic variants in COL4A3 or COL4A4 genes, is the most prevalent form of Alport syndrome and is increasingly recognized within the spectrum of collagen IV–related nephropathies. While sensorineural hearing loss is a hallmark of X-linked Alport syndrome, auditory involvement in ADAS appears less frequent and remains poorly characterized.

This study aim to systematically review the available evidence on the prevalence, characteristics, and clinical significance of auditory manifestations in ADAS.

MATERIAL & METHODS

A PRISMA-based systematic review registered in PROSPERO (CRD420261403740) was conducted using PubMed, Scopus, and Web of Science. Studies reporting patients with ADAS and objective auditory assessment were included. Data regarding audiological evaluation, prevalence and characteristics of hearing loss, and relevant genotype-related findings were extracted.

RESULTS

After screening 297 records, 32 full-text articles were assessed for eligibility, and 20 studies were included in the final analysis. Across these studies, objective auditory assessment was available for 316 patients with ADAS, with hearing loss identified in 82 (26%) individuals. When present, hearing loss was predominantly sensorineural and generally mild. Notably, pediatric cohorts showed very low rates of objectively confirmed hearing loss, suggesting that auditory involvement in ADAS tends to occur later in life. Some studies also suggested that auditory involvement may occur independently of renal disease progression. Nevertheless, audiological characterization was highly heterogeneous across studies, with inconsistent reporting of hearing thresholds, progression, and audiometric patterns. Comparative data between ADAS and other forms of Alport syndrome were limited, although available evidence suggested that auditory involvement in ADAS is less frequent and generally milder.

CONCLUSIONS

Auditory involvement in ADAS appears less frequent and generally milder than in X-linked and autosomal recessive Alport syndrome, though the available evidence is limited by heterogeneous study designs and often incomplete audiological assessment. Standardized, prospective studies incorporating systematic audiometric evaluation are needed to better define the prevalence, characteristics, and natural history of hearing loss in ADAS, enabling earlier diagnosis and improved quality of life.

OP-053

THE DIAGNOSTIC VALUE OF WIDEBAND TYMPANOMETRY IN THE PERIOPERATIVE MANAGEMENT OF ADENOID HYPERTROPHY

Nikolai A. Daykhes[1,3], **Anton S. Machalov**[1,2,3], **Alla A. Grigorieva**[1,2], **Dmitrii P. Polyakov**[1,3], **Kristina A. Oganyan**[1], **Marina V. Bazanova**[1,2]

[1]National Medical Research Center for Otorhinolaryngology of the Federal Medico-Biological Agency of Russia, Russia; [2]Russian Medical Academy of Continuous Professional Education, Russia; [3]Pirogov Russian National Research Medical University, Russia; [4]National Medical Research Center for Otorhinolaryngology of the Federal Medico-Biological Agency of Russia, Russia

BACKGROUND & AIM

Adenoid hypertrophy, a prevalent pediatric condition, frequently causes otitis media with effusion (OME), often undiagnosed due to subtle symptoms. Although 226 Hz tympanometry is the gold standard for diagnosing OME, its limited sensitivity in early-stage cases impedes timely intervention. Given these diagnostic limitations, there is a pressing need for more sensitive assessment methods. Therefore, this study aims to evaluate wideband tympanometry (WBT) as a diagnostic tool for assessing middle ear function in children with adenoid hypertrophy throughout the perioperative period.

MATERIAL & METHODS

In a prospective study (January 2024–September 2025) at the National Medical Research Center for Otorhinolaryngology, Russia, we enrolled 120 children (median age 6 years [IQR 5–7]). The study group (n=60, 120 ears) had grade II–III adenoid hypertrophy with OME; the control group (n=60, 120 ears) had isolated adenoid hypertrophy. All patients underwent standardized diagnostic evaluation including otomicroscopy, age-appropriate audiometry, 226 Hz tympanometry and wideband tympanometry. Data were analyzed using Mann-Whitney U-tests and Spearman's correlation ($p<0.05$).

RESULTS

Wideband absorbance was significantly reduced in the study group compared to control group ($p<0.05$). The study identified distinct tympanometric patterns differentiating OME from eustachian tube dysfunction, with the latter demonstrating significantly greater differences between absorbance values at peak pressure and ambient pressure (18,50 [13,38; 23,00]), compared to both OME patients (0,00 [0,00; 6,00]) and control group (1,00 [0,00; 4,50]) ($p<0,05$). A characteristic 2500 Hz peak identified in OME patients, and a significant inverse correlation between wideband absorbance and the air-bone gap ($r = -0.505$, $p < 0.01$), further substantiate the method's diagnostic value. Its distinct clinical advantage lies in unique postoperative utility, enabling dynamic assessment of middle ear function and tympanostomy tube patency—unattainable with 226 Hz tympanometry.

CONCLUSIONS

Integrating WBT into the audiological assessment of adenoid hypertrophy enhances diagnostic accuracy for OME, enables objective evaluation of treatment efficacy, and facilitates monitoring of postoperative middle ear recovery.

OP-054

Unilateral "Pillow-Like" Sensation In The Ear: Could This Be A Vestibular Schwanoma?

Sanja Vučić[1], **Anđelina Jovanović**[1]

[1]Department of Otorhinolaryngology with Maxillofacial Surgery, Clinical Hospital Center "Zemun", Belgrade, Serbia

BACKGROUND & AIM

Vestibular schwannoma is a benign tumor originating from Schwann cells of the vestibulocochlear nerve. Usually, it presents with unilateral sensorineural hearing loss, tinnitus, vestibular disturbances, but early symptoms may be atypical, leading to delayed diagnosis. The aim of this case report is to emphasize how an unusual complaint—a "pillow-like" sensation in the ear—could lead to the detection of more serious diagnosis, such as vestibular schwannoma in a young adult, highlighting the diagnostic relevance of even mild unilateral auditory symptoms.

MATERIAL & METHODS

A 34year old male with no previous otologic disease reported a persistent “pillow-like” sensation in the left ear, along with intermittent tinnitus. Initial audiometry demonstrated mild unilateral sensorineural hearing loss with an air-bone gap of up to 20 dB only at 250 Hz, while tympanometry was normal. Fiberoptic nasopharyngoscopy revealed mild edema around the left Eustachian tube orifice. Although, the patient didn’t report worsening of symptoms, one month later, tonal audiometry showed further deterioration, with a 5–10 dB decrease across most air-conduction frequencies and absence of an air-bone gap. Tympanometry remained unchanged, while stapedial reflexes were nearly absent on the left side. A CT scan of the temporal bones identified a contrast-enhancing mass in the left cerebellopontine angle extending into the internal auditory canal, measuring 17×13× 12 mm, with thinning of bony structures. MRI confirmed CT findings, and the patient was referred to a multidisciplinary team including otologyst and neurosurgeon.

RESULTS

Radiologic and clinical data confirmed the diagnosis of vestibular schwannoma. The multidisciplinary team recommended stereotactic radiosurgery (Gamma Knife). The patient was scheduled for regular follow-up to monitor tumor evolution and treatment response.

CONCLUSIONS

The aim of this case is to highlight that these tumors may initially present with nonspecific or minimal symptoms, such as a pillow-like sensation in the ear, without vestibular disturbances. Progressive unilateral auditory changes, even when mild, warrant prompt imaging. Early identification and multidisciplinary management enable optimized therapeutic strategies and may prevent long-term morbidity.

OP-055

Utilization Of CROS/Bicros For Auditory Rehabilitation Following Sudden Sensorineural Hearing Loss: A Single Center Retrospective Cohort Study

You Sung (Jon) Nam, MD[1], **Jaspreet Grewal, RAud**[2], **Le Truc Linh Vaccarello, RAud PhD**[2], **Allan TP Ho, MBBS MSc FRCSC FRCSEd(ORL)**[1]

[1]Division of Otolaryngology-Head and Neck Surgery, Department of Surgery, University of Alberta, Edmonton, AB, Canada; [2]The Ear Clinic, Edmonton, AB, Canada

BACKGROUND & AIM

Sudden sensorineural hearing loss (SSNHL) is an otologic emergency often causing permanent unilateral deficits that significantly impair quality of life. However, post-SSNHL auditory rehabilitation strategies are poorly defined. This study aims to characterize real-world utilization of CROS (contralateral routing of signal) and BiCROS (bilateral microphone contralateral routing of signal) devices among non-recovering patients to optimize clinical rehabilitation pathways.

MATERIAL & METHODS

This study was a single-center retrospective cohort study of 100 patients between ages of 13 to 50 who presented with an acute onset unilateral sudden sensorineural hearing loss who made non-meaningful recovery and was followed up to 6 weeks post-intratympanic steroid injections to assess rehabilitation decisions from December 31, 2013, to January 31, 2026. Data was extracted from electronic medical records to evaluate the primary endpoint: the decision to purchase or return an amplification device. We used journal logs on the hearing devices to delineate usage.

RESULTS

Median age was 39.5 years (IQR: 13–52; 51.0% female). Thirty-four patients (34.0%) trialed amplification (64.7% CROS; 35.3% conventional), with 79.4% reporting subjective improvement. Final decisions included device purchase (58.8%, n=20), return (26.5%, n=9), or trial extension (14.7%, n=5). Purchasers (median age 42.5) showed balanced sex and laterality of loss. Conversely, those returning devices (median age 35.0) were predominantly female (66.7%) with right-sided loss (55.6%) and a higher frequency of CROS trials (55.6%) versus conventional aids (44.4%). We further report details on usage of these devices.

CONCLUSIONS

This is the first study to investigate the relationship between SSNHL and early utilization of air conduction hearing amplification with modern CROS devices. Results indicate that only a small proportion of patients trial devices. Patients over age 40 who attempt a trial consistently proceed to purchase regardless of sex or laterality, whereas females in their 30s with right-sided loss are less likely to adopt devices. These findings should inform targeted counseling and patient education to optimize early auditory rehabilitation treatment pathways.

OP-056

The Impact Of Hearing Loss, Hearing Care And Empowerment In The Workplace

Mark Laureyns[1,2,4], **Lidia Best**[3]

[1]*Thomas More University College, Audiology Department, Antwerp;* [2]*Amplifon Centre for Research and Studies CRS, Milano, Italy;* [3]*EFHOH – European Federation of Hard of Hearing People;* [4]*AEA – European Association of Hearing Aid Professionals*

BACKGROUND & AIM

The relation between hearing loss and employment is well document and in the WHO World Report on Hearing you can read "An association between hearing loss and employment in adults is evident and adults with hearing loss have increased odds of unemployment or underemployment".

The impact of hearing care and empowerment on employment needs to get more attention. Informing and guiding hard of hearing people and their employers on how to be successful at work is a challenge for audiologists, and many other health and social workers.

MATERIAL & METHODS

We developed a survey on this topic, joint with EFHOH (the European Federation of Hard of Hearing People), AEA (European Association of Hearing Aid Professional) and the audiology department of the Thomas University College of Applied Sciences in Antwerp, where we used the International Outcomes Inventory for Hearing Aids (IOI-HA), which we also adapted for Cochlear Implant users (IOI-CI), and questions for hard of hearing people using hearing aids, cochlear implants or other assistive devices on their experiences, needs, solutions, information and support at work. This survey was first evaluated by English native speakers, adjusted and then translated in 10 languages. After proofreading by native speakers of this language, the survey was distributed to all EFHOH and AEA member associations and networks. So far, we received responses from 1170 participants.

RESULTS

95% of the participants state that their hearing aids or cochlear implants were at least moderately worth the trouble, 85% indicated that they improved at least moderately the situations at work, where they wanted to hear better.

95% need to communicate regularly or more at work, and the acoustics at work are in 40% of the cases poor or very poor and in 36% average.

75% experience difficulties to communicate at work, 59% indicate their hearing loss affects their performance at work.

31% reported negative experiences related to exclusion or discrimination at work, and in 82% of the cases, the issue was not resolved or even got worse.

51% responded they were not informed about possible accomodations at work.

CONCLUSIONS

Although hard of hearing people experience that their hearing aids or cochlear implants, improve the situation at work and are worth the trouble, they still face challenges to be successful at work.

More than half of the participants were no informed about the possible support they could receive at work, or had to find it out for themselves.

We need urgently to inform users, employers and audiologists much better, on what it takes or what can help to be more successful at work.

OP-057

Effects Of Modified Epley And Semont Maneuvers On Residual Dizziness In Patients Diagnosed With Posterior Canal BPPV

Sabri Mutlu[1], **Onur Çelik**[1], **Uzdan Uz**[1]

[1]*Manisa Celal Bayar Üniversitesi Kulak Burun Boğaz Hastalıkları Anabilim Dalı*

BACKGROUND & AIM

This study aims to evaluate the effects of the Modified Epley Maneuver and the Semont Maneuver on residual dizziness in patients diagnosed with posterior canal benign paroxysmal positional vertigo.

MATERIAL & METHODS

A total of 42 patients were included in the study, with 21 patients in the Epley Group and 21 patients in the Semont Group. The patients were evaluated at the time of diagnosis, and at the first week and first month after repositioning treatment using the Dizziness Handicap Inventory, Vertigo Symptom Scale, Static Subjective Visual Vertical, and Dynamic Subjective Visual Vertical tests.

RESULTS

In both treatment groups, statistically significant reductions were observed in the within-group scores of the Dizziness Handicap Inventory and Vertigo Symptom Scale from baseline to the first-month follow-up ($p<0.001$). No significant

differences were found between the groups at follow-up points regarding residual dizziness (p>0.05). However, in the Epley Group, a statistically significant normalization was detected in the proportion of pathological head tilts on Static Subjective Visual Vertical measurements at the first-month assessment (p<0.05).

CONCLUSIONS

Our findings indicate that while both the Modified Epley and Semont Maneuvers exhibit comparable efficacy in the treatment of posterior canal BPPV. However, the Epley maneuver may provide a superior clinical benefit by potentially reducing the residual dizziness. These findings could guide the the selection of maneuvers in daily clinical practice and will contribute to the literature on the management of residual dizziness.

OP-058

Side-Dependent Effects Of Single-Sided Hearing Loss On Auditory And Cognitive Processing

Fatma Yurdakul Çınar[1]

[1]*Department of Audiology, Faculty of Health Sciences, Inonu University*

BACKGROUND & AIM

Single-sided hearing loss (SSHL) is a condition that involves not only peripheral auditory dysfunction but also alterations in central auditory processing. Unilateral auditory deprivation has been associated with cortical reorganization and alterations in hemispheric lateralization, which may contribute to side-dependent differences in auditory–cognitive interactions. This study aimed to examine side-dependent differences in auditory and cognitive processing in individuals with SSHL.

MATERIAL & METHODS

The study included 66 participants aged 18–35 years, of whom 44 had SSHL (22 right-sided and 22 left-sided) and 22 were normal-hearing controls. Auditory processing abilities were evaluated electrophysiologically using the P300 auditory event-related potential (ERP) and behaviorally using the Frequency Pattern Test (FPT), Duration Pattern Test (DPT), and Gaps-In-Noise (GIN) test. Cognitive executive abilities were assessed with the Stroop Color–Word Test. Group comparisons were conducted using analysis of variance (ANOVA) followed by post hoc pairwise comparisons.

RESULTS

Participants with SSHL showed significant group differences across all measures. For P300, controls had the shortest latencies and highest amplitudes, the left-sided SSHL group showed intermediate values, and the right-sided group exhibited the longest latencies ($p < 0.05$). On behavioral tests, controls outperformed both SSHL groups on the FPT, DPT, and GIN ($p < 0.05$). Within the SSHL cohort, right-sided group scored lower on the FPT and GIN, whereas left-sided group scored lower on the DPT ($p < 0.05$). Stroop scores were lower in both SSHL groups compared with controls, with no significant difference between right- and left-sided participants ($p > 0.05$).

CONCLUSIONS

These findings indicate that SSHL is associated with alterations in cortical auditory processing, as evidenced by prolonged P300 latencies and reduced amplitudes, reflecting slower auditory discrimination and reduced attentional resource allocation.Right-sided SSHL showed greater deficits in frequency-based temporal ordering and temporal resolution, whereas left-sided SSHL predominantly affected duration-based temporal ordering.Both groups also exhibited reduced executive function relative to controls, suggesting that unilateral hearing loss can impact both auditory and cognitive domains.Together, these results highlight that the side of hearing loss differentially affects cortical and behavioral auditory processing, emphasizing the importance of side-specific assessment and the potential for individualized rehabilitation strategies.

Genetic Assessment For Hearing Loss In Adults: A Monocentric Observational Study In A National Reference Center

Ghizlene Lahlou[1,2,3], **Breil Eugénie**[1], **Mosnier Isabelle**[1], **Jonard Laurence**[1,4], **Marlin Sandrine**[1,4]

[1]*Assistance Publique Hopitaux de Paris;* [2]*Sorbonne Université;* [3]*Institut Reconnect;* [4]*Institut Imagine*

BACKGROUND & AIM

Hearing loss (HL) is the most common sensory impairment, impacting 10% of the global population, including 1-3 per 1000 newborns. While the genetic contribution to congenital HL is well established, the role of genetics in adult-onset HL remains under-explored. Genetic testing in adults could lead to earlier diagnoses and therapeutic interventions, but its application is not yet routine. The aim of this study was to evaluate the diagnostic yield of genetic testing in adults with HL and identify predictive factors for a positive genetic diagnosis, enhancing understanding of the genetic contribution to adult-onset HL.

MATERIAL & METHODS

A monocentric, retrospective study was conducted study in a national reference center specializing in hearing loss, including adult patients with HL who underwent genetic assessment between 2017 and 2023. All participants received clinical and audiological evaluations before undergoing genetic testing using targeted gene sequencing or panels of up to 110 HL-related genes. The primary outcome was the identification of pathogenic or likely pathogenic variants in HL-related genes. Genetic variants were classified based on American College of Medical Genetics and Genomics guidelines, with positive results defined as the presence of such variants.

RESULTS

A total of 279 adult patients with HL (mean age 44 years) who completed genetic evaluations were included. Patients with familial relationships to others in the study or who were still undergoing analysis were excluded. Genetic causes of HL were identified in 52% (n=145) of the patients and GJB2 was the most commonly identified gene (22%). Prelingual HL had a higher diagnostic yield (65%) compared to postlingual HL (46%). Positive results were more likely in cases of younger onset, symmetrical, and progressive HL, as well as those with a family history of HL. Postlingual HL was predominantly autosomal dominant, with DIAPH3, TMPRSS3, and COCH among the most frequent genes.

CONCLUSIONS

Genetic testing proves valuable in diagnosing adult HL, particularly in younger patients with symmetrical and progressive HL. This study emphasizes the role of genetic evaluation in adult-onset HL, offering insights that may inform personalized care and potential therapeutic approaches.

OP-060

The Effect Of Age And Instrumentation On Wideband Acoustic Immittance (WAI)

Shahnaz, N., Ph.D.[1], **Rahmani Manesh, M., M.Sc.**[1], **Elbar, M., Ph.D. Student**[1,2], **Motallebzadeh, H., Ph.D.**[2]

[1]*University of British Columbia;* [2]*California State University*

BACKGROUND & AIM

Earlier research has shown that age has a significant, frequency-dependent impact on WAI. The majority of these variations have been seen in the mid-to-high frequency range (~2–6 kHz), where older persons often exhibit somewhat lower absorbance. Whether these differences reflect true morphological and anatomical changes in the aging ear, measurement variability across instruments, or a combination of both remains unclear. To the best of our knowledge, however, no direct comparison between two commercially available WAI, Tympstar Pro from GSI and Titan from Interacoustics, has been published. This study's primary objective was to look into how aging and instrumentation affect WAI.

MATERIAL & METHODS

WAI was compared between two studies at the Middle Ear Lab (MEL), University of British Columbia: a younger cohort from the VEMP study and an older cohort from the COVID-19 study. Both cohorts were tested using the Titan Interacoustics and Tympstar Pro. The younger group (n=34; mean age 23 years) had normal hearing, whereas the older group (n=41; mean age 54 years) had varying degrees of sensorineural hearing loss. Absorbance was harmonized across devices and analyzed using a repeated-measures Gaussian marginal model, with ear as the repeated unit and multiple-comparison adjustments applied.

RESULTS

The study group × frequency interaction was significant for the linear and cubic frequency terms. This indicates that the spectral shape of absorbance differed between the VEMP and COVID groups. Instrumentation × frequency terms were not statistically significant, suggesting that Tympstar Pro GSI and Titan Interacoustics produced broadly similar frequency-dependent patterns at the population-average level. The three-way study group × instrumentation × frequency terms were not significant in the robust repeated-measures model, suggesting that the group-related spectral differences were not strongly dependent on the instrument used. Planned post-hoc frequency-band comparisons found no instrumentation differences that survived FDR correction within either study group. In contrast, study-group differences were observed for several Tympstar Pro GSI frequency bands after FDR correction. These differences were frequency-dependent, with the COVID group exhibiting higher absorbance in some lower-frequency bands and the VEMP group exhibiting higher absorbance in several mid-to-high-frequency bands.

CONCLUSIONS

Tympstar Pro GSI and Titan Interacoustics produced comparable mean absorbance estimates, with no significant overall instrumentation effect, supporting the use of shared normative data across systems. Because the COVID group was older and the VEMP group younger, differences should be interpreted as study-group (age-related) effects. The significant study group × frequency interaction indicates that age-related changes in absorbance are frequency-specific, supporting the need for age-stratified norms. This has clinical implications, as reliance on young adult norms may bias interpretation in older adults and affect diagnosis of middle ear conditions such as Otosclerosis.

OP-061

Retrospective Study Of Clinical Histories, Audiometric Tests And APDQ Results Of Children Attending The Auditory Processing Disorder (APD) Glasgow Clinic

Megan E Ruddy[1], **Bebek Bhattarai**[2], **Haytham Kubba**[1,2]

[1]*University of Glasgow, Scotland;* [2]*NHS Greater Glasgow and Clyde*

BACKGROUND & AIM

Auditory Processing Disorder (APD) is defined as, "difficulty in listening despite possessing hearing thresholds within the normal limit"(1). APD is believed to affect approximately 7% of American children(2), which is a similar prevalence to ADHD(3). Despite being common, diagnosis remains controversial. Therefore we decided to do an exploratory study into children who attended the Auditory Processing Disorder clinic in Glasgow, to see if we could identify patterns in those who attended.

MATERIAL & METHODS

A retrospective study of children attending the Auditory Processing Disorder Clinic at the Royal Hospital for Children in Glasgow from 2016 to present day. Referral criteria were: aged ≥ 7, resident in Greater Glasgow and Clyde area, normal thresholds on audiometry and APD suspected by educational or health professionals. We analysed clinical history, audiometric tests and the Auditory Processing Disorders Questionnaire (APDQ).

RESULTS

159 children were seen, 65/145 (45%) with a history of otitis media and neurodivergence in 58/130 (45%). APDQ scores were: 31 (28%) were rated High APD Risk, 10 (9%) as APD Risk, 10 (9%) as Combined APD and ADHD Risk and 37 (34%) as Language-Learning and Listening Challenges risk. Dyslexia was found in 39 (57%) of children, Autism was found in 6 (9%) of children and Attention Deficit Hyperactivity Disorder was found in 4 (6%) of children. 14 of the 39 (35.9%) children with a diagnosis of dyslexia were identified as having a Language-Learning and Listening Challenges risk. 0 of the 4 children with a diagnosis of ADHD were identified as having a risk of ADHD. We found no difference in APDQ scores between children with a history of otitis media and those with a neurodivergent diagnosis ($x2= 2.29$, $df= 7$, $p= 0.94$).

CONCLUSIONS

Regardless of children having a neurodivergent condition or history of recurrent otitis media, they have the same primary risk factor pattern generated by the APDQ. It appears that associated neurodiversity is important to consider in APD diagnosis and management. This requires further exploration and study of APDQ results in these subgroups, treatment modalities and outcomes.

OP-062

From Eligibility To Implantation: Why Adults Fall Through The Cochlear Implant Care Pathway

Dr.Muhammed Ayas AuD PhD CCC-A[1]

[1]*University of Sharjah, United Arab Emirates*

BACKGROUND & AIM

Despite strong evidence supporting cochlear implantation(CI) in adults with severe-to-profound hearing loss, uptake remains low even among eligible candidates. Many adults disengage at different stages of the CI care pathway, from identification and referral to decision-making and implantation. This study aims to identify key patient-, professional-, and system-level factors contributing to attrition across the adult CI pathway, using evidence from the UAE. The findings are intended to inform strategies that improve pathway navigation, timely referrals, and adult cochlear implant uptake, with relevance to global clinical practice.

MATERIAL & METHODS

This study adopts a mixed-methods pathway analysis approach. Primary data were drawn from the IMPLANT-UAE study, involving adults identified as potential CI candidates and examined across multiple stages of the care pathway.Structured questionnaires captured patient-reported barriers related to awareness, stigma, access, cost, and decision-making, complemented by clinician-reported insights on referral and counselling practices. To contextualise the findings, a targeted narrative review of international literature was conducted to map common attrition points within adult CI pathways globally. Barriers were organised using a care-pathway framework spanning identification, referral, candidacy assessment, and implantation. Descriptive and thematic analyses were used to identify patterns of disengagement and convergence between local and global evidence, enabling the development of a pragmatic model highlighting critical drop-off points amenable to intervention.

RESULTS

Analysis revealed substantial attrition across multiple stages of the adult CI care pathway. The most prominent drop-off points occurred prior to referral and during the decision-making phase. Key patient-reported barriers included limited awareness of CI candidacy, stigma associated with implantation, fear of surgery, and financial concerns. Professional-level barriers included delayed referrals, inconsistent counselling practices, and misconceptions regarding adult outcomes. System-level factors such as fragmented pathways and limited structured follow-up further contributed to disengagement. Mapping UAE findings against international literature demonstrated striking convergence in attrition patterns, suggesting that these challenges are not context-specific but globally pervasive. A pathway-based attrition model was developed, highlighting critical stages where targeted audiologist-led interventions could substantially improve adult CI uptake.

CONCLUSIONS

Low adult CI uptake reflects cumulative pathway failures rather than limited clinical benefit. Attrition occurs at identifiable stages, particularly before referral and during decision-making, driven by gaps in awareness, counselling, and care coordination. A shift from eligibility-focused care to proactive, audiologist-led pathway management is needed. Targeted interventions at key drop-off points could substantially improve adult CI uptake, with lessons that are relevant to hearing healthcare systems globally.

OP-063

Audible Contrast Threshold Across Hearing Loss Severity And Long-Term Amplification Effects: Preliminary Outcomes

Merve Torun Topcu[1], **Nihat Arda Büyükaşık**[2], **Özlem Ertuğrul**[1], **Mahmut Tayyar Kalcıoğlu**[2]

[1]*Department of Audiology, İstanbul Medeniyet University;* [2]*Department of Otorhinolaryngology, İstanbul Medeniyet University*

BACKGROUND & AIM

Individuals with hearing loss often struggle to understand speech in noise despite appropriate amplification, and there is no objective clinical tool to personalize noise-management settings. The Audible Contrast Threshold (ACT) test quantifies sensitivity to contrast in speech-like modulations and may help address this limitation. This study aims to examine how ACT thresholds vary across different degrees and configurations of hearing loss and to determine whether long-term hearing aid use influences suprathreshold contrast processing.

MATERIAL & METHODS

This clinical observational study included 93 adult's ears: normal-hearing participants (n=12) and individuals with sensorineural hearing loss of varying degrees and configurations (minimal, mild, moderate, and sloping). Hearing-impaired participants were categorized as long-term hearing aid users (≥5 years of regular use) or non-users with at least two years of unaided hearing loss. ACT was administered in a controlled clinical setting. The primary outcome measure was ACT threshold (dB nCL). Independent variables included hearing status, severity, configuration, and amplification history. Group comparisons were conducted using pairwise analyses with Bonferroni correction (α=0.05).

RESULTS

Mean ACT in the normal-hearing group was 1.47 ± 0.98 dB nCL. No significant differences were observed between normal-hearing individuals and very mild hearing loss groups ($p>0.05$). ACT thresholds increased progressively with severity, with moderate hearing loss groups exceeding 6 dB on average. Significant differences were found between normal hearing and mild-to-moderate hearing loss categories after Bonferroni correction ($p\leq0.039$). Across comparable severity levels, long-term hearing aid users demonstrated slightly lower ACT thresholds than non-users. Furthermore, severity-related differences were less pronounced among hearing aid users, whereas unaided participants showed clearer stratification according to hearing loss degree.

CONCLUSIONS

ACT appears sensitive to hearing loss severity beyond very mild impairment. Preliminary findings suggest that long-term amplification may be associated with a stabilizing effect on suprathreshold contrast processing. Establishing normative ACT data may support more individualized noise-management strategies and clinical counseling. Ongoing data collection will further clarify these associations.

OP-064

Prevalence And Clinical Characteristics Of Dizziness, Imbalance, And Associated Factors Following Bariatric Surgery: A Cross-Sectional Study

Murad Almomani[1]

[1]*King Abdulaziz University Hospital*

BACKGROUND & AIM

Bariatric surgery has emerged as an effective intervention for severe obesity; however, post-operative dizziness remains poorly characterized in the literature. This study aimed to determine the prevalence of dizziness, imbalance, and hearing problems following bariatric surgery and to identify associated risk factors.

MATERIAL & METHODS

2.1. Subjects This cross-sectional study was conducted among patients who had undergone bariatric surgery at multiple centers across Saudi Arabia between 2018 and 2024. Participants were recruited through bariatric surgery clinics, patient support groups, and social media platforms dedicated to post-bariatric patients. This recruitment strategy, while facilitating access to a diverse sample, introduces important methodological considerations. Recruitment through specialized clinics and support groups may have preferentially captured patients experiencing ongoing post-operative concerns. Similarly, social media recruitment may have attracted symptomatic individuals motivated to participate in research addressing their health issues.

RESULTS

3.5. Associations Between Dizziness and Other Related Symptoms Chi-square tests revealed significant associations between dizziness and other outcomes. Dizziness was strongly associated with imbalance (chi-square = 14.325, df = 1, p = 0.0002), with 46.6% of dizzy patients also reporting imbalance compared to only 8.8% of non-dizzy patients. Dizziness was also significantly associated with falls (chi-square = 7.085, df = 1, p = 0.008), with 25.9% of dizzy patients reporting falls compared to 2.9% of non-dizzy patients. The association between dizziness and hearing problems did not reach statistical significance (chi-square = 0.507, df = 1, p = 0.477) (Table 4).

CONCLUSIONS

In conclusion, post-surgery complications, particularly dizziness, are highly prevalent following bariatric surgery and demonstrate a significant dose–response relationship with the magnitude of weight loss. However, the 77.3% prevalence should be interpreted cautiously due to potential selection bias, response bias, and the broad definition of dizziness encompassing both vestibular and non-vestibular etiologies. The strong associations between dizziness and functional outcomes, including imbalance and falls, underscore the clinical importance of these symptoms. Enhanced awareness, systematic screening, and appropriate management integrated into comprehensive post-bariatric care to optimize patient outcomes and quality of life.

eywords: bariatric surgery; dizziness; vertigo; balance disorders; weight loss; postoperative complications

OP-065

Comparison Of Satisfaction And ACT Scores In Hearing Aid Users With And Without Bluetooth Features

Leyla Türe[2], **Özlem Ertuğrul**[1], **Büşra Aktürk**[3]

[1]*Department of Audiology, Faculty of Health Sciences, Istanbul Medeniyet University, Istanbul, Türkiye;* [2]*Department of Speech and Language Therapy, Faculty of Health Sciences, Istanbul Kent University, Istanbul, Türkiye;* [3]*Cagri Hearing Center, Istanbul, Türkiye*

BACKGROUND & AIM

Age-related hearing loss is frequently associated with reduced temporal processing abilities and increased listening effort, particularly in noisy environments. Direct audio streaming via Bluetooth technology may enhance signal-to-noise ratio (SNR) and reduce reverberation effects, potentially improving speech perception and subjective listening experience in older hearing aid users.

MATERIAL & METHODS

This prospective, randomized, cross-over study included 30 adults aged 60–80 years with mild-to-moderate bilateral sensorineural hearing loss who had been using bilateral hearing aids for at least six months. Participants were evaluated Speech-in-noise performance was assessed using the Audible Contrast Threshold Test. Subjective outcomes were measured using the International Outcome Inventory for Hearing Aid (IOI-HA) and Satisfaction with Amplification in Daily Life.Statistical analyses (SADL) were conducted using repeated-measures ANOVA, and effect sizes were calculated.

RESULTS

Preliminary findings demonstrated significantly higher speech recognition scores in the Bluetooth condition, particularly in noisy settings (p < 0.05). The most pronounced benefit was observed in participants with poorer baseline temporal processing performance. Subjective ratings of speech quality and overall satisfaction were significantly improved with Bluetooth streaming, while perceived listening effort was significantly reduced (p < 0.05).

CONCLUSIONS

Direct Bluetooth transmission appears to provide a measurable advantage in challenging listening conditions and may partially compensate for age-related temporal processing deficits. These findings suggest that beyond improving sound clarity, Bluetooth streaming may reduce central auditory processing load, supporting its clinical relevance in auditory rehabilitation for older adults.

OP-066

Can Electrical Hearing Maintain Speech Performance In The Presence Of Cochlear Microphonic Positivity? Evidence From Performance-Intensity Function

Fatma Zehra Gümüş Selek[1], **Hatice Kübra Bozkurt**[2], **Bülent Satar**[3]

[1]*Department of Audiology, Faculty of Health Science, KTO Karatay University, Konya, Türkiye;* [2]*Department of Audiology, Gulhane Faculty of Health Science, University of Health Science, Ankara, Türkiye;* [3]*Department of Otorhinolaryngology, Gulhane Faculty of Medicine, University of Health Science, Ankara, Türkiye*

BACKGROUND & AIM

This study investigated the presence of rollover phenomenon using the performance-intensity (PI) function in cochlear implant (CI) users and examined its relationship with cochlear microphonic (CM) responses, an electrophysiological marker of auditory neuropathy spectrum disorder (ANSD). It was hypothesized that the rollover ratio would be higher in CM-positive cases.

MATERIAL & METHODS

In this prospective observational study (Ethics Approval No: 2025/029), participants were divided into two groups based on the presence of polarity-dependent CM in preoperative auditory brainstem response (ABR) recordings: CM-positive (n = 10) and CM-negative (n = 12). The PI function was obtained in free field using monosyllabic word lists presented at five intensity levels above the speech reception threshold (SRT +10 to +50 dB SL). The rollover index (RI) was calculated from the minimum and maximum word recognition scores, and RI ≥ 0.35 was accepted as rollover. Between-group comparisons were performed using independent samples t-tests and chi-square tests. The relationship between RI and audiological variables was analyzed using Spearman correlation analysis ($p < 0.05$).

RESULTS

No significant differences were observed between groups in speech recognition scores across presentation levels ($p > 0.05$). However, RI was significantly higher in the CM-positive group ($p = 0.021$). Rollover was observed only in the CM-positive group (30%) and was not detected in the CM-negative group ($\chi^2 = 4.168$; $p = 0.041$). Weak negative correlations were found between RI and pure-tone averages as well as frequency thresholds; however, these associations were not statistically significant ($p > 0.05$).

CONCLUSIONS

Rollover was observed in some CI users and was associated with the presence of cochlear microphonic responses. Although performance deterioration at higher presentation levels was noted in CM-positive individuals, the absence of this decline in the majority of participants (70%) suggests that speech performance can be maintained under CI stimulation. While CM presence may represent an electrophysiological characteristic associated with ANSD, it is not a standalone diagnostic indicator. These findings demonstrate that the PI function may exhibit heterogeneous patterns in CI users.

OP-067

Screening Of Auditory Development Of Preterm Children At 18-30 Months Of Age: A Cross-Sectional Study

Faria Elbabour[1], **Wanesa Mahjoub**[2], **Asma Elorafy**[2]

[1]*University of Benghazi;* [2]*Benghazi Medical Center*

BACKGROUND & AIM

Background: Children born preterm are at increased risk for auditory and other developmental delays.

Objectives: This research paper aimed to study the effectiveness and feasibility of using the LittlEARS auditory questionnaire (LEAQ) to screen for the development of pre-verbal auditory skills in preterm children aged 18 and 30 months, with the purpose of early detection of any hearing problems or speech delays.

MATERIAL & METHODS

Forty-seven children born preterm (study group) and 42 age-matched full-term peers (control group) had auditory skills assessment using the validated Arabic version of the parent-based LEAQ, administered by phone, regardless of whether newborn hearing screening was completed and/or its result.

RESULTS

Percentages of children who didn't achieve age-expected auditory milestones were 21% for preterm group and 7% for full-term group. A statistically significant correlation was found between age and total LEAQ scores (Spearman rho = 0.449, p=0.002) and between expected and total scores (Spearman rho = 0.462, p=0.001) in the study group. Neither gestational age nor gender had a significant impact on the total scores for preterm children. Wilcoxon W tests revealed a significant difference between the medians of total and expected scores in the preterm group (p<0.001), but not in the full-term group (p=0.768). However, the Mann Whitney U test showed no significant difference in LEAQ scores compared with the full-term group (p=0.065).

CONCLUSIONS

The LittlEARS auditory questionnaire is feasible and suitable for assessing of age-dependent early auditory milestones in preterm children and helpful in identifying who is at risk.

Hearing Screening Among Individuals Aged 60 Years And Older In Eskişehir: A Cross-Sectional Study

Muhammed Sefa Uyar[1], **Sena Yüksel**[1], **Arzu Kırbaç**[1], **Merve Bayri Ulukan**[1], **Ercan Kaya**[1], **Ş. Armağan İncesulu**[1]

[1]*Eskişehir Osmangazi University Faculty of Medicine, Department of Otorhinolaryngology*

BACKGROUND & AIM

Although hearing loss is common among elderly individuals, it is often not diagnosed in the early stages and may negatively affect quality of life. Community-based hearing screening programs are important for the early detection of hearing loss and the identification of potential risk factors. The aim of this study was to determine the prevalence of hearing loss among individuals aged 60 years and older living in the city center of Eskişehir, to evaluate potential risk factors associated with hearing loss, and to highlight the importance of community-based hearing screening for early diagnosis.

MATERIAL & METHODS

This study presents preliminary results from an ongoing cross-sectional hearing screening study conducted at the Otorhinolaryngology outpatient clinic of Eskişehir Osmangazi University Faculty of Medicine. Individuals aged 60 years and older who presented with complaints other than hearing loss were included. A brief questionnaire including demographic characteristics and potential risk factors was administered to the participants. Following the otologic examination, hearing screening was performed using otoacoustic emission (OAE) testing. Individuals who obtained a refer result in the screening test underwent pure tone audiometry for confirmatory evaluation. The prevalence of hearing loss was assessed based on the obtained data. One ear from a participant with previously diagnosed hearing loss who was using a hearing aid was excluded from the analysis.

RESULTS

A total of 154 individuals (53 males and 101 females) were included in the study. A total of 307 ears were evaluated during screening. A refer result was obtained in 93 individuals (60.4%) and in 158 ears (51.5%) on otoacoustic emission testing. All of these individuals underwent pure tone audiometry for further evaluation. Audiometric assessment revealed very mild hearing loss in 74 ears (46.8%), mild hearing loss in 37 ears (23.4%), and moderate hearing loss in 8 ears (5.1%) among the 158 ears with refer results, while hearing thresholds were within normal limits in 39 ears (24.7%).

CONCLUSIONS

The findings of this study indicate that hearing loss is highly prevalent in the elderly population. Community-based hearing screening programs may play an important role in the early detection of hearing loss and in timely referral for appropriate rehabilitation.

Extended High-Frequency Hearing Declines With Age Despite Normal Conventional Audiograms

Shahnaz, Navid, Ph.D.[1], **Loganathan, Ragul, M.Sc. Student**[1], **Rahmani Manesh, Mohammadreza, M.Sc.**[1], **Ciocca, Valter, Ph.D.**[1], **David, Eytan, BSc MD FRCSC**[1]

[1]*University of British Columbia*

BACKGROUND & AIM

Conventional pure-tone audiometry between 250–8000 Hz has long been the gold standard for assessing hearing, based on its assumed contribution to speech recognition. However, emerging evidence suggests that extended high frequencies (EHF; 9–16 kHz) are more sensitive to early auditory changes associated with noise exposure and aging. Age-related auditory decline may therefore be detectable in the EHF range even when conventional thresholds remain within normal limits. The aim of this study was to determine whether EHF testing improves the detection of age-related differences among individuals with clinically normal hearing in the conventional frequency range.

MATERIAL & METHODS

This cross-sectional study included 1,240 ears with normal conventional hearing (PTA4 at 0.5, 1, 2, and 4 kHz < 25 dB HL), tested between 2015 and 2024 in a private practice using an automated Békésy method. The sample comprised 434 ears from individuals aged 18–39 years, 564 ears from those aged 40–59 years, and 242 ears from those aged 60 years and older. Mean ages were 30.7 ± 5.9, 49.7 ± 5.6, and 65.5 ± 4.7 years, respectively. Pure-tone thresholds from 250 Hz to 16 kHz were compared across age groups. Frequency-specific differences were evaluated using omnibus group comparisons with false discovery rate correction. Predictive modeling was conducted to distinguish older (≥60 years) from younger (18–39 years) ears using conventional frequencies, extended high frequencies, and combined models, with performance assessed via cross-validated ROC analysis. A sensitivity analysis using a stricter ≤20 dB HL criterion yielded similar results.

RESULTS

ROC analysis demonstrated that hearing thresholds could accurately distinguish older from younger ears, even within a clinically normal-hearing sample. A model based on conventional frequencies alone yielded an AUROC of 0.907, indicating good discrimination. In contrast, a model using extended high frequencies (EHF) alone performed substantially better, with an AUROC of 0.971, indicating superior sensitivity to age-related auditory changes. Although thresholds at conventional frequencies showed statistically significant differences across age groups, these values largely remained within the clinically defined normal range (≤ 25 dB HL), limiting their impact on routine clinical classification. In comparison, EHF thresholds demonstrated marked age-related deterioration, providing greater separation between age groups. These findings suggest that EHF audiometry captures early auditory changes associated with aging that are not reflected in conventional-frequency thresholds.

CONCLUSIONS

Taken together, these findings indicate that a clinically normal hearing at conventional frequencies does not necessarily reflect the absence of age-related auditory change. Significant deterioration is already evident in the EHF range, where thresholds show clear age-related separation even before conventional pure-tone averages exceed the clinical boundary for hearing loss. These results suggest that reliance on conventional audiometry alone may underestimate early auditory decline. EHF audiometry provides a more sensitive measure of early age-related changes and may offer important clinical value for identifying subtle auditory deterioration before it becomes apparent within the conventional frequency range.

OP-070

Music Listening Habits And Sound Intolerance In Relation To Listening Fatigue In Young Adults: A Cross-Sectional Study

Talha Çögen[1], **Fatma Telci**[2]

[1]*Department of Audiology, Faculty of Health Sciences, Bingöl University, Bingöl, Türkiye;* [2]*Department of Audiometry, Health Services Vocational School, Harran University, Şanlıurfa, Türkiye*

BACKGROUND & AIM

Listening-related fatigue is the subjective tiredness arising from sustained effortful listening. It has been characterised predominantly in adults with hearing loss. However, recreational sound exposure is common in young populations through daily headphone music use. The World Health Organization estimates that more than one billion young people aged 12 to 35 are at risk from unsafe listening practices. Evidence linking these exposures to subjective fatigue outcomes in young adults without self-reported hearing loss remains sparse. This study examined whether daily headphone music duration, perceived music loudness, and self-reported loud-sound annoyance are independently associated with listening-related fatigue in a young-adult sample.

MATERIAL & METHODS

This cross-sectional online survey enrolled 346 adults aged 18 years or older. After exclusion of seven participants reporting hearing loss, 339 were analysed. Listening-related fatigue was assessed using the Listening Fatigue Scale (LFS), a 24-item Turkish-validated instrument developed by Şahin (2024). The scale comprises Social-Emotional (7 items), Physical (7 items), and Cognitive (10 items) subscales. Items were scored from 0 (Never) to 4 (Always), and subscale and total scores were computed as item means. Predictors of interest were daily headphone music duration (hours per day), self-rated music

loudness (0 to 10), and loud-sound annoyance (0 to 10). Age, gender, and sleep quality were included as covariates. The primary analysis used fractional-logit regression to accommodate the bounded LFS outcome and substantial floor effects. Linear regression and heteroscedasticity-consistent standard errors served as sensitivity analyses. Internal consistency was re-estimated in the present sample.

RESULTS

Mean age was 20.1 years (SD 1.26), with 76% female. Mean daily headphone music duration was 2.8 hours (SD 3.2). Cronbach's α was high (Total 0.97). LFS scores were low (mean 0.84/4, median 0.67) with a marked floor effect (21% exact zeros for Total, 27 to 30% for subscales). Headphone music duration predicted higher fatigue in the primary fractional-logit model (exp[β] = 1.04 per hour, 95% CI 1.00 to 1.09, p = .034). Loud-sound annoyance was the strongest predictor (exp[β] = 1.09 per unit, 95% CI 1.04 to 1.15, p < .001). Music loudness was not associated with fatigue (p = .124). Subscale models showed similar patterns, with loud-sound annoyance most consistent. Under HC3 robust standard errors the headphone-duration effect became marginal (p = .082), whereas loud-sound annoyance remained robust (p < .001). The duration × loudness interaction was non-significant (p = .37).

CONCLUSIONS

In this young-adult sample without self-reported hearing loss, listening-related fatigue was generally low but identifiable, with marked floor effects supporting the use of fractional-logit modelling. Daily headphone music duration showed a small positive association with listening fatigue that attenuated under robust inference, whereas self-rated music loudness showed no clear association. Loud-sound annoyance was the most consistent and strongest predictor across model specifications and subscales. These findings suggest that self-reported auditory sensitivity, rather than recreational music habits alone, may be the dominant correlate of listening-related fatigue in young adults.

OP-071

When Pass Doesn’t Mean Clear: Long-Tearm Outcomes In Newborns With Refer TEOAE And Pass AABR

Francesca Forli[1], **Silvia Capobianco**[1], **Francesco Lazzerini**[1], **Luca Bruschini**[1], **Stefano Berrettini**[1]

[1]*ENT, Audiology and Phoniatrics Unit, University of Pisa, Pisa, Italy;* [2]*Division of ENT Diseases, Karolinska Institutet, Stockholm, Sweden*

BACKGROUND & AIM

The universal neonatal hearing screening program aims to identify children with congenital hearing loss. Early identification and intervention are crucial for improving language outcomes. The two-stage screening protocol involves testing newborns who fail the Otoacoustic Emissions (OAEs) with Automatic Auditory Brainstem Responses (AABR). Infants who pass the AABR after failing the OAEs receive a Pass result. Adding AABR reduces false positives and unnecessary clinic referrals, but its effect on false negatives remains underexplored. This study estimates the incidence of long-term auditory problems at five years in children who failed OAEs but passed AABR.

MATERIAL & METHODS

Between November 2011 and December 2019, 16,574 newborns underwent hearing screening. Of these, 75 (0.45%) failed Transient Evoked Otoacoustic Emissions (TEOAE) but passed AABR. According to the Tuscany Region Neonatal Hearing Screening protocol, all infants failing twice the first-stage TEOAE or at risk for auditory neuropathy underwent second-stage AABR screening. All infants failing TEOAE were referred for follow-up, even if they passed AABR. At age five, these 75 children were assessed using behavioral audiometry to determine long-term auditory outcomes.

RESULTS

Among the 75 newborns, 44 (58.7%) had no risk factors for auditory issues, while 31 (41.3%) had risk factors such as family history (n=1), ototoxic drugs (n=12, 16%), cleft palate (n=1), Down syndrome (n=3), and Small for Gestational Age (n=1). Prematurity was observed in 23 (30.6%): 3 (13%) extremely preterm, 4 (17.4%) very preterm, and 16 (69.6%) moderate-to-late preterm. Neonatal Intensive Care Unit admission occurred in 9 (12%). Bilateral TEOAE failure was observed in 34 (45.3%), and unilateral in 41 (54.7%). Long-term auditory results will be discussed, with a focus on the proportion of newborns presenting some degree of hearing loss, without risk factors for late onset or progressive or acquired hearing loss.

CONCLUSIONS

Findings will clarify the proportion of children with hearing loss who would have been missed if screening was considered a pass at birth. These results may inform follow-up strategies for newborns passing AABR but failing TEOAE.

Evaluation Of Middle Ear Functions With Wideband Tympanometry In Adult Hearing Aid Users

Hande Arslan[1], **Zeynep Özer**[1], **Onur Günaydın**[1,2], **Dursun Mehmet Mehel**[1], **Asüde Ünal**[1,2], **Doğukan Özdemir**[1,2]

[1]*Samsun City Hospital;* [2]*Samsun University*

BACKGROUND & AIM

The present study aimed to assess middle ear function in adult hearing aid (HA) users with sensorineural hearing loss (SNHL) using wideband tympanometry (WBT) and to examine the effects of WBT-derived parameters and hearing loss severity on hearing aid adherence.

MATERIAL & METHODS

49 adult patients (mean age: 59.8 ± 13.2) with moderate and severe SNHL who had been using HAs for at least 6 months were included in the study. Patients were stratified according to daily HA use into two groups: users for <12 hours/day, and users for ≥12 hours/day. 40 individuals (mean age: 56.4 ± 6.9) with a similar average age and no hearing loss were included in the study as the control group. Middle ear function was evaluated using the WBT over a frequency range of 226–8000 Hz. Key WBT parameters, including absorbance, resonance frequency, and compliance, were analyzed.

RESULTS

A statistically significant difference was observed in compliance at 1000 Hz and resonance frequency between patients using HAs for ≥12 hours/day and those using them for <12 hours/day (p: 0.04; p: 0.04, respectively). There was a significant negative correlation between HA usage duration and both compliance (ρ: −0.43; p < 0.01) and absorbance at 500–1000 Hz (ρ: - 0.3; p: 0.04). In contrast, HA usage duration was positively correlated with resonance frequency (ρ: 0.36; p: 0.01). Furthermore, individuals with severe hearing loss exhibited significantly higher device adherence compared with those with moderate hearing loss (p: 0.04).

CONCLUSIONS

Wideband tympanometry enables a comprehensive evaluation of middle ear mechanics in adult HA users and may contribute to the optimization of individualized amplification strategies. For patients with low hearing aid adherence, fitting based on their WBT values may increase the daily usage time of their hearing aids; further research is needed on this topic.

Feasibility Of Rapid Cortical Auditory Evoked Potentials Using The Sofi Hearing Assessment (R&D Version) System In Pediatric Populations

Ahmet Alperen Akbulut[1,2], **Rohit Vijayakumar**[3], **Oscar Portoles**[3], **Ayşenur Karaman Demirel**[1,4], **Nezafet Öztürk Akar**[1], **Nilüfer Bal**[5], **Ayça Çiprut**[5]

[1]*Audiology and Speech Disorders PhD Program, Institute of Health Sciences, Marmara University, 34865, Istanbul, Türkiye;* [2]*Department of Audiology, Hamidiye Faculty of Health Sciences, University of Health Sciences, 34668, Istanbul, Türkiye;* [3]*MindAffect BV, The Netherlands;* [4]*Vocational School of Health Services, Istanbul Okan University, 34959, Istanbul, Türkiye;* [5]*Department of Audiology, Faculty of Medicine, Marmara University, 34899, Istanbul, Türkiye*

BACKGROUND & AIM

Early and accurate detection of hearing loss is paramount for pediatric populations. While behavioral pure-tone audiometry (PTA) remains the clinical gold standard, it relies heavily on active patient cooperation, which is often difficult to obtain in young children. Rapid Cortical Auditory Evoked Potentials (Rapid-CAEP®) presents a novel, objective method to estimate hearing thresholds utilizing short electroencephalography (EEG) recordings. The objective of this study is to assess the absolute errors between hearing thresholds obtained with rapid-CAEP and PTA on a pediatric population of normal and impaired hearing.

MATERIAL & METHODS

42 children (aged 2-14 years; n=20 with normal hearing [≤20 dB HL] and n=22 with mild-to-moderate sensorineural hearing loss) underwent behavioral PTA and two 12-minute Rapid-CAEP® sessions (test-retest) utilizing the 8-channel R&D Sofi EEG system. Thresholds were estimated bilaterally at 500, 1000, 2000, and 4000 Hz. Age-specific stimulus rates were applied (2.5 Hz for <12 years; 5 Hz for ≥12 years). Data quality was strictly controlled; EEG sessions yielding a cross validation Canonical Correlation Analysis score < 0.1 were systematically excluded from the analysis.

RESULTS

The Rapid-CAEP® system yielded a median absolute error of 10 dB across all four tested frequencies compared to behavioral PTA. Indicating its potential clinical utility, 71.8% to 81.5% of the estimated thresholds (depending on the frequency) fell within a ≤15 dB margin of the behavioral PTA thresholds. The mean Pearson correlation of the CAEP between test-retest sessions was 0.94 (0.012 SEM).

CONCLUSIONS

These findings highlight a promising consistency between objective Rapid-CAEP® thresholds and behavioral responses, confirming its validity in pediatric cohorts. Furthermore, Rapid-CAEP shows potential as a reliable and time-efficient clinical tool, particularly for children who are unable to provide consistent behavioral feedback. While overall accuracy is high, factors such as participant fatigue, age-related effects, and transducer differences might have contributed to the variability and outliers observed in some of the results.

OP-074

The Challenge Of A Mature Final Diagnosis Of Hearing Loss Severity And Early Cochlear Implantation

Dr. Mahmoud Mahrous[1]

[1]*Audio-Vestibular Medicine Unit, Otorhinolaryngology Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt. 2Audio-Vestibular Medicine Unit, Otorhinolaryngology Department, King Fahad Hospital of University, Imam Abdulrahman Bin Faisal University, Dammam, Saudi Arabia.*

BACKGROUND & AIM

Despite the recent trend of cochlear implantation (CI) at the age of six or even four months is prevalent in many centers around the world, clinicians should be cautious because perinatal risk factors of auditory neuropathy and/or delayed maturation carry the possibility of reversible hearing loss, yielding better auditory performance at the age of one year. The purpose of this study is to raise awareness that early CI may not be universal for all patients. In addition, we specify the factors to be considered in the pre-operative evaluation of CI in infants younger than one year.

MATERIAL & METHODS

This study describes four cases provisionally diagnosed with severe to profound sensorineural hearing loss that were presented to the CI clinic to determine candidacy for implantation. Two cases had histories of prematurity, one had Down syndrome, and one had a family history of hearing loss.

RESULTS

None of the study cases were candidates for CI, as they had varying degrees of hearing improvement.

CONCLUSIONS

Although early CI may yield better auditory performance, the final diagnosis should be made only after repeated subjective and objective measurements as well as family feedback on the child's auditory performance, especially in preterm children. Early auditory brainstem response (ABR) prior to the age of one year in children with cognitive, neurologic, or developmental comorbidities should be interpreted with caution, as ABR "alone" could not accurately represent the child's true hearing ability in this patient population.

Auditory neuropathy; Cochlear implantation; Delayed maturation and auditory brainstem response.

OP-075

Investigating Parental Perceptions And Cultural Beliefs About Hearing Loss In Children: A Key To Strengthening Hearing Health Systems In Ghana

1S. Mensa-Yawson, 2K. K.K. Baidoo, 2A. Adam Jangu, 2E. D. Kitcher, 3B. Abaidoo[1]

[1]*37 Military Hospital, Accra, Ghana.*

BACKGROUND & AIM

Hearing loss (HL) in children is a public health concern. Despite its prevalence, HL remains poorly understood with misconceptions about its causes and consequences. An exploration of parental understanding, beliefs and perceived causes of HL in children may help in addressing the knowledge gaps and misconceptions surrounding it.

The aim of this study was to explore parental understanding, beliefs and perceived causes of HL in children.

MATERIAL & METHODS

This was a cross-sectional study among parents/guardians of pre-school children in selected schools around Korle Bu Teaching Hospital, Ghana. IBM SPSS version 21.0 was used for the data analysis. The demographic characteristics of the participants were analysed using descriptive statistics. Perceived causes of HL were presented in percentages on a frequency distribution table. An interpretive content analysis of the parents' understanding of HL in children and traditional beliefs about HL in children were examined and analysed to identify themes from the interviews.

RESULTS

A total of 465 parents with an average age of 34.4±4.6 years participated in the study. Most (90.8 %) were females. Perceived causes of HL among preschool children were; congenital causes, childhood infections/illness, ear infections, birth injuries and

maternal alcohol/drug abuse. The following themes demonstrated participants understanding of HL in children; partial or total inability to hear, reduced ability to comprehend given instructions and communicate, inability to respond to verbal information and difficulty with perceiving and differentiating different sounds. Perceived traditional beliefs about the causes of HL in children were; eating fishhead during pregnancy, adultery in pregnancy, pregnant woman eating snails, bewitchment by ancestral/evil spirits and hereditary.

CONCLUSIONS

Hearing loss in children is attributed to both biological and sociocultural factors, with parental understanding influenced by clinical knowledge, functional interpretation, and strongly held traditional beliefs.

OP-076

The Role Of Nystagmus Characteristics During The Epley Maneuver In Evaluating Treatment Success

Rumeysa Nur Akbaş[1], **Bülent Satar**[2], **Ercan Karababa**[1], **Abdullah Sunar**[3]

[1]*University of Health Sciences, Gülhane Faculty of Health Sciences, Department of Audiology, Ankara, Türkiye;* [2]*University of Health Sciences, Gülhane Faculty of Medicine, Department of Otorhinolaryngology, Ankara, Türkiye;* [3]*University of Health Sciences, Gülhane Training and Research Hospital, Ankara, Türkiye*

BACKGROUND & AIM

Benign Paroxysmal Positional Vertigo (BPPV), primarily affecting the posterior semicircular canal (P-BPPV), is the leading cause of peripheral vestibular vertigo. While typically managed via the Epley maneuver, real-time success prediction remains challenging. This study evaluates the prognostic value of nystagmus parameters recorded via videonystagmography (VNG) using VNG goggles during the fourth position (P4) of the Epley maneuver. The aim was to determine if nystagmus presence or elimination at P4 immediately predicts treatment efficacy.

MATERIAL & METHODS

This prospective, descriptive, and analytical observational study included 90 voluntary participants (59 females, 31 males) diagnosed with P-BPPV who met the inclusion criteria. Diagnostic Dix-Hallpike tests were performed, and patients underwent the Epley maneuver within the same session. Eye movements were monitored in real-time during the Epley maneuver using VNG goggles, and head positions were tracked with VORTEQ IMU sensors; low-amplitude nystagmus, often undetectable via bedside observation, was objectively recorded. Treatment efficacy was subjectively evaluated using the Dizziness Handicap Inventory (DHI) and the Numerical Rating Scale (NRS).

RESULTS

Recovery was achieved in 84% of participants (n=76) with a single maneuver. The absence of nystagmus at P4 predicted success with a sensitivity of 97.6% for right P-BPPV and 100% for left P-BPPV. Conversely, all participants (100%) exhibiting reversed nystagmus (i.e., opposite to that expected for the affected canal during the Dix–Hallpike test) or downbeat nystagmus at P4 experienced treatment failure. Statistical analyses revealed that immediate nystagmus elimination at P4 increased the probability of full recovery approximately 66-fold. DHI (from 57 to 0) and NRS (from 8 to 0) scores significantly decreased following treatment ($p < 0.001$).

CONCLUSIONS

This study demonstrates that nystagmus responses at the P4 stage of the Epley maneuver strongly predict treatment success. The absence of nystagmus at P4 is associated with successful outcomes. If nystagmus persists, immediate repetition of the maneuver is recommended. These findings indicate that nystagmus monitoring is a real-time prognostic marker with high predictive value.

OP-077

Features Of War-Related Hearing Loss Diagnostics

Khrystyna Kovalyshyn[1], **Mykola Novitskyy**[1], **Roman Fishchuk**[1]

[1]*Hearing Centre;* [2]*Central city clinical hospital of Ivano-Frankivsk city council*

BACKGROUND & AIM

The ongoing Russian war against Ukraine has led to a significant increase in auditory trauma among both military personnel and civilians. Blast-related injuries, prolonged exposure to high-intensity impulse noise (gunfire, artillery), and psychological trauma create a complex clinical profile of hearing loss. The aim of this study is to analyze the clinical features of war-related hearing disorders observed at our specialized Hearing Centre and to identify key diagnostic challenges in this patient population.

MATERIAL & METHODS

We conducted a retrospective analysis of patients who were consulted at the Hearing Centre after February 24th 2022 and presented with subjective hearing complaints following exposure to war-related acoustic trauma. Diagnostic protocols included pure-tone audiometry, tympanometry, distortion product otoacoustic emissions (DPOAE), and auditory brainstem response (ABR) when indicated. Data regarding symptom onset, mechanism of injury (e.g., blast wave vs. chronic noise exposure), and comorbidities such as post-traumatic stress disorder (PTSD) were evaluated.

RESULTS

The patient cohort exhibited a high prevalence of high-frequency sensorineural hearing loss and bilateral tinnitus. A significant portion of patients presented with mixed hearing loss and tympanic membrane perforation. We observed a correlation between the intensity of blast exposure and the severity of threshold shifts. The diagnostic process was frequently complicated by the presence of concurrent traumatic brain injury (TBI) and stress-related psychological symptoms.

CONCLUSIONS

Diagnostics for war-related hearing loss requires a multidimensional approach beyond standard audiometry. Our findings emphasize that clinicians must be prepared to identify non-traditional signs of auditory injury, particularly in patients exposed to high-pressure blasts. Early and comprehensive assessment, including objective measures of cochlear and neural function, is critical for effective management. Addressing these "silent" injuries is vital for the long-term rehabilitation and quality of life of patients affected by the Russian war against Ukraine.

OP-078

Impact Of Cisplatin-Induced Hearing Loss On Health-Related Quality Of Life: A Prospective Cohort Study

Lebogang Ramma[1], **Zenzo Chakara**[1]

[1]*Department of Health & Rehabilitation Sciences, Faculty of Health Sciences, University of Cape Town*

BACKGROUND & AIM

Cancer claims approximately 8.2 million lives worldwide and this number is set to double to 17.5 million by 2050. In South Africa the lifetime risk of cancer is estimated to be 1 in 8 among males and about 1 in 9 females. Cisplatin, a common chemotherapy drug used for treatment of various types of cancer, is associated with many adverse effects, including hearing loss. This study aimed to determine the impact of cisplatin-induced hearing loss on health-related quality (HRQoL) of life in patients undergoing cancer treatment.

MATERIAL & METHODS

A prospective cohort design was used to follow-up patients undergoing high dose cisplatin chemotherapy at Groote School Hospital, Cape Town, South Africa. Patients' hearing thresholds were prospectively monitored using pure tone audiometry (0.25 to 8 KHz) and HRQoL was assessed using both the Short Form – 36 (SF-36) and the Abbreviated Profile for Hearing Aid Benefit (APHAB) questionnaires. Descriptive and inferential statistics were used to analyse the data.

RESULTS

A significant decline in hearing thresholds was correlated with a decline in role-physical ($p = 0.006$) vitality ($p = 0.011$) and social functioning ($p = 0.016$) domains scores post-treatment. A significant decline in hearing was also significantly correlated to significant difficulty with ease of communication sub-scale of the APHAB ($p = 0.046$) and with increased challenges in reverberation post-treatment ($p = 0.022$).

CONCLUSIONS

Decline in pure tone hearing thresholds was significantly associated with a decline in health-related quality of life.

Cisplatin, hearing loss, health-related quality of life

OP-079

Impact Of Surgical Approach And Electrode Type On Middle Ear Mechanics In Pediatric And Adult Cochlear Implant Recipients: A Wideband Tympanometry Study

Cihangir Gönenç[1], **Sevgi Kutlu**[1], **Ayşe Tanrıverdi**[1], **Zahide Çiler Büyükatalay Yaldız**[1]

[1]*Ankara University*

BACKGROUND & AIM

Cochlear implantation may alter middle ear biomechanics through changes in cochlear impedance and postoperative tissue response. Wideband tympanometry enables frequency-specific assessment of these biomechanical changes. The aim of this study was to evaluate frequency-dependent changes in middle ear mechanics following cochlear implantation using wideband tympanometry and to investigate the influence of electrode type, surgical approach, and age group.

MATERIAL & METHODS

This retrospective study included 52 cochlear implant recipients (30 pediatric, 22 adult). Wideband tympanometry (226–8000 Hz) was performed bilaterally. Absorbance values were compared between implanted and contralateral ears, across electrode types, and between round window and cochleostomy approaches using appropriate statistical analyses.

RESULTS

Implanted ears demonstrated lower absorbance values compared to contralateral ears, particularly in the low-frequency range. Statistically significant differences were observed only at specific frequency bands, with significant findings at 324 Hz and 3175 Hz in pediatric patients and 408 Hz in adults. In pediatric patients, significant frequency-specific differences were identified between electrode types, whereas no significant electrode-related differences were observed in adults. Surgical approach analysis demonstrated limited frequency-specific differences, with higher absorbance values in the cochleostomy group at 1260 Hz in pediatric patients and in the round window group at 8000 Hz in adults.

CONCLUSIONS

Cochlear implantation is associated with frequency-dependent alterations in middle ear mechanics, predominantly reflected as reduced low-frequency absorbance. These findings suggest a stiffness-dominant biomechanical effect, with a more pronounced and variable response in pediatric patients. Wideband tympanometry may serve as a valuable non-invasive tool for detecting postoperative biomechanical changes and guiding individualized surgical and postoperative management strategies.

Speech Understanding With The BHM Contact Forte Bone Conduction System In Conductive Hearing Loss

M. Kompis[1], **M. Leimbacher**[1], **G. Mantokoudis**[1], **S. Weder**[1], **M. Caversaccio**[1], **T. Gawliczek**[1]

[1]*Department of ENT, Head and Neck Surgery, Bern University Hospital, University of Bern, Switzerland*

BACKGROUND & AIM

The Contact Forte system from BHM Inc (Grafenschachen, Austria). is a non-implantable bone conduction device allowing different wearing options. Our aim was to evaluate the audiological performance of two of its wearing options—an adhesive adapter and headband—worn unilaterally and bilaterally.

MATERIAL & METHODS

Both ears of 15 subjects with normal hearing were occluded to simulate a bilateral conductive hearing loss. The average hearing threshold became 45dB HL (500 to 4000 Hz). Measurements were performed in unaided conditions, with Contact Forte devices (unilateral and bilateral), with a headband, and with the self-adhesive wearing option. Speech understanding was measured in quiet (Freiburg words) at 50 and 65 dB and in noise (OLSA) in a diffuse noise field.

RESULTS

The self-adhesive adapter option resulted in a mean improvement in free sound field hearing thresholds of 16.3 dB for unilateral fitting and 19.1 dB for bilateral fitting. With the headband, the thresholds were, on average, better by 1.0 dB. Word understanding in quiet improved by 58 % to 75 % and was slightly better with the headband (3 %) and with two devices (5%). In background noise, speech understanding from the front was improved by an average of 2.8 dB. When speech was presented from the contralateral side, speech understanding deteriorated slightly by -0.8 dB with the unilateral fitting, whereas bilateral fitting led to an improvement of +4.2 dB. In noise, there was no significant difference between the headband and the self-adhesive adapter.

CONCLUSIONS

Significant improvements in speech understanding in quiet and noise were found, both with the headband and with the self-adhesive adapter. Using a bilateral fitting can improve speech understanding in noise.

How Do Digital Competence And Institutional Support Influence Tele-Audiology Practice Among Audiology Professionals?

Hülya Göçmenler[2], **Şeyma Nur Tabak**[3], **Azize Arzu Köroğlu Koçyiğit**[4], **Beyza Ekşi Bayrakdar**[1], **Cennet Akyol**[3]

[1]*İstanbul Rumeli Üniversitesi;* [2]*İstanbul Medeniyet Üniversitesi;* [3]*İstanbul Aydın Üniversitesi;* [4]*Zonguldak Bülent Ecevit Üniversitesi*

BACKGROUND & AIM

While tele-audiology is increasingly used in audiology services, limited research has examined the combined role of digital competence and perceived organizational support in shaping professional attitudes. This study aimed to investigate factors influencing audiology professionals' attitudes toward tele-audiology and to assess the mediating role of digital competence.

MATERIAL & METHODS

This cross-sectional study included 247 hearing health professionals (163 audiologists and 84 audiometrists) working in clinical, academic, rehabilitation, and hearing aid centers across Türkiye. The mean age was 26.95 ± 4.99 years, 75.3% were female, and approximately half held a bachelor's degree. Participants were recruited using snowball sampling, and data were collected online via Google Forms. Data collection instruments included a Demographic Information Form, the Digital Competence Scale (DCS), the Survey of Perceived Organizational Support (SPOS), and PAESRUT, a researcher-developed questionnaire based on the literature and expert opinion; its psychometric properties have not yet been established. Descriptive statistics, correlation analyses, and group comparisons were conducted, and mediation was tested using the HAYES PROCESS macro (Model 4) with 5,000 bootstrap resamples (95% CI).

RESULTS

Approximately 31.6% of participants had prior tele-audiology experience. Tele-audiology knowledge ($p = 0.007$), professional competence/self-confidence ($p = 0.001$), and total PAESRUT scores ($p = 0.049$) differed significantly according to years of professional experience. By educational level, only tele-audiology knowledge scores differed significantly ($p = 0.013$), with higher scores among postgraduates. Participants with tele-audiology experience scored significantly higher across all PAESRUT subscales and total scores ($p < 0.001$). Age showed low but significant positive correlations with tele-audiology knowledge ($r = 0.149$, $p = 0.019$) and professional competence/self-confidence ($r = 0.160$, $p = 0.012$). Mediation analysis indicated that digital competence significantly mediated the relationship between perceived organizational support and total PAESRUT scores.

CONCLUSIONS

Tele-audiology experience and professional seniority were the strongest determinants of positive attitudes and perceived professional competence. The mediating role of digital competence suggests that sustainable tele-audiology adoption requires organizational support alongside targeted digital skills training. Accordingly, structured in-service training and mentorship in clinical settings, together with the integration of tele-audiology and digital health into educational curricula, may enhance long-term and effective practice.

OP-082

Establishing Normative Data For The Acoustic Reflex Latency Test In Normal-Hearing Individuals

Sare Çankaya[1], **Eyyup Kara**[2], **Melih Tütüncü**[3]

[1]*Department of Audiology, Speech and Language Disorders, Institute of Graduate Studies, Istanbul University-Cerrahpaşa, Istanbul, Turkey;* [2]*Department of Audiology, Faculty of Health Sciences, Istanbul University-Cerrahpaşa, Istanbul, Turkey;* [3]*Department of Neurology, Cerrahpaşa Faculty of Medicine, Istanbul University-Cerrahpaşa, Istanbul, Turkey*

BACKGROUND & AIM

The Acoustic Reflex Latency Test (ARLT) is an objective otoneurological diagnostic tool that determines the time interval between the onset of an intense auditory stimulus and the initial impedance change resulting from the contraction of the stapedius muscle. For ARLT to be utilized as a standard and reliable method in clinical practice, there is a need for normative values that precisely define the boundaries of normal responses. The aim of this study is to establish a large-scale, age- and device-sensitive normative database specific to our clinic, using data obtained from normal-hearing individuals across different age groups.

MATERIAL & METHODS

Acoustic Reflex Latency Test (ARLT) measurements were conducted using the GSI TympStar Pro clinical tympanometer. The study evaluated normative data from 335 normal-hearing individuals (206 females, 129 males; mean age: 38.52 years). Participants were categorized into five age groups (18–25, 25–35, 35–45, 45–55, and 55–70 years) to analyze the effects of age on latency parameters. ARLT was performed across four frequencies (500 Hz, 1000 Hz, 2000 Hz, and 4000 Hz). The analyzed parameters included P1, P2, P3, and P4 latencies, alongside dynamic waveform properties, specifically Rise time and Fall time.

RESULTS

Statistical analysis showed no significant differences between the right and left ears, and likewise, no significant differences were found across the different age groups for all tested frequencies and latency parameters ($p > 0.05$), indicating that these normative data can be universally utilized across all normal-hearing age categories. The mean normative latency values were: P1 = 90.01 ms (SD: 38.85), P2 = 254.74 ms (SD: 101.59), P3 = 142.63 ms (SD: 45.25), and P4 = 312.48 ms (SD: 99.71). For the dynamic characteristics of the waveform, the mean rise time was 172.50 ms (SD: 91.19) and the mean fall time was 177.05 ms (SD: 84.02).

CONCLUSIONS

This study establishes a comprehensive normative database for ARLT across a wide age spectrum. The findings demonstrate that the acoustic reflex arc maintains symmetric and simultaneous neural transmission in healthy individuals. The established P1–P4 durations and rise/fall times serve as a reliable clinical reference framework, essential for accurately interpreting reflex delays or amplitude reductions in neurodegenerative, retrocochlear, or neuromuscular pathologies.

OP-083

School-Based Hearing Screening Conducted By Teachers Using A Localized Mobile Application.

Suwicha Kaewsiri Isaradisaikul, M.D.[1], **Thita Chantachote, B.Sc.**[1], **Sangvorn Seesutas, MEng.**[2]

[1]*Department of Otolaryngology, Faculty of Medicine, Chiang Mai University, Thailand;* [2]*National Electronics and Computer Technology Center, National Science and Technology Development Agency, Thailand*

BACKGROUND & AIM

Background: Pediatric hearing loss is a significant, often invisible handicap that can severely impair speech development and lead to declining academic performance. In resource-limited settings, routine screening is frequently hindered by a critical shortage of audiologists and equipment that is ill-suited for non-native English speakers. Schoolteachers represent a vital, untapped resource for early detection if provided with appropriate tools. This study evaluates a school-based hearing screening results conducted by teachers using the Preschool Audiometry Screening System–Pro (PASS-Pro), a localized application developed by National Electronics and Computer Technology Center, Thailand.

MATERIAL & METHODS

Methods: A retrospective study was conducted during the 2023 academic year across three primary schools in Chiang Mai. Teachers completed a standard workshop training before performing hearing screenings on 4th-to-6th-grade students. Ambient noise levels during testing were monitored using a sound level meter application.

RESULTS

Results: A total of 656 students successfully underwent hearing screening. The program demonstrated high efficiency, with a mean testing time per student of 70.6 ± 9.6 seconds. The screening revealed a unilateral referral (fail) rate of 6.2% and a bilateral referral rate of 1.7%. Despite the non-clinical school environment, the mean ambient noise level during testing was maintained at 43.05 ± 5.05 dB, which falls within acceptable limits for screening purposes.

CONCLUSIONS

Conclusion: Teacher-led, app-based screening is a time-efficient and accessible strategy for early hearing loss detection in school-aged children. This model provides a scalable solution to increase screening coverage in developing countries facing shortages of audiologists.

OP-084

RECORDING OTOACOUSTIC EMISSIONS (OAE) WITH ADAPTIVE NOISE CANCELLATION (ANC) - FINDINGS FROM CLINICAL APPLICATION IN NEWBORN HEARING SCREENING

Peter Böttcher[1], **Prof. W. Adjibabi**[2]

[1]*PATH MEDICAL GmbH;* [2]*Centre National Hospitalier Universitaire Hubert Koutoukou MAGA, Cotonou, Benin*

BACKGROUND & AIM

Otoacoustic emissions (OAEs) are low-level sounds of cochlear origin, which can be recorded by a sensitive microphone fitted into the ear canal. Measurements are difficult in environments with higher ambient noise levels, as even a well-fitting probe cannot prevent external noise from entering the ear canal and masking the low-level OAE response.

The aim of the study was to record OAEs in subjects with normal hearing under noisy environmental conditions in order to evaluate the performance of the ANC algorithm.

MATERIAL & METHODS

To compensate for this, we have developed an ear probe that has an additional microphone to pick up noise outside the ear canal. An adaptive noise cancellation (ANC) algorithm filters out external noise and subtracts it from the internal signal, resulting in an improved signal-to-noise ratio (SNR) and a shorter test time without affecting the OAE response. The ANC algorithm has been implemented on our QSCREEN hearing screener for measuring Transient Evoked Otoacoustic Emissions (TEOAE) and Distortion Product Otoacoustic emissions (DPOAE).

RESULTS

The results show that the use of ANC makes testing in noisy environments up to 20 times faster than testing with a conventional single-microphone ear probe. In noisy conditions of around 70 dBA, over 70% of initial overall “refer” changed to “pass” results after applying the ANC.

CONCLUSIONS

The benefits of ANC include: (1.) reduced number of false positives, i.e., an improvement of specificity; (2.) shorter test time, and (3.) a possibility of performing the screening of cochlea function based on OAE tests in adverse environmental conditions, e.g., in the neonatal ward, at bedside, in pediatric practices, or in schools.

OP-085

The Trend Of Audiologic Risk Factors, Comparing Study In NICU Settings, Albania

Birkena Qirjazi[1,2], **Ervin Dyrmishi**[2]

[1]*Faculty of Medicine, University of Medicine of Tirana, Albania;* [2]*ENT Unit, Tirana University Hopsital Center, Albania*

BACKGROUND & AIM

This study aims to assess the evolving impact of audiological risk factors on neonates admitted to NICUs in Albania over time

MATERIAL & METHODS

To enable comparison, this study focused on neonates admitted to the Neonatal Intensive Care Units (NICUs) of the two maternity hospitals in Tirana during the period 2018–2019. As fully equipped NICUs are available only in Tirana, the findings can be considered broadly representative of the national situation. Data from a similar study conducted in 2006–2007 were used for comparison. Both study periods spanned two years, with an approximate 10-year interval between them.

RESULTS

The dominant risk factors in the study population were prematurity, NICU stay, the use of ototoxic medication, low birth weight, hyperbilirubinemia and mechanical ventilation.

CONCLUSIONS

There has been a shift in the distribution of risk factors in the Albanian Neonatal population; premature birth is becoming more prominent than previously. The second most significant risk factor remains the length of stay in the NICU.The use of ototoxic medications continues to carry significant weight as a risk factor. Improved prenatal monitoring and adjustments to antimicrobial therapy are essential for reducing exposure to these risks.

KEYWORDS

universal neonatal hearing screening, audiological risk factors, NICU, ,low birth, aminoglycosides.

OP-086

Spatial Hearing In Elite Esports Athletes: Auditory Localization Under Visual Occlusion

Soner Türüdü[1], **Mehmet Kadir Ercan**[2], **Ezgi Büşra Aktaş**[3]

[1]*University of Groningen Medical Center Department of Otorhinolaryngology/Head and Neck Surgery, The Netherlands;* [2]*Radboud University Medical Center Department of Otorhinolaryngology/Head and Neck Surgery, The Netherlands;* [3]*Marmara University Department of Audiology and Speech Disorders, Turkiye*

BACKGROUND & AIM

Spatial hearing is crucial for orienting toward behaviorally significant sounds; however, quantifying its limits under naturalistic high-pressure settings remains challenging. Elite first-person shooter esports athletes offer a distinctive framework for examining auditory localization in virtual acoustic environments. We hypothesized that geometric visual occlusion would increase horizontal localization error during responses to enemy footsteps, while motor initiation speed would remain preserved.

MATERIAL & METHODS

This study analyzed high-frequency telemetry from professional Counter-Strike 2 matches involving top-ranked teams. Server-side demo files were parsed at 64 Hz to extract player position, view angle, movement, visibility, and enemy footstep events. After excluding trials with major auditory or visual confounders, unstable pre-stimulus movement, anticipatory reactions, and delayed responses, 2,475 auditory-dominant occluded events and 106 visible control events were included. The main outcome was horizontal localization error 200 ms after reaction onset. Secondary outcomes were reaction time, front-back confusion, sector effects, angular velocity, and differences across five competitive roles. Geometric visibility checks classified events as occluded or visible.

RESULTS

Visual occlusion significantly reduced spatial accuracy. Mean localization error was higher in auditory-dominant occluded events than in visible controls (52.7 ± 45.1° vs 37.3 ± 42.3°; $p < 0.001$). Front-back confusion occurred more frequently during occluded events (19.8% vs 13.2%). In the occluded condition, rear-hemifield sources caused more errors than frontal sources ($p < 0.001$), in line with cone-of-confusion effects. In contrast, reaction time was similar between occluded and visible events (291 ± 115 ms vs 284 ± 128 ms), and peak angular velocity did not differ significantly ($p = 0.732$). Localization performance was homogeneous across competitive roles ($p = 0.178$).

CONCLUSIONS

Elite esports athletes can react to visually occluded sound sources as quickly as to visible targets, but they localize them less accurately, especially when the sound comes from behind. This suggests that the main limitation is not delayed motor response, but reduced spatial precision when vision is unavailable. Professional esports telemetry may therefore offer an innovative and naturalistic approach for studying spatial hearing in virtual acoustic environments.

Cleft Plate And Hearing Loss

Bardia Masrouri[1], **Aida Soltanmoradi**[1], **Parisa Rasouli Fard**[1]

[1]*Shahid Beheshti University of Medical Sciences*

BACKGROUND & AIM

This study was conducted to investigate the prevalence and types of hearing loss in patients with cleft palate. There is general consensus among official sources that the prevalence of hearing loss is higher in the cleft palate population compared to the non-cleft population. In general, hearing impairment is more frequently observed in children with cleft palate than in adults with the same condition. Some studies have provided data suggesting a possible association between the type of cleft and the incidence of cleft-related hearing loss.

MATERIAL & METHODS

In this descriptive cross-sectional study, 64 infants and young children (aged 0–4 years) with cleft palate were evaluated at Mofid Children's Hospital. Hearing status was assessed using tympanometry, Distortion Product Otoacoustic Emissions (DPOAE), and Auditory Brainstem Response (ABR) tests. ABR is a reliable tool for detecting hearing loss in newborns by measuring the electrical responses of the auditory pathway to brief acoustic stimuli. In this study, two electrodes were placed on the mastoid processes behind the ears and one on the upper forehead using conductive gel. The recorded electrical activity from the forehead was compared with the activity from the stimulated ear. Auditory evoked potentials were analyzed based on response latency following the stimulus.

RESULTS

The results showed that 52 of the participants had conductive hearing loss, which was directly associated with Eustachian tube dysfunction and otitis media. The prevalence of conductive hearing loss was significantly higher in comparison to sensorineural or mixed hearing loss in this group ($p < 0.05$).

CONCLUSIONS

The high prevalence of conductive hearing loss in patients with cleft palate highlights the necessity of regular hearing screening and follow-up in this population. Early diagnosis, along with appropriate therapeutic and rehabilitative interventions, can improve quality of life and help prevent speech and communication difficulties in these individuals.

OP-088

Prevalence And Clinical Course Of Multi-Canal Benign Paroxysmal Positional Vertigo: A Retrospective Comparative Study

RIŞVAN DENİZ[1], **AHMET ATAŞ**[2], **CEM UZUN**[2]

[1]*Department of Audiology, Koç University Hospital, Istanbul, Turkey;* [2]*Department of Otorhinolaryngology, Koç University , Istanbul, Turkey*

BACKGROUND & AIM

Benign Paroxysmal Positional Vertigo (BPPV) is one of the most common peripheral disorders of the vestibular system. Although the majority of patients present with involvement of a single semicircular canal, multi-canal BPPV—defined as the simultaneous involvement of more than one canal—leads to more complex clinical findings and treatment processes. The aim of this study was to determine the frequency of multi-canal involvement in patients with BPPV and to compare the clinical course of these patients with those diagnosed with single-canal BPPV.

MATERIAL & METHODS

In this retrospective study, medical records of a total of 304 patients who presented for vestibular evaluation within the past year were reviewed. Patients were classified into three groups based on their diagnosis: normal group (n=64), single-canal BPPV group (n=198), and multi-canal BPPV group (n=42). Demographic characteristics, positional test findings, distribution of affected canals, applied repositioning maneuvers, and follow-up outcomes were evaluated for all patients. The diagnosis of BPPV was established based on characteristic nystagmus findings obtained during Dix-Hallpike and supine roll tests within the videonystagmography test battery.

RESULTS

Among the 304 patients included in the study, 240 were diagnosed with BPPV. Of these, 198 patients (82.5%) had single-canal involvement, while 42 patients (17.5%) exhibited multi-canal involvement. The most common pattern in the multi-canal BPPV group was the coexistence of posterior and horizontal canal involvement. The mean number of treatment sessions was higher in the multi-canal BPPV group compared to the single-canal group. Similarly, the follow-up duration was significantly longer in the multi-canal group ($p<0.001$). Although the rate of recovery after the first maneuver was lower in the multi-canal group, the overall treatment success was high in both groups. A history of previous BPPV episodes was more frequent in the multi-canal BPPV group compared to the single-canal group. No significant differences were found between the groups in terms of age and gender distribution.

CONCLUSIONS

In our study, multi-canal BPPV accounted for 17% of all BPPV cases. Multi-canal involvement was found to be more common, particularly in patients with a history of previous BPPV episodes and those presenting with prolonged symptoms. Furthermore, the higher recurrence rates observed in multi-canal BPPV suggest that these patients require closer follow-up. The absence of significant differences in age and gender indicates that multi-canal involvement may be more closely associated with the clinical course of the disease rather than demographic factors.

OP-089

Agreement And Diagnostic Performance Of Mimi Hearing Test Versus Screening And Pure-Tone Audiometry In Normal-Hearing Subjects

Jorge Burdiles-Aguirre[1], **Jaime Crisosto-Alarcón**[1], **Menali Montecinos-Muñoz**[1], **Katalina Torres-Godoy**[1], **Constanza Quezada-Herrera**[1]

[1]*Departamento de Ciencias de Rehabilitación en Salud. Facultad de Ciencias de la Salud y los Alimentos, Universidad del Bío-Bío. Chillán*

BACKGROUND & AIM

Mobile applications for hearing assessment represent low-cost alternatives for population-based screening. However, their agreement with pure-tone audiometry (gold standard) and their performance under environmental noise conditions require validation. We hypothesized that the Mimi Hearing Test would demonstrate acceptable agreement and high diagnostic accuracy in silent conditions, but reduced performance in the presence of background noise.

MATERIAL & METHODS

A cross-sectional comparative study was conducted in 60 adults with confirmed normal hearing. Frequency-specific thresholds (250–8000 Hz) and pure-tone average (PTA; 500–1000–2000 Hz) were analyzed. In 0 dB background noise, 60 subjects were evaluated; under 70 dB environmental noise with an attenuator, 49 participants were assessed; and under 50 dB with an attenuator, 27 subjects were tested. Agreement by threshold was evaluated using the intraclass correlation coefficient (ICC2, absolute agreement) and Bland–Altman analysis. Diagnostic performance for PTA classification (normal hearing vs. hearing loss) was assessed using quadratic weighted Kappa, sensitivity, specificity, accuracy, and McNemar test.

RESULTS

At 0 dB noise, the conventional screening audiometer showed higher agreement for PTA (right ear ICC2 = 0.82; left ear ICC2 = 0.55) compared to Mimi (right ear ICC2 = 0.42; left ear ICC2 = 0.36), with lower variability (limits of agreement ±5.6 dB vs. ±14 dB). Mimi demonstrated low systematic bias (−2.48 to +0.34 dB). In silent conditions, Mimi showed high diagnostic accuracy (accuracy right ear = 0.98; left ear = 1.00). However, at 70 and 50 dB environmental noise, accuracy decreased markedly (0.02–0.07), with specificity approaching zero ($p < 0.001$ vs. 0 dB).

CONCLUSIONS

In normal-hearing subjects, the Mimi Hearing Test demonstrated high diagnostic accuracy in silent conditions with low bias compared to pure-tone audiometry, although with greater variability and lower threshold agreement than a conventional screening audiometer. Performance deteriorated significantly in the presence of environmental noise (50–70 dB), mainly due to increased false positives. Mimi may be a useful screening tool under controlled acoustic conditions but is not interchangeable with diagnostic audiometry and requires strict noise control protocols for community implementation.

Clinical And Audiological Evaluation Of Huppke–Brendel Syndrome, A Rare Genetic Disorder

Elif Öğün[1,2], **Serpil Mungan Durankaya**[3]

[1]Department of Audiology, Faculty of Health Sciences, Ege University, İzmir, Türkiye; [2]Department of Otorhinolaryngology, Audiology PhD Program, Dokuz Eylül University, İzmir, Türkiye; [3]Department of Otorhinolaryngology, Hearing-Speech and Balance Unit, Dokuz Eylül University Faculty of Medicine, İzmir, Turkey

BACKGROUND & AIM

Huppke–Brendel syndrome (HBS) is a rare autosomal recessive neurodevelopmental disorder caused by mutations in the SLC33A1 gene. It is clinically characterized by bilateral congenital cataracts, sensorineural hearing loss, and developmental delay. Due to the limited number of reported cases, audiological findings remain insufficiently described. This study aims to present the clinical and audiological findings of a patient diagnosed with HBS.

MATERIAL & METHODS

A 15-month-old male patient who passed bilateral newborn hearing screening but was referred for further evaluation due to risk factors was included. He was born at 37 weeks of gestation with a birth weight of 3500 g, and parental consanguinity was reported. Ophthalmological evaluation revealed visual impairment, and surgery for congenital cataracts was performed. Subsequent genetic analysis confirmed HBS, with both parents identified as carriers. Clinical evaluation revealed hypotonia, feeding difficulties, inability to tolerate solid foods, lack of independent sitting, and absence of head control. Audiological assessment included otoacoustic emissions, acoustic immittance measurements, and auditory brainstem response (ABR) testing.

RESULTS

Immittance measurements revealed Type A tympanograms bilaterally. Acoustic reflex testing showed ipsilateral reflexes in the right ear at 500 and 1000 Hz. Contralateral reflexes in the right ear were present at 500 Hz. In the left ear, ipsilateral reflexes were present at 500 Hz while contralateral reflexes were absent at all frequencies.

Transient evoked otoacoustic emissions (TEOAEs) were absent bilaterally.

In ABR testing using click stimuli, wave V was obtained at 60 dB nHL in the right ear and 70 dB nHL in the left ear, with abnormal intensity–latency functions. In tone-burst ABR evaluation, wave V was recorded at 60 dB nHL at 500 Hz and 75 dB nHL at 2000 Hz in the right ear. In the left ear, wave V was obtained at 60 dB nHL at 500 Hz, while no wave V was detected at 2000 Hz at 90 dB nHL.

These findings indicate bilateral moderately severe sensorineural hearing loss.

CONCLUSIONS

Based on the audiological evaluation findings, hearing aid–based auditory rehabilitation was recommended.The family was informed about the auditory rehabilitation process and follow-up protocol.

OP-091

QUALITY CRITERIA IN NEWBORN HEARING SCREENING - FOUR IDENTICAL PROJECT APPROACHES - FOUR DIFFERENT OUTCOMES

Peter Böttcher[1], **Prof. W. Adjibabi**[2], **Prof. M. Keita**[3], **Dr. Ch. Ndoleriire**[4], **Dr. Rabindra**[5]

[1]PATH MEDICAL GmbH; [2]Centre National Hospitalier Universitaire Hubert Koutoukou MAGA, Cotonou, Benin; [3]Centre Hospitalo-Universitaire Gabriel Touré, Bamako, Mali; [4]Makerere University, ENT Dept., Kampala, Uganda; [5]Tribhuvan University Teaching Hospital, Kathmandu, Nepal

BACKGROUND & AIM

Results from four identically implemented neonatal hearing screening projects (referred to as A, B, C and D) are presented. All projects show different results. Even when standards such as the specificity of a test method are used, the results vary widely.

MATERIAL & METHODS

In all four projects, screening strategy, training courses, choice of methods, local conditions and the measuring devices used were identical. All projects also provided a tracking office with automated data transmission to a central server, complete with a tracking supervisor responsible for this data and ensuring continuous quality assurance measures.

Each project was supervised and managed by external experts. Statistical results were compared and evaluated.

RESULTS

Despite comparable conditions, the outcome of the screening differs significantly. When considering the TEOAE measurements alone, a different test specificity was found for each of the projects. The collection rates, failed rates and the effort per baby show how differently the projects developed.

Project A (n=21,636); Project B (n=15,853); Project C (n=9,268); Project D (n=3,996)

Specificity of TEAOE measurements:

97.8% (A); 92.6% (B); 94.4% (C); 85.7% (D)

Transmitted patients, compared to birth rate:

89.2% (A); 37.3% (B); 15.0% (C); 96.0% (D)

Transmitted and tested patients:

99.8% (A); 96.5% (B); 99.9% (C); 99.3% (D)

Primary screening failed:

1.3% (A); 6.4% (B); 15.6% (C); 23.4% (D)

TEOAE tests per patient (average):

2.2 (A); 2.8 (B); 2.7 (C); 3.4 (D)

CONCLUSIONS

These figures demonstrate that there must be other reasons why projects can develop so differently. The permanent monitoring of a screening program is therefore of crucial importance. "Soft skills" of program supervisors, ongoing quality control and constant feedback for motivation are all very important factors to ensure the success of a hearing screening program.

OP-092

Intratympanal Application Of Corticosteroids For Meniere Disease Treatment

Nikica Atanasova[1], **Lidija Ristovska**[1], **Marina Davceva Cakar**[2]

[1]*General City Hospital ,,8-th September " - Skopje, North Macedonia;* [2]*ENT Clinic, Clinical Center ,,Mother Theresa " - Skopje, North Macedonia*

BACKGROUND & AIM

Meniere Disease is still with unknown etiopatogenesis and still without strictly defined therapeutic protocol. Meniere Disease is characterized with three symptoms – rotatory vertigo, tinnitus in the ear and fluctuating hearing reduction. High frequency of Meniere Disease atacs leads to persistent vertigo and significant sensorineural hearing loss.

MATERIAL & METHODS

Randomized controlled study on patients with definitive and probable Meniere Diasease , divided in two groups. First group 30 patients with intervention – Intratympanal application of amp. Dexamethason 4mg /1 ml with injecting in posterior inferior quadrant of tympanal membrane, once a week/ 3 applications, under local anesthesia. Second group consists of 30 patinets without intervention. All patients are with signed Informed consent for including in the study.

Study is performed at ORL department at General City Hospital ,,8-th September "- Skopje, North Macedonia with an ethical approval by Ethical Committee.

RESULTS

All patients included in the study were examined with audio-vestibular testings -TLA, tympanometry, caloric test, VNG , tinnitus evaluation, filled Tinnitus Handicap Inventory, Dizziness Handicap Inventory and individual questionnaire were preformed before intratimpanal application of Dexamethason, and followed in a period of 1, 3 and 6 months after intervention.

Distribution by gender, age, profession and results from blood count and biochemistry analyse were statisticaly analized.

CONCLUSIONS

Intratympanal application of amp.Dexamethason 4 mg /1 ml, once a week in period of three weeks is reducing the frequency of Meniere Disease atacs, improves tinnitus, reduces SNHL. Procedure of intratympanal application is safe with minimal local pain and side effects.

OP-093

Evaluation Of Clinical Factors Associated With Auditory Brainstem Response Maturation In Children Aged 0–48 Months: A Retrospective Study

İrem Damla Güver Çalapkulu[1]

[1]*Ankara Yıldırım Beyazıt University Yenimahalle Training and Research Hospital, Otorhinolaryngology- Head and Neck Surgery*

BACKGROUND & AIM

Hearing is essential for speech, language, and cognitive development during early childhood. Auditory Brainstem Response (ABR/BERA) is widely used for the objective evaluation of hearing thresholds and auditory pathway maturation in infants and young children. Several neonatal risk factors, including NICU admission and hyperbilirubinemia, may affect auditory maturation and prolong ABR latencies. This study aimed to evaluate the relationship between clinical risk factors, newborn hearing screening outcomes, and ABR Wave V latencies in children aged 0–48 months.

MATERIAL & METHODS

This retrospective study included 242 children aged 0–48 months who underwent Auditory Brainstem Response (ABR) testing between August 2025 and April 2026. Clinical risk factors, newborn hearing screening results, and Wave V latencies at 15 dB

and 35 dB were evaluated. Correlations between age and ABR latencies were analyzed using Spearman correlation analysis, while group comparisons were performed using non-parametric tests. Logistic regression analysis was used to assess the effect of risk factors on newborn hearing screening outcomes. A p-value <0.05 was considered statistically significant.

RESULTS

A total of 242 children aged between 0 and 48 months were included in the study. A progressive decrease in 35 dB Wave V latency was observed with increasing age, with the highest values detected in the 0–6 month group. Spearman correlation analysis demonstrated a significant negative correlation between age and 35 dB Wave V latency (rho = -0.404, p < 0.001). Significant differences in Wave V latencies were also observed among age groups (p < 0.001). Children who failed newborn hearing screening showed significantly prolonged 35 dB Wave V latencies compared to those who passed the screening (p = 0.017). In addition, clinical risk factors were significantly associated with newborn hearing screening failure (p < 0.001). Prolonged 15 dB Wave V latencies were similarly observed in children with risk factors and failed screening results.

CONCLUSIONS

In the present study, Wave V latency significantly decreased with increasing age in children aged 0–48 months, supporting progressive auditory pathway maturation during early childhood. Children, failed newborn hearing screening demonstrated prolonged Wave V latencies, suggesting delayed auditory maturation even without significant peripheral hearing loss (1–3). In addition, risk factors such as NICU admission and hyperbilirubinemia were significantly associated with newborn hearing screening failure. Previous studies have shown that hyperbilirubinemia may exert neurotoxic effects on the auditory brainstem and prolong ABR latencies (4). Despite its retrospective singlecenter design, the relatively large pediatric population increased the clinical value of the study.

OP-094

Assessment Of Otolith Functions In Individuals With Motion Sickness

Almıla Avşar Demir[1], **Deniz Uğur Cengiz**[2]

[1]*Audiology Department, Institute of Health Sciences, İnönü University, Malatya;* [2]*Audiology Department, Faculty of Health Sciences, İnönü University, Malatya*

BACKGROUND & AIM

Motion sickness (MS) is characterized by dizziness, nausea, and postural instability resulting from sensory conflict among the vestibular, visual, and proprioceptive systems. The contribution of the otolith organs and vestibulo-ocular system to MS pathophysiology remains incompletely understood. This study aimed to evaluate vestibular function in individuals with MS by assessing otolithic mechanisms and vestibulo-ocular responses and comparing the findings with healthy controls.

MATERIAL & METHODS

This prospective study was conducted between June 2025 and January 2026 at the Audiology Unit of İnönü University Turgut Özal Medical Center. Ethical approval was obtained from the Scientific Research Ethics Committee of İnönü University Health Sciences (Approval No. 2025/7905), and written informed consent was obtained from all participants. Forty-five individuals with MS and 45 age- and sex-matched healthy controls (18–50 years) were included. Participants underwent cervical vestibular evoked myogenic potential (cVEMP), ocular vestibular evoked myogenic potential (oVEMP), video ocular counter-roll (vOCR), and static and dynamic subjective visual vertical (SVV) and subjective visual horizontal (SVH) assessments. Test parameters were compared between groups.

RESULTS

cVEMP and oVEMP asymmetry ratios were significantly higher in the MS group than in controls (p<0.05). Significant group differences were observed in right, left, and mean cVEMP amplitudes (p<0.05). oVEMP measurements demonstrated shorter latencies and longer interlatency values in individuals with MS (p<0.05). All SVV angle measurements differed significantly between groups (p<0.05), whereas significant differences in SVH were observed at −30°, −20°, −10°, and +30° (p<0.05). Dynamic SVV and SVH testing revealed greater perceptual deviations in the MS group (p<0.05). Higher vOCR gain values and asymmetry were also identified in individuals with MS (p<0.05).

CONCLUSIONS

The findings suggest that MS is a multifaceted vestibular disorder characterized by impaired integration among otolith function, vestibulo-ocular reflexes, and perceptual systems of verticality and horizontality. VEMP and vOCR findings indicate otolith-related asymmetry, temporal irregularities, and hyperresponsive vestibular patterns. Although central compensation appears partially preserved, it becomes insufficient under dynamic conditions, leading to increased perceptual deviations. Overall, MS may represent a complex clinical condition associated with otolith-dominant dysfunction and impaired vestibulo-ocular integration under sensory loading conditions.

OP-095

Investigation Of Medial Olivocochlear Efferent Modulation In Individuals With Different Tinnitus Pitches

Fatma Yurdakul Çınar[1]

[1]*Department of Audiology, Faculty of Health Sciences, Inonu University, Malatya, Türkiye*

BACKGROUND & AIM

Subjective tinnitus is the perception of sound in the absence of external acoustic stimulation and may originate from any level of the afferent and/or efferent auditory pathways.While most previous studies have focused on high-frequency tinnitus perception, evidence regarding individuals with tinnitus centered in the mid-frequency region remains limited. Accordingly, this study aimed to investigate medial olivocochlear (MOC) efferent modulation, indexed by contralateral suppression (CS) of transient-evoked otoacoustic emissions (TEOAEs),in normal-hearing adults with tinnitus centered within the 1–4 kHz range, a functionally critical region of the auditory system that encompasses speech-relevant acoustic information and corresponds to frequencies of maximal auditory sensitivity.

MATERIAL & METHODS

Fifty-six adults (18–40 years) with normal hearing were allocated into four groups (n = 14 each): three tinnitus groups based on tinnitus pitch ranges—Group 1 (1–2 kHz), Group 2 (2–3 kHz), Group 3 (3–4 kHz)—and a control group (no tinnitus). Tinnitus perception severity was assessed using the Tinnitus Handicap Inventory (THI). MOC modulation was measured via CS of TEOAEs at 1, 1.5, 2, 3, and 4 kHz using a 65 dB peSPL TEOAE stimulus with 65 dB SPL broadband noise. Recordings employed a dual-probe, linear-mode protocol (Otodynamics ILO292-II). Statistical analyses were performed using ANOVA followed by post-hoc comparisons.

RESULTS

The mean tinnitus pitch was 1478.69 ± 319.12 Hz for Group 1, 2741.92 ± 213.41 Hz for Group 2, and 3754.61 ± 239.36 Hz for Group 3. THI scores did not differ significantly among tinnitus groups (Group 1: 38.23 ± 12.39; Group 2: 40.19 ± 12.79; Group 3: 41.23 ± 13.28 ; $F(2, 39) = 0.32$, $p = 0.73$). TEOAE amplitudes and contralateral suppression were significantly reduced in all tinnitus groups compared to controls at all tested frequencies (all $p < 0.05$), whereas no significant differences were observed among tinnitus groups at any frequency (all $p > 0.05$).

CONCLUSIONS

The findings suggest that individuals with normal hearing who perceive tinnitus in the mid-frequency range may exhibit alterations in cochlear output and MOC efferent modulation compared with those without tinnitus.Despite the distribution of tinnitus percepts across different mid-frequency bands,the absence of significant differences among tinnitus subgroups suggests that the observed changes in cochlear output and MOC modulation may reflect a common mechanism independent of tinnitus pitch.These alterations in MOC modulation may be associated with peripheral contributions related to reduced TEOAE responses and/or may reflect independent efferent regulatory processes.Further studies are required to understand these mechanisms and clarify their clinical implications.

OP-096

INDUSTRIAL DEAFNESS IN NIGERIA: A SILENT SCOUGE-SYSTEMATIC REVIEW

Prof Nekwu E. Okolugbo[1]

[1]*Federal University of Medical and Health Sciences Kwale*

BACKGROUND & AIM

Industrial Deafness also known as Occupational Deafness is the general term for Noise Induced Hearing Loss resulting from one or two things: from working in a noisy environment for a prolonged period of time without adequate hearing protection or following acoustic trauma caused by a one-off exposure to extremely high levels of noise.

The term, silent scourge is actually an irony because it has to do with the effect of loud sounds at the workplace and its long - lasting effects.

MATERIAL & METHODS

A search was conducted on databases like PubMed, African Journals online (AJOL) and Cochrane library using key words 'Nigeria', 'Noise Induced Hearing Loss' Occupational Hearing Loss and Hearing Conservation.

RESULTS

Most studies came from Southern Nigeria, North Central or North Western Nigeria. Industrial deafness can be caused by a one-time exposure to an intense impulse sound and such as an explosion or by conscious exposure to loud sounds over an extended period of time such as noise. Research suggests that significant noise induced hearing loss usually develops another or more years of exposure.Prevalence appears to be on the rise from all the studies reviewed, a rise from 9.1% to 40.9% was noted in glass factory workers (Okolugbo 2020). Ighorodje et al in a 9 year study found all subjects in a saw mill suffered.

Risk groups: Textile worker (Osibogun et al 2000). Cement factory (Chukuma 2020 and Nasiiru et al 2006), Power plant and flour mills (Mgbe et al 2021) and Music Industry (Ologe et al 2007).

CONCLUSIONS

Work still needs to be done to educate the Nigerian populace in prevention of Industrial deafness. Labor, safety, Health and welfare bill was passed in Nigeria in 2012 and there is no evidence that it has been updated and reviewed.

In Nigeria there is limited capacity to enforce safety laws by monitoring agencies due to severe budgetary constraints. There is also the need to improve capacity. Labor unions are hamstrung to ensure that workers' rights are protected.

OP-097

How Work Sector And Experience Moderate The Effects Of Hopelessness And Burnout On Audiologists' Work-Life Quality?

Hülya Göçmenler[1], **Beyza Ekşi Bayrakdar**[2], **Şeyma Nur Tabak**[3]

[1]*İstanbul Medeniyet Üniversitesi;* [2]*İstanbul Rumeli Üniversitesi;* [3]*İstanbul Aydın Üniversitesi*

BACKGROUND & AIM

The aim of this study was to examine the effects of hopelessness and burnout on audiologists' work-related quality of life and job satisfaction, and to evaluate the moderating roles of work sector and experience in these relationships.

MATERIAL & METHODS

An analytic cross-sectional study employing moderationanalyses based on PROCESS Model 1. A total of 167 audiologists(102 in hearing aid, 65 in rehabilitation centers; aged 22–45 years) completed a demographic form and four scales: Beck HopelessnessScale, Job Satisfaction Scale, Burnout Questionnaire, Quality of Work Life Scale for Healthcare Professionals. Data were collectedface-to-face and online. Analyses were performed in SPSS 27.0 using PROCESS Model 1 to examine the moderating effects of work sector (hearing aid/rehabilitation) and work experience(≤24/>24 months). Statistical significance was determined usingbootstrapped confidence intervals (5000 resamples, 95% CI) withp<0.05.

RESULTS

Hopelessness showed no significant main effect on work-related quality of life (p=0.224) or job satisfaction (p=0.143), and its interactions with work sector and experience were non-significant. However, among audiologists with more than 24 months of experience, higher hopelessness was associated with lower work-related quality of life (β=-0.833, p=0.034). Greater hopelessness also predicted lower job satisfaction in both experience groups, remaining significant only among those working in hearing aid centers.Burnout was a stronger predictor, showing significant negative associations with both work-related quality of life and job satisfaction. Although work experience did not significantly moderate these relationships, burnout reduced job satisfaction in both experience groups and lowered work-related quality of life among those with ≤24 months of experience. Work sector significantly moderated burnout effects, with audiologists in hearing aid centers experiencing more pronounced declines than those in rehabilitation centers.

CONCLUSIONS

The findings suggest that burnout is the keydeterminant of professional well-being among audiologists. Thefirst 24 months of practice constitute a critical period in whichburnout more strongly impairs work-related quality of life and jobsatisfaction, particularly in high-pressure commercial environmentssuch as hearing aid centers. These results underscore the need fororganizational strategies to reduce burnout and to support early-career audiologists working under intensified sectoral demands.

OP-098

Exploring The Relationship Between Noise Acceptance And Tinnitus Distress

Zahra Sharifi[1], **Maryam Sadeghijam**[1], **Zeinab Hassanpour**[1], **Hassan Haddadzadeh Niri**[1]

[1]*Department of Audiology, School of Rehabilitation Sciences, Iran University of Medical Sciences, Tehran, Iran*

BACKGROUND & AIM

This study explores the relationship between noise acceptance levels and tinnitus distress, focusing on individuals with chronic non-pulsatile tinnitus and normal hearing. Given the neurological overlap between tinnitus perception and noise suppression mechanisms, we hypothesized that increased tinnitus distress correlates with reduced noise acceptance.

MATERIAL & METHODS

28 individuals with tinnitus and 17 normal-hearing controls participated. The tinnitus group was categorized into bothersome and non-bothersome tinnitus based on Tinnitus Handicap Inventory (THI) scores. Psychoacoustic assessments, psychometric evaluations, and the Acceptable Noise Level (ANL) test were conducted. ANL, Background Noise Level (BNL), and Most

Comfortable Listening Level (MCL) were compared across groups, and correlations between ANL scores and tinnitus distress measures were analyzed.

RESULTS

Individuals with bothersome tinnitus exhibited significantly higher ANL scores than non-bothersome tinnitus and normal-hearing controls ($p < 0.001$). BNL was significantly lower in the bothersome tinnitus group than in the control group ($p = 0.001$), whereas MCL did not differ significantly across groups. A positive correlation was found between ANL and THI scores ($r = 0.51$, $p = 0.005$), suggesting that greater tinnitus distress is associated with lower noise acceptance. No significant correlation was observed between ANL and psychoacoustic characteristics of tinnitus.

CONCLUSIONS

The findings indicate that individuals with bothersome tinnitus have reduced noise acceptance, likely due to deficits in central inhibitory mechanisms. The relationship between ANL and tinnitus distress supports the hypothesis that top-down noise suppression deficits contribute to tinnitus perception and its bothersomeness. These results underscore the importance of considering noise acceptance in tinnitus rehabilitation strategies.

Frequency-To-Place Mismatch Does Not Predict Cochlear Implant Speech Outcomes

Dimitrios Paouris[1,2], **Lukáš Varga**[1,2], **Peter Hubka**[1,2]

[1]*1 Clinical Research Unit in Audiology, Department of ENT – Head and Neck Surgery, Faculty of Medicine and the University Hospital, Comenius University, Bratislava, Slovakia;* [2]*2 Laboratory of Complex Brain and Auditory Studies, Institute of Experimental Endocrinology, Biomedical Research Center, Slovak Academy of Sciences, Bratislava, Slovakia*

BACKGROUND & AIM

Tonotopic alignment between cochlear implant electrode position and assigned stimulation frequency is considered a potentially modifiable determinant of cochlear implant performance. We hypothesized that greater frequency-to-place mismatch, reflecting discordance between intracochlear electrode location and fitting-software frequency allocation, would be associated with poorer postoperative speech perception. This study aimed to evaluate whether anatomical, surgical, and frequency-allocation parameters predict hearing outcomes after cochlear implantation.

MATERIAL & METHODS

This retrospective single-center cohort study included 69 postlingually deafened cochlear implant recipients implanted with MED-EL lateral wall electrode arrays at a tertiary otorhinolaryngology center. All subjects underwent preoperative and postoperative high-resolution computed tomography and OTOPLAN-based analysis. Forty-nine ears had complete electrode insertion and 20 had incomplete insertion. Cochlear duct length, electrode angular insertion depth, age at implantation, duration of severe hearing loss, surgical approach to the cochlea, and frequency-to-place mismatch were evaluated. Mismatch was calculated between predicted preoperative and postoperative electrode frequencies, and between postoperative electrode frequencies and MAESTRO default fitting values, expressed in Hertz and semitones. Audiological outcomes at ≥12 months after activation included sound field audiometry, Slovak Speech Audiometry in noise, and monosyllabic word recognition in noise. Analyses included Wilcoxon signed-rank tests, Mann–Whitney U tests, Kruskal–Wallis tests, correlation analyses, and multivariable linear regression.

RESULTS

Preoperative OTOPLAN predictions significantly overestimated postoperative electrode frequencies from E12 to E2, with the largest discrepancies basally; E1 showed no significant difference. Postoperative electrode frequencies were significantly higher than MAESTRO preset frequencies for all electrodes (all $p<0.001$). In complete insertions, the largest absolute mismatch was basal, with E12 showing a median mismatch of 3199 Hz, whereas the largest semitone mismatch was apical, with E1 showing a median mismatch of 18.3 semitones. Organ of Corti-based mapping produced less mismatch than Spiral Ganglion-based mapping ($p<0.001$). Angular insertion depth was the strongest predictor of semitone mismatch ($\beta\approx-0.96$, $p<0.001$), whereas cochlear duct length, age, and surgical approach were not significant predictors. Frequency-to-place mismatch did not correlate with postoperative speech or sound field audiometry outcomes. The only significant clinical predictor of poorer

performance was longer duration of severe hearing loss, associated with lower monosyllabic word recognition in noise (ρ=−0.293, p=0.041).

CONCLUSIONS

Frequency-to-place mismatch was systematic and strongly dependent on electrode insertion depth, but it did not predict speech audiometry or aided hearing outcomes 12 months after cochlear implantation. These findings do not support a measurable clinical benefit of frequency-matched stimulation in this cohort and suggest that auditory deprivation duration remains a more relevant prognostic factor. Further prospective studies are needed to refine anatomy-based fitting strategies and identify patients who may benefit from individualized frequency allocation.

Not Just An Electrode Insertion: What Should You Know About Cochlear Parameters

Professor Abdulrahman Hajar[2]

[1]*JAZAN HEALTH CLUSTER, SAUDI ARABIA;* [2]*KING SAUD UNIVERSITY*

BACKGROUND & AIM

Recently developed otological planning software (OTOPLAN) allows surgeons to directly measure cochlear parameters. The objective was to determine the A-value reported in the literature, to assess the accuracy of the A-value measurement and to evaluate a novel cochlear measurement C – value in distinguishing malformed cochlea and to compare the cochlear parameters measured using the OTOPLAN by a neurotologist and those measured on the PACS by another independent neurotologist. The secondary aim was to determine the A-value reported in the literature, to assess the accuracy of the A-value measurement and to evaluate a novel cochlear measurement in distinguishing malformed cochlea.

MATERIAL & METHODS

In this retrospective descriptive study, a total of 127 human ears were investigated. the 3D Slicer segmentation software was used to confirm of the cochlear morphology. Then by HRCT was performed, and OTOPLAN was used to measure the cochlear parameters A,B,H Values. All measured parameters were statistically analyzed. Finally, more investigation done for the A-value and novel C-value measurement were evaluated as predictors of inner ear malformation type.

RESULTS

There was no significant difference between the A-value measured on the PACS and that on the OTOPLAN by the two independent neurotologists. Both A- and B-values, which were measured using the OTOPLAN, showed a high positive correlation to the CDL. However, the B-value showed a stronger correlation to the CDL than the A-value. The A-values of the normal cochleae compared to the cochleae with cochlear hypoplasia, incomplete partition (IP) type I, -type II, and -type III were significantly different. The A-value does not predict the C-value. The C-values of the normal cochleae compared to the cochleae with IP type I and IP type III were significantly different.

CONCLUSIONS

The new OTOPLAN tool could enable ontological surgeons to independently perform appropriate preoperative planning, including electrode visualization. Moreover, the cochlear width (B) has a strong correlation to the CDL. Thus, we suggest using the combination of A and B to accurately estimate the CDL rather than using one of them. The A-value is different in normal vs. malformed cochleae. The novel C-value could be used to predict malformed anatomy, although it does not distinguish all malformation types.

Extracochlear Electrode Looping and Cochlear Implant Electrode Migration

Ergin Eroğlu[1], **Yaşar Atay**[1], **Erdem Ersan Akyürek**[1]

[1]*Hacettepe University, Department of Otorhinolaryngology, Ankara, Turkey*

BACKGROUND & AIM

Electrode migration is a rare but clinically significant complication following cochlear implantation (CI), potentially resulting in deterioration of auditory performance and the need for revision surgery. The during CI surgery is the creation of an extracochlear electrode loop, which may reduce mechanical tension on the electrode array. The present study aimed to evaluate the association between extracochlear electrode looping and the occurrence of postoperative electrode migration. We hypothesized that the absence of an extracochlear electrode loop would be associated with a higher rate of electrode migration.

MATERIAL & METHODS

This retrospective observational study included CI recipients with available postoperative imaging and operative documentation sufficient to determine electrode loop status. A total of 143 patients were analyzed, consisting of all migration cases identified over the study period combined with cochlear implant recipients operated within the last 1.5 years. Patients were categorized according to the presence or absence of an extracochlear electrode loop. Electrode migration, defined radiologically as postoperative displacement of the intracochlear electrode array, was the primary outcome measure. Categorical variables were analyzed using Fisher's exact test due to the low incidence of migration events. Effect size was estimated using odds ratios (OR) and Cramer's V. Statistical significance was defined as $p < 0.05$.

RESULTS

Among 143 cochlear implant recipients, electrode migration was observed in 13 patients (9.1%). Migration occurred in 4 of 86 patients (4.7%) with an extracochlear electrode loop, compared with 9 of 57 patients (15.8%) without a loop. The absence of an extracochlear electrode loop was significantly associated with a higher rate of electrode migration (Fisher's exact test, $p = 0.035$). The presence of an extracochlear loop was associated with lower odds of migration (OR ≈ 0.26). The effect size indicated a small-to-moderate association (Cramer's V = 0.19).

CONCLUSIONS

Extracochlear electrode looping was significantly associated with a lower incidence of cochlear implant electrode migration in this retrospective cohort. Although causality cannot be inferred, these findings suggest that extracochlear looping may represent a simple surgical technique associated with improved electrode stability.

Evaluation Of Performance Of Piezoelectric Bone Conduction Device

Krittayot Patchanee[1,2], **In Seok Moon**[1]

[1]*Department of Otorhinolaryngology, Severance Hospital, Yonsei University College of Medicine, Seoul, Korea;* [2]*Department of Otolaryngology, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand*

BACKGROUND & AIM

Optimal implant position for the Osia® OSI300 piezoelectric bone conduction device (Cochlear Ltd, Sydney, Australia) across varying indications and mastoid conditions lacks consensus. This cadaveric study aims to evaluate the performance of the OSI300 across different implant locations and mastoid conditions using Laser Doppler Vibrometry (LDV).

MATERIAL & METHODS

In four fresh-frozen human cadaveric heads, the OSI300 was implanted at three location A) mastoid area, B) retrosigmoid area, and C) temporal area. To simulate clinical situation, the device was driven by standard clinical fitting software. Ipsilateral and contralateral cochlear promontory (CP) vibrations were measured using LDV under both intact mastoid and post-mastoidectomy condition. A difference of > 5 dB between conditions was established as the threshold for clinically significance.

RESULTS

In intact mastoid condition, location A significantly outperformed location B and C ipsilateral CP vibrations across most frequencies. In contralateral side, location A achieved higher CP vibration at lower frequencies but exhibited significant Transcranial Attenuation (TA) up to 7.1, 14.6 and 17.7 dB at 1.5, 3.0 and 6.0 kHz. Conversely, location B maintained a stable transcranial transmission profile while location C exhibited significant TA only at 6.0 kHz. Following mastoidectomy, ipsilateral CP vibrations showed no clinically significant difference (> 5 dB) compared to intact mastoid condition. Similary, post-mastoidectomy contralateral CP vibration and TA measurements revealed no clinically significant difference when compared to intact mastoid state.

CONCLUSIONS

Location A is the optimal implant location for ipsilateral conductive and mixed hearing losses in intact mastoid condition. Location B overcomes high-frequency transcranial attenuation seen at other sites, emerging as the optimal placement for contralatearl routing of signal in Single-Sided Deafness (SSD). Performing mastoidectomy does not clinically disrupt CP vibration profiles.

OP-103

Factors Associated With Ehealth Literacy In Adult Cochlear Implant Users: A Preliminary Study

Burak KABİŞ[1], **Elçin ORÇAN**[2], **Bülent GÜNDÜZ**[1]

[1]Department of Audiology, Faculty of Health Sciences, Gazi University; [2]Institute of Health Sciences, Audiology and Speech Disorders Doctoral Program, Ankara University

BACKGROUND & AIM

Introduction (Background & Aim): Health information is increasingly delivered through digital channels, yet little is known about how effectively adult cochlear implant (CI) users engage with online health resources. eHealth literacy, the capacity to seek, understand, and appraise health information from electronic sources, may be particularly salient in this population. We aimed to examine eHealth literacy in adult CI users and its associations with sociodemographic, communication, and audiological factors. We hypothesized that eHealth literacy in adult cochlear implant users would vary according to demographic characteristics, particularly those related to communication abilities.

MATERIAL & METHODS

Material & Methods: This preliminary cross-sectional study was conducted at the Department of Audiology, Faculty of Health Sciences, Gazi University, Ankara, Turkey. Forty-four adult CI users aged 18 to 64 years (mean 40.75 ± 16.32; 17 women, 27 men) were enrolled. Hearing loss was prenatal in 18 and postnatal in 26; CI use was unilateral in 33 (14 left, 19 right; 12 with a contralateral conventional hearing aid, i.e. bimodal) and bilateral in 11. The eHealth Literacy Scale (eHEALS) was administered, and its total score was the primary outcome. Examined factors included educational level, communication modality (spoken language only, sign language only, or both), use of assistive devices, and auditory rehabilitation status. After assessing normality with the Shapiro–Wilk test, two-group comparisons used the Mann–Whitney U test and multi-group comparisons the Kruskal–Wallis test, with $p < 0.05$ considered significant.

RESULTS

Results: eHealth literacy scores did not differ significantly by educational level ($p > 0.05$). In contrast, assistive device users scored significantly higher than non-users ($p < 0.05$). Scores also differed significantly by communication modality, participants using both spoken and sign language differing from those using spoken language only or sign language only ($p < 0.05$). Likewise, participants currently receiving auditory rehabilitation differed significantly from those not receiving it ($p < 0.05$).

CONCLUSIONS

Conclusions: In this preliminary sample, eHealth literacy among adult CI users was independent of educational level but significantly associated with assistive device use, communication modality, and auditory rehabilitation history. These findings suggest that communication and rehabilitation profiles, rather than formal education, shape digital health competence in this population and may inform targeted support.

Long-Term Safety And Efficacy Of The Bonebridge BCI 601: A Decade Of Experience With Active Transcutaneous Bone Conduction

Kristen Rak[1], Thomas Keintzel[2], Georg Sprinzl[3], Carolina Köstler[1], Nicole Knoelke[5], Susan Busch[5], Tobias Raffelsberger[2], Astrid Magele[3], Philipp Schörg[3], Robert Jago Wiek[4], Thomas Lenarz[5]

[1]Department of Oto-Rhino-Laryngology, Head and Neck Surgery Comprehensive Hearing Center University of Wuerzburg; [2]Ear, Nose and Throat Department, Klinikum Wels-Grieskirchen, Wels; [3]Ear, Nose and Throat Department, University Clinic St. Poelten, Karl Landsteiner Private University, St. Poelten; [4]Vibrant Clinical Research Department, MED-EL, Innsbruck; [5]Department of Otorhinolaryngology, Hannover Medical School, Hannover

BACKGROUND & AIM

The MED-EL Bonebridge® (BB) BCI 601 represents a significant advancement in auditory rehabilitation technology, as it is the first active transcutaneous bone conduction implant to be introduced. It has been developed to address conductive and mixed hearing loss, as well as single-sided deafness, with the objective of providing audiological benefits that are not associated with the complications that are commonly encountered with traditional devices. However, there remains a paucity of comprehensive long-term clinical data over the entire expected lifespan.

MATERIAL & METHODS

The objective of this retrospective multicentre study was to verify the long-term safety and audiological performance of the Bonebridge® BCI 601 implant, with a minimum follow-up of five years and an extension of nearly eleven years post-implantation.

RESULTS

Audiological and safety data from 186 implanted ears (151 adults, mean age 40 years; 35 children, aged 5-17 years) were retrospectively analysed across four clinical centres in Germany and Austria. Audiometric evaluations encompassed pure-tone average (PTA4) thresholds, sound field hearing thresholds, and speech perception (word recognition scores, WRS). Device safety was appraised through the documentation of complications, explantation rates, and survival analyses (Kaplan-Meier method).

CONCLUSIONS

The Bonebridge® system demonstrated significant long-term audiological improvements. After at least five years, hearing thresholds improved by 23.44 dB in adults and 27.69 dB in children. Speech understanding increased markedly (adults: +58.22%, children: +80.00%). Bone conduction thresholds remained stable, indicating preserved inner ear function. Overall complication rates were low. Implant survival reached 89.4% at ten years, with technical failures accounting for only 2.5% of cases. These findings confirm the long-term safety and effectiveness of the system.

Restoring Sound Localization In Single-Sided Deafness Through Cochlear Implantation: A Meta- Analysis

Mohammed Alhamoud[1], **Mona Alshehri**[3], **Wejdan Abbag**[3], **Layan Almulla**[4], **Ibrahim Al Sulaiman**[2], **Farid Alzhrani**[1]

[1]King Abdullah Ear Specialist Center, King Saud University, Saudi Arabia; [2]Otolaryngology-Head and Neck Surgery Resident, King Khalid Hospital, Najran, Saudi Arabia; [3]Otolaryngology-Head and Neck Surgery Resident , Aseer Central Hospital, Abha, Saudi Arabia; [4]College of Medicine, Imam Abdulrahman Bin Faisal University, Dammam, Saudi Arabia

BACKGROUND & AIM

Single-sided deafness impairs sound localization, reducing quality of life and spatial awareness. Cochlear implantation has emerged as a promising intervention, yet the magnitude of benefit and influence of rehabilitation factors remain unclear. This systematic review and meta-analysis examined localization outcomes after cochlear implantation in single-sided deafness.

MATERIAL & METHODS

Multiple databases were searched from their earliest available records to February 2025 for studies reporting quantitative localization outcomes in cochlear implant recipients with single-sided deafness. The primary outcome was a reduction in root mean square (RMS) localization error. A random-effects meta-analysis was performed, with subgroup analyses by age, etiology, and rehabilitation factors.

RESULTS

Forty studies (667 participants) met the inclusion criteria. Cochlear implantation significantly improved localization, with a pooled RMS error reduction of 20.8 degrees (95% CI: 17.9-23.7 degrees, $P < 0.001$; $I2 = 94.2\%$). Younger patients achieved greater gains (42.4 degrees for ≤ 50 y vs. 15.8 degrees for > 55 y, $P = 0.032$), as did those with sudden sensorineural hearing loss compared with Ménière's disease (23.5 vs. 11.3 degrees, $P = 0.018$). Structured rehabilitation was associated with larger improvements than standard care (26.1 ± 8.2 degrees vs. 18.4 ± 7.6 degrees, Cohen's $d = 0.977$; $P < 0.01$). Earlier activation (≤ 21 d) and high daily use (≥ 10 h) were associated with the most favorable outcomes.

CONCLUSIONS

Cochlear implantation provides clinically meaningful localization improvements in single-sided deafness, though performance remains below normal hearing levels. Outcomes are optimized by structured rehabilitation, earlier activation, and consistent device use. These findings support cochlear implantation as an effective intervention and inform evidence-based rehabilitation strategies.

OP-106

Reliability Of Angular Insertion Depth Assessment After Cochlear Implantation: Postoperative Imaging Versus Combined Pre-/Postoperative Image Fusion

Taha Oğuz Kayhan[1], **Markus Pietsch**[11]

[1]Helios Klinikum Hildesheim

BACKGROUND & AIM

Angular insertion depth (aDOI) of the electrode array is a key parameter for tonotopic electrode positioning and anatomy-based fitting after cochlear implantation. aDOI can be derived from postoperative imaging alone or from postoperative imaging fused with preoperative data, but it remains unclear how closely these approaches agree and how robust the assessment is against variability in defining the cochlear reference axis. We aimed to compare aDOI from postoperative imaging only versus pre-/postoperative fusion in MED-EL recipients using a tablet-based planning software, and to explore whether an automated approach to the reference axis can reduce differences in the calculated angles.

MATERIAL & METHODS

Retrospective, monocentric analysis of MED-EL recipients implanted with FLEX24, FLEX26, FLEX28 and FLEXSOFT arrays. For each electrode, insertion angles were determined for all twelve contacts (apical contact 1 to basal contact 12) within the same tablet-based planning software, using two methods: (a) postoperative imaging only and (b) postoperative imaging fused with preoperative imaging, with automatic cochlea detection. An automated adjustment of the cochlear reference axis was

additionally applied to both datasets and evaluated as a secondary analysis. Insertion angle profiles were compared between methods across contacts and electrode types.

RESULTS

Insertion angle profiles were broadly comparable between both methods across all electrode types. Mean per-contact differences between postoperative-only and fusion-based assessment were small at group level (approximately 1.5°, maximum about 3.4°), largest at apical and mid-array contacts and near-identical basally. Differences in the calculated angles were more pronounced for some electrode types and influenced the assessment; dedicated computational adjustment of the reference axis reduced these differences and improved consistency between methods, at least within our cohort. Patient-level agreement statistics are currently being analysed.

CONCLUSIONS

Insertion angle profiles were broadly comparable between both methods across all electrode types. Mean per-contact differences between postoperative-only and fusion-based assessment were small at group level (approximately 1.5°, maximum about 3.4°), largest at apical and mid-array contacts and near-identical basally. Differences in the calculated angles were more pronounced for some electrode types and influenced the assessment; dedicated computational adjustment of the reference axis reduced these differences and improved consistency between methods, at least within our cohort. Patient-level agreement statistics are currently being analysed.

OP-107

CONTRAINDICATIONS FOR COCHLEAR IMPLANTS IN CHILDREN WITH POOR AUDITORY PERFORMANCE WITH HEARING AIDS. WHEN AND WHY?

Guilherme Doehl Knebel[1], **Fábio André Selaimen**[1], **Alice Lang da Silva**[1], **Carolina da Fonseca Mussel Jones**[1], **Letícia Petersen Schmidt Rosito**[1]

[1]*Hospital de Clínicas de Porto Alegre*

BACKGROUND & AIM

Cochlear implantation in children has been performed within Brazil's public healthcare system for several years. However, outcomes related to auditory skills and oral language development remain inferior to those reported in developed countries. In our population, only 36% of implanted children use oral language as their primary mode of communication. In response, a pre–cochlear implant evaluation program was reorganized over the past two years to improve candidate selection by integrating audiological, socioeconomic, and pediatric neurological factors. This study aimed to identify patients with audiological indications who were deemed unsuitable for cochlear implantation and to analyze the reasons for contraindication.

MATERIAL & METHODS

A prospective cohort study was conducted through the review of medical records and audiological assessments of 297 pediatric patients initially evaluated for cochlear implantation. All patients underwent multidisciplinary assessments including speech therapy, social work, and psychological evaluation to determine surgical eligibility. Variables analyzed included age at first consultation, etiology of hearing loss, and time to surgery. Patients considered unsuitable were classified into five categories: social, technical, follow-up-related, neurological, and low adherence to pre-implant therapies.

RESULTS

Among the 297 evaluated patients, 68 (22.9%) met audiological criteria for cochlear implantation. Of these, 35 (51.5%) underwent implantation, 17 (25.0%) were contraindicated, and 16 (23.5%) remained under evaluation. The mean age at implantation was 20.94 months, with a mean time to surgery of 5.94 months. Patients deemed unsuitable had a significantly higher mean age of 35 months (95% CI: −25.23 to −2.88 months; p = 0.015). Contraindications were attributed to low adherence to pre-implant therapies in 7 patients (41.2%), social factors in 4 (23.5%), follow-up issues in 4 (23.5%), and neurological conditions in 2 (11.8%).

CONCLUSIONS

Cochlear implant candidacy assessment must extend beyond audiological thresholds, incorporating socioeconomic context, family support, and adherence capacity. Multidisciplinary evaluation is essential to optimize outcomes and ensure appropriate use of cochlear implantation within public healthcare systems.

Cochlear Implantation Using An Exoscope: An Anatomical–Technical Case Series From Peru

Francis Martinez Samaniego[1], **Diana Díaz-Llontop**[1], **Richard Eduardo Castillo Laborio**[1]

[1]*Detecta Clínica*

BACKGROUND & AIM

The surgical microscope remains the standard visualization tool in cochlear implantation. However, the exoscope has emerged as an alternative platform that may enhance shared visualization and ergonomics. Evidence regarding its use in cochlear implantation remains limited, particularly in Latin America. This study aims to describe the anatomical–technical characteristics and intraoperative findings of cochlear implantation performed exclusively using an exoscope in a Peruvian tertiary center.

MATERIAL & METHODS

An observational descriptive case series was conducted including 23 cochlear implantation procedures performed in 21 patients (2 bilateral cases). All surgeries were carried out using an exoscope as the sole visualization system. Variables analyzed included demographic characteristics, etiology and onset of hearing loss, surgical approach, STH anatomical classification, operative time, electrode insertion grade, impedance measurements, and intraoperative neural response. Exploratory bivariate analysis was performed using Fisher's exact test and Student's t-test.

RESULTS

The cohort was predominantly pediatric (73.9%), with congenital (69.6%) and prelingual (69.6%) hearing loss as the most frequent etiologies. Most procedures were primary implantations (95.7%), and the round window approach was used in 82.6% of cases. The mean operative time was 161.7 ± 27.5 minutes. Complete electrode insertion was achieved in 87.0% of procedures, with normal impedance values in all cases. Neural response was detectable in 78.3% and weak but detectable in the remaining cases. A highly significant association was identified between STH anatomical classification and surgical approach ($p = 0.0001$), with STH III cases predominantly managed via cochleostomy, whereas STH I–IIa cases were treated exclusively through the round window. No significant associations were observed between STH classification and neural response ($p = 0.615$), between surgical approach and operative time ($p = 0.411$), or between prominent crest and electrode insertion ($p = 1.000$).

CONCLUSIONS

This series demonstrates that exoscope-assisted cochlear implantation is a technically feasible approach, with intraoperative outcomes comparable to those reported internationally. In the absence of previous national evidence, these findings provide initial data supporting the use of the exoscope as a valid alternative to the surgical microscope in cochlear implantation and justify future comparative and multicenter studies.

OP-109

Automatic Segmentation With Synchrotron Imaging & Deep Learning – Implications For Cochlear Implantation

Sumit Agrawal[1], **Ashley Micuda**[1], **Carmine Spedaliere**[1], **Hanif Ladak**[1]

[1]*Western University, London, ON, Canada*

BACKGROUND & AIM

Variations in cochlear morphology have significant implications for scalar size, round window size, and tonotopic distributions. Previous efforts to perform automatic cochlear segmentation in clinical scans have been limited by histologic artefacts and poor soft-tissue contrast in micro-CT scans used for ground truth data. Understanding the relationship between cochlear morphology, cochlear tonotopy, and round window size can aid in achieving atraumatic and individualized cochlear implantation. Synchrotron radiation phase-contrast imaging (SR-PCI) enables the visualization of micro-anatomy in intact cadaveric cochleae. This work aimed to develop a multi-resolution cochlear predictive model on pre-operative clinical scans, using SR-PCI as the ground truth data.

MATERIAL & METHODS

One hundred and eight cadaveric cochleae were scanned with SR-PCI and various clinical scanner resolutions, protocols, and manufacturers. In each SR-PCI scan, ground truth segmentations (i.e. delineations) were obtained of the scala tympani, scala vestibuli, and round window. An ensemble deep learning algorithm, combining 5 trained networks, was developed to obtain segmentations and anatomical measurements in clinical scans at each angular location. Automatic segmentation was performed on 500 pre-operative clinical CT scans from four different countries, and qualitative segmentation viability was confirmed. Additionally paired pre- and post-operative cochlear implant recipient scans to analyze electrode location relative to the scalar segmentations and assess round window size in relation to electrode choice and surgical technique.

RESULTS

Automatic segmentations from the cadaveric clinical scans achieved a mean Dice similarity coefficient of 0.9 for all segmentation structures when compared to the SR-PCI ground truth segmentations. The network successfully segmented all non-pathologic clinically diagnostic scans. In the automatic segmentations obtained from post-operative patient scans, round window size, cochlear volume, and translocation rates were assessed at each contact.

CONCLUSIONS

Accurate automatic cochlear segmentation and measurement of both cadaveric and patient clinical scans have been achieved when compared to SR-PCI data. Each measurement obtained has provided insight into cochlear variability and the relationship between cochlear scalar and round window geometry for planning and individualization purposes.

Intraoperative Surgical And Audiological Outcomes Of Cochlear Implantation In Children With Inner Ear Malformations

Nadjmutdinova Nazima[1], **Musaev Abdukhalil**[1], **Abdukamilova Mukhlisa**[1], **Inoyatova Flora Ilyasovna**[1], **Abdukayumov Abdumannon**[1]

[1]*Republician Center of Pediatrics in Uzbekistan*

BACKGROUND & AIM

To evaluate intraoperative audiological parameters and surgical features of cochlear implantation (CI) in children with Enlarged Vestibular Aqueduct (EVA) and Incomplete Partition Type II (IP-II).

MATERIAL & METHODS

A retrospective analysis was conducted in children aged 1–4 years who underwent unilateral cochlear implantation in 2025 at the ENT Department of the Republican Specialized Scientific and Practical Medical Center of Pediatrics. A total of 339 patients underwent surgery, including 13 children with EVA and 27 with IP-II. All patients underwent intraoperative audiological monitoring, including impedance telemetry, ART, ESRT, and, when necessary, eABR, as well as postoperative temporal bone CT imaging (0.6–0.7 mm slices). Standard and Medium electrode arrays were used.

RESULTS

Among patients with EVA, a “gusher” phenomenon was observed in 6 cases; cochleostomy was performed in all children. All patients received a Standard electrode array.In the IP-II group, “gusher” occurred in 17 patients, while cochleostomy was required in 2 cases. In 96% of patients, a Medium electrode array was used.Impedance values were within normal limits (0.8–1.2 qu) in 97% of children. ESRT responses were recorded on electrodes 2, 6, and 11 at a stimulation level of 35 qu. One patient with IP-II demonstrated high impedance values (10.29 kΩ) and absence of ART/ESRT responses. Postoperative CT confirmed extracochlear placement of electrodes 11 and 12, correlating with the intraoperative findings. In two EVA patients with absent ART responses, positive eABR responses were obtained.

CONCLUSIONS

Cochlear implantation in children with EVA and IP-II is safe and effective when the electrode array is selected individually. Intraoperative audiological monitoring combined with postoperative CT control enables timely detection of electrode misplacement and improves the prognosis of successful auditory-verbal rehabilitation.

Experimental Laboratory of Translational Neurosciences and Dento-Otolaryngology, Faculty of Medicine and Health Sciences, University of Antwerp (UA), Antwerp, Belgium;* [4]*Clinical Research Department, MED-EL GmbH, Innsbruck, Austria*

BACKGROUND & AIM

Evidence on the educational and occupational outcomes of individuals with hearing loss and cochlear implants (CI) is limited. In particular, little is known about how CI users experience their professional life and whether they perceive stigma related to hearing loss or CI use. This study aims to evaluate the influence of hearing loss and CI treatment on professional life, including education and work, and to explore perceived stigma among CI users.

MATERIAL & METHODS

This multicentre, prospective observational study will include CI users aged 16–80 years with at least six months of CI experience. Participants complete a patient-reported outcome questionnaire on work/career and stigma, as well as the WHO-5 Well-Being Index and the Speech, Spatial and Qualities of Hearing Scale.

RESULTS

Data collection is ongoing. Results will be presented at IFOS 2026

CONCLUSIONS

The study will provide insights into professional experiences and perceived stigma among CI users and may help improve counselling and support for CI users in educational and professional contexts.

An EABR Paradigm For Assessing Inner Ear Malformations In Cochlear Implantation

Salman Alhabib[1]

[1]*King Abdullah Ear Specialist Center (KAESC), King Saud University Medical City, King Saud University, Riyadh, Saudi Arabia.*

BACKGROUND & AIM

To evaluate a novel intraoperative eABR paradigm in children with IEM and compare the findings with those from children with normal inner ear anatomy.

MATERIAL & METHODS

Nineteen cochlear implant candidates (11 with IEM, 8 with normal anatomy) underwent implantation following comprehensive preoperative imaging and audiological evaluation. Under general anesthesia, intraoperative eABR was recorded using three stimulation paradigms, namely: external promontory (ePEABR), internal promontory (iPEABR), and intracochlear (iEABR). The presence, latency, amplitude, and threshold of Waves III and V were analyzed.

RESULTS

ePEABR responses were observed in 45.5% of IEM and 37.5% of normal cases, with elevated thresholds and frequent artifacts. iPEABR responses were detected in all patients, showing consistent latency patterns. iEABR elicited robust responses in all pateints . Latencies shortened and amplitudes increased as stimulation approached the cochlear nerve.

CONCLUSIONS

Intraoperative iPEABR is feasible and provides valuable objective information on auditory pathway function in children with IEM, supporting surgical decision-making during cochlear implantation.

Hearing NeuroprosthesisIn Children With Inner Ear Malformations And Cochlear Nerve Deficiency

Myška P.[1], **Jurovčík M.**[1], **Okluský M.**[1], **Bauer L**[1], **Vlasák A.**[1], **Čada Z.**[1]

[1]*Department of Otorhinolaryngology, The Second Faculty of Medicine, Charles University in Prague, University Hospital Motol & Homolka*

BACKGROUND & AIM

The aim of the study is twofold. Firstly, to know if it is possible to implant children with inner ear congenital anomalies, considering the approach and type of the electrode. Secondly, to know what is a long-time outcome of surgery, from the point of view of electrophysiology, hearing and speech.

MATERIAL & METHODS

There were 13 children with inner ear anomalies and/or cochlear nerve deficiency (CND) implanted in a time period 2014 – 2020. The average age in the surgery was 4 years 1 months. Four children were implanted bilaterally, the rest unilaterally. There was one revision surgery in one patient. Types of anomalies included IP-1 3x, IP-2 4x, IP-3 1x, common cavity 2x, hypoplastic cochlea 1x, CND 2x. Some of the children had additional syndromology, like Charge and Waardenburg.

RESULTS

Implanted children were evaluated by speech and hearing tests (Categories of Auditory Performance, CAP, Motol Speech Scale, MSS) and by electrophysiology (neural response telemetry). As expected, the results are worse than in implanted peers with normal cochleas.

CONCLUSIONS

Children with congenital malformation of the inner ear should not be excluded from the implantation programme, since the implantation has a positive impact on their communication skills and quality of life, in spite of the fact there is a difference in speech production and perception compared with their peers with physiological cochleas. Surgery wise, the implantation is possible even in malformed inner ears.

Auditory Implants: Patients' Perspective For Future Improvement

Vicki Proctor[1], **Meghna Ray**[1], **Larissa Greenwood**[1]

[1]*Sheffield Teaching Hospitals*

BACKGROUND & AIM

Implantable hearing devices are indicated for those who are not suitable for conventional hearing aids. However a diverse array of percutaneous and transcutaneous options have been introduced over the last 25 years needing complex and confusing decision trees based more on hearing types rather than patient choice. Informed choice driven by patient led prioritisation will shape future development of such devices.

MATERIAL & METHODS

Initial questionnaire design was undertaken in conjunction with a expert patient user group of six implant patients. This study included 60 patients who had received implantable acoustic hearing solutions. Data was collected prospectively via a postal questionnaire. Two versions of the questionnaire were sent out according to the type of implanted device. Those with a transcutaneous device received vT questionnaire whilst those with a percutaneous device received vP questionnaire A Likert scale of 1 to 10 was used for patients to rank their priorities (1 being highest and 10 being lowest). All were asked to prioritise Battery life, Connectivity, Control switches, Design aesthetics, Head wear compatibility, Output power, Visibility, Water resistance, Wireless accessories. The vT questionnaire had an additional questionnaire on MRI compatibility whilst the vP questionnaire had an additional question about Aftercare.

RESULTS

A total of 60 patients were included. Those with a transcutaneous device (vT questionnaire) [n=35; Carina (9), Osia (10) and BAHA attract (16)]. Those with a percutaneous device vP questionnaire [n= 25 ; BAHA connect (22) Oticon Ponto (3)]. The overall response rate was 71.43%, The output power of the device was the highest priority in both groups. For vP group had a close second priority for water resistance whilst MRI compatibility was the third priority. Battery life, Design aesthetics and Control switch were the next priorities for both, Connectivity and streaming were much lower down the list.

CONCLUSIONS

Patient choice in device selection and design helps guide product refinement. The top priority for patients with implantable hearing solutions remains power optimum output, water resistance and MRI compatibility.

BACKGROUND & AIM

Cochlear implantation is the primary treatment for severe-to-profound hearing loss, but adult adoption is low despite evidence of improved speech recognition and quality of life. Most outcome measures focus narrowly on hearing, neglecting broader impacts on daily functioning, communication, and participation. The International Classification of Functioning, Disability, and Health (ICF) provides a multidimensional framework to evaluate these outcomes. This study aimed to investigate the evolution of Cochlear Implant (CI) outcomes using the ICF-based CI outcome assessment protocol (CI-ICF).

MATERIAL & METHODS

The raw data of a prospective, longitudinal, multicenter study assessing ICF was analyzed. In total, 72 CI candidates were assessed before and six months after cochlear implantation using CI-ICF protocol. The following assessment tools were used: (1) the Work Rehabilitation Questionnaire (WORQ) revised for CI users, (2) the Abbreviated Profile of Hearing Aid Benefit (APHAB), (3) the Audio Processor Satisfaction Questionnaire (APSQ), (4) the Speech, Spatial, and Qualities of Hearing

Questionnaire with 12 items (SSQ12), (5) the Hearing Implant Sound Quality Index 19 (HISQUI19), (6) the Nijmegen Cochlear Implant Questionnaire (NCIQ) (7) pure tone audiometry, (8) speech audiometry in quiet and in noise, and (9) sound localization.

RESULTS

There was a significant improvement of speech discrimination in quiet ($p = 0.015$; $p < 0.001$) and in noise ($p = 0.041$; $p < 0.001$), sound detection (PTA4; $p < 0.001$), tinnitus (WORQ question 7; $p = 0.026$), listening (HISQUI19 total score; $p < 0.001$), communicating with – receiving – spoken messages (APHAB total score; $p < 0.001$), conversation (WORQ question 11; $p < 0.001$), family relationships (WORQ question 14; $p < 0.001$), community life (WORQ question 13; $p = 0.019$), the NCIQ total score ($p < 0.001$) and all NCIQ subdomain scores ($p < 0.001$). Sound localization measured with the SSQ12 Spatial subdomain score significantly improved ($p < 0.001$), while the psychometric sound localization test results did not. There was no significant subjective deterioration of vestibular functioning and lack of substantial change in sound aversiveness. CI users reported a high level of implant satisfaction after implantation.

CONCLUSIONS

This study highlights the positive impact of cochlear implantation on auditory performance, communication, and subjective well-being. The CI-ICF protocol provides a holistic and comprehensive view of the evolution of CI outcomes by not only covering body functions and structures outcomes, but also including results concerning activities and participation as well as environmental factors.

Influence Of Scala Tympani Volume On Electrode Insertion Tactic

Andrei Lilenko[1], **Vladislav Kuzovkov**[1], **Serafima Sugarova**[1], **Polina Timofeeva**[1], **Polina Kharitonova**[1], **Grigoriy Ivanov**[1]

[1]*St. Petersburg ENT Research Institute*

BACKGROUND & AIM

Individual anatomic variations of the spiral canal are examined before cochlear implantation with the use of temporal bone CT and inner ear MRI. Cochlear duct length and volume as well as angular insertion depth are measured to select optimal electrode length and provide atraumatic insertion avoiding electrode kinking or incomplete insertion. This approach enhances the residual hearing preservation and minimizes risk of vestibular complications in the follow-up period.

Objective: to examine the individual variations in scala tympani volume and to determine its influence of on the electrode choice and insertion tactic in patients without congenital or acquired inner ear pathology.

MATERIAL & METHODS

60 consecutive patients aged from 7 months to 73 years who underwent cochlear implantation in St. Petersburg ENT Research Institute. They didn't have neither cochlear malformations nor acquired inner ear pathology according to the temporal bone CT and inner ear MRI. 69% of patients were children. Scala tympani volume was measured with the use of automated cochlea 3d segmentation.

RESULTS

Scala tympani volume varied from 35,096 mm3 to 51,521 mm3 with average meaning 42,405 mm3. In 23 cases scala tympani volume was in the interval of 41,6 mm3 and 44,9 mm3, in 11 patients - between 38,3 mm3 and 41,6 mm3 as well as 44,9 mm3 and 48,2 mm3. 8 patients presented with 35 mm3 – 38,3 mm3 scala tympani volume, while 7 – with 48,2 mm3 – 51,5 mm3. In cases of the smallest scala tympani volumes the full insertion of the standard-length electrode could not be achieved.

CONCLUSIONS

Measurements of the scala tympani volume can be a helpful tool for electrode selection and atraumatic insertion tactic optimization.

Real-Time Cochlear Insertion Angle: Correlation And Agreement Between Intraoperative Telemetry And Postoperative Standard Radiography

M. Loudghiri[1], **W. Bijou**[1], **M. Lahjaouj**[1], **Y. Oukessou**[1], **S. Rouadi**[1], **R. Abada**[1], **M. Roubal**[1], **M. Mahtar**[1]

[1]*ENT and Head and Neck Surgery Department, 20 Août 1953 Hospital, Ibn Rochd University Hospital Center. Faculty of Medicine and Pharmacy of Casablanca, Hassan II University of Casablanca*

BACKGROUND & AIM

The emergence of intraoperative telemetry techniques based on the analysis of trans-impedance matrix profiles offers promising new perspectives. These approaches enable real-time estimation of Angular insertion depth (AID), potentially allowing optimization of electrode positioning while the patient is still in the operating room.

The primary objective of this study was to quantify and analyze the correlation between the insertion angle measured by intraoperative telemetry and that obtained through postoperative standard skull radiography, in order to determine to what extent these two methods may be considered interchangeable, complementary, or hierarchically applicable in routine clinical practice.

MATERIAL & METHODS

The study population consisted of 22 patients who underwent cochlear implantation and met the established audiometric and medical criteria according to current recommendations.

Telemetry-based estimation of AID was carried out intraoperatively, immediately after complete insertion of the electrode array, using algorithms derived from trans-impedance matrix profile analysis.

Postoperative AID was measured on modified Stenvers radiographic views. Angular measurements were independently performed by two operators.

Agreement between the two measurement methods was assessed using three statistical analyses: Pearson's correlation coefficient (r) and Lin's concordance correlation coefficient . The threshold for statistical significance was set at $p < 0.05$.

RESULTS

Analysis of the angular measurements obtained by the two methods revealed very similar mean values.

The mean absolute difference between the two methods was therefore 5.9°.

Evaluation of the relationship between the two measurement techniques demonstrated excellent correlation. Pearson's correlation coefficient reached $r = 0.96$, indicating a very strong linear association between telemetry-based and radiographic measurements. This finding was confirmed by Lin's concordance correlation coefficient (CCC = 0.96), which incorporates both correlation and accuracy.

The statistical significance of this correlation was exceptionally high, with a p-value < 0.01, confirming the robustness of the observed relationship.

CONCLUSIONS

These findings support a complementary and combined use of both modalities: intraoperative telemetry as a real-time screening tool for detecting electrode misplacement or aberrant insertions, enabling immediate correction during surgery; and postoperative standard radiography as an accessible, cost-effective, and low-radiation confirmation method, particularly valuable when systematic access to CT imaging is limited.

Clinical Evaluation Of The OTODRIVE/OTOARM (MED-EL, Innsbruck, Austria) Robotic-Assisted System In Cochlear Implantation: Workflow Integration And Impedance Dynamics

Sébastien SCHMERBER[1,2], **Julie CORDIER**[1], **Vincent PEAN**[1], **Raphaele QUATRE**[1,2]

[1]*University Grenoble Alpes, France;* [2]*INSERM, Braintech Lab, University Grenoble Alpes, France*

BACKGROUND & AIM

Cochlear implantation (CI) is the gold standard for severe sensorineural hearing loss, with increasing emphasis on preserving intracochlear structures and residual hearing. Manual electrode insertion is inherently limited by human hand tremor and inconsistent mechanical force, which can lead to insertion trauma. Robotic-assisted motorized insertion tools (MITs), such as the OTODRIVE/OTOARM system, have been developed to provide slow, continuous, and highly controlled electrode advancement to mitigate these risks.

MATERIAL & METHODS

We conducted a clinical evaluation of the OTODRIVE/OTOARM system in a prospective cohort of 26 adult patients (mean age 70, range 22–88, f :16, m : 10) since December 2024. The series included six cases of partial hearing loss using Flex 24 (n=4) and Flex 28 (n=2) electrodes. All other cases were implanted with a Flex 28. Surgical workflow integration and postoperative impedance dynamics were assessed. Impedance analysis was performed using a linear mixed model—incorporating electrode position, intraoperative impedance, and age as fixed effects—and compared against a matched retrospective cohort of manual insertions.

RESULTS

Integration of the MIT into the surgical routine was feasible without major workflow disruptions. All 26 robot-assisted insertions were successful. In particular, no resistance was observed for insertion of the most apical electrodes, which can occur in manual insertion.

Regarding hearing preservation, residual hearing was successfully maintained in 100% of the six cases where partial hearing loss was present preoperatively, further supporting the atraumatic nature of the motorized insertion. A highly significant effect of the insertion method on impedance stabilization was observed ($p < 10\text{-}5$); the impedance decay was significantly steeper for the OTODRIVE group (slope = 0.25) compared to the manual group (slope = 0.56), with a significant slope difference of -0.31 (95% CI: -0.43 to -0.20). While apical electrodes (1–4) exhibited higher postoperative impedances across both groups, no significant effect of age was observed on these electrophysiological outcomes.

CONCLUSIONS

MIT-assisted cochlear implantation using the OTODRIVE/OTOARM system is clinically feasible and demonstrates a superior stabilization of postoperative impedances compared to manual insertion. This steeper impedance decay suggests a more controlled, atraumatic electrode-tissue interface. To optimize the surgical workflow, we propose a technical modification for the loading and unlocking of the electrode array: the use of a drape clamp to stabilize the forceps during these critical transitions. This refinement enhances the mechanical reliability of the coupling process and reduces the risk of unintended electrode displacement.

Nasalance And Articulation Proficiency In Children With Cochlear Implants: A Comparative Study Using Praat-Assisted Nasometry

Burak Arpacı[1], **Ramazan Çelik**[1], **Hasan Sami Bircan**[1], **Mehmet Akif Kılıç**[2], **Başak Fırat Koçer**[3], **Enise Akdemir**[4], **Özgür Yiğit**[5]

[1]Istanbul Training and Research Hospital, Department of Otolaryngology-Head and Neck Surgery; [2]Lokman Hekim İstanbul Hospital, Department of Otolaryngology-Head and Neck Surgery; [3]Istanbul Training and Research Hospital, Speech And Language Therapy; [4]Istanbul Training and Research Hospital, Audiology; [5]Çam and Sakura City Hospital, Department of Otolaryngology-Head and Neck Surgery

BACKGROUND & AIM

To compare nasalance profiles across bilateral cochlear implant (BCI), unilateral and bimodal CI (UCI/bimodal), hearing aid (HA), and normal-hearing (NH) control groups using the Praat-Assisted Nasalance Meter (PANM), and to examine relationships with speech proficiency and audiometric performance.

MATERIAL & METHODS

The study adopted a cross-sectional design with prospective data collection. Eighty-five children aged 3–12 years (BCI n=22, UCI/bimodal n=20, HA n=21, NH n=22) were evaluated. Nasalance was measured using PANM during sustained vowels (/a/, /m/, /i/) and six syllable repetition tasks (open and closed nostril conditions). Oral-nasal difference scores served as indicators of velopharyngeal function. Articulation was assessed using the Turkish Articulation-Phonology Test (SST-SET). Flexible fiberoptic nasopharyngoscopy confirmed absence of structural velopharyngeal insufficiency in all device users. Group comparisons used Kruskal-Wallis H test with Bonferroni-corrected Mann-Whitney U tests. Spearman correlation coefficients examined relationships between nasalance, speech, and audiometric variables.

RESULTS

All hearing-impaired groups demonstrated significantly higher oral syllable nasalance and open-closed difference scores compared to NH peers ($p<0.05$–$p<0.001$). The HA group showed the most pronounced elevation for /papapa/ and /kakaka/ (vs. NH: $p<0.001$, Bonferroni-corrected). The BCI group exhibited significantly higher /i/ vowel nasalance compared to both UCI/bimodal ($p=0.021$) and HA groups ($p=0.033$). Using NH internal reference thresholds (mean + 2SD), high nasalance prevalence was: BCI 68.2%, UCI/bimodal 47.4%, HA 71.4%, NH 13.6% ($\chi^2=18.46$, $p<0.001$). Using adult thresholds (>25%), prevalence estimates were lower: BCI 27.3%, UCI/bimodal 10.0%, HA 4.8%, NH 0% ($\chi^2=9.83$, $p=0.020$). Sex-specific analysis revealed higher prevalence in females. All hearing-impaired groups performed significantly lower than NH children on SST z-scores and correct consonant percentage ($p<0.001$). Nasalance scores did not correlate with age at implantation, device use duration, or aided thresholds; however, /a/ nasalance correlated negatively with SST z-score ($\rho=-0.331$, $p=0.009$).

CONCLUSIONS

Children using cochlear implants and hearing aids exhibit elevated nasalance and increased velopharyngeal dysfunction prevalence compared to normal-hearing peers. The BCI-specific elevation in /i/ nasalance may be partially explained by the additional low-frequency acoustic feedback provided in bimodal fitting. The lack of correlation between nasalance anomalies and device experience variables suggests that resonance control depends on separate mechanisms requiring targeted intervention beyond standard auditory-verbal rehabilitation.

Detection Of Electrode Tip Fold-Over In Cochlear Implantation

Bülent Ulusoy[1], **Serhat Pazır**[1], **Özgür Demir**[1]

[1]Selçuk University School of Medicine, Department of Otolaryngology, Head and Neck Surgery, Konya, Türkiye

BACKGROUND & AIM

Cochlear implantation is the surgical procedure for severe-to-profound sensorineural hearing loss. Precise electrode placement within the scala tympani and absence of tip fold-over (TFO) are paramount for optimal auditory rehabilitation. TFO can cause electrode dysfunction, degraded auditory performance, and revision surgery. Current routine intraoperative electrophysiological assessments demonstrate limited sensitivity in definitive detection of malposition. While intraoperative fluoroscopy is advantageous, postoperative CT is frequently necessitated in suspicious cases. Consequently, there is a critical need for robust intraoperative detection modalities. This prospective study evaluates the diagnostic potential of integrating conventional electrophysiological tests with SmartNav data for reliable TFO detection.

MATERIAL & METHODS

This prospective observational study is conducted at the Selçuk University Faculty of Medicine, Department of Otorhinolaryngology, following ethical approval (2025/217). The study comprises 50 patients, aged 1–75 years, undergoing implantation with Cochlear® CI522 devices. Following standard surgery, measurements are completed primarily with SmartNav (Insertion velocity, Placement Check, Impedance, ESRT, and AutoNRT). To validate SmartNav's reliability, routine assessments and TFO-specific measurements (TIM and SOE) are subsequently performed using Custom Sound EP software. The reliability of both methodologies in detecting TFO is evaluated by comparing results with the gold standard: postoperative radiological imaging. Furthermore, measurement durations are analyzed to assess potential anesthetic exposure risks. Postoperative electrode positioning is verified using transorbital radiographs, with CT for suspicious cases. Any intraoperative findings suggestive of TFO derived from SmartNav or Custom Sound are cross-verified with radiological data for definitive confirmation.

RESULTS

To date, 25 insertions were performed across 17 patients (23 ears). Preliminary results included 17 patients (9 males, 8 females) with a mean age of 15.7 years (range: 1.2–52). Mean duration for SmartNav system assessments was 1 minute 39 seconds, while Custom Sound TIM test mean duration was 1 minute 44 seconds. Regarding the SoE test, which is NRT-dependent and requires an experienced audiologist for interpretation, the mean duration for two separate electrodes (11th and 16th) was 3 minutes 1 second. Tip fold-over (TFO) was detected at a rate of 8.7% (n=2/23). In these cases, a 100% correlation was observed between SmartNav findings and intraoperative radiological data. In contrast, the TIM test identified TFO in only one case, yielding normal findings in the second. In this inconsistent case, SOE detected TFO at the 11th electrode but not at the 16th.

CONCLUSIONS

According to preliminary findings, the SmartNav system successfully identifies electrode tip fold-over (TFO), demonstrating superior diagnostic performance compared to the conventional Trans-Impedance Matrix (TIM) test. While procedural durations were comparable, the Spread of Excitation (SoE) test—despite similar sensitivity—presents clinical feasibility limitations due to dependence on experienced audiologists and mandatory Neural Response Telemetry (NRT). Considering risks of radiation exposure, additional costs, and potential secondary surgeries in undetected cases, SmartNav can mitigate these adverse outcomes. SmartNav emerges as a prominent diagnostic tool enhancing cochlear implantation safety by minimizing misdiagnosis risk. However, these preliminary results require further large-scale confirmation.

Cochlear Implant Functionality And Outcome In Patients With Inner Ear Malformation

Musaed AlZahrani[1], **Rana Almuslem**[2], **Tareq Eldessouki**[1], **AlAnood Alothman**[1]

[1]King Fahd Specialist hospital, Dammam, Saudi Arabia; [2]Maternity and children hospital, Dammam, Saudi Arabia

BACKGROUND & AIM

Sensorineural hearing loss affects approximately 0.35% of Saudi newborns. Cochlear implantation improves speech, language, cognitive, and intellectual abilities in hearing-impaired children. Outcomes are influenced by factors including age at implantation, duration of hearing loss, inner ear anatomy, auditory nerve physiology, neurodevelopmental disorders, psychosocial support, and postoperative follow-up compliance. Around 20% of patients have inner ear malformations, requiring careful perioperative planning. The electrically evoked compound action potential (eCAP) objectively assesses cochlear implant functionality by measuring spiral ganglion neural responses. This study aimed to determine incidence of inner ear malformations and compare cochlear implant and speech outcomes in affected and unaffected patients.

MATERIAL & METHODS

Retrospective cohort study at KFSHDfrom 2011–2022

•Approved by Institutional Review Board (IRB)

•Inclusion/ Prelingual pediatric patients with SNHL who had undergone bilateral CI

•Exclusion/ (1)Patients who had language before CI(post lingual SNHL). (2) patients who did not attend the required postsurgical speech therapy rehabilitation at our center. (3) who had intellectual disabilities.

All patients underwent CT and MRI of the temporal bone

•During all CI procedures, our audiologists measured eCAP in response to the electrical stimulation given. The results were categorized into either measured (gave full or partial response) or none measured (no response).

•The CAP and SIR ratings were determined regularly during each visit . CAP and SIR assessments conducted within the 12-month post-implantation period were used in this study

Statistical analysis

•The data were analyzed using the Statistical Packages for Software Sciences (SPSS) version 26 software program . A p-value of less than 0.05 was considered statistically significant.

RESULTS

A total of sixty-five pediatric patients underwent bilateral cochlear implantation, with a mean implantation age of twenty-nine months. The eCAP was measured bilaterally in ninety-five point four percent of patients. The mean CAP and SIR scores were four point three two and two point four two, respectively. Eleven patients, representing sixteen point nine percent, had cochlear abnormalities, with Mondini deformity being the most common abnormality, found in seven patients. There was no statistically significant relationship between cochlear anatomy and eCAP, with a p-value greater than zero point zero five. Although patients with abnormal cochleae had lower CAP and SIR scores, the difference was not statistically significant.

CONCLUSIONS

•cochlear functionality represented by eCAP is similar in normal patients to the functionality in patients with cochlear abnormalities.

• speech and audiological outcomes one year after implantation were comparable in both groups.

•early implantation is strongly advised for cochlear implant users, even those with inner ear malformations

Air Along The Enlarged Vestibular Aqueduct After Cochlear Implantation In Incomplete Partition Type II: The Reverse-Pathway Sign

Leticia Rosito[1], **Fabio Selaimen**[1], **Alice Lang Silva**[1], **Levent Sennaroğlu**[2], **Vinícius Nitz**[1]

[1]Hospital de Clínicas de Porto Alegre, affiliated with the Federal University of Rio Grande do Sul; [2]Hacettepe University

BACKGROUND & AIM

Incomplete partition type II (classic Mondini malformation) is defined by a cystic cochlear apex, mild vestibular dilation, and an enlarged vestibular aqueduct (EVA). EVA may act as a third window and as a pathway for cerebrospinal fluid pressure transmission, explaining intraoperative pulsation, oozing, or gusher during cochlear implantation, yet postoperative imaging correlates are limited. We aimed to report a postoperative CT pattern—air in the vestibule with continuous extension along the entire EVA after cochlear implantation in IP-II—and to propose it as the “reverse-pathway sign,” supporting a pressure-transmission model and aiding counseling and surgical planning.

MATERIAL & METHODS

We performed a descriptive case-series review of intraoperative findings and postoperative high-resolution temporal bone CT in two patients with progressive sensorineural hearing loss and a radiologic diagnosis of incomplete partition type II (classic Mondini malformation) with enlarged vestibular aqueduct (EVA). Preoperative imaging was reviewed to confirm the malformation pattern. Cochlear implantation was carried out using a round-window approach, and intraoperative events suggestive of altered labyrinthine hydrodynamics (e.g., perilymphatic oozing after round-window opening and resistance to electrode advancement) were documented. Postoperative CT studies were analyzed for pneumolabyrinth and for the distribution of air within the vestibule and along the endolymphatic pathway, specifically assessing whether air tracked continuously through the full course of the EVA on the implanted side.

RESULTS

Both patients underwent cochlear implantation with a MED-EL FORM 24 electrode array. Intraoperatively, persistent perilymphatic oozing after round-window opening and resistance to electrode advancement were observed, suggesting altered labyrinthine hydrodynamics related to the malformation. Postoperative high-resolution CT demonstrated pneumolabyrinth, with air in the vestibule and continuous air tracking along the full course of the enlarged vestibular aqueduct on the implanted side, matching the pattern proposed as the “reverse-pathway sign.” In Case 2, this finding was absent contralaterally, where insertion proceeded without resistance, supporting an association between the imaging sign, EVA anatomy, and the intraoperative behavior encountered during implantation.

CONCLUSIONS

The reverse-pathway sign—postoperative CT pneumolabyrinth with vestibular air and continuous air tracking along the full enlarged vestibular aqueduct (EVA) after cochlear implantation in incomplete partition type II (classic Mondini)—provides an objective imaging correlate of an EVA-mediated pressure-transmission mechanism. It supports the concept that the EVA is a hydrodynamically functional conduit, not merely an anatomic variant. After intracochlear intervention, reverse air propagation may reveal the physiologic route, indicating a postoperative shift in inner-ear hydrodynamic equilibrium and helping explain intraoperative findings such as persistent oozing and insertion resistance.

OP-123

Shape Of The Cochlear Basal Turn: An Indicator For An Optimal Electrode-To-Modiolus Proximity With Precurved Electrode Type

Professor Abdulrahman Alsanosi[2]

[1]*JAZAN HEALTH CLUSTER, SAUDI ARABIA;* [2]*KING SAUD UNIVERSITY*

BACKGROUND & AIM

The authors, to the best of their knowledge, are unaware of any prior studies that report specifically on the shape of the cochlear basal turn by measuring the cochlear parameters and its implications on the electrode-to-modiolus proximity with CI electrode array types. The objectives of this study was to determine the shape of cochlear basal turn through basic cochlear parameters measurement. The secondary aim was to overlay an image of the precurved electrode array on top of the three-dimensional (3D) image of the cochlea to determine which shape of the cochlear basal turn gives optimal electrode-to-modiolus proximity.

MATERIAL & METHODS

Computed tomography (CT) preoperative image-data sets of 117 ears were made available for the measurements of cochlear parameters retrospectively. Three-dimensional slicer was used in the visualization and measurement of cochlear parameters from both 3D and 2D (2-dimensional) images of the inner ear. Cochlear parameters including basal turn diameter (A), width of the basal turn (B), and cochlear height (H) were measured from the appropriate planes. B/A ratio was made to investigate which ratios correspond to round and elliptical shape of the cochlear basal turn.

RESULTS

The cochlear size as measured by A value ranged between 7.4 mm and 10 mm. The B value and the cochlear height (H) showed a weak positive linear relation with A value. The ratio between the B and A values anything above or below 0.75 could be an indicator for a more round- or elliptical shaped cochlear basal turn, respectively. One sized/shaped commercially available precurved electrode array would not offer a tight electrode-to-modiolus in the cochlea that has an elliptical shaped basal turn as identified by the B/A ratio of <0.75.

CONCLUSIONS

Accurate measurement of cochlear parameters adds value to the overall understanding of the cochlear geometry before a cochlear implantation procedure. The shape of cochlear basal turn could have clinical implications when comes to electrode-to-modiolus

OP-124

The Chronological Evolution Of Cochlear Implant Contraindications: A Comprehensive Review

Nezar Hamed[1]

[1]*king saud university*

BACKGROUND & AIM

Frequency-to-place mismatch in cochlear implants (CIs) may influence auditory and speech outcomes, yet its impact on pediatric patients remains underexplored. This study aims to assess the impact of mismatch on hearing and speech outcomes.

MATERIAL & METHODS

In this retrospective study, the actual angular insertion depth and frequency of each electrode contact were derived. The difference between the tonotopic and default frequency was used to estimate the mismatch. The impact of this mismatch on auditory and speech outcomes was assessed in pediatric CI users.

RESULTS

This study included 89 implanted ears of young children. The analysis revealed a significant difference between default and actual postoperative electrode frequencies, with greater mismatches observed in shorter electrode arrays. A weak but significant correlation was observed between mismatch and SF-AT, while no clear trends were found in other outcome

measures. Patients with lower mismatches tended to perform better, while those with mismatches exceeding 7 semitones showed slightly lower—though non-significant—speech performance. However, a significant difference was observed in SIR, favoring the lower mismatch group.

CONCLUSIONS

Children with <7 semitones of mismatch showed better, though non-significant, outcomes across multiple measures—including SDS, CAP, and SF-AT—and a significant difference in SIR. Despite no significant linear correlations overall, these findings suggest that specific mismatch levels may still influence outcomes after three years of CI use. Future studies should explore early post-activation effects and assess whether tonotopic-based mapping improves speech perception and overall auditory performance in young CI users.

OP-125

PREDICTING CSF LEAK DURING COCHLEAR IMPLANTATION IN PATIENTS WITH ENLARGED VESTIBULAR AQUEDUCT

Sima Sugarova[1], **Vlad Kuzovkov**[1], **Andre Lilenko**[1]

[1]*Saint Petersburg ENT and Speech Research Institute*

BACKGROUND & AIM

Enlarged vestibular aqueduct (EVA) is a common inner ear malformation often associated with congenital hearing loss. Despite advances in diagnosis, challenges remain in accurately assessing aqueductal parameters and predicting surgical risks like intraoperative CSF leak. While CT and MRI are standard for EVA detection, traditional linear measurements may be insufficient. Emerging evidence supports three-dimensional visualization and volumetric analysis for more precise morphological assessment and reduced diagnostic errors. Consequently, our objective was defined as evaluating a method for predicting intraoperative CSF leak in EVA patients using three-dimensional volumetry.

MATERIAL & METHODS

Materials and Methods: A retrospective study of 30 patients with isolated enlarged vestibular aqueduct (cochlear implant recipients). The mean age was 7±4 years. Based on high-resolution CT data of the temporal bones, three-dimensional modeling and volumetry of the vestibular aqueduct were performed using 3D Slicer software. Statistical analysis was carried out using StatTech v. 4.1.7 software.

RESULTS

We found a statistically significant correlation between the probability of developing intraoperative CSF leak and the volume of the vestibular aqueduct, where a larger volume (>30mm^3) was associated with a higher probability of CSF leak (p=0.034).

CONCLUSIONS

3D volumetry of the vestibular aqueduct is a more accurate predictor of intraoperative CSF leak compared to standard linear measurements. Incorporating this method into the preoperative protocol allows for risk stratification of patients and advance planning of the surgical strategy (selection of the implant electrode type and method for sealing the round window) to prevent complications.

Outcomes Of Cochlear Implantation In Patients With Inner Ear Malformations: A Retrospective Study

Pınar Kundi[1], **Özgür Yiğit**[1], **Zeliha Kapusuz Gencer**[1], **Ozan Özdemir**[2], **Nursena Nair Polat**[1], **Ahmet Berkay Yeşiller**[1]

[1]*Başakşehir Çam ve Sakura Şehir Hastanesi;* [2]*İstanbul Eğitim ve Araştırma Hastanesi*

BACKGROUND & AIM

Cochlear implants are electrically stimulating systems for the auditory nerve that are used in individuals with severe and/or profound sensorineural hearing loss who do not benefit from the conventional amplification. The aim of this study was to discuss the surgical challenges, types of inner ear anomalies, intraoperative and postoperative complications, and postoperative audiological outcomes in patients with inner ear anomalies who underwent cochlear implantation surgery at Başakşehir Çam ve Sakura City Hospital and Istanbul Training and Research Hospital.

MATERIAL & METHODS

A retrospective study was conducted by reviewing the medical records of 97 patients who underwent cochlear implantation between 2015 and 2026 at Başakşehir Çam and Sakura City Hospital and Istanbul Training and Research Hospital; in whom inner ear anomalies were identified on preoperative radiological evaluation. The classification of inner ear anomalies was based on preoperative radiological imaging findings. Surgical difficulties during cochlear implant in these patients were identified and evaluated. Postoperative complications were classified as minor and major. Minor complications resolved with

minimal treatment, whereas major complications required additional surgical intervention. In addition, postoperative audiological outcomes were evaluated in 68 of this 97 patients. Free-field hearing thresholds were analyzed as audiological parameters. Free-field hearing thresholds were classified according to hearing level as normal (0–25 dB HL), mild (26–40 dB HL), moderate (41–55 dB HL), moderately severe (56–70 dB HL), severe (71–90 dB HL), and profound (>90 dB HL) hearing loss.

RESULTS

The 97 patients with inner ear anomalies, 46(47.42%) were female and 51(52.58%) were male. Types of inner ear malformation and their frequencies were: incomplete partition type I 9(9.27%) patients; incomplete partition type II (mondini deformitiy) 49(50.51%), incomplete partition type III 4(4.12%), common cavity 15(15.4%), cochlear hypoplasia 13(13.4%), cochlear nerve hypoplasia 3(3.09%), cochlear nerve aplasia 1(1.03%), labyrinthitis ossificans 4(4.12%) and hypoplasia of the modiolus 1(1.03%) patients.Surgical difficulties encountered: anomalies of the facial nerve 6(6.18%), the incus–stapes block is located more inferiorly than expected 1(1.03%), rudimentary stapedius muscle 1(1.03%).Complications occurred in 86(88.6%) patients. Minor complications occurred in 71(73.1%) patients, which included otitis media(12.7%), facial palsy(1.16%), vertigo(2.32%), intraoperative cerebrospinal fluid (CSF) gusher(48.8%), hematoma(13.9%) and chorda tympani nerve injury(2.32%). Major complications occurred in 15(15.4%) patients. These included device failure(13.3%), device migration(26.6%), perforation of the tympanic membrane(53.3%) and misplaced electrodes(6.6%).Our postoperative audiological results showed that the most common category was mild hearing loss 50(73.5%) patients.

CONCLUSIONS

This study reveals which types of inner ear anomalies are more frequently encountered in patients with severe sensorineural hearing loss accompanied by inner ear malformations and the anatomical difficulties that may be encountered during surgery. In addition, this study shows that the postoperative complication rate after cochlear implantation in the anomalies inner ear is at a level that cannot be ignored and that the presence of malformation in inner ear may also negatively affect postoperative hearing results.

OP-127

Cochlear Implant Candidacy Evaluation In Elderly

Anna Balakina[1], **Anton Machalov**[1], **Alexander Kuznetsov**[1]

[1]*Federal State Budgetary Institution "National Medical Research Center for Otorhinolaryngology" of the FMBA of Russia, Moscow*

BACKGROUND & AIM

In Russia, as in most countries worldwide, the population is aging. Hearing loss is one of the most common sensory deficits in elderly. Cochlear implantation in elderly with severe to profound hearing loss is in the focus of attention. Since CI in elderly is not only a surgical procedure, but a system of measures requiring the cooperation between physicians of various specializations, psychological and pedagogical support;its effectiveness largely depends on high-quality evaluation, strict data analysis, taking into account the indications/contraindications.

MATERIAL & METHODS

The retrospective study was conducted at the Federal State Budgetary Institution "National Medical Research Center for Otorhinolaryngology" of the FMBA of Russia, Moscow, (Director Daikhes N.A.) from January 2021 to December 2025; 491 case histories were analyzed. During this period, 97 patients over 60 years old were considered as candidates for CI. All patients underwent a comprehensive audiological examination (including vestibular function assessment), imaging (CT temporal bone, MRI scan including cochlear, auditory nerves and internal acoustic canals), assessment of general health, cognitive function (MMSE, MoCa, Mini-Cog), and fitness for anesthesia.

RESULTS

Ninety-five (98%) patients over 60 years old received their cochlear implant. The center's medical commission declined cochlear implantation for two study participants due to the presence of comorbidities in the acute stage.

CONCLUSIONS

In structure of total amount of cochlear implantations among adults (489 cases) which were held at the Center in the period from January 2021 to December 2025 the elderly accounted for 19.4% (95 patients). There is a trend toward an increasing number of cochlear implantations in this age group from year to year. Age, as the sole contraindication for cochlear implantation, should not be considered, as the elderly population is highly heterogeneous.

OP-128

Feasibility Of Stapedius Reflex Detection Via Middle Ear Pressure Monitoring

Thomas Bitter[1], **Katharina Geißler**[1], **Gerd Fabian Volk**[1], **Orlando Guntinas-Lichius**[1]

[1]ENT department, University hospital Jena

BACKGROUND & AIM

The stapedius reflex (SR) is a bilateral protective response of the auditory system to intense acoustic stimuli and is commonly used as an objective measure in cochlear implant (CI) fitting. Current SR detection methods rely on impedance audiometry, which requires tympanometry equipment and in-clinic sessions. This study hypothesized that SR-related pressure changes could be detected directly within the middle ear using a pressure transducer, enabling future integration into CI systems.

MATERIAL & METHODS

This prospective, observational feasibility study included 11 adult patients undergoing tympanotomy for transtympanic corticosteroid injection. A pressure transducer was inserted into the middle ear, and contralateral acoustic stimulation was delivered using a tympanometry device. ECG-synchronized stimulation and a custom filtering algorithm were used to suppress heartbeat-induced artifacts, enhancing signal clarity. Reflex detection was assessed across 32 frequency-intensity combinations (500–4000 Hz, 80–110 dB). Reflexes were classified based on signal morphology and changes to stimulation intensity.

RESULTS

Middle ear pressure changes consistent with SR were detected in 62.5% (20/32) of measurements. In 25% (8/32), no reflexes were elicited, and none were detected, while in only 12.5% (4/32), reflexes were detected by tympanometry but not by the pressure sensor. When considering only measurements where a reflex was elicited (n=24), the detection success rate was 83.3%. The method showed comparable threshold sensitivity to tympanometry, with minimal average differences (<1 dB).

CONCLUSIONS

This study demonstrates the feasibility of detecting SR via middle ear pressure monitoring. The method correctly identified reflex presence in 83.3% of cases and offers a promising pathway for integrating objective reflex detection into CI systems. Such integration could enable more frequent, remote, and user-independent fitting, particularly benefiting patients with limited communication abilities, such as infants or individuals with cognitive impairments.

OP-129

Cochlear Implant: The Impact Of Proximity On Facial Nerve Stimulation

Alhassan Algazlan[1]

[1]King Abdullah Ear speciality Center , King Saud University,Riyadh, Saudi Arabia

BACKGROUND & AIM

To investigate the association between facial nerve stimulation (FNS) and the distance from the labyrinthine segment of the facial nerve (LSFN) to the upper basal turn of the cochlea (UBTC) in cochlear implant recipients, and to develop a predictive nomogram incorporating anatomical, surgical, and intraoperative factors.

MATERIAL & METHODS

This retrospective cohort study included 94 ears from 73 patients with normal cochlear anatomy. Patients were divided into facial nerve stimulation (FNS) (n = 48) and control (n = 46) groups. Preoperative measurements were obtained using OTOPLAN® software (MED-EL, Innsbruck, Austria), including cochlear-facial nerve distance, cochlear dimensions, and electrode insertion angle. Cochlear duct length, predicted scala tympani volume, and basal turn shape were calculated from the previous values. Intraoperative impedance and compound action potentials were recorded. Logistic regression identified independent risk factors, and a predictive nomogram was developed and validated using receiver operating characteristic (ROC) analysis.

RESULTS

Shorter cochlear-facial distance (CFD) (mean 0.5 mm in FNS group vs. 0.8 mm in controls, $p < 0.001$), lower B-value and basal impedance, and the use of specific electrode types were independently associated with increased FNS risk. A good specificity and positive predictive value were observed when using CFD to predict FNS (89.1%, and 80.8, respectively). However, the sensitivity was low (43.8%). On the other hand, using the suggestedl nomogram demonstrated superior predictive

accuracy (AUC = 0.85) compared to CFD alone (AUC = 0.72; p < 0.001), with high specificity (87.0%), sensitivity (72.9%) and positive predictive value (85.4%).

CONCLUSIONS

Facial nerve stimulation following cochlear implantation is strongly associated with reduced CFD, specific cochlear morphologies, and intraoperative factors. Thedeveloped nomogram improves risk prediction over single-variable models and may aid in preoperative planning and personalized surgical decision-making

Measuring The Angular Insertion Depth Of Cochlear Implant Electrode Array From The Plane X-Ray

Hessa AlHammadi[1], **Ahmad Alamadi**[1], **Yassin Abdelsamad**[2]

[1]ENT Department, Kuwait Hospital – Dubai, Emirates Health Services, United Arab Emirates; [2]Research Department, MED-EL GmbH, Riyadh, Saudi Arabia

BACKGROUND & AIM

Background: Cochlear implant (CI) angular insertion depth is important information. It reports the anatomical position of the electrode inside the cochlea to know how deep the electrode array is.

Objective: This work aims to investigate a simple method to measure the angular insertion depth (AID) after cochlear implantation using the postoperative routine plane X-ray. This work also reports the AID of a single electrode array among patients from different populations implanted at the same clinic.

MATERIAL & METHODS

The routine post-operative skull x-ray was used to measure the AID. Stenverse view was utilized and three reference lines were used. The measurements were done retrospectively for patients who underwent CI surgery by one surgeon and one electrode array.

RESULTS

Thirty-six CI ears for patients were studied, all of whom were classified according to their geographical regions into 30.6% South Asians (including Afghans, Bangladeshis, Indians & Pakistanis), 13.9% East Africans (including Comorian & Sudanese) and 55.6% Middle Eastern (including Emiratis, Egyptians, Syrians & Palestinians). About 66.7% of them were males and 33.3% were females. Their mean age at implantation was 5.8 ± 7.5 years old. About 36.1% were left-sided cochlear insertion, while the remaining 63.9% were right-sided. The measured mean AID was 527.2 ± 68.6 degrees.

CONCLUSIONS

While the slandered medical imaging modality to determine the AID is the CT scan, this study confirms that the postoperative X-ray could be used efficiently as well. X-rays are less costly, easier to access, more comfortable for patients, and provide substantially less radiation. While the slandered medical imaging modality to determine the AID is the CT scan, this study confirms that the postoperative X-ray could be used efficiently as well. X-rays are less costly, easier to access, more comfortable for patients, and provide substantially less radiation.

Early Activation Satisfaction: Single-Unit Cochlear Implant Processors

Isra Aljazeeri[1]

[1]King Abdullah Ear Specialist Center

BACKGROUND & AIM

The successful rehabilitation of children with cochlear implants (CIs) is highly dependent on consistent device use. Early activation within the first days after implantation is a safe and feasible option with conventional behind-the-ear (BTE) processors. However, the literature lacks studies on early activation with single-unit off-the-ear (OTE) audio processors.

Aim: To evaluate the safety, magnet retention, audiological performance, and satisfaction with the single-unit processors after early activation.

MATERIAL & METHODS

Methodology: This cross-sectional retrospective chart review study assessed ten pediatric CI users fitted with the Rondo sound-processor. The magnet power use was documented. Outcomes were measured using objective audiological measures (pure-tone audiometry) and validated parent-report questionnaires: the 12-item Speech, Spatial and Qualities of Hearing Scale (SSQ12), and the Audio Processor Satisfaction Questionnaire (APSQ).

RESULTS

Results: Successful early fitting with 2- and 3-processor configurations was achieved in all 25 cochlear implants; nine used the standard magnet power setting of 3, and one used a setting of 2. Aided sound-field thresholds indicated good audibility across the frequency spectrum. Questionnaire results showed high levels of auditory development, improved hearing quality, and significant parental satisfaction, particularly regarding the device's ease of use, comfort, and cosmetic appeal.

CONCLUSIONS

Conclusion: Using a single-unit audio processor is a feasible and effective option for early activation in very young children and adults with cochlear implants. It delivers sufficient auditory performance while addressing practical challenges associated with BTE processors, resulting in high parental acceptance and satisfaction. This may support consistent device use, which is critical for optimal language development.

OP-132

Familial Incomplete Partition Type II Due To Homozygous SLC26A4 (Pendrin) Mutation In Five Siblings: Comparative Audiological Outcomes Of Cochlear Implantation And Hearing Aids

İlker Akyıldız[1]

[1]*University of Health Sciences Etlik City Hospital*

BACKGROUND & AIM

Incomplete partition type II (IP-2) is a common inner ear malformation frequently associated with pathogenic variants of the SLC26A4 (pendrin) gene. Although affected siblings may share identical genetic and radiological features, auditory outcomes following different rehabilitation strategies may vary considerably. This study presents a sibling case series with homozygous SLC26A4 mutations and uniform IP-2 anatomy, comparing audiological outcomes after cochlear implantation (CI) and hearing aid (HA) rehabilitation, with particular emphasis on changes in pure-tone averages (PTA).

MATERIAL & METHODS

Five siblings born to consanguineous parents were included. All patients carried a homozygous SLC26A4 mutation and demonstrated the characteristic radiological features of IP-2. Three siblings underwent bilateral cochlear implantation, while two were rehabilitated with bilateral hearing aids. Audiological outcomes were evaluated using pure-tone averages measured before rehabilitation and at the 12-month follow-up.

RESULTS

All patients presented with bilateral severe-to-profound sensorineural hearing loss pre-rehabilitation. In the CI group, preoperative PTA values exceeding 100 dB improved consistently to the moderate hearing loss range (35–55 dB) at 12 months. In contrast, the HA group demonstrated more limited and heterogeneous PTA improvement, with post-rehabilitation values remaining in the moderate-to-severe range. Overall, post-rehabilitation audiological assessment revealed more favorable hearing thresholds than initially anticipated, particularly in CI recipients.

CONCLUSIONS

Despite identical homozygous SLC26A4 mutations and uniform IP-2 anatomy, post-rehabilitation hearing outcomes differed according to the rehabilitation modality. Cochlear implantation resulted in consistent and clinically meaningful improvement in PTA, whereas hearing aid outcomes were variable. The observed improvement in hearing thresholds suggests that auditory performance may be better than initially expected, emphasizing the importance of careful post-rehabilitation evaluation before considering revision interventions and highlighting the need for individualized management strategies in SLC26A4-related inner ear malformations

10-Year Results Of Minimal-Invasive Cochlear Implantation With The Bremen Approach

Ercole Di Martino[1], **Alicia Pinzon-Assis**[1], **Denise Ress**[1]

[1]*ENT Clinic Diako Lutheran Hospital Bremen*

BACKGROUND & AIM

Assessment of long-term results in minimally-invasive Cochlear Implantation with the Bremen Approach at Diako Bremen ENT clinic

MATERIAL & METHODS

Retrospective study surveying 150 minimal-invasively performed Cochlear Implantation (CI) operations with 156 devices employing the Bremen Approach (BA) over a ten year period. This includes primary and revision surgeries. Assessment of

surgical parameters, audiological outcome, implant failure, general patient features, complications. Multivariate analysis have been performed.

RESULTS

For BA mean extent of skin incision was 29.7 (+ 2,3)mm. Median size of mastoidektomies was 11×12 mm found significantly smaller in females. Median duration of operation was found to be 80 mins. Side of implantation had no significant influence. BMI> 25 had a statistic significant impact on operation time. Improvement of both hearing threshold (4PTA) and speech recognition was significant (p<0,001). Overall complication rate was 10.7% after 24 hrs. and 8% after 4 weeks. Most prevalent symptom was transient vertigo. There was no implant specific clinical complication observed. No tip fold- over occured. Implant failures showed distinctly device specific characteristics. For revision surgeries no statistically significant correlation was found for parameters such as duration of surgery, age, BMI and gender.

CONCLUSIONS

The BA is a surgical concept that proved over ten years to be a safe , reliable and cost-effective adjunct to conventional surgical approaches. It requires no special surgical equipment and precautions other than applied in conventional CI surgery. As a minimally-invasive approach BA is a viable alternative to costly high-end approaches in health systems that face budget constraints and/or limitations in surgical equipment.

No More Dressing After Cochlear Implantation: Exposing Benefits And Simplifying Care

Hisham Almousa[1], **Aseel AlMughaiseeb**[1], **Ghadah Alhenaki**[1], **Majed Assiri**[1], **Fida Almuhawas**[1], **Abdulrahman Hagr**[1]

[1]*Department of Otolaryngology - Head and Neck Surgery, King Saud University, Riyadh, Kingdom of Saudi Arabia.*

BACKGROUND & AIM

Mastoid pressure dressings have long been believed to reduce the risk of hematoma and seroma. However, recent studies suggest that these dressings may be unnecessary after uncomplicated middle ear and mastoid surgeries, as they do not appear to improve patient outcomes. Therefore, this study aimed to evaluate the role of mastoid pressure dressings in preventing postoperative complications following cochlear implant surgery.

MATERIAL & METHODS

The present retrospective cohort study included 127 cochlear implant recipients, divided into two groups: 64 patients who underwent cochlear implant surgery with head dressing and 63 patients who underwent the cochlear implant surgery without head dressing. Medical records were reviewed, and relevant clinical data were collected and analyzed to compare postoperative outcomes between the two groups.

RESULTS

The mean age of the patients was 14.9 ± 14.4 years, with 59.8% male and 40.2% female. A statistically significant difference was observed between the groups in the incidence of infection (P = 0.03) and focal skin necrosis (P = 0.03), both of which were higher among patients with head dressings. However, no statistically significant differences were found between the groups in terms of overall postoperative complications, hematoma, edema, wound dehiscence, or keloid scar.

CONCLUSIONS

This study found no evidence supporting the routine use of mastoid pressure dressings to prevent complications following cochlear implant surgery. Conversely, their use was associated with a higher incidence of infection and focal skin necrosis. Therefore, the application of mastoid pressure dressing should be individualized based on specific clinical circumstances rather than applied routinely.

Where Do We Go From “Hear”? Factors Impacting Outcomes In CI Rehabilitation-From Language To Cognition. The Saudi Experience.

Samira Ashour[1]

[1]*King Fahad University Hospital*

BACKGROUND & AIM

Hearing loss (HL) is one of the most prevalent sensory impairment globally and the most common congenital abnormality in the Kingdom of Saudi Arabia (KSA), affecting 1-2% of school-aged children. Newborn Hearing Screening (NHS) programs, advances in hearing technology, and evidence-based habilitation models, transformed the developmental outcomes for children with HL.

Approximately 90% of infants with HL are born to hearing parents driving the majority of families at King Fahad University Hospital (KFUH) to elect early cochlear implantation (CI) and enrolling in listening and spoken language (LSL) habilitation. Auditory-Verbal therapy (AVT) is the LSL program adopted in our cochlear implant program.

MATERIAL & METHODS

This study examines the longitudinal outcomes of KFUH Cochlear Implant program, established in 2009. Through an evaluation of over 400 cases, parental surveys, and literature, this research assesses the impact of NHS initiated in 2012 at KFUH and implemented nationally in 2016 on intervention timelines, clinical rationale for implementing AVT, AVT strategies and their effectiveness in parental commitment, proficiency, self-efficacy, and parental language input. Moreover, to associate these factors with auditory, speech-language, neurocognitive, academic, and social outcomes for children with CIs.

RESULTS

Key findings highlight the pivotal role of early identification and intervention and proper access to sound, with the average age of CI decreasing to 1.8 years. Parental factors including active parental involvement, supported by targeted AVT coaching, emerged as a critical factor impacting self-efficacy and effective integration of strategies and language model with the child influencing language skills and educational performance with 67% of children with CI achieving mainstream education placement, close to global benchmarks. Additionally, five key AVT strategies employed by 80% of parents demonstrated significant efficacy in daily habilitation practices.

CONCLUSIONS

This study underscores the pivotal role of early identification, timely intervention, and a collaborative partnership between AVT practitioners, parents, and children to achieve age-appropriate communication skills, academic success, and enhanced quality of life for CI recipients in Saudi Arabia.

Effects Of The Vestibulocochlear Implant On Balance And Gait In Bilateral Vestibulopathy

Meichan Zhu[1,2], Rik Marcellis[3], Paul Willems[2], Jona Beckers[3], Bernd Vermorken[1], Benjamin Volpe[1], Stan van Boxel[1], Joost Stultiens[1], Elke Devocht[1], Angélica Pérez Fornos[4], Nils Guinand[4], Kenneth Meijer[2], Raymond van de Berg[1], Christopher McCrum[2]

[1]Department of Otorhinolaryngology and Head and Neck Surgery, Division of Balance Disorders, Maastricht University Medical Center, School for Mental Health and Neuroscience, Maastricht, The Netherlands; [2]Department of Nutrition and Movement Sciences, NUTRIM School of Nutrition and Translational Research in Metabolism, Maastricht University, Maastricht, The Netherlands; [3]Department of Physical Therapy, Maastricht University Medical Center, Maastricht, Limburg, The Netherlands; [4]Service of Otorhinolaryngology and Head and Neck Surgery, Department of Clinical Neurosciences, Geneva University Hospitals, Geneva, Switzerland

BACKGROUND & AIM

Bilateral vestibulopathy (BVP) often leads to common gait and balance issues, increasing the risk of falls due to impaired spatial orientation and postural stability. The vestibular implant is a neuroprosthesis that offers a promising treatment option for patients with severe bilateral vestibulopathy. This study aims to assess the impact of different prosthetic vestibular stimulation modes on gait and balance outcomes in patients with vestibulocochlear implants.

MATERIAL & METHODS

The VertiGo! trial is a prospective, nonrandomized, single-center cohort study. The trial includes nine patients with severe BVP who demonstrated inadequate compensation despite conventional treatment. Nine patients received the VCI and were extensively tested in four testing weeks, the first providing reference data (no VCI stimulation) followed by different stimulation modes: (A) baseline stimulation combined with head motion-modulated stimulation, (B) reduced baseline stimulation combined with head motion-modulated stimulation, and (C) only baseline stimulation, without modulation. For the gait and balance assessments, patients walked at 0.6m/s, 0.8m/s, and 1.0m/s on an instrumented treadmill integrated in a 6-DoF motion platform. Five walking conditions were evaluated: unperturbed walking in both lit and dark environments, along with three sizes of pseudorandom mediolateral platform sway perturbations. Coefficients of variation (CoV) were analyzed using 3D motion capture data for step time, step length, double support time and step width. Patients also completed the Mini-BESTest each week.

RESULTS

Step time, length and double support time CoV consistently reduced with increasing walking speeds across all walking conditions whereas step width CoV increased with increasing walking speeds across all walking conditions. Larger perturbations increased CoV consistently. The CoV in the reference mode and stimulation modes A, B and C varied across patients for all gait parameters with no consistent effect for any one stimulation mode. Darkness usually increased CoV but no clear effect of a specific stimulation mode in darkness was found. In the Mini-BESTest, at least one stimulation condition total score was higher than the reference total score for 6 of 9 patients but these were distributed across the different stimulation modes.

CONCLUSIONS

Walking speed, perturbation conditions, and stimulation modes significantly influence gait stability and balance performance. While specific stimulation modes may provide slight advantages in acute stimulation by minimizing variability and enhancing stability under challenging conditions, individual responses exhibit considerable variability. The findings emphasize the importance of tailored stimulation modes and comprehensive gait analysis in optimizing interventions for this population.

Detection Of Cell Layer On Cochlear Implants (CI) For Long-Term Monitoring Of Stimulation Efficiency

Dr. Mit Bhavsar[1], **Jan Anton Wittwer**[2], **Dr. Yvonne Roger**[3], **Prof. Dr. Andrea Hoffmann**[3], **Dr. Nils Prenzler**[1], **Prof. Dr. Andrej Kral**[1], **Prof. Dr. Stefan Zimmermann**[2], **Prof. Dr. Hannes Maier**[1]

[1]Department of Otolaryngology (NIFE), Hannover Medical School, Hannover, Germany; [2]Institute of Electrical Engineering and Measurement Technology, Leibniz University Hannover, Germany; [3]Clinic of Orthopaedic Surgery (NIFE), Hannover Medical School, Hannover, Germany

BACKGROUND & AIM

Cochlear implants (CIs) are effective neural prostheses for restoring hearing in individuals with sensorineural hearing loss. However, implantation can trigger an immune response leading to fibrosis within the cochlea, which reduces stimulation efficiency and may result in suboptimal clinical outcomes. Electrochemical Impedance Spectroscopy (EIS) provides a powerful tool to assess CI functionality during and after implantation. Despite this, its potential for analyzing electrical properties, detecting fibrotic cell layers, and distinguishing between cell types remains unutilize. This study aims to develop and validate an equivalent electrical circuit (EEC) model capable of reliably detecting cell layer formation on CI electrode arrays.

MATERIAL & METHODS

The cell layer experiments demonstrated a clear increase in impedance across the mid and high frequency range as cell layer formed on the CI electrodes. The presence of a cellular layer led to measurable changes in the electrical response, indicating altered electrode–tissue interface properties. Notably, impedance values returned to baseline after electrode cleaning, confirming that the observed increase was due to the presence of the cell layer. These impedance changes were consistently observed across different electrode types, suggesting that cell layer formation has a reproducible and significant impact on electrode behaviour.

RESULTS

The cell layer experiments demonstrated a clear increase in impedance across the mid and high frequency range as cell layer formed on the CI electrodes. The presence of a cellular layer led to measurable changes in the electrical response, indicating altered electrode–tissue interface properties. Notably, impedance values returned to baseline after electrode cleaning, confirming that the observed increase was due to the presence of the cell layer.

CONCLUSIONS

Our findings confirm that cell layer formation on CI electrodes leads to a measurable increase in impedance. EIS is therefore a promising, sensitive and non-invasive approach for detecting and monitoring cell layer formation on CI electrodes. This approach may support improved assessment of device condition and provide insights into biological responses that influence long-term implant performance.

Using Cortical Auditory-Evoked Potentials To Assess The Benefits Of Aural Rehabilitation In Adult Cochlear Implant Users

Caris Bogdanov[1], **Wilhelmina H.A.M. Mulders**[1], **Helen Goulios**[1], **Welber Marinovic**[2], **Dayse Tavora-Vieira**[1]

[1]University of Western Australia; [2]Curtin University

BACKGROUND & AIM

Outcomes following cochlear implantation vary considerably, with some adult cochlear implant (CI) users demonstrating persistently poor speech perception despite appropriate device programming. This study investigated whether structured aural rehabilitation improves speech perception in long-term CI users and whether these behavioural changes are reflected in cortical auditory-evoked potential (CAEP) responses.

MATERIAL & METHODS

Adult unilateral CI users with post-lingual bilateral hearing loss or single-sided deafness participated in a clinician-directed Aural Rehabilitation Program (ARP) incorporating structured auditory training over 10 weeks. Participants completed weekly one-hour sessions and underwent repeated assessments at baseline and 10-week intervals. Speech perception in quiet was

assessed using CNC words under implant-alone and binaural listening conditions. Electrically evoked CAEP (eCAEP) responses were analysed using P1-N1-P2 latency and amplitude measures.

RESULTS

Significant improvements in speech perception were observed following rehabilitation. Participants receiving ARP demonstrated higher CNC scores compared with controls across listening conditions. Improvements were maintained longitudinally. No significant changes were observed in eCAEP latency or amplitude measures following rehabilitation.

CONCLUSIONS

Structured auditory rehabilitation improves speech perception outcomes in adult long-term CI users with poor baseline performance. While neurophysiological changes were not identified using eCAEP measures, behavioural findings support integration of targeted auditory rehabilitation into routine CI clinical care.

Impact Of Patient-Specific 3D-Printed Temporal Bone Models On Cognitive Load In Cochlear Implant Surgery: A Randomized Controlled Trial

Adam Omari[1,2], **Obinna I. Nwosu**[2], **Steven A. W. Andersen**[1], **Alicia M. Quesnel**[2]

[1]*Department of Otolaryngology–Head & Neck Surgery, Rigshospitalet, Copenhagen University Hospital, Copenhagen, Denmark;* [2]*Department of Otolaryngology-Head and Neck Surgery, Massachusetts Eye and Ear, Harvard Medical School, Boston, Massachusetts, USA*

BACKGROUND & AIM

Patient-specific 3D printed temporal bone models increasingly support surgery, but robust evidence characterizing their intraoperative effect is lacking. To determine if intraoperative inspection of patient-specific 3D-printed TB models, as supplement to standard imaging, affects the cognitive load of surgeons during cochlear implantation (CI).

MATERIAL & METHODS

Randomized, controlled clinical trial of consecutive adult primary CI surgeries from September to December 2025 at a large CI center. Seven attending surgeons and five trainee surgeons (two fellows and three senior residents) participated. Cases were randomized 1:1 to current standard with surgical planning based on review of preoperative computed tomography and/or magnetic resonance imaging (controls) or to current standard plus additional intraoperative 3D-printed model inspection during surgery (intervention).

The primary outcome was intraoperative cognitive load measured using the Surgery Task Load Index (Surg-TLX). Linear mixed-effects models for repeated measures were used. Secondary outcomes included ratings of model anatomy, utility, and user experience (Schlegel questionnaire) and subjective reports of predicted and unpredicted intraoperative challenges.

RESULTS

Forty patients were included in the analysis. Attending surgeons reported lower mean overall cognitive load with 3D models vs controls (3.8 [95% CI, 3.0–4.7] vs 5.5 [95% CI, 4.7–6.4]; P<0.01), primarily driven by reduced physical fatigue (P=0.01). Residents reported higher overall load (7.2 [95% CI, 5.8–8.7] vs 4.8 [95% CI, 3.6–6.1]; P=0.02), with higher mental fatigue (P=0.01) and physical fatigue (P<0.001). Fellows reported no difference in overall cognitive load (8.2 [95% CI, 6.7–9.6] vs 8.0 [95% CI, 6.1–9.9]; P = 0.88) but reported lower case complexity (P=0.02) offset by higher physical fatigue (P=0.04).

Models were generally viewed as accurate, practically useful in the operating room, especially for selective use. Utility was strongest for trainee education and case-specific decision support such as anticipating difficulty and clarifying boundaries.

CONCLUSIONS

The clinical impact of intraoperative 3D-printed models is significantly modulated by surgical experience. For experts, these models served as a high-fidelity reference that facilitated cognitive offloading. Conversely, for residents, intraoperative models were found to increase mental effort. Selective implementation is recommended to align these tools with the surgeon's position along the novice-to-expert continuum and optimize both operative efficiency and surgical training.

Impacts Of COVID-19 Pandemic On Daily Communication & Speech Development Of Paediatric Cochlear Implant Patients

Wai Tsz CHANG[1], **Tze Hei YAU**[3], **Pui Kei Peggy KAN**[3], **Yuk Chau Emily LAM**[1], **Hoi Yee Iris NG**[2]

[1]*The Chinese University of Hong Kong, Otorhinolaryngology, Head and Neck Surgery, Shatin, Hong Kong, SAR of China;* [2]*Institute of Human Communicative Research, Shatin, Hong Kong, SAR of China;* [3]*The Chinese University of Hong Kong, Shatin, Hong Kong, SAR of China*

BACKGROUND & AIM

The optimal hearing outcomes and speech acquisition of children with cochlear implants (CI) rely heavily on age of implant and post-implant aural rehabilitation and speech training. Face masks, social distancing, online communication, and such like became the new normal during the COVID-19 pandemic. We would like to explore the effects of the COVID-19 pandemic on daily communication and speech development of CI children, and whether they could be salvaged by an intensive speech training course.

MATERIAL & METHODS

Subjects

- Cantonese-speaking paediatric patients with prelingual deafness, who received CI & rehabilitation sessions during the COVID-19 pandemic and paired, age-matched control group with normal hearing

Methods

- Modified APHAB evaluates the hearing experience under mask-off versus mask-on situations in 4 subscales - communication under quiet, noisy & reverberated environment, and hearing discomfort
- COVID-19 questionnaire evaluates impacts of face masks, virtual communication and anti-epidemic measures
- Intensive speech training course consists of 10 weekly personalized sessions hosted by 2 speech therapists, with parental observership and suggested home training plans after each sessionPre- & post-course speech assessment on speech perception, oral language comprehension & expression and speech production
- Post-course parental questionnaire on perceived improvement of children's language performance and overall course satisfaction

RESULTS

CI children experience more significant communication challenges with face masks under quiet and noisy environment. COVID-19 pandemic caused significantly greater impacts to CI children in terms of communication and speech development, with the use of face masks being the key contributor. Anti-epidemic measures least affect CI children among all measures

~50% participants showed measurable grade improvement in speech assessment. Parental questionnaire reveals high perceived effectiveness and satisfaction, suggesting noticeable improvement in everyday conversations. The course improves home training of participants, including both learning proactiveness and duration.

CONCLUSIONS

COVID-19 pandemic has brought negative impacts to daily communication and speech development specifically to CI children, with the use of face masks being the key contributor. In case of the next pandemic, anti-epidemic measures, e.g. social distancing & partition boards, could be a modality of infection control to balance with the communication needs of CI children.

Intensive speech training course could be a concurrent/ post-pandemic speech rehabilitation measures to improve everyday communication of CI children.

OP-141

Can A Single A-Value Replace Anatomy-Based Planning? Comparative Evaluation Of Alexiades–Jolly Formula And OTOPLAN For Cochlear Duct Length Estimation

Dr Rajika Ramakrishnan[1]

[1]*Madras ENT Research Foundation,.Chennai, Tamil Nadu, India*

BACKGROUND & AIM

To evaluate the agreement between CDL measurements obtained using the Alexiades–Jolly formula and OTOPLAN in cochlear implant candidates undergoing preoperative imaging.

MATERIAL & METHODS

A retrospective observational study was conducted in cochlear implant candidates with normal cochlear anatomy who underwent preoperative high-resolution computed tomography of the temporal bone at a tertiary referral otology center. The cochlear basal turn A-value was measured using multiplanar reconstruction in the cochlear view, and CDL was calculated using the Alexiades–Jolly formula. OTOPLAN-based CDL measurements were independently obtained using anatomy-based cochlear reconstruction at the level of the Organ of Corti/basilar membrane.

Measurements were performed independently by two blinded observers. Intermethod agreement was assessed using intraclass correlation coefficient and Bland–Altman analysis. Secondary analyses included interobserver reliability and assessment of the potential impact of measurement differences on electrode array selection and insertion planning.

RESULTS

Preliminary analysis demonstrated strong overall agreement between formula-based and anatomy-based CDL estimation methods. OTOPLAN measurements demonstrated improved reproducibility with lower interobserver variability. Although the two methods showed close correlation in the majority of cases, greater discrepancies were observed in cochleae

demonstrating increased anatomical variability. In a subset of patients, differences between the two methods were sufficient to potentially influence electrode selection and predicted insertion depth.

CONCLUSIONS

The Alexiades–Jolly formula demonstrates good agreement with OTOPLAN for routine cochlear duct length estimation in cochlear implant candidates and may serve as a practical surrogate in resource-limited settings. However, anatomy-based planning using OTOPLAN may provide a more individualized assessment in anatomically variable cochleae and in cases where precision electrode selection is critical. Further studies correlating imaging-derived CDL measurements with intraoperative and audiological outcomes are warranted.

The Effect Of Early Activation Of Cochlear Implantation On Adults Psychological Status: A Case-Control Study

Moayyad Malas[2], **Yaseen Abdulsamad**[1], **Abdulrahman Hagr**[1]

[1]Department of Otolaryngology-Head and Neck Surgery, College of Medicine, King Saud University, Riyadh, Saudi Arabia; [2]King Abdullah Ear Specialist Center (KAESC), King Saud University Medical City, Riyadh, Saudi Arabia

BACKGROUND & AIM

Introduction: Adult cochlear implantation (CI) is becoming more concerned to the otology service since about 50% of adults over 60 years of age complain of hearing loss. Early activation of CI has been proposed recently and is now performed in most high-volume CI centers.

Objective: This study aims to evaluate the psychological effect of early activation of CI in adult population.

MATERIAL & METHODS

Our trained psychologist on CI patients will be using a pre-validated Beck depression inventory questionnaire, Patient Health Questionnaire 9-item depression scale (PHQ-9), and 7-item Generalized Anxiety Disorder scale (GAD-7). We will compare the results of these questionnaires between adults who had unilateral or bilateral CI, and patients with early or late fitting. We will also analyze factors related to the success of CI in these patients and whether they had an impact on the questionnaire results.

RESULTS

Data analysis is currently underway, and results will be presented at the time of the conference.

CONCLUSIONS

Data analysis is currently underway, and results will be presented at the time of the conference.

Early Outcomes Of Cochlear Implantation In Single-Sided Deafness: Discrepancy Between Psychoacoustic Performance And Patient-Reported Spatial Benefit

Dohee Kim[1,2], **Hye-Rim Park**[1,2], **Byung Yoon Choi**[1,2]

[1]Department of Otorhinolaryngology-Head and Neck Surgery, Seoul National University College of Medicine, Seoul, Republic of Korea; [2]Department of Otorhinolaryngology-Head and Neck Surgery, Seoul National University Bundang Hospital, Seongnam, Republic of Korea

BACKGROUND & AIM

Cochlear implantation (CI) has emerged as an effective treatment for single-sided deafness (SSD), restoring elements of binaural hearing and improving communication in challenging environments. Although postoperative gains in subjective satisfaction are well documented, the mechanisms linking psychoacoustic recovery—particularly sound localization—to patient-reported benefit remain unclear. Prior research has generally demonstrated overall improvements, yet few studies have examined the dissociation between objective localization accuracy and perceived spatial benefit. This study investigated early audiological and subjective outcomes in SSD CI users, focusing on how localization performance contributes to patient-reported improvements across different listening domains.

MATERIAL & METHODS

This retrospective study included 55 adults with SSD who underwent cochlear implantation. Ear-specific speech perception was assessed through direct audio streaming to isolate the implanted ear. Subjective outcomes were measured using the Korean versions of the Speech, Spatial, and Qualities of Hearing Scale (K-SSQ) and the Abbreviated Profile of Hearing Aid Benefit (APHAB). A subset of 20 patients completed standardized sound localization testing in a controlled acoustic booth. Correlation analyses were performed to evaluate relationships among deafness duration, changes in localization accuracy, and subjective improvements across questionnaire domains. Deafness duration within this predominantly short-duration cohort (mean 3.09 years) was additionally examined as a potential predictor of outcome variability.

RESULTS

Postoperatively, ear-specific speech perception improved markedly from 0% to consistent open-set recognition across the cohort. Subjective outcomes demonstrated significant benefit, with K-SSQ Spatial scores increasing from 59 ± 36 to 84 ± 35 ($p < 0.05$), accompanied by notable improvements in Speech and Qualities domains. Localization accuracy improved in the 20-patient subset, and correlation analyses revealed domain-specific associations: greater localization improvement significantly correlated with gains in K-SSQ Speech ($\rho = 0.53$, $p = 0.017$) and Qualities ($\rho = 0.49$, $p = 0.029$), but not with K-SSQ Spatial improvement ($\rho = 0.18$, $p = 0.46$). This dissociation suggests that patients who achieved better booth-measured localization perceived clearer speech and improved sound quality, yet their subjective spatial impressions were not directly aligned with objective localization accuracy. Deafness duration—within a predominantly short-duration cohort—did not significantly predict postoperative audiological or subjective outcomes.

CONCLUSIONS

Cochlear implantation for SSD yields robust improvements in speech perception and overall listening satisfaction. The key finding is the dissociation between objective localization gains and subjective spatial benefit: localization improvement predicted better Speech and Qualities scores, but not Spatial scores. This pattern suggests that early subjective benefit is driven mainly by restored audibility, head-shadow reduction, and improved interaural level difference cues, rather than precise interaural time difference processing required for complex spatial tasks. CI therefore provides meaningful functional relief and enhanced listening comfort in daily life, even when fine-grained spatial accuracy remains limited.

OP-144

Evaluation Of Remote Programming Of Cochlear Implants Under Challenging Conditions

Luis Lassaletta[1], **Miryam Calvino**[1], **Isabel Sánchez-Cuadrado**[1], **Elena Muñoz**[1], **Javier Gavilán**[1]

[1]*Department of Otolaryngology, La Paz University Hospital. Madrid, Spain*

BACKGROUND & AIM

Since the COVID pandemic, the adoption of telemedicine in cochlear implant (CI) care has accelerated significantly. Two modalities have been implemented: synchronous remote fitting, which replicates real time programming sessions with the patient and clinician connected at the same time, and asynchronous remote monitoring, which provides fitting through digital platforms that can be carried out in different places and at different times. The aim of this study was to assess the safety, and clinical value of both synchronous and asynchronous remote monitoring, and to explore how these strategies support continuity of care, and early detection of technical issues.

MATERIAL & METHODS

Synchronous remote fitting was performed using the standard MAESTRO fitting software operated by expert clinicians via a secure web service, with a local assistant supporting the CI user. Satisfaction and technical performance were evaluated through online questionnaires for both clinicians and users.

Asynchronous monitoring involved CI users employing the HearCare app to check implant integrity, audio processor status, and daily usage. Clinicians reviewed automated alerts and remote diagnostic reports, and users completed a usability questionnaire. Changes in the fitting maps were done when necessary via MAESTRO software, managing the same parameters as in a face-to-face session, the patient received the new fitting in their app and they can upload it in the audio processor.

RESULTS

55 questionnaires were collected from CI users and 45 from programmers in the synchronous evaluation. Users reported high satisfaction (mean 8.1/10), and clinicians rated compliance at 9.3/10, with 95% satisfied and all would recommend the procedure. Technical performance was robust (mean score for audio quality, video quality, internet connection and server access were 8.8, 8.0, 8.7 and 9.0, respectively), with minimal delays (only in 16% of the sessions) or interruptions (in 19%) and session duration comparable to face-to-face sessions. No patients required additional scheduling.

CONCLUSIONS

Synchronous remote fitting and asynchronous digital monitoring form complementary pillars of modern CI telehealth. Moreover, the asynchronous remote monitoring allows more autonomy and does not rely on scheduled appointments. Real time adjustments and continuous surveillance together enhance safety, autonomy, and access, reinforcing the potential of telemedicine in diverse CI populations.

Flap Complications After Cochlear Implant

Abdulbaset Naas[1], **Salem Farhat**[2], **Amal Abusreweel**[1]

[1]*Tripoli University Hospital;* [2]*Tripoli Central Hospital*

BACKGROUND & AIM

To report complications related to the flap around cochlear implants and to discuss the possible causes and treatment options.

MATERIAL & METHODS

This is a retrospective review of 264 of cochlear implant of pediatric and adult patients operated in our center during the period from April 2013 to April 2021, with review of complications related to flap around the implant, complications are divided into minor and major complications

Minor complications include skin infection, wound dehiscence without exposure of the implant, wound seroma and hematoma. Major complications include flap necrosis and implant extrusion.

RESULTS

Among 264 cochlear implant recipient 10 cases of seroma and/or hematoma, 9 of them treated with aspiration and one by surgical evacuation, compression and I/V antibiotics and they recovered completely, 7 cases of wound infection, delayed wound healing and wound dehiscence without exposure of the implant treated with daily dressing, debridement and intravenous antibiotics. 2 patients suffered with flap necrosis and extrusion of the implant, one of them presented after 3 years of surgery, treated with transposition of the implant, secured with a vascularized peri-cranial flap based upon temporalis muscle and rotation skin flap, the other patient presented 2 weeks after surgery and ended with explantation.

CONCLUSIONS

Complications related to flap in CI are considered uncommon with incidence of 7 %. In our study, only 0.75% of them are major complication.

We consider the age, sex and preceding upper respiratory tract infection with acute otitis media and head trauma as possible related factors in these complications. Management of complications of CI should start with prevention and early detection and treatment of any wound infection, hematoma, and seroma.

OP-146

Pediatric Cochlear Implantation: The Impact Of Frequency-To-Place Mismatch After A Three-Year Follow-Up

Nezar Hamed[1]

[1]*king Saud University*

BACKGROUND & AIM

Frequency-to-place mismatch in cochlear implants (CIs) may influence auditory and speech outcomes, yet its impact on pediatric patients remains underexplored. This study aims to assess the impact of frequency-to-place mismatch on hearing and speech outcomes.

MATERIAL & METHODS

In this retrospective study, the angular insertion depth and center frequency of each electrode contact were derived. The difference between the tonotopic and default frequency was used to estimate the mismatch. The impact of this mismatch on auditory and speech outcomes was assessed in pediatric CI users.

RESULTS

This study included 89 implanted ears of young children. The analysis revealed a significant difference between default and postoperative electrode frequencies, with greater mismatches observed in shorter electrode arrays. A weak but significant correlation was observed between mismatch and sound field-aided thresholds (SF-AT), while no clear trends were found in other outcome measures. Patients with lower mismatches tended to perform better, while those with mismatches exceeding 7 semitones showed slightly lower—though non-significant—speech performance. However, a significant difference was observed in SIR, favoring the lower mismatch group.

CONCLUSIONS

Children with <7 semitones of fequency-to-place mismatch showed better, though non-significant, outcomes across multiple measures—including SDS, CAP, and SF-AT—and a significant difference in SIR. Despite no significant linear correla-

tions overall, these findings suggest that specific mismatch levels may still influence outcomes after three years of CI use. Future studies should investigate whether tonotopic- based mapping improves speech perception and overall auditory performance in young CI users.

Using Cortical Auditory Evoked Potentials In Middle Ear And Bone Conduction Implant Users: An Objective Method To Optimise The Fitting

Marcus Voola[2], **Lorenzo Vignali**[1], **Caris Bogdanov**[2], **Hamidreza. Mojallal**[1], **Dayse Tavora-Vieira**[2,3]

[1]*MED-EL;* [2]*University of Western Australia;* [3]*Curtin University*

BACKGROUND & AIM

CAEP has successfully been used for cochlear implant verification and optimisation. The study aimed to investigate whether cortical auditory evoked potential (CAEP) measures could be used to optimise middle ear implant (MEI) and bone conduction implant (BCI) fitting, with the goal of improving hearing outcomes in adults.

MATERIAL & METHODS

CAEPs were recorded from electrodes Cz and Fz in response to three speech tokens (/U/, /A/ and /SCH/) presented in sound field. Decision (response present or response absent) was assisted by statistical criterions (Hotelling's T2 statistical test) and confirmed by visual inspection of the waveforms. Optimisation was performed only when current clinical setting did not elicit a CAEP response. Hearing outcomes were measured as pre- and post-optimisation pure tone averaged aided thresholds (PTA4) as well as adaptive speech in noise scores.

RESULTS

Of the 14 participants, three did not need optimisation, two could not be optimised, and seven were successfully optimised using CAEP measurement. Univariate and multivariate analysis showed significant differences pre- and post-optimisation for middle and high frequency (i.e., /A/ and /SCH/) tokens. No difference was recorded for the low frequency speech token /U/. Optimised settings resulted in an overall improved speech perception in noise score (M(SD) = 5.11(4.24) SNR) and an improvement in PTA4 (M(SD) = 11.25(7.9) dB) pre- minus post-optimisation. An overall high degree of satisfaction with the procedure was observed.

CONCLUSIONS

These preliminary findings demonstrated that middle and high frequency tokens could be successfully optimised using CAEPs, resulting on significant improvement in hearing performance. Our results provide preliminary evidence supporting the use of CAEPs for optimisation of MEI and BCI adult users' fitting.

Our Experience With Power Stapes Vibroplasty In Patients With Otosclerosis

Benjamin Loader[1]

[1]*Klinik Landstraße, Vienna, Austria*

BACKGROUND & AIM

Otosclerosis is a common cause of progressive conductive hearing loss resulting from abnormal bone remodeling, particularly involving the stapes footplate. Conventional management includes hearing aids or surgical procedures such as stapedotomy or stapedectomy to restore ossicular chain mobility. An alternative approach is power stapes vibroplasty, a form of active middle ear implantation. This technique combines stapes surgery with an active transducer, such as the Vibrant Soundbridge system. The floating mass transducer is coupled to the incus following stapedotomy, thereby augmenting or bypassing impaired ossicular mechanics to improve vibratory stimulation of the inner ear.

MATERIAL & METHODS

A retrospective chart review was conducted to identify all power stapes vibroplasty cases and assess the post operative outcome.

RESULTS

The average preoperative air bone gap (for 0.5; 1; 2; 3kHz) i.e. was 28.9 dB and reduced to 11.6 dB after surgery, yielding an average improvement of 17.3 dB (SD +/- 11 dB). After activation of the VSB, speech perception in quiet at 65 dB SPL improved on average by 33% at 65 dB SPL and by 56% at 80 dB SPL, respectively.

CONCLUSIONS

Power Stapes vibroplasty is a safe and effective treatment option for patients suffering from otosclerosis.

Experimental Laboratory of Translational Neurosciences and Dento-Otolaryngology, Faculty of Medicine and Health Sciences, University of Antwerp (UA), Antwerp, Belgium;* [3]*Department of Otorhinolaryngology, Head and Neck Surgery, Brussels University Hospital (UZ Brussel), Jette, Belgium*

BACKGROUND & AIM

Hearing loss is a major modifiable risk factor for cognitive decline and dementia in older adults. Cochlear implantation improves auditory function and quality of life in individuals with severe-to-profound hearing loss, but long-term cognitive trajectories after implantation remain insufficiently characterized. This study aimed to evaluate longitudinal changes in cognitive functioning, assessed with the Repeatable Battery for the Assessment of Neuropsychological Status for Hearing-Impaired Individuals (RBANS-H), over five years following cochlear implantation in older adults with severe-to-profound hearing loss.

MATERIAL & METHODS

In this prospective cohort study, a consecutive sample of 104 older adults (mean [SD] age at baseline, 69 [8.7] years; 53% male) with postlingual bilateral severe-to-profound hearing loss, who received a unilateral cochlear implant (CI) was enrolled between April 2015 and July 2025 at the Antwerp University Hospital. Participants were assessed preoperatively and annually for five years. Cognitive function was measured using RBANS-H. Secondary outcomes included health-related quality of life (HRQoL), speech perception in quiet and in noise, and vestibular function.

RESULTS

Global RBANS-H cognitive scores significantly improved during the first year after implantation and remained stable over the subsequent four years. Memory domains showed early postoperative gains, whereas attention and language remained stable and visuospatial performance declined over time. Participants at risk for mild cognitive impairment preoperatively (RBANS-H total score ≤16th percentile preoperatively: n = 37) showed relatively larger early improvements, particularly in attention, and only two participants progressed to dementia over five years. HRQoL and speech perception improved significantly after implantation and remained elevated throughout follow-up, while vestibular function remained unchanged.

CONCLUSIONS

Cochlear implantation in older adults with severe-to-profound hearing loss is associated with early increases in cognitive RBANS-H scores, followed by five-year stabilization, alongside sustained improvements in HRQoL and speech perception. These findings suggest that timely intervention may help preserve cognitive and psychosocial functioning, though further research is needed.

OP-151

Successful Hearing Rehabilitation With The Fully Implantable Cochlear Implant TICI

Kristen Rak[1], **Stephan Hackenberg**[1], **Heike Kühn**[1], **Johannes Völker**[1], **Anja Kurz**[1]

[1]*Department of Oto-Rhino-Laryngology, Head and Neck Surgery, Comprehensive Hearing Center, University of Wuerzburg*

BACKGROUND & AIM

The fully implantable cochlear implant 'Total Implantable Cochlear Implant' (TICI) represents a revolutionary new development. It combines the stimulation implant, microphone and signal processing unit, enabling hearing without external

components. As part of a multicentre European study, five patients underwent TICI treatment at the University ENT Clinic in Würzburg.

MATERIAL & METHODS

The patient group comprised two women and three men aged 48 ± 20 years. The preoperative PTA4 was 95.25 ± 7.02 dB HL and monosyllable comprehension with a hearing aid was 12 ± 21% (65 dB SPL).

RESULTS

The duration of the operation was 136 ± 7.1 min. There were no intraoperative or postoperative complications. All patients were treated with a FlexSoft electrode. The insertion angle of the apical electrode contact was 652 ± 54°, which corresponds to a frequency of 216 ± 60 Hz. At the 6-month follow-up, patients achieved a free-field threshold of 32.5 ± 3.9 dB SPL, monosyllabic word recognition at 65 dB HL of 69.0% ± 18.5% and an SRT of 0.87 ± 5.34 at 65 dB SNR in the OSLA. The patients reported perceiving the body's own background noise, but after the initial fittings, they no longer found it disturbing; in some cases, they even found it pleasant and natural.

CONCLUSIONS

These results show that TICI is a safe form of treatment. The high effectiveness of the system is particularly evident in its excellent speech comprehension. The approximate doubling of the operating time can be considered acceptable, taking into account the implantation of several components. The developed system thus represents a significant positive advancement in the field of cochlear implants.

The Effect Of Cochlear Implantation On Auditory Gain, Sensory Reorganization, And Quality Of Life: 6-Month Follow-Up Results In Postlingual Adults

Sevgi Kutlu[1], **Banu Baş**[2], **Emre Ocak**[3], **Cem Meço**[3,4,5]

[1]Ankara University, Faculty of Health Sciences, Department of Audiology, Ankara, Türkiye; [2]Ankara Yıldırım Beyazıt University, Faculty of Health Sciences, Department of Audiology, Ankara, Türkiye; [3]Department of Otorhinolaryngology, Faculty of Medicine, Ankara University, Ankara, Türkiye; [4]Department of Otorhinolaryngology-Head and Neck Surgery, Salzburg Paracelsus Medical University, Salzburg, Austria; [5]Department of Otolaryngology, Head and Neck Surgery, Cornell University, Weill Cornell Medical College, New York, NY, USA

BACKGROUND & AIM

In individuals with postlingual hearing loss, cochlear implantation (CI) aims to trigger changes at the cortical level by restoring auditory input and improving quality of life. The aim of this study is to examine the changes in objective auditory thresholds, auditory perception performance, sensory processing strategies, and quality of life in postlingual adults who underwent CI.

MATERIAL & METHODS

The study included 18 postlingual adult patients diagnosed with bilateral very severe sensorineural hearing loss. Preoperative (with hearing aid) and postoperative 6-month (with cochlear implant) data of the patients were evaluated using free-field hearing thresholds, the Speech, Spatial and Qualities of Hearing Scale (SSQ), the SF-36 Quality of Life Scale, and the Adult/Adolescent Sensory Profile. The Wilcoxon Signed-Rank Test was used in the analyses.

RESULTS

A significant improvement in favor of CI was detected in all frequencies (250-6000 Hz) at free-field thresholds ($p<0.001$). A statistically significant increase was recorded in all sub-dimensions of the SSQ ($p<0.001$). While significant improvements were detected in the Social Functioning, Physical Role, and Emotional Role Difficulty dimensions of the SF-36 scale ($p<0.05$); the change in sensory processing dimensions remained limited, and a significant difference was observed only in Sensory Sensitivity scores ($p=0.029$).

CONCLUSIONS

Our study shows that cochlear implantation significantly improves auditory performance and quality of social life in postlingual adults. Despite the dramatic increase in auditory perception, the more limited change in sensory processing strategies suggests that cortical reorganization and sensory habits established in the postlingual period follow a slower adaptation process. It was concluded that neural plasticity, which begins with the restoration of auditory input, may require follow-up and rehabilitation lasting longer than 6 months to fully reflect in complex sensory integration processes.

Cochlear Implant Fixation: Evolution Of The Techniques – Current Options

Mohamad A. Bitar[1,2]

[1]Al Jalila Children's Specialty Hospital - Dubai Health; [2]Mohammed Bin Rashid University of Medicine & Health Sciences

BACKGROUND & AIM

Cochlear implants have undergone progressive technological and design evolution. With time, they became slimmer and easier to insert under a subperiosteal pocket. However, fixing the implant and or the electrode in place varies among surgeons, with a wide range of options.

MATERIAL & METHODS

We reviewed 66 consecutive surgeries and examined the fixation technique used, duration of implantation, presence of craniofacial abnormality, history of trauma to the head post-implantation, changes in implant function, and evidence of implant or electrode migration.

RESULTS

all implants were placed in a tight subperiosteal pocket, had a drilled bed with an anterior elevated edge, 15% were fixed by a suture, and in 34.8% bone dust was used to fix the redundant electrode. Three patients had head trauma. One resulted in a device malfunction, though there was no displacement. The device needed to be replaced. The other 2 patients had displacement of the device after trauma; one had no symptoms, but the other one started having discomfort wearing the processor.

CONCLUSIONS

A tight subperiosteal pocket with a drilled bony bed (even a limited one) provides stability for the cochlear implant. Adding a suture seems unnecessary. Adding bone dust might further stabilize the implant and the redundant electrodes, which could help prevent pulling on the electrodes in case of trauma, but its usefulness needs to be further explored.

OP-154

Effects Of Cochlear Implantation On Audiological Outcomes And Quality Of Life: A Comparison Of Geriatric And Adult Patients

Dr. Serdar Mete[1], **Prof.Dr. Yüksel Olgun**[1], **Doç. Dr. Serpil Mungan Durankaya**[2], **Prof.Dr. Enis Alpin Güneri**[1]

[1]*Department of Otorhinolaryngology - Head and Neck Surgery, Dokuz Eylül University Faculty of Medicine, İzmir, Turkey;* [2]*Department of Otorhinolaryngology - Head and Neck Surgery, Hearing, Balance and Speech Unit, Dokuz Eylül University Faculty of Medicine, İzmir, Turkey*

BACKGROUND & AIM

As the geriatric population increases, the impact of hearing loss is becoming more significant. The aim of this study was to examine the complication rates during and after cochlear implantation in geriatrc patients, to evaluate the effects on auditory outcomes and quality of life, and to reveal the differences by comparing these results with the adult patient group.

MATERIAL & METHODS

In this retrospective study, 19 patients aged 65 years and older with postlingual hearing loss who underwent unilateral cochlear implantation at Dokuz Eylul University between 2009 and 2023 and 20 adult patients aged 18-64 years were analysed to compare the results with these patients. Patient characteristics, such as age at implantation, time elapsed after surgery, time since the onset of hearing loss, time since the development of total or profound sensorineural hearing loss, preoperative hearing aid use, Complications, daily implant usage time were analyzed. Audiological results including preoperative pure tone audiometry thresholds, postoperative free field thresholds, preoperative and postoperative speech reception thresholds, and postoperative matrix test results in silence and noise were compared between the groups. Additionally, Nijmegen Cochlear Implantation Questionnaire outcomes, administered both before and after surgery, were evaluated to assess the effect of cochlear implantation on quality of life.

RESULTS

Outcomes of cochlear implantation were compared between patients aged 18-64 and $\geq$65 years. Baseline characteristics (duration of hearing aid use and total hearing loss), daily implant use, and surgical complication rates showed no significant differences between groups ($p>0.05$). Both cohorts exhibited significant postoperative improvements in audiological measurements and Nijmegen Cochlear Implant Questionnaire (NCIQ) scores ($p<0.001$). When the age groups were compared, there were no significant differences in overall audiological improvement, matrix test in noise, or any of the NCIQ subdomains —including basic sound perception, speech production, activity, social interaction, self-esteem, and advanced sound perception ($p>0.05$). Overall, there was no significant difference in the effect of surgery and improvement in quality of life between the age groups. Ultimately, overall surgical efficacy and general outcomes of cochlear implantation did not differ significantly between the two age groups.

CONCLUSIONS

Cochlear implantation in elderly patients resulted in significant improvements in hearing levels and quality of life. Complication rates were low, and the auditory and psychosocial results suggest that elderly patients benefit from CI as much as adults.

Anatomy-Based Spacing: A Novel Concept In Cochlear Implant Electrode Design

Isra Aljazeeri[1]

[1]*King Abdullah Ear Specialist Center*

BACKGROUND & AIM

Using anatomy-based fitting, we can determine the place-specific map with individualized center frequencies for each electrode contact that is a closer match to the natural pitch-place of the cochlea. The primary objective of this study is to evaluate the tonal presentation across the electrode array and to calculate the semitone difference between each adjacent pair of contacts according to their anatomy-based map. The secondary objective is to determine the distancing of the contacts that would result in an equal semitone difference with a uniform tonal presentation.

MATERIAL & METHODS

Anatomy-based electrode spacing was determined by dividing the frequency range of the anatomy-based array frequency coverage into equal semitonal distances. After determining the frequencies that would result in equal semitonal distances, the corrected Greenwood equation was used to determine the spacing of each pair of adjacent electrodes.

RESULTS

A total of 167 ears were included in this retrospective study. The frequencies across the electrode arrays were found to be unequally presented. The semitonal condensations were higher in the apical inter-contact spaces compared to the basal inter-contact spaces, being 3.0–2.3 semitones/mm (Kruskal Wallis test, $p<0.000$). The anatomy-based spacing of the electrode contacts was larger in the basal inter-contact spaces compared to the apical inter-contact spaces, ranging from 1.92 to 1.48 mm.

CONCLUSIONS

In conclusion, the current electrode designs do not have uniform tonal representation throughout the electrode array. There is a more condensed tonal presentation in the apical electrodes than in the basal electrodes, resulting in a lower tonal resolution in the apical region.

OP-156

Hearing Rehabilitation With Cochlear Implantation In Postmeningitis, -Labyrinthitis Deafness

Gábor Polony[1], **Márton Kondé**[1], **Márk Zaránd**[1], **Nóra Kecskeméti**[1], **Anita Gáborján**[1]

[1]*Dept. of ENT and H&NS Semmelweis University Budapest, Hungary*

BACKGROUND & AIM

Purulent labyrinthitis and meningitis are both potentially life-threatening diseases that require acute care w antibiotics, surgery and often intensive care. A common residual symptom is profound sensorineural hearing loss. Fibrosis and ossification of the cochlea caused by the inflammation may prevent patients from undergoing hearing rehabilitation with cochlear implantation and may hinder postoperative rehabilitation.

MATERIAL & METHODS

We retrospectively worked up the cases of patients with severe to profound hearing loss after bacterial meningitis and labyrinthitis.between January 2023 and October 2025 in the Department of Oto-Rhino-Laryngology, Head and Neck Surgery, Semmelweis University, Budapest, Hungary. Results of imaging (CT and MRI), eligibility to cochlear implantation, intraoperative findings and postoperative rehabilitation results were evaluated.

RESULTS

13 patients were included (7 labyrinthitis, 6 meningitis), 10 adults and 3 children. Preoperative imaging confirmed ossification in the cochlea in 5 cases, with different extent. Succesful cochlear implantation was performed in 8 cases (2 bilateral and 6 unilateral). Based on the postoperative PCCT scan,all implanted cases were fully inserted. In 2 cases of the 5 non-implanted patients surgery was contraindicated due to extensive ossification, one patient refused implantation and 2 turned out intraoperatively to be non-implantable due to extensive intracochlear fibrosis without ossification. In 2 cases intraoperative NRT measurements showed no electric response therefore rehabilitation was unsuccessful. Postoperative rehabilitation results were overall inferior to non-meningitis and non-labyrinthitis cases.

CONCLUSIONS

Rehabilitation of severe hearing loss caused by meningitis can pose a number of challenges for clinicians among other things in regards to CI. A critical point in care is the urgent referral of patients to a cochlear implantation center as soon as possible after a serious, life-threatening condition. In our data set the success rate of postop hearing rehabilitation is doubtful even after a succesful electrode insertion.

OP-157

Hearing Outcomes And Quality Of Life After Implantation With The Sentio System

Nicole Amichetti[1], **Dennis Lindholm**[1], **Marianne Philipsson**[1], **Maria Håkansson**[1]

[1]*Oticon Medical*

BACKGROUND & AIM

Active transcutaneous bone conduction implant systems have been proven a useful solution for patients with conductive or mixed hearing loss (CHL/MHL), or single-sided deafness (SSD). Sentio is the most recent system on the market, introduced 2024. It has a low profile and compact design without compromising sound quality.

MATERIAL & METHODS

The Sentio System was evaluated in a prospective, multicenter clinical study including 51 patients implanted with the Sentio Ti implant and fitted with the Sentio 1 sound processor. Participants were followed for up to 24 months, with ten scheduled follow-up visits. Outcome measures included changes in hearing thresholds, speech understanding in quiet and in noise, and patient-reported benefits assessed using validated questionnaires covering hearing performance and quality of life. Safety was assessed by monitoring device- and surgery-related incidents and adverse events throughout the study period.

RESULTS

Compared with the unaided condition, Sentio resulted in clear improvements in hearing performance, with a mean improvement in pure-tone average (PTA4) of 32.8 dB and an increase in speech understanding from 46% to 98% in quiet. When compared with a preoperative non-surgical solution (Ponto on Softband), additional improvements were observed, including a 7.2 dB improvement in PTA4 and a 2.9 dB improvement in speech understanding in noise.

Patient-reported outcomes showed a high perceived benefit, with 100% reported improvement by the Speech, Spatial and Qualities of Hearing Scale, along with 97% reported improvements in quality of life by the Glasgow Benefit Inventory. Surgeries were uneventful and there were no serious or unexpected incidents or adverse events related to the system or the surgical procedure.

CONCLUSIONS

The Sentio System is an effective treatment that provides meaningful and clinically relevant improvements in hearing performance for patients with CHL, MHL, and SSD. Excellent patient-reported outcomes can be expected, including improved perceived hearing ability and quality of life. Few and mild complications indicate a favorable safety profile, supporting the Sentio System as an effective and safe active transcutaneous bone conduction treatment option.

Predictors And Behavioral Correlates Of Speech-In-Noise Performance In Cochlear Implant Users: A Real-World Datalogging Analysis

Mohamed Alshehabi[1]

[1]*The Royal Medical Services Bahrain*

BACKGROUND & AIM

To examine how real-world cochlear implant (CI) use—quantified through objective datalogging—relates to speech-in-noise performance, with specific focus on bilateral symmetry, daily usage patterns, and exposure to different listening environments.

MATERIAL & METHODS

Retrospective cross-sectional study of 32 CI users (51 ears) at a tertiary referral center. Datalogging from newer-generation processors provided daily usage hours and time spent in quiet, noise, and music environments. Speech-in-noise performance was assessed using AzBio sentences at 60 dB SPL. Analyses included paired comparisons, correlation testing, quadratic modeling, and multiple regression, with sensitivity analyses to assess robustness.

RESULTS

Among 17 bilateral users, speech-in-noise performance showed excellent interaural agreement (ICC = 0.871) with no significant left–right differences. Daily usage hours demonstrated a significant negative linear association with speech-in-noise performance ($r = -0.453$, $p = 0.004$) and a significant quadratic term ($p = 0.030$), indicating an inverted-U relationship. Optimal performance occurred at approximately 8–10 hours/day, with poorer outcomes at both lower and higher usage levels. Listening environment exposure was strongly associated with performance (model $R^2 = 0.850$). Time spent in quiet showed the strongest negative association ($\beta = -1.07$), followed by music ($\beta = -1.48$) and noise ($\beta = -0.81$), with all predictors remaining significant after sensitivity analyses.

CONCLUSIONS

Real-world CI outcomes are shaped not only by total daily wear time but also by the diversity of listening environments. Moderate daily use appears optimal for speech-in-noise performance, whereas excessive quiet exposure may reflect listening avoidance or limited auditory challenge. These findings support a more nuanced interpretation of datalogging metrics in clinical practice, emphasizing the importance of both quantity and quality of auditory experience.

OP-159

Clinical Outcomes And Implementation Challenges Of Remote Cochlear Implant Programming

Dr.Muhammed Ayas AuD PhD CCC-A[1]

[1]*University of Sharjah, United Arab Emirates*

BACKGROUND & AIM

Remote cochlear implant (CI) programming has emerged as a tele-audiology solution to improve access, continuity, and follow-up care for CI recipients. While international interest is increasing, evidence on clinical effectiveness, patient experience, and real-world feasibility remains fragmented. This study aims to synthesise existing evidence on remote CI programming and to evaluate its clinical feasibility with relevance to post-implant care models globally.

MATERIAL & METHODS

Remote CI programming was implemented as part of routine follow-up within a d CI service, and a feasibility assessment was undertaken to evaluate technical performance, workflow integration, clinician experience, and patient acceptance. In parallel, a systematic review of the literature was conducted on remote CI programming. Outcomes of interest included audiological performance, patient satisfaction, and service delivery feasibility. Findings from the local implementation and the literature were synthesised thematically.

RESULTS

Local implementation demonstrated that remote CIprogramming was technically feasible and well accepted within routine follow-up care. Sessions were completed successfully without major technical failures, and both patients and clinicians reported high satisfaction, particularly due to reduced travel burden and improved appointment flexibility. Findings from the systematic review were concordant with the local experience, showing audiological outcomes comparable to in-person programming for speech perception and device optimisation. Across studies, patient satisfaction was consistently high. However, recurrent challenges were identified, including variability in programming protocols, connectivity limitations, infrastructure requirements, and the need for clinician training.

CONCLUSIONS

Remote CI programming is a feasible and clinically effective adjunct to conventional post-implant care. The current study demonstrated successful integration into routine follow-up with high patient and clinician acceptance, consistent with international evidence showing comparable audiological outcomes to in-person programming. While not a replacement for face-to-face mapping, hybrid care models can enhance continuity and access. Standardised protocols, clinician training, and robust digital infrastructure are required for safe and scalable implementation.

Cochlear implants; Remote programming; Post-implant care; Hybrid care models

OP-160

Integration Of Otoplan And Intraoperative Navigation To Improve Safety In Challenging Cases Of Bonebridge Surgery

Nils Kristian Prenzler[1], **Niels Rudnik**[1], **Rolf Salcher**[1], **Daniel Schurzig**[1,2]

[1]*Hannover Medical School;* [2]*Med-El Research Center Hannover*

BACKGROUND & AIM

The second-generation Bonebridge is increasingly used in patients with conductive or mixed hearing loss. Preoperative imaging often reveals limited areas of sufficient bone thickness, in which the floating mass transducer and fixation screws can be safely

and completely implanted. Inadequate positioning may increase the risk of dural or vascular injury. The latest version of Otoplan enables not only assessment of bone thickness but also virtual implantation with export of a patient-specific implant model. The combination of digital planning and intraoperative navigation may improve surgical precision and safety.

MATERIAL & METHODS

Patients underwent Bonebridge implantation following preoperative planning with Otoplan. Prior to intraoperative cone-beam CT (CBCT), three marker screws were inserted for navigation registration. The imaging data were imported into Otoplan to define the optimal implant position through virtual placement. A model of the planned Bonebridge position was then exported. Both the CBCT data and the implant model were transferred to an electromagnetic navigation system. The marker screws were used for accurate registration, allowing real-time projection of the planned implant position onto the patient during surgery. Implantation was subsequently performed according to the navigated guidance.

RESULTS

At all planned screw positions, bone thickness was sufficient, confirming the feasibility and precision of the method. No dural injury or surgery-related complications occurred. The workflow enabled accurate transfer of the virtual plan to the intraoperative setting.

CONCLUSIONS

Preoperative Bonebridge planning with Otoplan, combined with model export and navigation-guided intraoperative projection, represents a practical and precise surgical adjunct. This integrated approach has the potential to enhance reliability and safety of Bonebridge implantation in patients with challenging anatomies like limited temporal bone thickness.

Fibrous Hydrogel Interface For High-Resolution In-Ear Ecochg Recording

Yueyi Shang[1], **Yuefan Jin**[1], **Wenxin Shen**[1], **Yingying Zhang**[1], **Jie Meng**[2], **Yibing Hu**[1], **Zhennong Chen**[1], **Linpeng Li**[1], **Shankai Yin**[1]

[1]Department of Orolaryngology-Head and Neck Surgery, Otolaryngology Institute of Shanghai Jiao Tong University, Shanghai Sixth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine, Shanghai 200223, P. R. China; [2]School of Engineering, Westlake University, Hangzhou 310030, P. R. China

BACKGROUND & AIM

Extracochlear Electrocochleography (ECochG) remains limited by unstable tympanic-membrane (TM) contact and high electrode–tissue impedance, compromising recording fidelity. We developed a fibrous in-ear ECochG electrode (ECochGel) designed to conformally interface with the TM for high-stability auditory electrophysiological monitoring without the need for conductive pastes or mechanical fixation.

MATERIAL & METHODS

Hydrogel-coated fiber electrodes were fabricated and characterized for morphology, phase transition, mechanical compliance, and impedance properties, using commercial conductive paste as control. Biocompatibility was assessed via fibroblast culture and fluorescence viability assays. In vivo ECochG recordings were obtained in anesthetized SD rats by placing ECochGel or control paste onto the TM, and tone-evoked cochlear potentials were recorded using a clinical-compatible electrophysiology platform. Cochlear tissues and major organs were examined histologically to evaluate local tissue response and systemic biosafety.

RESULTS

ECochGel exhibited thermoreactive sol–gel transition that enabled rapid in-situ fixation onto the TM surface with uniform coverage and stable adhesion. Mechanical compliance allowed the hydrogel to accommodate TM micro-vibrations without wrinkling or delamination. The ionic conductive matrix supported low interface impedance and enhanced signal coupling. In vivo, ECochGel achieved improved ECochG waveform clarity and reduced recording thresholds across multiple tone frequencies compared with control electrodes, indicating superior bioelectrical transduction efficiency. Histological examination confirmed preserved cochlear tissue integrity with no inflammatory infiltration or epithelial disruption, and major organs showed no pathological abnormalities.

CONCLUSIONS

ECochGel provides a non-invasive, mechanically compliant, and biocompatible interface for ECochG recording, yielding enhanced signal fidelity and stable TM adhesion. These findings support the potential of hydrogel-based peripheral auditory electrodes as a translatable platform for electrophysiological diagnostics and intraoperative otologic monitoring.

Advances In Cochlear Implantation : Robotized Electrode-Array Insertion Under Fluoroscopy.

Thierry MOM[1], **LIsa Mégneaud**[1], **Léa Motreff**[1], **Mathilde Puechmaille**[1], **Roy Alhallak**[1], **Margaux Bézé**[1], **Chloé Trillat**[1], **Bruno Pereira**[2], **Sonia Mirafzal**[3]

[1]Department of Otolaryngology Head Neck Surgery, University Hospital Gabriel Montpied, Clermont-Ferrand France; [2]Department of Biostatistics University Hospital Gabriel Montpied, Clermont-Ferrand France; [3]Department of Radiology, University Hospital Gabriel Montpied, Clermont-Ferrand France

BACKGROUND & AIM

Refinement in cochlear implantation (CI) currently makes it possible to better preserve residual hearing. Robotized-electrode-array (EA) insertion is a seducing mean as it allows for a steady insertion as slow as <1 mm/sec. We aimed at checking the efficacy of a robotized-EA vs. manual insertion, and to confirm the usefulness of fluoroscopy.

MATERIAL & METHODS

The hearing outcome of patients with an attempt of hearing preservation (HP) with a robotized-EA insertion from 2022-2024 in our tertiary ENT University Center, using the RobOtol® (Collin SA, Paris , France) was compared to a contemporary manually implanted cohort. All EA-insertions were achieved at low speed <1mm/sec. HP was defined in all cases with a postoperative measurable hearing <90 dB HL on 250 Hz and/or 500 Hz. We noted he use of fluoroscopy and its influence on CI. Comparisons used a Mann and Whitney test or a CHI-square test, with p≤0.05 considered significant.

RESULTS

Group M consisted of 24 manually implanted patients (16 women; 56+/-17 y.o.). Group R consisted of robotized implanted patients (24 subjects, 14 women ; 64+/-14 y.o.) Twelve of them were also implanted under fluoroscopy, with a robotized cone-beam C-arm (Siemens Ziego ®, Germany) and remote EA-insertion, the surgeon driving the CI from behind a leathered screen. All EAs were straight ones. At one year, hearing preservation rate was better in Group R (71% vs.62.5%) with an mean hearing loss of 25+/-19 dB (250 Hz) vs. 30+/-26 dB (250 Hz) (non significant). Fluoroscopy helped for real time detection and correction of one tip-foldover.

CONCLUSIONS

This series shows a better tendency of hearing preservation in Group R at one year. The non-significant difference between groups may point to a mandatory slow-speed EA-insertion whatever the technique. This series also confirms the advantage of fluoroscopy during CI, that can be achieved from a remote X-ray protected position.

OP-163

Intraoperative ABR In Vibrant Soundbridge Surgery: Influence Of Bone-Conduction Thresholds

Farid Alzhrani[1], **Asma Alahmadi**[1], **Medhat Yousef**[1]

[1]King Abdullah Ear Specialist Center (KAESC), College ofMedicine, King Saud University Medical City (KSUMC

BACKGROUND & AIM

Vibrant Soundbridge (VSB) has shown effective hearing rehabilitation for patients with conductive, mixed, orsensorineural hearing loss. However, optimal floating mass transducer (FMT) coupling is critical for device performance.This study investigates the utility of intraoperative auditory brainstem response (ABR) for assessing coupling efficiency andguiding surgical decision-making, particularly in patients with normal bone conduction. (PDF) Intraoperative ABR in Vibrant Soundbridge Surgery: Influence of Bone-Conduction Thresholds. Available from: https://www.researchgate.net/publication/404141307_Intraoperative_ABR_in_Vibrant_Soundbridge_Surgery_Influence_of_Bone-Conduction_Thresholds#fullTextFileContent [accessed May 13 2026].

MATERIAL & METHODS

This retrospective cohort study included VSB patients with complete audiometric data. Coupling efficiency wasassessed by comparing postoperative Vibrogram and intraoperative ABR thresholds with preoperative bone conduction (BCpre-op) thresholds (PTA3 at 1, 2, and 4 kHz). Segmented regression with breakpoint estimation was used to model the rela-tionship between BC pre-op and ABR thresholds, accounting for variability at lower BC values. (PDF) Intraoperative ABR in Vibrant Soundbridge Surgery: Influence of Bone-Conduction Thresholds. Available from: https://www.researchgate.net/publication/404141307_Intraoperative_ABR_in_Vibrant_Soundbridge_Surgery_Influence_of_Bone-Conduction_Thresholds#fullTextFileContent [accessed May 13 2026].

RESULTS

Thirty-six patients (mean age 23 ± 18 years) were evaluated. Postoperative functional gain averaged 32.6 ± 11.9dB HL, with speech discrimination improvement by 22.3 ± 10.1%. ABR thresholds correlated moderately with Vibrogramthresholds ($r = 0.481$, $p = 0.003$). Vibrogram–BC differences (mean = 15.9 ± 13.3 dB) were consistently lower than ABR–BC(mean = 34.8 ± 14.8 dB; $t(34) = 8.74$, $p < 0.001$). Segmented regression identified a breakpoint at 18.3 dB (SE = 7.1). Belowthis value, the slope was

non-significant (-0.21, p = 0.483), and mean ABR–BC difference was 39.84 dB. In contrast, abovethis value, a proportional relationship was observed (slope = 0.659) with difference of 21.67 dB (PDF) Intraoperative ABR in Vibrant Soundbridge Surgery: Influence of Bone-Conduction Thresholds. Available from: https://www.researchgate.net/publication/404141307_Intraoperative_ABR_in_Vibrant_Soundbridge_Surgery_Influence_of_Bone-Conduction_Thresholds#fullTextFileContent [accessed May 13 2026].

CONCLUSIONS

Intraoperative ABR provides adjunctive physiological information that may inform surgical judgment. How -ever, its interpretation should account for preoperative BC thresholds, particularly in patients with normal BC levels. (PDF) Intraoperative ABR in Vibrant Soundbridge Surgery: Influence of Bone-Conduction Thresholds. Available from: https://www.researchgate.net/publication/404141307_Intraoperative_ABR_in_Vibrant_Soundbridge_Surgery_Influence_of_Bone-Conduction_Thresholds#fullTextFileContent [accessed May 13 2026].

Do Cochlear Dimensions Affect The Surgical Decision In Cochlear Implantation?

Cristian Mircea Neagos[1,2], **Ana Fulga**[5], **Adriana Neagos**[1,4], **Mahmut Tayyar Kalcioglu**[3], **Anca Ileana Sin**[4]

[1]*ENT Clinic, County Emergency Clinical Hospital of Targu Mures, Targu Mures, Romania;* [2]*Doctoral School of Medicine and Pharmacy, George Emil Palade University of Medicine, Pharmacy, Science, and Technology of Targu Mures, Targu Mures, Romania;* [3]*Otorhinolaryngology Department, Istanbul Medeniyet University, Istanbul, Turkiye;* [4]*George Emil Palade University of Medicine, Pharmacy, Science, and Technology of Targu Mures, Targu Mures, Romania;* [5]*Clinical Department, Faculty of Medicine and Pharmacy, 'Dunarea de Jos' University of Galati, Galati, Romania.*

BACKGROUND & AIM

Cochlear malformations represent a heterogeneous group of inner ear anomalies that may influence surgical strategy and outcomes in cochlear implantation. Preoperative imaging plays a crucial role in identifying anatomical variations and guiding implant selection. The relationship between cochlear dimensions, cochlear volume, and surgical decision-making remains an important topic in otologic practice. To evaluate cochlear dimensions and volume in patients undergoing cochlear implantation and to analyze correlations between cochlear malformations, morphometric parameters, and surgical approach.

MATERIAL & METHODS

A retrospective study was conducted on 100 patients who underwent cochlear implantation between 2012–2024 at the ENT Clinic of the Emergency Clinical County Hospital Târgu Mureș. Preoperative temporal bone CT scans were analyzed using RadiAnt DICOM Viewer. Cochlear height (mid-modiolar section) and basal turn width were measured bilaterally. Cochlear volume was calculated using the conical approximation formula: $V = (\pi R^2 h)/3$. Statistical analysis was performed using GraphPad Prism 10 (t-test, ANOVA). Patients were stratified by age (children, adolescents, adults), gender, and presence/absence of cochlear malformations.

RESULTS

No statistically significant differences were found between right and left cochlear volumes in non-malformed ears (p=0.2197) or malformed ears (p=0.5310). Additionally, no significant differences were observed between malformed and non-malformed cochleae (right: p=0.2622; left: p=0.2371). Cochlear width and height showed no significant laterality differences in either normal or malformed groups. Age and gender based analyses did not demonstrate consistent statistically significant volumetric variations. Surgical approach selection was primarily influenced by anatomical particularities rather than volumetric differences alone.

CONCLUSIONS

Cochlear volume does not significantly differ between sides or between malformed and non-malformed cochleae in implanted patients. Surgical decision-making in cochlear implantation should rely on comprehensive anatomical evaluation rather than volumetric parameters alone. Detailed preoperative imaging remains essential for optimal implant selection and surgical planning.

OP-165

Hearing Outcomes And Complications Of Cochlear Implantation In Patients With Cochlear Ossification: A Systematic Review And Meta- Analysis

Alhassan Algazlan[1]

[1]*King Abdullah ear specialist center, king Saud university, Riyadh,SAUDI Arabia*

BACKGROUND & AIM

Background

Cochlear implantation, the primary treatment for severe to profound hearing loss, relies critically on proper electrode array design and insertion.
Objectives
This systematic review and meta-analysis examined the complications, and hearing outcomes of cochlear implantation in ossified cochleae, compared them with those in non-ossified cases, and explored management strategies to enhance surgical success and patient outcomes.

MATERIAL & METHODS

Methods: A comprehensive literature search was conducted using the PubMed, Scopus, Web of Science, and Cochrane Library databases, following the PRISMA guidelines. We used the following broad search strategy: Ossified OR ossification and cochlear AND implantation or implant. Two independent investigators screened titles, abstracts, and full texts, and extracted data. A total of 20 studies and 971 patients were included.

RESULTS

Results
Post-implantation and intraoperative complications had pooled incidence rates of 13.48% and 7.2%, respectively. Complete electrode insertion was successful in 82.2% of cases, whilepartial insertion occurred in 22.6%. Hearing performance outcomes were significantly better for patients without ossification (SMD = 0.35, p=0.005), although word and sentence scores showed no significant differences.

CONCLUSIONS

Conclusion: Despite adaptations such as modified drilling and electrode arrays, hearing outcomes were inferior compared to non-ossified cochleae in addition to the risk of complications associated with the procedure. These findings underscore the need for continued research to improve outcomes in this patient population and have important implications for surgical planning and patient counseling

Qualitative Assessment Of Quality And Readability Of Patient-Directed Arabic Online-Resources For Cochlear Implants In Children

Faisal Zawawi[1], **Hisham Alem**[1], **Afnan Bukhari**[1], **Aseel Mokhtar**[1], **Manar Alharbi**[1], **Saad Sanad**[1]

[1]King Abdulziz University, Otolaryngology Head and Neck Surgery department; [2]Prince Sultan Military Medical City, Otolaryngology Head and Neck Surgery department; [3]First health cluster, King Saud Medical City

BACKGROUND & AIM

This study aimed to assess the readability and quality of various websites providing information on cochlear implantation in children in the Arabic language.

MATERIAL & METHODS

Cross-Sectional Online Search. We conducted searches in the Arabic language using the three most popular search engines, Yahoo, Google, and Bing, to search for the topics of "cochlear implant" and "cochlear implant in children." The information quality was evaluated through the DISCERN tool, while readability was examined using the OSMAN readability tool, which incorporated two readability metrics: the Automated Readability Index and the LIX score.

RESULTS

In a study of 50 websites, the median DISCERN quality score was 38 (with an interquartile range [IQR] of 29-46), suggesting poor quality. Out of the 50 websites evaluated, only ten were deemed to be of good quality. The median readability ARI score was 8th grade (interquartile range [IQR], 6-9), which is considered above the level of the general population. Certain websites were found to be at or below the suggested 6th-grade reading proficiency level. The median LIX score was 69 (interquartile range [IQR], 64-71), indicating that the text is very difficult. There was no correlation between readability and the DISCERN score.

CONCLUSIONS

Our results suggest that the majority of websites offering information on cochlear implants for children in Arabic exhibit varying levels of quality and are composed in a language surpassing the general population's reading ability. Developers should focus on improving the readability of their online content to ensure that the average reader can understand and benefit from the information.

OP-167

Cochlear Implant's Battery Consumption In Different Type Of Electrode Array And Time Of Activation

Abdullah Tohari[1], **Kholoud Alanazi**[1]

[1]*King Abdullah Ear Specialist Center , King Saud University Hospital*

BACKGROUND & AIM

There are factors that have been proven to impact the outcomes of the cochlear implant such as age of implantation, pre speech recognition, pre language level and duration of deafness. The effectiveness of cochlear implantation is affected by different factors including timings of activation (early Vs later), and electrode placement (perimodular Vs lateral wall electrodes) which offers potential benefits in auditory performance.This paper aims to evaluate the effect of the electrodes array placement on the cochlea and the effect of device activation time on the battery consumption of the cochlear implant device.

MATERIAL & METHODS

It is retrospective study of 40 participants (58 ears) who are already agreed to go into Cochlear implant surgery. All Subject who received cochlear implant were included to the study except cases with Inner ear anomalies, or if it is a revision case. Participants were divided to two groups based on electrode placement either in lateral wall or pre-modiolar insertion and based on time of device activation either early or late activation time. The battery lifespan was measured among these groups one months, three months, 6 months and one year after device activation. Battery lifespan was measured through the calculation of the battery estimation in Custom Sound PRO software

RESULTS

There are no difference in battery consumption between early and late activation time , however; pre-modiolar electrode had longer life span compare to lateral wall electrodes in different battery types.

CONCLUSIONS

Pre-modiolar electrodes consume lass battery compare to lateral wall electrodes

Sequential Bilateral Cochlear Implantation In Prelingual Adolescents With A Long Interval Between Surgeries

I.V. Koroleva[1], **V.V. Dvoryanchikov**[1], **E.A. Levina**[1], **S.B. Sugarova**[1], **G.Sh. Tufatulin**[1,2], **S.V. Levin**[1,2], **D.S. Klyachko**[1]

[1]*Saint-Petersburg Research Institute of Ear, Throat, Nose and Speech;* [2]*North-Western State Medical University named after I.I. Mechnikov*

BACKGROUND & AIM

The prelingual adolescents has a risk of failure to use CI on the 2nd ear (CI2) and low result after sequential bilateral cochlear implantation with a long interval after first CI (CI1).

The aim of the study. The development of an algorithm for follow-up support of adolescents after sequential bilateral cochlear implantation with a long interval between surgeries.

MATERIAL & METHODS

Subjects. 40 prelingual adolescents aged 10-16 years (mean age 13.5±3.1 years), implanted in one ear before age 3 years. The period after the first surgery was 8-15 years (9.3±4.4 years). 12 patients used a hearing aid (HA) on opposite ear after 1-st surgery.

Method. The CAP II, SIR scale, EARS battery, questionnaires were used for the assessment preoperatively, in 3, 6, 12 months after switch on CI2 processor. For 10 days after the switch on CI2 processor, patients wore only CI2 for 3-5 hours a day and had speech therapist's sessions with CI2 in auditory-visual paradigm and only by listening. The teenagers were taught self-auditory training and with parents using special materials, ReDi App (MedEl) and continued auditory training with CI2 at home for 3-12 months.

RESULTS

2 patients were denied the CI2 surgery because of low efficiency of CI1. The CI2 surgery was postponed due to lack of motivation in 2 patients. In 3, 6, 12 months after switch on CI2 processor all teenagers constantly wore C2 with CI1. After 6 months the auditory performance with CI2 reached CI1 level in patients who used HA. After 12 months, the level of auditory perception with CI2 approached the CI1 level in 60% of patients. For 40% of patients, auditory performance with CI2 reached level 7-9 (CAP II) but was lower than at CI1, primarily due to low phoneme recognition and slow auditory processing.

CONCLUSIONS

The motivation for CI2, realistic expectations and regular auditory training with CI2 during 3-12 months are necessary for a successful sequential bilateral cochlear implantation with long interval between surgeries in prelingual adolescents. The patients who worn HA after CI1 adapt more quickly to CI2, use of CI1+CI2, achieve a high level of listening skills with CI2.

Conversion To Active Transcutaneous OSIA Implant From Preexisting Implants

Meghna Ray[1], **Muhammad Suleiman**[1], **Jaydip Ray**[1], **Vicki Proctor**[1]

[1]*Sheffield Teaching Hospitals*

BACKGROUND & AIM

Bone Conduction Implants (BCI) have become a stable and reliable option for hearing rehabilitation in patients where conventional hearing are unsuitable or inadequate. However there may be occasional need for conversion from one design to another due to complications of patient preferences. We explored the backgrounds and outcomes in these cases and discuss the various consideration needed in undertaking these procedures.

MATERIAL & METHODS

This study included patients who needed their preexisting BCI removed and replaced by another variety. These included those moving from either the percutaneous or the passive transcutaneous option to the newer active transcutaneous Osia implant. Consideration was needed for any change in hearing thresholds, previous soft tissue thinning and current state of scalp and surrounding tissue, need for further surgery or MRI scans in future.

RESULTS

A total of 21 patients were included. Three needed removal of their BAHA Attract implants whilst the rest were percutaneous devices. The percutaneous abutments were removed in clinic allowing the skin puncture site to heal in 4 weeks before undertaking the conversion surgery. The 'Sheffield S' incision was used in all these cases. The preexisting fixture was utilized in 7 cases. It the others a new fixture was used with careful planning to avoid the Osia transducer contacting the old fixture. In case of the Attract implants, the original fixture was reused in two cases with slight realignment of the Osia implant to about 45 degrees from the vertical. A transverse incision across the waist of the implant was used in these cases.

CONCLUSIONS

Patients using BCIs can easily and safely migrated from percutaneous to transcutaneous options and vice versa within the same across product range depending on their individual circumstances and prefernces.

OP-170

Cochlear Implantation In Patients With Chronic Otitis Media.

Andrey Lilenko[1], **Serafima Sugarova**[1], **Polina Timofeeva**[1], **Vladislav Kuzovkov**[1]

[1]*Saint Petersburg ENT and Speech Research Institute*

BACKGROUND & AIM

Worldwide, the incidence of chronic otitis media is 4.76 cases (from 1.7 to 9.4) per 1,000 population (or 31 million cases per year), of which 22.6% are children under 5 years of age. Chronic otitis media can be either the cause of severe hearing loss, up to deafness, or can be combined with profound sensorineural hearing loss. Currently, there is no generally recognized algorithm for the management of patients with chronic otitis media and profound sensorineural hearing loss.

MATERIAL & METHODS

A retrospective analysis included 52 patients who underwent cochlear implantation in St. Petersburg ENT and Speech Research Institute from 2014 to 2025 with profound sensorineural hearing loss and chronic otitis media.

RESULTS

In patients whose otomicroscopy revealed a defect in the pars tensa of the eardrum and the absence of an exacerbation at the time of surgery, tympanoplasty with cochlear implantation was performed simultaneously. The patients with epitympanitis, who had no surgical interventions on the implanted ear, underwent CI in one or two stages depending on the middle ear condition. During the surgery, cholesteatoma was detected in two patients: a patient with a history of antromastoidectomy in the implanted ear, and a patient with epitympanitis without a historyof ear surgery. In the latter, CI was performed in two stages. All patients underwent otomicroscopy 1 month and 6 months after surgery. The CT scans were obtained in 1,5 – 2-year period. No postoperative complications were found in any of the patients. The results of auditory-speech rehabilitation were comparable with the results of patients who did not have chronic purulent otitis media.

CONCLUSIONS

Performing cochlear implantation and middle ear surgery in one stage is especially important for patients with chronic otitis media and profound sensorineural hearing loss and can be considered as a technique to accelerate auditory and speech rehabilitation.

cochlear implantation, chronic otitis media, profound sensorineural hearing loss

OP-171

Outcomes And Future Directions Of The Pediatric Cochlear Implant Program In Kuwait

Mariam alkandari[1]

[1]*Zain specialized otolaryngology and head&neck surgery and shaikh Salem Alali hearing and speech Centre Kuwait*

BACKGROUND & AIM

The cochlear implant (CI) program in Kuwait began in 2001 and has significantly impacted children with severe to profound hearing loss who did not benefit from hearing aids. This study reviews the data of children who received cochlear implants between 2001 and 2024. The average age at implantation was 3.86 years, showing that many children received early intervention.

MATERIAL & METHODS

Most of the children (95%) had severe to profound sensorineural hearing loss (SNHL). Right-sided implantation was more common (63.3%) than left-sided (34.5%), while a small number (2.3%) received bilateral implants. Over the years, the program has expanded to include children with moderately severe SNHL and more bilateral implantations, in line with global clinical practices.

After implantation, hearing thresholds improved significantly. About 90% of children reached hearing levels within 45 dB, allowing them to detect most everyday sounds. Following consistent speech therapy, 58.8% of children developed speech and became post-lingual, meaning they acquired language after implantation. These children showed good progress in communication and academic skills, often catching up with their hearing peers.

However, 21.2% of children remained pre-lingual, primarily due to a lack of follow-up and limited access to speech therapy. This highlights the importance of continuous care after implantation, including regular audiological assessments, proper device programming (mapping), and speech-language therapy.

RESULTS

Overall, the cochlear implant program in Kuwait has been a successful national health initiative. It has significantly improved hearing, speech development, and quality of life for many children with hearing loss. Continued follow-up and rehabilitation remain key factors for long-term succe

CONCLUSIONS

Looking ahead, the program aims to further reduce the age of implantation to maximize language outcomes, expand newborn hearing screening efforts, and improve access to multidisciplinary rehabilitation services across the country. It also plans to increase the number of bilateral implantations and explore advanced technologies, such as electro-acoustic stimulation, remote fitting, and objective measures for fitting and follow-up. These steps ensure that all eligible children in Kuwait receive timely, effective, and comprehensive hearing care.

Synchrotron-Based Trauma Assessment Of Robotic Electrode Insertions In Cochlear Implantation

Joseph M. Chen[1], **Sumit Agrawal, MD**[2], **Trung Le, MD**[1], **Vincent Lin, MD**[1], **Demir Bajin, MD**[2]

[1]*Sunnybrook Health Sciences Center, University of Toronto, Ontario, Canada;* [2]*Western University, Ontario, Canada*

BACKGROUND & AIM

Minimizing intraoperative trauma during cochlear implant electrode insertion is crucial for preserving residual hearing. Manual insertions are subject to variability due to surgeon experience and anatomical differences, often leading to inconsistent outcomes. Robotic-assisted systems have been developed to improve insertion precision and reduce trauma. This study evaluates the safety and efficacy of the OTODRIVE® system for cochlear implant electrode insertion.

MATERIAL & METHODS

Fifteen cadaveric human temporal bones were implanted with a variety of electrodes (FLEX26, FLEX28, FLEXSOFT, FLEX34) and inner ear catheter (INCAT). The OTODRIVE system was used to maintain a constant insertion speed of 0.1 mm/s. The samples were subsequently imaged using synchrotron radiation phase-contrast imaging (SR-PCI) to assess intracochlear trauma. Parameters such as linear and angular insertion depths, and cochlear coverage were measured. The presence of trauma was analyzed using a trauma evaluation plot.

RESULTS

The average linear insertion depth was 24.8 ± 3.5 mm, and the average angular insertion depth was 527 ± 81°. Cochlear coverage was 74 ± 7%. Only one case of partial scala media translocation and two cases of basilar membrane elevation were observed, with no instances of severe trauma such as tip fold-over, scala vestibuli translocation or osseous spiral lamina fracture.

CONCLUSIONS

The findings indicate that the OTODRIVE system enables consistent and controlled electrode placement while minimizing trauma to cochlear structures, suggesting its potential to enhance hearing preservation outcomes. Preliminary clinical data will be presented.

The Stapes Head Coupler: A Novel, Low-Profile Solution For Optimized Vibroplasty Outcomes

Kristen Rak[1], **Björn Spahn**[1], **Carolina Köstler**[1], **Mario Cebulla**[1], **Anja Kurz**[1], **Stephan Hackenberg**[1], **Johannes Völker**[1]

[1]*Department of Oto-Rhino-Laryngology, Head and Neck Surgery Comprehensive Hearing Center University of Wuerzburg*

BACKGROUND & AIM

Vibroplasty using active middle ear implants, such as the Vibrant Soundbridge®, typically requires secure and space-efficient coupling to the ossicular chain. Existing coupling methods to the stapes head present limitations, particularly due to their vertical alignment and height, complicating procedures in anatomically restricted or previously operated middle ears In order to address these challenges, the novel Stapes Head Coupler was developed, featuring a significantly reduced functional height and enhanced flexibility for positioning. The objective of this retrospective study was to evaluate the surgical practicality, audiological effectiveness, and safety profile of the newly developed SH Coupler in patients undergoing VSB implantation.

MATERIAL & METHODS

A retrospective analysis was conducted on 12 patients (mean age: 43.1 years; range: 18–64) who underwent vibroplasty using the SH Coupler. The surgical placement of the Floating Mass Transducer (FMT) was performed by attaching it laterally onto the stapes head, with the orientation being directed either towards the promontory or the facial nerve. Audiological outcomes were assessed preoperatively and postoperatively by measuring auditory brainstem responses (ABR), sound field thresholds, vibrograms, and speech perception (Freiburg monosyllabic word test).

RESULTS

All SH Coupler implantations achieved stable fixation of the FMT, as confirmed intraoperatively by ABR thresholds that were consistent with preoperative bone conduction thresholds (mean intraoperative ABR: 30.8 dB nHL). Postoperative audiometric evaluations demonstrated significant functional gains, with mean improvements in free-field thresholds of 35.1 dB. Speech recognition exhibited a significant enhancement, rising from 5.8% preoperatively to 58.8% postoperatively at 65 dB SPL. It is of particular significance that no deterioration in bone conduction thresholds was observed, thereby reinforcing the safety of the coupling technique.

CONCLUSIONS

The SH Coupler has been developed to provide a safe, effective and versatile coupling solution for vibroplasty, especially in anatomically challenging cases. The device's low-profile configuration has been demonstrated to enhance surgical flexibility and yield audiological outcomes that are comparable to, or in some cases superior to, those of conventional coupling methods. This finding supports the integration of the device into standard vibroplasty practice.

Music Therapy For CI Users: A New Concept Centered On Anatomy-Based Fitting

Bianca Wirthner[1], **Georg M. Sprinzl**[1,2], **Philipp Schörg**[1,2], **Max Schlögel**[1,2], **Adrian D. Piec**[1], **Astrid Magele**[1,2]

[1]*University Clinic St. Pölten, Department of Otorhinolaryngology, Head & Neck Surgery, Dunant-Platz 1, 3100 St. Pölten, Austria;* [2]*Karl Landsteiner Institute of Implantable Hearing Devices, 3100 St. Pölten, Austria*

BACKGROUND & AIM

For the past 10 years, the ENT Department at the University Clinic St. Pölten, Austria, has incorporated music therapy (MT) into a multidisciplinary rehabilitation program for cochlear implant (CI) recipients. As medicine increasingly emphasizes personalized treatment, the importance of individualized approaches has grown. In audiology, the variety of sensorineural hearing loss cases has driven the development of advanced technologies that enable anatomy-based fitting (ABF) strategies for cochlear implants and speech processors. This study evaluates ABF effects on audiological outcomes, with particular focus on

music therapy, comparing ABF with conventional fitting methods regarding music perception, sound quality, and speech recognition.

MATERIAL & METHODS

All patients over 18 years of age with single-sided deafness or asymmetrical sensorineural hearing loss who received cochlear implants between 2024 and 2025 were included. Participants were divided into two groups: (1) ABF group, utilizing digital radiological imaging and frequency channel detection, and (2) non-ABF group, using standardized logarithmic frequency mapping. Both fitting strategies were applied during the initial CI activation. Outcomes were evaluated at 3 and 6 months post-activation through speech recognition tests (CVC monosyllables), structured music perception assessments, and sound quality questionnaires.

RESULTS

A total of 40 patients were tested, with 20 participants in the ABF fitting group and 20 in the non-ABF fitting group. Results will be presented comparing speech recognition performance, music perception, and reported sound quality satisfaction between the two groups.

CONCLUSIONS

Anatomy-based fitting may promote a more natural integration of music perception in CI users and highlights the crucial role of music therapy in the rehabilitation of CI recipients.

Audiological Benefits And Performance Improvements Of Bone Conduction Hearing Implantation In Patients With Single Sided Deafness

M. Mahtar[1]

[1]*ENT and Head and Neck Surgery Department, 20 Août 1953 Hospital, Ibn Rochd University Hospital Center. Faculty of Medicine and Pharmacy of Casablanca, Hassan II University of Casablanca*

BACKGROUND & AIM

The aim of this study is to determine the auditory and functional impact of a bone-conduction hearing implant in patients with unilateral hearing loss, with particular attention to speech perception, and subjective benefit over time.

MATERIAL & METHODS

Ten patients aged between 7 and 50 years old with single-sided hearing loss who fulfilled audiological candidacy criteria were prospectively enrolled. All patients were evaluated before and after implantation. The assessment battery included pure-tone thresholds, speech recognition testing in quiet, speech recognition testing in noise and standardized patient-reported outcome questionnaires.

RESULTS

All study subjects showed improvements in speech test results in all conditions tested.

Word recognition score in quiet improved by 70% after surgery (normal ear plugged).

The overall score of the hearing-in-noise test was improved 6 months after surgery. The median total scores of SSQ questionnaires demonstrated benefits in speech (+3 [1.64, 4.56]), quality of hearing (+1.38 [0.35, 2.40]) and spatial hearing (+1,83 [0.12, 3.55]).

CONCLUSIONS

Bone conduction hearing implant provides enough auditory benefits and performance improvements for hearing impaired patients

Our Experience With The Vibrant Soundbridge Middle Ear Implant At A Large Teaching Hospital: Patient-Reported Outcomes And Clinical Insights

Anand V Kasbekar[1,2], **Nian Patel**[1], **Courtney Chan**[1], **Ellen Jeffs**[1]

[1]*Nottingham University Hospitals NHS Trust, United Kingdom;* [2]*The University of Nottingham, United Kingdom*

BACKGROUND & AIM

Active middle ear implants (MEIs) represent a significant advancement in hearing rehabilitation for patients who are unable to wear conventional hearing aids. We review our 15 year experience of developing MEI surgery, emphasising patient-reported outcome measures (PROMs) to evaluate efficacy and satisfaction.

MATERIAL & METHODS

Retrospective review of adult patients referred for consideration of MEI between 2010 to 2025. The Medel Vibrant Soundbridge was implanted in all cases. Audiology and PROMs were analysed using validated questionnaires; Speech, Spatial and Qualities of Hearing Scale (SSQ12) and the Glasgow Benefit Inventory (GBI).

RESULTS

Our experience in developing the MEI service and improving referrals and patient engagement will be discussed. 67 referrals were received between 2010 and 2025 of which 31 ears (further 3 awaiting surgery) received MEIs. These include 10 bilateral cases. 90% of MEI surgeries were undertaken in the last 6 years. 22% of patients did not engage with the assessment. In 31% of cases MEI was not recommended. 9 (13%) cases are currently being assessed. Age at implantation 22 to 78 years. Aetiologies included sensorineural (75%) and mixed (25%) hearing loss. Audiometric improvement was seen in all but 1 patient. PROMs showed significant improvement overall in hearing and quality of life.

CONCLUSIONS

Our 15-year experience underscores MEIs as a reliable option for hearing restoration when hearing aids are not an option. Careful patient selection is important to mitigate risks. In future we will be expanding the indications for MEI as our experience and confidence increases.

Medium Term Experience Of Over 125 New Active Transcutaneous Piezoelectric Osia® Bone Conduction Implant

Vicki Proctor[1], **Meghna Ray**[1], **Muhammad Suleiman**[1]

[1]*Sheffield Teaching Hospitals*

BACKGROUND & AIM

The Osia® System is an active transcutaneous osseointegrated bone conduction implant utilising a piezoelectric transducer. The Osia 2 was introduced following an initial multicentre trial of the Gen1 device for which outcome data is being collected and evaluated routinely.

MATERIAL & METHODS

Data were collected prospectively on 125 consecutive cases of Osia® Systems that were implanted over 5 years. The clinical, surgical and audiological outcomes were collected prosprectively. The key finding are presented here.

RESULTS

125 Osia® devices were implanted in 106 patients during the five-year period. The implantation was bilateral in 19 patients. The male to female ratio was 77: 39 and the mean age of recipients was 54 years (age range 26yr - 76yr). The mean duration of surgery was 35.5 min (range 30min-55min). The most commonly used incision was the 'Sheffield S' incision 88%. Other incisions included 'C' or 'J' shaped or transverse across the waist of the device. A scalp pocket was fashioned in 35 cases . Bone polishing was undertaken in 22 cases and the actuator was recessed in 15 cases. The surgery involved conversion to active transcutaneous solution in 21 cases. Twelve complications were observed, none of which were device-related. Three devices were explanted due to wound breakdown from patient related factors. The average gain in conductive and mixed hearing loss was 32dB.

CONCLUSIONS

The piezoelectric active transcutaneous Osia® System is a stable, safe and effective implantable solution for hearing loss. There is good gain especially in the high-frequency, low complication rates and excellent patient satisfaction.

Objective Measure Of VSB Coupling Quality Using Intraoperative ABR

Farid Alzhrani[1]

[1]*King Abdullah Ear Specialist Center, King Abdulaziz Hospital, King Saud University, Riyadh, Saudi Arabia*

BACKGROUND & AIM

Vibrant Soundbridge outcomes depend greatly on the quality of floating mass transducer coupling. Intraoperative assessment, however, is often based on subjective surgical judgment. This study aimed to develop an objective intraoperative measure of coupling quality using auditory brainstem response and to evaluate its ability to predict postoperative audiological outcome.

MATERIAL & METHODS

This prospective study included 10 patients undergoing Vibrant Soundbridge implantation. Intraoperative auditory brainstem response was measured using the AcoustiAP system. A novel Coupling Quality Index (CQI) was developed as the difference between the estimated intraoperative ABR threshold, corrected using a center-derived correction factor, and the preoperative bone conduction PTA4. The CQI was then evaluated for its ability to distinguish good from loose coupling and its association with postoperative Vibrogram PTA4.

RESULTS

At a CQI cut-off of 22.6 dB, the index showed 70% sensitivity and 90% specificity in differentiating good from loose coupling, with an AUC of 0.74 (95% CI 0.51–0.97). Median CQI values were significantly lower in good coupling than in loose coupling (24.3 ± 14 vs. 38.8 ± 18.2 dB; $p < 0.001$). Intraoperative ABR threshold also showed a significant positive correlation with postoperative Vibrogram PTA4 ($r = 0.63$; $p = 0.039$).

CONCLUSIONS

The Coupling Quality Index provides a practical and quantifiable intraoperative measure of Vibrant Soundbridge coupling quality. It may support surgical decision-making, improve standardization of coupling assessment, and help optimize postoperative audiological outcomes.

OP-179

Effects Of Early Test Termination In A German Matrix Speech Test In Noise In Cochlear Implant Recipients

M. Kompis[1], **C. Schmid**[1], **W. Wimmer**[2]

[1]*Department of ENT, Head and Neck Surgery, Bern University Hospital, University of Bern, Switzerland;* [2]*Klinikum rechts der Isar der Technischen Universität München, Germany*

BACKGROUND & AIM

Speech reception thresholds (SRTs) in noise can be estimated with speech in noise tests using adaptive procedures. The most frequently used class of tests for this purpose are matrix-tests, which are available in several languages. Since these tests are time-consuming, it is preferable to use as few trials as possible to identify reliable results. Our aim was to investigate the effect of early termination.

MATERIAL & METHODS

We retrospectively evaluated clinical records of matrix sentence tests from cochlear implant patients (N = 789 tests) and simulations thereof to investigate the effect of a premature test termination on SRT assessment. In addition, the adaptive test data were fitted with a psychometric function to the test track to determine its reliability.

RESULTS

Terminating the clinical tests after 20 trials instead of 30 trials would have shortened the testing time by 1.4 minutes on average. The deviation of the two SRTs was 1 dB or higher in 7.9 % of the tests. For clinical data and simulation results, the deviation increased with increasing SRTs. Fitting a psychometric function resulted in accurate thresholds which correlated very well with the conventionally calculated results (intra-class correlation coefficient (ICC) = 0.99).

CONCLUSIONS

The agreement of the test results after 20 and after 30 trials is high and for the majority of the tested patients trials 20 trials would have produced reliable results. However, clinical data and simulation results agree that for poor performing listeners the deviations can become considerable. We therefore recommend the reduction of the number of trials only for listeners with a relatively good speech understanding, i.e. achieving negative SRTs in the first 20 test items.

Professional And User-Reported Outcomes Of Percutaneous And Active Transcutaneous Bone Anchored Hearing Systems Across Clinical Contexts

Nicole Amichetti[1], **Marianne Philipsson**[1], **Kia Nøhr Iversen**[1], **Sara Al-Dalal**[1], **Ulrika Petersson**[1], **Maria Håkansson**[1]

[1]*Oticon Medical*

BACKGROUND & AIM

Bone Anchored Hearing Systems (BAHS) have demonstrated favorable clinical benefits in both pediatric and adult populations across non-surgical, percutaneous, and transcutaneous forms. There is a somewhat limited understanding of user reported subjective performance and professional satisfaction across different devices.

MATERIAL & METHODS

The research question is explored in three sub-studies: (1) a pediatric survey evaluating Ponto sound processors worn on a non-surgical solution, e.g., softband; (2) a cross-sectional survey assessing subjective performance and satisfaction with percutaneous Ponto sound processors in adults; and (3) two surveys designed to assess performance, usability, and comparative experiences across percutaneous and transcutaneous BAHS, for audiologists and surgeons.

Participants included parents of pediatric users (1), adult users (2), and surgeons and audiologists experienced with BAHS (3).

Outcomes included questionnaires such as the Parental Evaluation of Aural/Oral Performance of Children (PEACH), Glasgow Children's Benefit Inventory (GCBI), International Outcome Inventory for Hearing Aids (IOI-HA), and structured usability and comparative surveys (3).

RESULTS

In study 1, parents of 64 pediatric Ponto Softband users reported good hearing performance (mean PEACH score 76.7%) and positive quality-of-life impacts (mean GCBI +38.3).

In Study 2, 153 adult percutaneous Ponto users reported high overall satisfaction (mean IOI-HA total score 4.0/5), strongest for daily use (mean 4.51) and satisfaction (mean 4.39), with higher scores for newer Ponto sound processor models compared with older generations.

Study 3 included 126 audiologists and 86 surgeons from 15 countries. Audiologists reported the greatest satisfaction with both Ponto and Sentio on fitting software, sound quality, ease of use, reliability, and frequency of feedback. Surgeons preferred the Sentio system for quickest surgical duration and in cases of compromised bone quality/quantity, smaller heads, cosmetic outcomes, fastest skin healing, and overall ease of surgical placement as compared with other available devices.

CONCLUSIONS

Across pediatric, adult, and professional perspectives, BAHS in general, and Ponto and Sentio in particular, demonstrate favorable subjective performance, satisfaction, and quality-of-life benefits. Data from audiologists and surgeons across the globe further support patient-reported outcomes within real-world clinical practice. Taken together, the Ponto and Sentio Systems can be considered highly successful treatment options for conductive, mixed, and single-sided hearing losses.

OP-181

Patient-Specific Basal Turn Analysis For Atraumatic Cochlear Implantation

Serafima Sugarova[1], **Vladislav Kuzovkov**[1], **Andrei Lilenko**[1], **Dmitrii Luppov**[1]

[1]*Saint Petersburg ENT and Speech Research Institute*

BACKGROUND & AIM

Preservation of intracochlear structures depends on cochlear anatomy. Conventional 2D DICOM orientation may misestimate A-value and CDL, increasing scalar translocation risk. 3D segmentation enables true basal turn visualization, and the C-value represents a clinically relevant safety parameter for electrode insertion.

MATERIAL & METHODS

A retrospective radiological study included computed tomography (CT) scans of 112 ears with normal inner ear anatomy for cochlear size analysis and 1932 scans for evaluation of anatomical variability and malformations. DICOM datasets were analyzed using OTOPLAN® and 3D Slicer software. 3D segmentation of the fluid-filled inner ear was performed using fixed grayscale thresholds. The oblique coronal plane was aligned to the basal turn using the 3D model as a spatial reference. A- and B-values were measured according to Escudé. Cochlear shape was determined by the B/A ratio. The C-value (effective straight segment from round window to lateral wall tangential to the inner wall) was calculated and correlated with the A-value using linear regression (95% confidence level). Outcome measures included measurement reliability, cochlear shape distribution, C-value range, and its relationship to electrode insertion safety.

RESULTS

3D segmentation enabled rapid and reproducible identification of the true basal turn in all anatomical types and facilitated visualization of the cochlear nerve and scala tympani ossification. The A-value ranged from 8.04 to 10.03 mm (mean 9.03 mm). Round basal turn configuration was observed in 48% and elliptical in 52%. The C-value ranged from 6.7 to 9.6 mm (mean 8.3 mm) and showed strong linear correlation with the A-value ($r = 0.87$; $r^2 = 0.757$; $p < 0.001$), being on average 0.7–0.8 mm shorter. Fixed electrode safety markers corresponded only to the mean cochlear size, indicating a mismatch in extreme anatomies.

CONCLUSIONS

3D segmentation provides a reliable method for patient-specific cochlear basal turn assessment and improves the accuracy of pre-operative measurements. The C-value represents a practical safety metric for predicting the point at which the electrode tip encounters the lateral wall and may help reduce scalar translocation, particularly with pre-curved arrays. Personalized, measurement-driven planning is essential for atraumatic cochlear implantation.

OP-182

Effect Of Changing The Input Dynamic Range On The Speech Performance Of Cochlear Implant Patients

Ossama Sobhy[1], **El-Deeb, MK**[1], **El-Qaraqssi, AA**[1], **Robaa, BM**[1]

[1]*Alexandria University, EGYPT*

BACKGROUND & AIM

Background: Compression is an essential function of the Cochlear Implant (CI) processor as it transforms acoustical amplitudes into electrical amplitudes. IDR is defined as the difference between T (threshold) and MCL (most comfortable level) on individual electrodes as the MCL parameter for every channel indicates the highest degree of stimulation, while still feeling comfortable.

Maplaw Compression factor is the definition of a compression curve, in Medel CI processors, that maps stimulation intensities to sound intensities as it varies between soft sounds and loud sounds.

Aim: Study the effect of changing IDR on the patient's speech performance in quiet and noise.

MATERIAL & METHODS

The study included 30 patients who were older than 3 years old and have been using Med-El CI for at least 2 years.

Four new experimental maps which were T level locked to 10% of the MCL level and maplaw 500, T level locked to 10% of the MCL level and maplaw 750, T level locked to 20% of the MCL level and maplaw 500 and T level locked to 20% of the MCL level and maplaw 750 have been tested both in quiet and noise after applying each map for a week.

RESULTS

The results show that there was no statistically significant difference between the four maps in speech discrimination scores but maps with T level locked to 20% showed less deterioration of the speech discrimination score with decreasing SNR from +10 to 0 dB and most of the cases in the study preferred maps with maplaw 750, this finding indicated the effect of increasing the compression on the speech clarity.

CONCLUSIONS

Changing IDR can affect speech perception which is also influenced by other factors as presence of noise, onset of HL, difference of patient’s language age, duration of phoniatric training and number of active electrodes of the implant. Using T level locked to 20% of MCL instead of T level locked to 10% can help cases with understanding difficulties in noise. Most of this study cases preferred the maps with T level locked to 10% or 20% of the MCL level and maplaw 750 as they receive the speech clearer.

Durable Zwitterionic Hydrogel Thin Film Coatings Of Cochlear Implant Electrode Arrays Reduce Intracochlear Inflammation And Electrode Impedance

Kameron R. Hansen[1], **Nir Ben-Shlomo**[1], **George Barrera**[1], **Parker Reinke**[1], **Rachel Scheperle**[1], **C. Allan Guymon**[2], **Marlan R. Hansen**[1]

[1]*University of Iowa;* [2]*Brigham Young University*

BACKGROUND & AIM

Implantation of electrode arrays into the cochlea triggers an inflammatory, foreign body response (FBR) to the implanted biomaterials, resulting in fibrosis and increased electrode impedance. Using reporter mouse models, we demonstrate that these responses create an ectopic lymphoid structure involving neoangiogenesis, neolymphogenesis, and recruitment of activated lymphocytes and mononuclear phagocytes in the scala tympani. The data reveal a robust lymphatic network and adaptive immune responses in the cochlea. Here we explore the ability of highly lubricious anti-fouling surface properties of zwitterionic hydrogel systems to mitigate biofouling and the FBR to cochlear implant biomaterials.

MATERIAL & METHODS

To provide the highly favorable surface properties of zwitterionic systems to electrode array biomaterials, we developed tunable processes to simultaneously photograft and polymerize permanent zwitterionic (carboxybetaine methacrylate, CBMA and sulfobetaine methacrylate, SBMA) hydrogel thin film coatings (10-100 µm) to cochlear implant electrode arrays. We used dynamic mechanical analysis, tribometry, protein and cell adhesion assays, and histological and electrophysiological methods to assess the mechanical, electrophysiological and biological responses to zwitterionic thin film coatings.

RESULTS

Using in vitro, mouse, and sheep models, we find that these coatings are robust and durable. The coatings dramatically reduce surface friction, force of insertion, protein and cell adhesion, and the inflammatory FBR. Further, these coatings significantly reduce electrode impedance even prior to implantation, likely due to enhanced current flow at the electrode interface. This reduction in impedance persists throughout a 6 month implantation in sheep. Histological and 3D Xray microscopy analysis reveal significantly decreased cellular infiltration, macrophage infiltration, fibrotic tissue deposition, and neoossification in cochleae with zwitterionic-coated implants compared to uncoated controls.

CONCLUSIONS

Durable, thin film zwitterionic coatings offer the potential to enhance cochlear implant performance by reducing insertional trauma, mitigating chronic inflammation and fibrosis, and enhancing the electrode:tissue interface.

Experimental Study: Stimulation Of The Facial Nerve In Cases Of Hormonal And Systemic Disorders.

Vladislav Kuzovkov[1], **Victoria Tanaschishina**[1], **Andrew Lilenko**[1], **Serafima Sugarova**[1], **Polina Haritonova**[1]

[1]*Saint-Petersburg ENT Research institute, Russia*

BACKGROUND & AIM

Facial nerve stimulation (FNS) may occur in cochlear implant users during the switching of a speech processor (SP) or during its usage. This complication is multifactorial and also has an unpredictable onset of occurrence. Otological studies often require the use of experimental models. Guinea pigs and rats are traditionally the main biomodels because they are easy to handle and their temporal bone anatomy is similar to that of humans. Objective: to share the results of the facial nerve stimulation experiment on hormone-induced otospongiosis in laboratory animals.

MATERIAL & METHODS

A hypothesis has been put forward about hormonal changes or systemic disorders leading to the relative otospongiosis of cochlea and to the manifistation of FNS. In this regard, the first experiment was conducted on 20 guinea pigs (10 experimental group, 10 control group) with the injection of 4 mg of estrogen weekly for 5 weeks. The resulting changes were recorded on otoacoustic emission (OAE) and CT scans of guinea pigs, as a result of which animals were selected for the CI. The second experiment was conducted on 20 rats (10 experimental group, 10 control group) with the injection of 0,1 ml of Freund's full adjuvant and 100 mkg of collagen weekly for 3 weeks. The resulting changes were recorded on otoacoustic emission (OAE) and CT scans of rats. Both experiments were completed with a histological examination of the inner ear.

RESULTS

in 3 months after the first dose of estrogen OAE was negative in 8/10 cases in the guinea pigs. Initial signs of otospongiosis in the area of the tympanic bull and cochlea were revealed on OAE and on CT scans of guinea pigs. During the CI FNS was noted at lower levels of stimulation than in the control group. The same changes were registered in rats after 7 months, but there were no chance to perform CI in this group.

CONCLUSIONS

hormonal changes and systemic disorders are factors that increase the risk of FNS in a CI patient during usage of SP. FNS correction techniques and changes in program settings allows to improve the quality of auditory and speech rehabilitation

OP-185

A Guide For Adult Cochlear Implantation Practice: A Consensus Paper

Isra Aljazeeri[1]

[1]*King Abdullah Ear Specialist Center*

BACKGROUND & AIM

Adult cochlear implant candidates are a large proportion of the total candidates. The aim of this study is to develop an evidence-based guide regarding adult cochlear implantation in Saudi Arabia that is supported by consensus agreement of the experts in the field.

MATERIAL & METHODS

In this study a task force of experts was involved to determine the important aspects of cochlear implantation practice in adults. The task force discussion guided a literature review, which resulted in drafting the provisional statements. A modified Delphi method was then utilized to determine the agreement level for these statements within the SORL Society cochlear implant practitioners, including audiologists and otologists.

RESULTS

This study started with fifteen preliminary statements that, after core committee meetings and one round of voting, resulted in formulating twenty final statements. The final statements reached an average of 95.9% agreement level (+/-4.6%). Two statements did not reach consensus with agreement levels of 77% and 70%.

CONCLUSIONS

This consensus paper presents the most agreed-upon practice for adult cochlear implantation in adults in Saudi Arabia. The high agreement levels among cochlear implant practitioners reflect a strong endorsement of the formulated statements, underscoring their relevance and applicability in real-world settings. This guide will serve as a valuable resource for clinicians, aiming to standardize practices and improve outcomes for adult cochlear implant candidates. Future efforts should focus on the integration of emerging evidence to adapt this guide to the practice of cochlear implantation.

Smart Selection: A Clinical Algorithm For Optimizing Bone Conduction Implant Choice

Maria Peixoto[1], **Victor Correia Silva**[1]

[1]*Hospital CUF Porto*

BACKGROUND & AIM

The selection of bone conduction hearing implants requires a structured and patient-centered approach due to the heterogeneity of clinical indications and individual characteristics. This study presents the development of a clinical decision-making flowchart designed to guide healthcare professionals in choosing the most appropriate bone conduction implant for different patient profiles.

MATERIAL & METHODS

The methodology involved a review of current clinical guidelines and evidence, combined with expert consensus from multidisciplinary teams in otology and audiology. The resulting decision tree aims to standardize clinical practice, reduce variability in implant selection, and improve patient outcomes.

RESULTS

The proposed organigram integrates key variables, including age, type and degree of hearing loss (conductive, mixed, or single-sided deafness), anatomical considerations, skin condition, comorbidities, and patient preferences. It also incorporates audiological criteria, radiological findings, and surgical feasibility to ensure a comprehensive evaluation. Special attention is given to differentiating between percutaneous and transcutaneous systems, as well as active versus passive devices.

Preliminary validation suggests that the use of this structured approach enhances decision consistency and facilitates shared decision-making with patients. Ultimately, this organigram serves as a practical tool to optimize individualized treatment strategies in bone conduction hearing rehabilitation.

CONCLUSIONS

This flow-chart is helpfull as a decision maker for doctors and patients. Further research is encouraged to validate its effectiveness across diverse clinical settings and populations.

BACKGROUND & AIM

This study aims to investigate the language and auditory skills of children undergoing sequential and simultaneous bilateral cochlear implantation. Auditory and language skills of the patients were analyzed for statistical differences between groups and among subgroups within the sequential group, and the findings were compared with existing literature.

MATERIAL & METHODS

The study included 47 children who underwent cochlear implantation at the Department of Otorhinolaryngology, Gazi University. All implantations (either the first implant in sequential cases or both implants) were performed before the age of 4.

Among the patients, 19 were female and 28 were male, with ages ranging from 2 to 15 years. The patients were divided into two main groups: those who received bilateral simultaneous cochlear implants and those who received sequential cochlear implants. Additionally, the sequential implant group was further subdivided into three subgroups. Group A consisted of patients with an interval of less than 2 years between the two implants, Group B 2–4 years, and Group C more than 4 years between implants. Patients with inner ear anomalies were excluded from the study. SRT(dB), SD(%) scores were analyzed and auditory Perception Test (CAPT) was used to assess the auditory perception skills of the children.

RESULTS

No statistically significant differences were observed between the simultaneous and sequential groups for right and left ear SRT (dB). Similarly, within both the simultaneous and sequential groups, right and left ear SRT (dB) values did not differ significantly. In the sequential group, comparison of the first and second implanted ears showed no significant difference in SRT (dB), whereas SD (%) was significantly higher in the first implanted ear than in the second ($p = 0.002$). Upon subgroup analysis of the sequential group, SRT values in the second implanted ear of Group C were significantly higher than those in Groups A and B. Conversely, SD scores in the second implanted ear of Group C were significantly lower than in Groups A and B. These findings indicate comparable auditory thresholds between ears overall, but lower speech discrimination in the second implanted ear, particularly in patients with a longer interval between implants.

CONCLUSIONS

No significant differences were observed between the simultaneous and sequential groups in SRT and SD scores. However, in the sequential group, SD scores were significantly lower in the second implanted ear compared to the first. Patients with an interval of more than 4 years between implants showed significantly poorer SRT and SD scores in the second implant relative to the first and to other subgroups. A significant difference was also found between groups in receptive language skills, with longer intervals associated with poorer outcomes. These results highlight the impact of delayed sequential implantation on auditory and language development.

BACKGROUND & AIM

Auditory implants, including cochlear implants (CIs), active middle ear implants (AMEIs), and bone conduction implants (BCIs), represent rapidly evolving treatment options for hearing loss. While several countries have established CI registries, no comprehensive national registry covering all auditory implant types had previously been reported. In 2023, the Japan Otological Society launched a nationwide electronic data capture (EDC) registry encompassing CIs, AMEIs, and BCIs, replacing the former paper-based CI reporting system. This study aimed to describe the establishment and initial findings of this registry, including patient demographics, surgical trends, and data completeness.

MATERIAL & METHODS

A web-based EDC system (Viedoc®) was implemented across facilities authorized to perform auditory implant surgeries in Japan. Between January 2023 and December 2024, data were voluntarily submitted by participating institutions. Collected variables included patient demographics, implant type, surgery details, preoperative hearing thresholds, etiology of hearing loss, and device manufacturer information. Patients were classified as pediatric (<18 years) or adult (≥18 years). Pure tone averages (PTAs) were calculated using a four-frequency weighted formula. Registry completeness was assessed by comparison with Japan's National Database of Health Insurance Claims (NDB).

RESULTS

A total of 1,809 patients from 104 facilities were analyzed, comprising 1,723 CI and 86 AMEI/BCI cases. Among 605 pediatric CI recipients, 10% were implanted under 1 year and 30% at 1 year of age. Among adult CI recipients, 271 were aged ≥75 years. Simultaneous bilateral CI was performed in 265 patients, including 175 children. Better ear thresholds <90 dB HL were observed in 33% of adults and 29% of children. Unknown etiology accounted for 39.6% of cases, while hereditary deafness was the most common known cause (24.5%). CI registry completeness reached 73% compared with NDB data.

CONCLUSIONS

This is the first comprehensive national auditory implant registry report including CIs, AMEIs, and BCIs. The registry demonstrated reliable nationwide data capture and revealed important trends, including increasing early-age and bilateral implantation, broader hearing threshold criteria, and a high proportion of unknown etiologies. These findings support evidence-based policymaking and the continued development of auditory implant medicine in Japan.

Cochlear Implant Outcomes In Elderly Adults In A Low/Middle-Income Country

Daniela González Casas[1], **Juan Manuel García Gomez**[2], **Clemencia Barón**[2], **Hanna Mateus**[2], **Nicole Pulido**[1], **Abel Martínez**[1]

[1]Section of Otolaryngology, Fundación Universitaria de Ciencias de la Salud, Bogotá, Colombia; [2]Department of Otolaryngology, Fundación Santa Fe de Bogotá, Bogotá, Colombia

BACKGROUND & AIM

Currently, hearing loss is a public health matters affecting over 466 million people in the world. With the aging population, the prevalence of hearing loss is increasing; one-third of adults older than 65 years experiences a disabling hearing loss. In Colombia the prevalence of hearing loss in older adults is estimated at 31.73% and hearing rehabilitation-only at 14.35%, these adults likely have hearing loss of a severity that would meet CI candidacy criteria. With aim to review our experience with CI in older adult over last 30 years, focusing on impact of CI on speech recognition.

MATERIAL & METHODS

A retrospective cohort study identifying all adults aged > 60 years who received cochlear implant from 1995 to 2025. The primary outcome measure compared pure tone threshold and free-field disyllabic speech scores in silence at 65 dB SPL available both preoperatively and 1-month, 6-months and 1 year post-CI activation.

RESULTS

Fifty adults aged > 60 years (mean 68.8 yr, 64% men) received cochlear implant from 1995 to 2025. All patients had improved after CI from a mean pre-CI pure tone threshold score of 105 dB HL (SD 20.7) improving to 29.3 dB HL (SD 9.4) after implantation ($p < 0.001$). Progressed from mean free-field speech scores at 65 dB SPL of 0.8% (SD 5.4) pre-CI to a score of 58.2% (SD 39.3), 73.5% (SD 29.9) and 82.6% (SD 19.9) in the implanted ear at 1-month, 6-months and 1 year post-activation respectively ($p < 0.001$).

CONCLUSIONS

Cochlear implantation in older adults can receive significant improvement in pure tone threshold and speech recognition, with similarity results in patients < 60 years. Older adults should not be dismissed as potential cochlear implant candidates.

Redefining Verification In Pediatric Cochlear Implantation: AI-Driven, Radiation-Free Paradigm Integrated With Clinical Profiling In A Diverse Anatolian And Refugee Cohort

Mehmet Türkalp Yıldız[1], **Esin Görgülü**[2], **Prof Dr İlker Burak Arslan**[1], **Prof Dr Abdullah Dalğıç**[1], **Levent Olgun**[3]

[1]Department of Otorhinolaryngology - Head and Neck Surgery, Izmir City Hospital, Izmir, Turkey; [2]Department of Audiology, Izmir City Hospital, Izmir, Turkey; [3]Department of Otorhinolaryngology, Baskent University, Zubeyde Hanim Practice and Research Center, Izmir, Turkey

BACKGROUND & AIM

We aimed to develop a Machine Learning model combining preoperative MRI metrics (nerve/IAC diameter) and intraoperative telemetry to predict insertion success. Uniquely, this study validates a "Radiation-Free Protocol" across a genetically diverse pediatric cohort including refugees and patients from seven Anatolian regions to demonstrate that AI can render routine post-op X-rays obsolete while ensuring patient safety globally

MATERIAL & METHODS

Methods: This retrospective study analyzed 38 pediatric cochlear implant recipients (representing diverse Anatolian and refugee backgrounds). We performed high-dimensional data extraction covering four domains:

- Clinical & Audiological: Qualitative data including etiology, consanguinity, device usage logs (compliance), and ABR asymmetry were encoded into numerical vectors to enable machine learning processing.
- 3D Anatomical Modeling: Using a U-Net deep learning pipeline on CTs, we extracted patient-specific metrics (Scala Tympani volume, Cochlear Duct Length, A-value), correlated with MRI-based Cochlear Nerve/IAC diameters.
- Telemetry: Channel-specific Impedance and ECAP thresholds. Ground Truth: Post-operative X-rays were evaluated by senior surgeons in a blinded, anonymized manner to establish unbiased insertion status. Computation: Leveraging a

cloud-based Google Colab environment to demonstrate accessible AI innovation, a Random Forest Classifier was trained via Leave-One-Out Cross-Validation (LOOCV).

RESULTS

The Random Forest model achieved a remarkable prediction accuracy of 92.11% in verifying electrode insertion against the ground truth of blinded surgeon reviews. Feature importance analysis revealed a distinct hierarchy in predictors: Intra-operative Average Impedance emerged as the most critical determinant (~35% weight), acting as a reliable proxy for electrode-tissue interface status. This was followed significantly by anatomical constraints: IAC Diameter (~29%) and Cochlear Nerve Diameter (~24%). Crucially, despite the high prevalence of consanguinity and varying etiologies in our diverse Anatolian and refugee cohort, the model demonstrated robust generalization, showing no performance degradation across different sociodemographic or device-brand subgroups.

CONCLUSIONS

This study proposes a paradigm shift: replacing "radiological confirmation" with "computational verification." Our AI model obviates the need for post-operative X-rays, thereby sparing children from ionizing radiation and the physical distress of immediate imaging during anesthesia recovery. Furthermore, by successfully integrating deep learning with soft-tissue (MRI) and telemetry data, this research paves the way for an "MRI-Only Preoperative Workflow," challenging the necessity of CT scans entirely. Validated across a sociodemographically complex cohort (high consanguinity, refugee background), this protocol offers a robust, humane, and globally applicable standard for the future of otology.

Cochlear Implantation In Case Of Severe Sensorineural Hearing Loss

Thierry MOM[1], **LIsa Mégneaud**[1], **Mathilde Puechmaille**[1], **Roy Alhallak**[1], **Chloé Trillat**[1], **Margaux Bézé**[1], **Bruno Pereira**[2]

[1]*Department of Otolaryngology Head Neck Surgery, University Hospital Gabriel Montpied, Clermont-Ferrand France;* [2]*Department of Biostatistics University Hospital Gabriel Montpied, Clermont-Ferrand France*

BACKGROUND & AIM

Cochlear implantation (CI) is an effective mean to rehabilitate severe to profound sensorineural hearing loss (SNHL), with a very good functional outcome. However, hearing outcome is most often globally analyzed, whatever the preoperative hearing loss (severe or profound). Knowing that numerous patients are reluctant to accept CI when classic hearing aids help them more or less understand their surroundings, we aimed to compare the hearing outcome and satisfaction of two groups of cochlear recipients, with either a preoperative severe or profound SNHL.

MATERIAL & METHODS

In this retrospective study, patients with severe preoperative SNHL (group S) implanted from 2017-2023 in our department were compared to a contemporary cohort of implanted patients with preoperative profound SNHL (group P). Pure tonal audiograms (PTA) were collected, as well as the monosyllabic-word speech discrimination score at 60 dB SPL (SDS) and their maximum dissyllabic-word intelligibility score (MIS). Their level of global satisfaction was also compared. Comparisons were made with either a t-test or a CHI-square test, with p≤0;05 considered significant.

RESULTS

There were 93 recipients, 104 implanted ears, 49 women; 68 patients (57+/-20 y.o., 80 ears) in group P, and 23 patients (57+/-21 y.o., 24 ears) in group S. Cochlear implants had all straight electrode-arrays. There were no significant differences in PTA (Group S: 32+/-9 dB HL; Group P: 35+/-16 dB HL), nor in SDS (Group S: 54%+/-3%; Group P: 42+/-3 dB HL) but in MIS (Group S: 85.5%+/-20%; Group P: 68%+/-32%; p<0.02). Group S had a better satisfaction level (p<0.01).

CONCLUSIONS

CI in adults with severe SNHL likely offers a better functional outcome than in profound SNHL, inciting to an earlier as possible CI.

Age Is Not A Barrier: Audiometric Outcomes And Quality Of Life After Cochlear Implantation In The Elderly

M. Loudghiri[1], **M. Lahjaouj**[1], **W. Bijou**[1], **Y. Oukessou**[1], **S. Rouadi**[1], **R. Abada**[1], **M. Roubal**[1], **M. Mahtar**[1]

[1]*ENT and Head and Neck Surgery Department, 20 Août 1953 Hospital, Ibn Rochd University Hospital Center. Faculty of Medicine and Pharmacy of Casablanca, Hassan II University of Casablanca*

BACKGROUND & AIM

Cochlear implantation represents a major advancement by restoring functional auditory perception. Beyond objective measures, the assessment of quality of life (QoL) has emerged as a central outcome. Specific questionnaires, such as the CIQOL,

allow for a comprehensive evaluation of the real-life impact of implantation. However, post-implantation outcomes show substantial interindividual variability, highlighting the importance of identifying factors influencing these differences.

The aim of the study was to identify thoses factors and evaluate the real-life impact of cochlear implantation among elderly.

MATERIAL & METHODS

Fourty-four patients aged with bilateral sensorineural hearing loss who fulfilled audiological candidacy criteria were enrolled. All patients were evaluated before and after implantation. The assessment battery included pure-tone thresholds, speech recognition testing in quiet, and standardized patient-reported outcome questionnaires (CIQOL-35)

RESULTS

CIQOL-35 assessment demonstrated a significant overall improvement in quality of life after cochlear implantation ($p < 0.05$). All dimensions improved, with the greatest gains observed in "Environmental "), followed by "Emotional" and "Communication". Analysis of factors influencing post-implantation quality of life revealed a significant negative correlation with age at implantation and a significant decrease in CIQOL35 scores among patients reporting postoperative tinnitus.

CONCLUSIONS

Cochlear implantation in elderly patients provides significant improvements in both hearing performance and quality of life. In our study, audiometric outcomes in older adults were comparable to those observed in younger patients, suggesting that advanced age alone should not be considered a limiting factor for cochlear implantation. These findings support the broader use of cochlear implants in the elderly population and highlight the importance of considering candidacy based on functional needs rather than chronological age.

BACKGROUND & AIM

Background: Etiological factors affecting outcomes of cochlear implants (Cis) are known; however, a direct comparison of efficacy based on lesion location is needed. We aimed to systematically examine the current evidence to compare the effectiveness of CIs in patients with presynaptic versus postsynaptic neuropathy.

MATERIAL & METHODS

Methods: A comprehensive literature search was conducted across multiple databases, including MEDLINE (via PubMed), Embase, CENTRAL, Web of Science, Scopus, CINAHL, and PsycINFO. Studies were selected based on their examination of CI efficacy in patients with auditory neuropathy spectrum disorder, distinguishing between pre- and postsynaptic lesions using genetic markers or electrophysiological assessments

RESULTS

Results: Analysis of seven studies consistently highlighted the importance of etiological diagnosis in predicting CI outcomes. Genetic mutations were correlated with more favorable CI outcomes, emphasizing the role of genetic etiology. Electrophysiological measures also proved useful in assessing auditory function, further emphasizing the value of detailed diagnostics

CONCLUSIONS

Conclusion: Etiological factors generally influence CI outcomes; however, the success varies between pre- and postsynaptic neuropathies. Integrating genetic and electrophysiological diagnostics is crucial for predicting CI performance, suggesting a need for personalized approaches in evaluating CI candidates for more targeted and effective auditory rehabilitation.

OP-194

Spatial Analysis Of Electrode- Proximity To-Lateral Wall And Its Impact On ECAP Latencies: An OTOPLAN Version 6-Based Study

Dr Mariam Aljehani[1], **Prof. Abdulrahman Al-Sanosi Professor of Otology and Neurotology King Saud University – College of Medicine**[1], **Dr. Yaseen Abdulsamad**[1]

[1]*King Saud University, Department of Otolaryngology, Riyadh, Saudi Arabia*

BACKGROUND & AIM

Precise electrode positioning is crucial cochlear implant outcomes, however the relationship between electrode-to-lateral wall distance and neural response timing remains understudied. This study investigated the correlation between lateral wall proximity and electrically evoked compound action potential (ECAP) latencies using OTOPLAN Version 6.

MATERIAL & METHODS

This retrospective cohort study analyzed 44 patients with lateral wall cochlear implants over two years. High-resolution cone beam computed tomography images were processed using OTOPLAN Version 6.0 to measure electrode-to-lateral wall distances. ECAP latencies were recorded immediately postoperatively and at six-month and 12-month follow-ups. Correlation analyses looked for distance-latency relationships at overall, channel-specific, and regional levels using Pearson correlation coefficients.

RESULTS

Electrode distances ranged from 1.91mm (basal) to 3.60mm (apical), with corresponding ECAP latencies from 7.90ms to 14.82ms. Overall analysis (n=174 electrode-ear pairs) revealed a significant positive correlation (r=+0.29, P-value<0.001). Channel-level analysis demonstrated a strong monotonic relationship (r=+0.76, P-value=0.004), with individual ear correlations averaging r=+0.41. Regional analysis showed the middle cochlear region (electrodes 5-8) mainlydrove this effect (r=+0.34, P-value= 0.0096), while basal and apical regions showed no significant correlation.

CONCLUSIONS

Greater electrode-to-lateral wall distance correlated with longer ECAP latencies, especially in the middle cochlear region. The temporal stability of the distance-latency relationship supports sustained programming strategies without frequent re-evaluation, while the demonstrated independence from impedance measurements validates separate optimization strategies for electrode positioning and programming parameters.

Effect Of Electrode Array And Surgical Approach On Structure And Hearing Preservation In Cochlear Implantation: A Randomized Controlled Trial

Imogen A. M. L. van Beurden MD[1], **Saad Jwair MD, PhD**[1], **Tim Nauwelaers**[3], **Ralf. A. Boerboom**[1], **Robert J. Stokroos**[1], **Huib Versnel**[2], **Hans G. X. M. Thomeer**[1]

[1]*Department of Otorhinolaryngology and Head & Neck Surgery, University Medical Center Utrecht, Utrecht, Netherlands;* [2]*UMC Utrecht Brain Center, Utrecht, Netherlands;* [3]*Advanced Bionics, European Research Center, Hannover, Germany*

BACKGROUND & AIM

To assess the effect of electrode array model, lateral wall and Mid-Scala, and surgical approach, via the round window or cochleostomy on structure and hearing preservation after cochlear implantation surgery.

MATERIAL & METHODS

Forty-eight adults with sensorineural hearing loss receiving a cochlear implant were included between 2020 and 2025 in a tertiary referral center in The Netherlands. Participants were eligible with any degree of residual hearing. According to randomization, participants underwent cochlear implantation of a lateral wall or perimodiolar array via round window or cochleostomy approach. Outcomes were structure preservation based on preoperative high resolution computed tomography and postoperative cone beam computed tomography images and hearing preservation based on pure tone thresholds from before implantation and at six months.

RESULTS

36/48 (75%) of arrays were in the scala tympani. The lateral wall + round window group showed no scalar translocation (0%), both the lateral wall + cochleostomy and perimodiolar + cochleostomy groups showed scalar translocation in 2/12 (17%) and the perimodiolar + round window group showed scalar translocation in 6/12 (50%), with a significant difference between the four interventional groups (P = 0.02). Median hearing preservation across participants was 24%, and was similar in all groups (lateral wall + round window: 26%, lateral wall + cochleostomy: 42%, perimodiolar + round window: 22%, perimodiolar + cochleostomy: 6%; P = 0.23). Median hearing preservation was similar in all degrees of trauma (no trauma: 18%, potential trauma: 28%, scalar translocation: 16%; P = 0.49). Minimal hearing preservation was seen in all degrees of trauma.

CONCLUSIONS

The least traumatic insertion is achieved with lateral wall arrays implanted via a direct round window approach. Non-mechanical factors may contribute to the loss of residual hearing.

OP-196

Auditory And Functional Outcomes Of Cochlear Implantation In Single-Sided Deafness: A Single-Center Retrospective Study

Bülent Ulusoy[1], **Özgür Demir**[1]

[1]*The Department of Otolaryngology and Head and Neck Surgery at Selçuk University Faculty of Medicine Hospital, Konya, Turkey*

BACKGROUND & AIM

The primary aim of this study was to retrospectively evaluate the outcomes of cochlear implantation in patients with single-sided deafness (SSD).

MATERIAL & METHODS

The data of 13 patients who underwent cochlear implantation for single-sided deafness (SSD) between August 2012 and December 2025 were included in the study. During routine postoperative follow-up visits, the patients were evaluated using a visual analog scale (VAS) in terms of sound localization, changes in hearing and speech understanding in noisy environments, overall quality of life, and tinnitus. In addition, preoperative and postoperative hearing outcomes were documented by audiometry.

RESULTS

Of the patients included in the study, 9 were female and 4 were male. Among the 13 patients, data from 11 patients who attended routine follow-up visits were evaluated. The mean preoperative VAS score for sound localization was 0.72, whereas the mean postoperative VAS score increased to 5.72. Regarding hearing and speech understanding in noisy environments, the mean preoperative VAS score was 0.9, while the mean postoperative VAS score was 4.54. The mean preoperative VAS score for overall quality of life was 1.54, which increased to 7.54 postoperatively. Only two patients had preoperative tinnitus; tinnitus completely resolved in one patient after cochlear implantation, while no improvement was observed in the other. In postoperative audiometric evaluation on the implanted side, the mean hearing threshold was 46.36 dB and the mean speech discrimination score was 31.63. In addition, two patients were found not to be actively using their cochlear implants.

CONCLUSIONS

The importance of unilateral hearing loss has been increasingly recognized in recent years, the search for effective treatment options is ongoing. Especially in the pediatric age group, unilateral hearing loss may have negative effects on educational performance; moreover, difficulties in sound localization, speech understanding in noisy environments, tinnitus, and reduced quality of life are among the most common complaints in these patients. Since there is still no clear consensus on the optimal treatment approach and the number of patients treated in individual centers remains limited, we believe that sharing clinical experience and knowledge on this subject is of great importance.

Computed Tomography Predictors Of Round Window Visibility During Cochlear Implantation

Melikşah Aytekin[1], **Esra Kavaz Uştu**[1], **Muzaffer Elmalı**[2], **Sinan Atmaca**[1]

[1]*Ondokuz Mayıs University, School of Medicine, Department of Otorhinolaryngology;* [2]*Ondokuz Mayıs University, School of Medicine, Department of Radiology*

BACKGROUND & AIM

Round window (RW) electrode insertion is widely regarded as a minimally traumatic route in cochlear implantation (CI) and has been associated with improved preservation of residual hearing. Nevertheless, RW membrane exposure after posterior tympanotomy can be unexpectedly limited in a clinically meaningful subset of cases, potentially prolonging bony work, increasing manipulation, and prompting unplanned escalation to extended RW approaches or cochleostomy. A reproducible, computed tomography (CT)-guided method to anticipate limited RW visibility could strengthen preoperative counseling, optimize operative setup, and standardize intraoperative decision-making. This study aimed to estimate round window membrane visibility using high-resolution temporal CT measurements.

MATERIAL & METHODS

We performed a retrospective cohort study of 52 implanted ears in 41 patients who underwent CI by a single surgeon (January 2019–March 2023). Intraoperative RW visibility was classified according to the St. Thomas Hospital Classification using high-

definition operative videos reviewed by two experienced CI surgeons on two occasions separated by a two-week interval. Ears were categorized as favorable RW visibility (Type I–IIa) versus limited RW visibility (Type IIb–III). Preoperative high-resolution temporal bone CT DICOM datasets were analyzed in OsiriX MD. A neuroradiologist conducted six predefined radiologic measurements twice with a two-week interval; mean values were used for final analyses (external auditory canal angle, cochlear basal turn–midline angle, facial recess width, facial nerve position, RW niche angle, and modified facial recess distance). Group comparisons, multivariable modeling, and ROC analyses were undertaken to identify clinically applicable predictors.

RESULTS

Of 52 ears, 23 (44.2%) demonstrated favorable RW visibility and 29 (55.8%) had limited RW visibility. Groups did not differ significantly in age, sex, or operated side. RW niche angle differed between groups (p=0.045). In logistic regression, cochlear basal turn–midline angle (per-unit decrease) and modified facial recess distance (per-unit increase) were associated with limited RW visibility (p=0.038 and p=0.029, respectively). ROC analysis demonstrated significant discriminatory performance for modified facial recess distance (p=0.023).

CONCLUSIONS

Selected preoperative CT measurements—particularly RW niche angle and modified facial recess distance—may help anticipate limited RW visibility during CI and facilitate a pre-defined operative strategy (exposure optimization, targeted overhang drilling, readiness for endoscopic assistance, and explicit criteria for extended RW or alternative cochleostomy). The proposed workflow emphasizes practicality through standardized landmarks and repeated-measure methodology, while acknowledging the inherent limitations of retrospective ear-level analyses and underscoring the need for multicenter external validation.

Toward A Better Understanding Of Intracochlear Environment: Insights From Trans-Impedance Matrix Analysis In Cochlear Implant Recipients

Pontarlier Flavie[1], **Andre Raphaelle**[1], **Alonso Camille**[1], **Korchagina Julia**[1], **Sicart Marielle**[1], **Kaderbay Akil**[1], **Venail Frédéric**[1], **Mondain Michel**[1], **Pascalini Marion**[2]

[1]*Cochlear implant center, Montpellier - Palavas, CHU Montpellier, University of Montpellier;* [2]*Cochlear® Corporation, Toulouse, France*

BACKGROUND & AIM

The effectiveness of cochlear implants depends on the proper positioning and functioning of the electrodes. The trans-impedance matrix (TIM) explores the electrode–tissue interface. The objectives of this study was to explore TIM profiles in a real-world cohort of cochlear implant recipients and assess their relationship with electrode array positioning and speech perception skills.

MATERIAL & METHODS

This monocentric retrospective study included 117 adult cochlear implant recipients. TIM measurements were performed during routine follow-up, more than six months after implantation. TIM data were summarized using multiple indicators reflecting global impedance levels and spatial variability, then analyzed using principal component analysis (PCA) and clustering. The first two principal components explained 90% of the total variance.

Scalar position was assessed using postoperative CBCT imaging. Associations between TIM profiles and scalar position, electrode type, speech perception skills, and duration of implant use were evaluated using non-parametric statistical tests with correction for multiple comparisons.

RESULTS

Distinct TIM profiles were identified, highlighting variability in intracochlear electrical field distribution across patients. A significant association was observed in 107 patients between the presence of local minima on TIMs and positioning anomalies detected on CBCT (p=0.0106; Fisher's exact test). However, no statistically significant link was found between the clusters (PCA method) and the positioning of the electrode array in 117 patients (p = 0.48). Electrode design was significantly associated with TIM patterns, suggesting an impact of electrode characteristics on electrical field propagation within the cochlea (p = 0,014). In a subgroup of 64 patients, no statistically significant association was found between the clusters (PCA method) and the speech perception score or data logging.

CONCLUSIONS

In conclusion, TIM analysis provides a complementary, objective perspective on the intracochlear environment. Electrode design appears to be a key factor influencing electrical field distribution within the cochlea. Further multicentric and longitudinal studies are warranted to better define their role in clinical practice.

OP-199

ROBOTIC SURGERY OF CI IN CHILDREN: OUTCOMES AND PERSPECTIVES

FIAMMETTA KORSCH[1], **Antonio della Volpe**[1], **Antonietta Evangelista**[1]

[1]*ENT department Santobono-Pausilipon children hospital*

BACKGROUND & AIM

Cochlear implantation is currently the therapeutic target for children with severe profound sensorineural hearing loss where the benefit of conventional hearing aids is poor or absent. As described in the literature, cochlear implant surgery must be a "soft surgery". The basic principle of the surgical approach is to be delicate and atraumatic in order to limit possible damage to the inner ear. At the CRR of cochlear implants of the Santobono-Pausilipon hospital in Naples, the use of robotic surgery for cochlear implants has been introduced. An observational study was performed on the audiological outcomes in patients operated with Robotic Surgery.

MATERIAL & METHODS

The aim of the study is to evaluate the short- and long-term results obtained in the audiological field in robot-assisted pediatric implantology. 12 children with bilateral sensorineural hearing loss operated between 2023 and 2024 with robotic surgery were analyzed (11 bilateral cochlear implants and 1 unilateral due to anatomical conditions unfavorable to the use of the robotic arm).

RESULTS

The results of our study showed longer times in the robotic intervention 148.12 +/- 28.18 compared to 108.6 +/- 25.20 min of manual surgery. However, our analyses showed reduced intracochlear trauma and preservation of residual hearing assessed with electrocochleography performed after the intervention and one month after the intervention. Furthermore, post-intervention telemetries and prosthetic fittings performed in the first year had better results compared to the control group that performed traditional surgery.

CONCLUSIONS

In conclusion, robotic surgery in the pediatric field has currently shown evidence of reduction of fibrotic damage at the cochlear level, trauma to the vestibular system and ability to preserve residual hearing in the patient, therefore, with the aforementioned results an improvement in the outcomes of cochlear implant surgery is expected in the near future.

Satisfaction Level Of Users Of Cochlea Implants In Libya

Halima A. Al Sheeyab - Hussain Alkhamry Belkhair[1], **Salem Omaer**[1], **Arej Elmansoury - Arej Alojaly**[1]

[1]*University of Benghazi- Specialized Surgical Centre*

BACKGROUND & AIM

Cochlear implants (CIs) are transformative neural prostheses, but traditional success metrics often rely on objective audiological scores that fail to capture a user's daily lived experience with their audioprocessor. This study evaluates the satisfaction level and functional quality of life (QoL) of post childhood Cochlear Implants users in Libya. The primary aim is to evaluate the quality of life (QoL) across physical, psychological, and social domains.

MATERIAL & METHODS

This cross-sectional study included 107 CI users aged ≥15 years. QoL was assessed using the 35-item Cochlear Implant Quality of Life (CIQOL-35) questionnaire. Negatively worded items were reverse-scored before analysis to ensure consistent interpretation. Descriptive statistics and Pearson correlation analyses were performed.

RESULTS

The mean age was 22.42 ± 10.15 years; 51.4% were male and 48.6% female. Participants aged 15–19 years constituted 52.3% of the sample. The physical domain achieved the highest mean score (71.8% ± 10.8%), with advanced sound perception scoring highest (83.8%). In contrast, the Speech Production and Listening Effort subdomain showed the lowest score (45.0%), indicating persistent listening fatigue despite successful auditory restoration. Media interaction demonstrated favorable outcomes (79.0%), whereas social avoidance remained relatively high, with a score of 51.6%, suggesting ongoing communication-related challenges. A strong positive correlation was observed between physical functioning and social integration ($r = 0.81$, $p < 0.01$).

CONCLUSIONS

Cochlear implantation substantially improves physical aspects of QoL; however, listening effort and communication-related fatigue continue to limit social participation. Long-term rehabilitation, including auditory-verbal therapy, optimized processor programming, and ongoing auditory support, is essential to maximize functional outcomes and social reintegration in adolescent and adult CI users.

Pre-Operative And Post-Activation Anxiety, Depression, And Hopelessness Levels In Parents Of Children Undergoing Cochlear Implantation

Maide Selis[1], **Secaattin Gülşen**[2], **Sercan Çıkrıkçı**[2]

[1]*Department of Otorhinolaryngology (ENT), Audiology Unit, Gaziantep City Hospital, Gaziantep, Türkiye;* [2]*Department of Otorhinolaryngology (ENT), Gaziantep City Hospital, Gaziantep, Türkiye*

BACKGROUND & AIM

Cochlear implantation is widely recognized as one of the most effective treatment approaches for children with severe-to-profound hearing loss.Childhood hearing loss may affect not only the child's communication and language development but also the psychological well-being of parents. Although the literature indicates that parents of children with hearing loss may experience an increased psychological burden, studies from Türkiye that comparatively examine the pre-operative and post-activation periods remain scarce.This study aimed to assess levels of anxiety,depression, and hopelessness in parents of children undergoing cochlear implantation at two time points-before surgery and after device activation-and to examine differences according to parental gender.

MATERIAL & METHODS

The study included mothers (n=36) and fathers (n=32) of children scheduled for cochlear implantation, comprising a total of 68 parents. The majority of families had a nuclear family structure (79.5%), and the primary caregiver was most commonly the mother (89.7%). Data were collected using the Beck Anxiety Inventory (BAI), Beck Depression Inventory (BDI), and Beck Hopelessness Scale (BHS). Assessments were conducted at two time points: pre-operatively and at approximately one month following device activation. The one-month post-activation assessment time was selected to capture parents' early psychological adjustment to the implantation process. Data distribution was evaluated using the Shapiro–Wilk test. Based on data distribution characteristics, paired-samples t-tests or Wilcoxon signed-rank tests were applied for pre- and post-activation comparisons. Between-group comparisons of mothers and fathers were conducted using the Mann–Whitney U test, as normality assumptions were not met for any of the variables. A p-value of < 0.05 was considered statistically significant.

RESULTS

Among mothers, a statistically significant reduction was observed only in anxiety scores following activation (BAI: 14.03 ± 11.72 to 7.88 ± 9.58; $p = 0.001$, $r = 0.57$). No statistically significant changes were detected in depression or hopelessness scores ($p = 0.126$; $p = 0.545$, respectively). Among fathers, statistically significant reductions were identified across all three measures following activation (anxiety: $p = 0.047$, $r = 0.38$; depression: $p = 0.045$, $d = 0.40$; hopelessness: $p = 0.008$, $d = 0.55$). Between-group comparisons revealed that mothers had significantly higher anxiety and depression scores than fathers at both time points ($p < 0.001$). No significant difference between groups was observed with respect to hopelessness scores at either assessment.

CONCLUSIONS

The findings suggest positive changes in parental psychological well-being following cochlear implant activation; however, the nature and extent of these improvements differ between mothers and fathers. The persistence of psychological burden in mothers following activation underscores the importance of targeted psychosocial support for this group. The results suggest that parental support programs integrated into the cochlear implant process should be tailored to the distinct needs of mothers and fathers. Future studies with larger samples and longitudinal follow-up are warranted to further substantiate these findings.

BACKGROUND & AIM

The aim of this study is to evaluate the effects of bone-anchored hearing system (BAHS) on hearing gain and quality of life of patients.

MATERIAL & METHODS

This retrospective study included patients aged 18-70 years who underwent BAHS implantation. Preoperative and postoperative hearing results were compared. The World Health Organization Quality of Life Scale, Speech Perception Scale,

Spatial Perception Scale, Hearing Quality Scale, and Chronic Otitis Media Questionnaire 12 questionnaire were used to assess patients' quality of life. The data obtained were compared statistically using benefit analysis.

RESULTS

A total of 15 patients who agreed to participate were included in the study. In the preoperative and postoperative audiological results, significant improvements were observed at all frequencies (p=0.001). A significant reduction in free field thresholds was observed. A statistically significant improvement in quality of life scores was observed (p<0.022). The COMQ12 scores decreased significantly from 1.93 ± 0.84 to 0.86 ± 0.57 (p < 0.001), indicating a reduction in the severity of chronic otitis media symptoms and their impact on quality of life.

CONCLUSIONS

BAHS provides significant improvements in both quality of life and free field hearing thresholds when used in the required indications. These findings support the use of BAHS as a viable treatment option for patients with conductive or mixed hearing loss.

OP-203

Test Electrode-Based Method Of Measuring The Achievable Electrode Insertion Depth In Cochlear Implantation.

Rabea Al sabilah[1]

[1]*MOH Saudia arabia*

BACKGROUND & AIM

Processing the optimal length of electrodes for cochlear implants (Cis) is vital for achieving maximum effectiveness, and the results tend to differ between the preoperative radiological estimations and the depth reached at the time of surgery.

MATERIAL & METHODS

This study evaluates the feasibility of using a flexible insertion test electrode with colored depth markers to determine the practically achievable electrode insertion depth before CI electrode placement. The study was conducted at a tertiary center and included patients with inner ear anomalies, reimplantation cases, and profound deafness with no residual hearing. A custom insertion test electrode, 31.5 mm long, was inserted into the scala tympani (ST) to assess cochlear lumen accessibility. Standard CI surgical procedures were followed, including impedance field telemetry testing and evoked compound action potential measurements.

RESULTS

Ten patients (11 ears), aged 1 to 29, met the inclusion criteria. The test electrodes achieved radial depth real-time determination, allowing the surgeons to tailor the electrode lengths to fit the most applicable depth for implantation. This advancement mitigated incomplete insertion and improved preoperative planning

CONCLUSIONS

In the context of these findings, this research describes a new approach for setting the limits of electrode selection that minimizes the complications of electrode instability during cochlear implantation. These findings point to the insertion of test electrodes to achieve greater accuracy in surgery and, consequently, better outcomes for patients with cochlear implants

Effect Of Baseline Stimulation On Vestibular Responses In Human Vestibular Implant Recipients

Raymond van de Berg[1], **Marieke ten Hoor**[1], **Elke Devocht**[1], **Bernd Vermorken**[1], **Benjamin Volpe**[1], **Nils Guinand**[2], **Angelica Pérez-Fornos**[2], **Stan van Boxel**[1]

[1]*Department of Otorhinolaryngology and Head & Neck Surgery, Maastricht University Medical Center, The Netherlands;* [2]*Department of Otorhinolaryngology, University Hospital Geneva, Geneva, Switzerland*

BACKGROUND & AIM

Unilateral vestibular implants require baseline stimulation to encode bidirectional head motion. However, baseline activation reduces the dynamic range available for excitation and may affect overall performance. This study evaluated how baseline stimulation influences vestibular responses evoked by electrical modulation in humans.

MATERIAL & METHODS

Ten patients with bilateral vestibulopathy participated in the VertiGO! trial. Each received a vestibulo-cochlear implant with three semicircular canal electrodes. Electrical stimulation was delivered as biphasic pulse trains, either without baseline or with a continuous baseline set at 50% of the individual dynamic range. Eye movements were recorded using video-oculography and quantified as peak eye velocity (PEV) and misalignment angle. Test-retest reliability was excellent (ICC = 0.96 for PEV, 0.82 for angle).

RESULTS

Baseline stimulation did not consistently alter the upper comfort limit. It enabled bidirectional percepts and eye movements but reduced response magnitudes. Excitatory PEVs decreased by 34% compared with stimulation without baseline, while inhibitory PEVs reached only 7% of this maximum. Excitatory responses were eight times stronger than inhibitory responses. Misalignment angles were comparable across conditions, indicating preserved response direction.

CONCLUSIONS

Baseline stimulation allows bidirectional encoding but reduces total response capacity. Inhibitory responses remain weak, and overall output is dominated by excitation. For optimal fitting of unilateral vestibular implants, lower baseline levels should be considered to preserve functional response magnitude. Bilateral implantation may ultimately offer superior bidirectional sensitivity without compromising excitatory strength

Long-Term Outcomes Of Cochlear Implantation In Adult And Pediatric Patients With Genetic Deafness

Ghizlene Lahlou[1,2,3], **Hannah Daoudi**[1,3], **Yann Nguyen**[1,2,3], **Laurence Jonard**[1,4], **Sandrine Marlin**[1,4], **Isabelle Mosnier**[1,3]

[1]*Assistance Publique Hopitaux de Paris;* [2]*Sorbonne Université;* [3]*Institut Reconnect;* [4]*Institut Imagine*

BACKGROUND & AIM

Cochlear implantation (CI) is now clearly established for severe-to-profound hearing loss (HL) rehabilitation. Genetic etiology remains the leading cause of hearing loss among implanted patients, and may be a potential determinant of CI outcomes. The aim of this study was to describe CI outcomes in a pediatric and adult population with genetic HL depending on gene and pathogenic mechanism.

MATERIAL & METHODS

This retrospective monocentric study, conducted in a national reference center, included 102 implanted patients with a genetic confirmed HL. The population was divided in 40 patients for the pediatric group – with 20 patients bilaterally implanted resulting in 60 ears – and 62 for the adult group – with 29 patients bilaterally implanted resulting in 92 ears –. Genetic diagnosis described 28 mutated genes, classified into 7 pathogenic mechanisms. Auditory performances were assessed regarding speech perception in silence (Fournier list) and in noise (MBAA words) at 60 dB SPL. Communication was evaluated with the CAP score, and quality of life with the APHAB score. Analyses were performed to compare auditory performances regarding the gene and pathogenic mechanism.

RESULTS

The two most frequently implicated genes were GJB2 (35% and 19% in the pediatric and adult group, respectively) and SLC26A4 (35% and 10% in the pediatric and adult group, respectively). In the pediatric population, At the last available assessment (13±1.0 years), mean speech perception was 83±2.9% in silence and 74±5.3% in noise. In the adult population, mean follow-up duration was 5±0.5 years. Auditory performances, communication and quality of life showed a significant improvement as early as 3 months after CI, this improvement being significant up to 11 years after CI. Mean speech perception 1 year after CI was 69±3.4% in silence and 53±5.0% in noise. The part of patients able to use phone with a known listener (CAP≥7) was 64% at 1 year after CI. No significant difference was observed, both in the pediatric and adult population, depending on the gene and the pathogenic mechanism.

CONCLUSIONS

CI outcomes in patients with a genetic HL are similar, if not superior in the adult population, compared with patients with non-genetic HL. These results remain consistent regardless the implicated gene or the underlying pathogenic mechanism, and thereby fail to explain the interindividual variability observed in CI outcomes.

OP-206

Building Anatomy Based Maps: Combining The Impedance And Pre-Op CT

Asma Alahmadi[1,2]

[1]*Makkah Health Cluster;* [2]*King Abdullah Ear Specialist Center*

BACKGROUND & AIM

Anatomy-based fitting (ABF) in cochlear implantation utilizes pre-operative imaging to create individualized tonotopic frequency maps using OTOPLAN. This study aimed to assess the accuracy of pre-operative predictions by comparing them with post-operative imaging findings and to explore a correction strategy based on basal electrode positioning.

MATERIAL & METHODS

A retrospective analysis was conducted on 27 adult ears implanted with MED-EL FLEX28 or FORM24 electrode arrays. Predicted angular insertion depths (AID) and corresponding frequency allocations from pre-operative planning were compared with measurements obtained from post-operative CT scans across all electrode contacts (C1–C12). A deviation of ±7 semitones was considered clinically acceptable. Intraoperative impedance telemetry was evaluated for its ability to confirm electrode insertion. A correction approach was developed and applied.

RESULTS

The mean absolute frequency error (MAFE) ranged from 2.8 to 3.0 semitones, remaining within the predefined clinical threshold. Four ears (16.7%) demonstrated at least one electrode exceeding ±7 semitones. A significant correlation was observed between basal electrode position and apical prediction error ($r = 0.52$, $p = 0.010$). Intraoperative impedance telemetry showed a 100% positive predictive value for identifying intracochlear placement, but a false-negative rate of 11.1% was noted at the basal electrode. Application of the correction method reduced MAFE to 2.5–2.6 semitones and decreased the outlier rate to 8.3%.

CONCLUSIONS

Pre-operative planning using OTOPLAN yields clinically acceptable frequency mapping in most cases. Incorporating a basal electrode–based adjustment improves accuracy and reduces variability. While impedance telemetry is useful for confirming electrode placement, it should be interpreted alongside imaging data.

BACKGROUND & AIM

This study aimed to evaluate the clinical characteristics, causes of readmission, postoperative com plications, and auditory outcomes of pediatric patients in whom otitis media with effusion (OME) was detected during cochlear implant (CI) surgery.

MATERIAL & METHODS

This retrospective study reviewed medical records and audiological follow-up data of 461 ears from 243 patients who underwent CI surgery. Postoperative complications were analyzed in the entire cohort. For audiological outcome analysis, 25 ears with intraoperatively detected OME were compared with 25 randomly selected ears without OME and with similar clinical characteristics to ensure balanced group sizes and reduce potential confounding. Appropriate parametric tests were applied, and effect sizes were calculated using Cohen's d and Cram´ er's V.

RESULTS

There were no significant differences between the OME and control groups regarding age or gender distribution ($p > 0.05$). Pure-tone average and most audiological parameters did not differ significantly between groups. However, the Speech Recognition Threshold (SRT) was significantly lower in the OME group compared with the control group ($p = 0.012$, $d = 0.741$). Postoperative infection occurred more frequently in ears with OME than in those without (12.0% vs. 2.5%), and this difference was statistically significant ($p = 0.035$).

CONCLUSIONS

Although the presence of OME during CI surgery is associated with an increased risk of postoperative infection, the clinical effect size is limited. OME does not appear to adversely affect overall auditory perfor mance. With appropriate perioperative management and follow-up, OME should not be considered an absolute contraindication for cochlear implantation in pediatric patients.

Customised Frequency Mapping And Basal Electrode Optimisation In Adult Cochlear Implant Users: A Prospective Crossover Study

Phoebe Ramos[1,2], **Raoul Willis**[1], **Aaron Collins**[2], **Christo Bester**[2], **Jean-Marc Gerard**[1,2], **Robert Briggs**[1,2], **Stephen O'Leary**[1,2]

[1]*Royal Victorian Eye and Ear Hospital, Melbourne, Australia;* [2]*Department of Otolaryngology, University of Melbourne, Melbourne, Australia*

BACKGROUND & AIM

Cochlear implants (CIs) provide substantial auditory benefit for individuals with severe-to-profound hearing loss; however, variability in outcomes persists despite advances in electrode design, surgery, and programming. Increasing evidence indicates that electrode position, particularly in the basal region, influences perceptual experience. Standard clinical frequency maps use fixed allocation tables that do not account for individual cochlear anatomy, potentially contributing to frequency-to-place mismatch and perceptual distortion. Anatomically informed programming with selective basal electrode optimisation may improve listening quality. We hypothesised that an imaging-guided customised frequency map (CFM) with targeted basal electrode deactivation would improve perceived sound quality without compromising auditory outcomes.

MATERIAL & METHODS

This prospective within-subject crossover study included 47 adult CI recipients (12 single-sided deafness, 35 bilateral deafness) implanted at a tertiary referral centre using 35 perimodiolar and 12 lateral wall electrode arrays. Participants were tested approximately 8 weeks after device switch-on and underwent sequential evaluation with a standard clinical map and a CFM during a single 1.5-hour session without acclimatisation. The CFM was derived from postoperative computed tomography imaging using the Stakhovskaya tonotopic model to estimate electrode frequency position. Basal electrode optimisation identified the electrode closest to 7438 Hz as the center upper frequency boundary, with more basal contacts deactivated to reduce frequency-to-place mismatch. Outcomes included consonant–vowel–consonant word and phoneme recognition, speech recognition threshold (SRT), spectral-temporo discrimination task (STDT) performance, global Likert ratings, and map preference. Paired statistical comparisons evaluated differences between mapping conditions, and exploratory analyses examined associations among electrode positioning, basal mismatch, electrode deactivation, and auditory performance.

RESULTS

Word and phoneme recognition scores were higher with the standard clinical mapping; however, the magnitude of the difference was modest, with mean absolute differences of approximately 9% between conditions ($p<0.01$). SRT and STDT did not differ between maps (all $p>0.05$). Subjective preference and voice-quality composite scores were comparable (mean difference 0.57, 95% confidence interval −0.32 to 1.46; $p=0.20$). Basal frequency mismatch significantly predicted electrode deactivation ($p=0.01$; Figures 1–2). On average, three electrodes per participant were deactivated (range 0–8). Four participants demonstrated anatomical alignment without basal mismatch and required no electrode deactivation. One participant was excluded due to a software-related programming issue during testing. Importantly, selective basal electrode deactivation was not associated with reduced speech perception, SRT, or STDT outcomes, indicating no detrimental acute auditory effect. Qualitative patient feedback suggested more natural sound perception with reduced listening effort using the CFM, particularly among single-sided deafness participants.

CONCLUSIONS

Imaging-guided customised frequency mapping with selective basal electrode deactivation was feasible within routine clinical programming and did not adversely affect objective speech outcomes. Formal subjective measures did not differ between maps in this acute setting, although qualitative patient impressions suggested perceptual differences requiring further study. These findings support anatomically informed programming and highlight the potential importance of basal electrode positioning. Future work should evaluate real-world listening outcomes and explore combined surgical and programming strategies to optimise CI performance.

OP-209

Thirty Years Of Cochlear Implant Revision Surgery: Indications, Management And Outcomes At A Single Tertiary Centre

Celal Emre Çavlan[1], **Başak Sıla eryiğit**[1], **Yavuz Gündoğdu**[1], **Ali Cemal Yumuşakhuylu**[1], **Çağlar Batman**[1]

[1]*Marmara University Hospital, Department of Otorhinolaryngology – Head and Neck Surgery, Istanbul, Turkey*

BACKGROUND & AIM

Cochlear implant revision surgery is performed for various reasons including device failure, wound complications, and electrode problems. Device failure has been reported as the most common indication in the literature, accounting for more than half of all revision cases. However, data from different centres show considerable variation. In this study, we present our

30-year single-centre experience with cochlear implant revision surgery and compare our indications, surgical management, and outcomes with the existing literature.

MATERIAL & METHODS

We retrospectively reviewed 1,359 patients who received primary cochlear implants at our centre between 1995 and 2025. A total of 54 patients required revision surgery. We recorded patient age, sex, time to revision, presenting complaint, fixation technique, electrode insertion approach, revision indication, and surgical outcome. Fisher exact test and Mann-Whitney U test were used for statistical analysis.

RESULTS

The overall revision rate was 3.97% (54/1,359). Thirty-one patients were female (57.4%) and 42 were paediatric (77.8%), with a median implantation age of 3.0 years. The mean time to revision was 29.8 months (median: 24.0; range: 0.1–132 months). Unlike most reports in the literature, implant exposure was the most common indication for revision surgery (n=28; 51.9%), followed by device failure (n=11; 20.4%) and electrode malposition (n=5; 9.3%). The presenting complaint clearly reflected the underlying cause: 96.4% of exposure cases presented with wound infection or discharge, while all device failure cases presented with hearing loss ($p < 0.001$). Classical bone well fixation was associated with a higher rate of implant exposure compared to subperiosteal pocket fixation (59.5% vs 25.0%; OR=4.41; 95% CI: 1.04–18.71; p=0.051). Device salvage was achieved in 51.9% and most revisions were completed in a single operation (74.1%).

CONCLUSIONS

Cochlear implant revision surgery carries a distinct aetiology profile that varies significantly across centres. In our experience, wound-related complications — not device failure — represent the primary driver of revision, and fixation technique is the most important modifiable factor. Careful selection of the receiver-stimulator fixation method at the time of primary implantation may substantially reduce long-term revision risk. Surgeons should be aware that the presenting complaint reliably guides the diagnosis, and that device salvage is achievable in the majority of cases without explantation.

Using Caeps To Verify CI Map And Improve Hearing Outcome

Dayse Tavora-Vieira[1,2], **Caris Bogdanov**[1], **Aanand Acharya**[1]

[1]*University of Western Australia;* [2]*Curtin University*

BACKGROUND & AIM

Background: The current standard programming of hearing implants relies heavily on subjective feedback from patients to determine the Threshold (T) and Most Comfortable Levels (C/MCL). However, subjective responses may not be reliable, especially in patients with cognitive impairments, non-English speakers, or children. Objective tools like CAEPs have the potential to eliminate subjectivity and expedite the creation of optimal maps for better hearing outcomes.

Objectives: This study aimed to explore whether acoustic cortical auditory evoked potential (aCAEP) measures could validate cochlear implant (CI) maps and enhance auditory outcomes in adults with single-sided deafness (SSD) or bilateral hearing loss.

MATERIAL & METHODS

aCAEPs were measired in CI recipients using speech tokens (/m/, /g/, /t/, /s/). If aCAEP responses were absent for any speech tokens, the CI map was adjusted and CAEP measures were repeated. Speech testing occurred before and after CAEP-guided map adjustments.

RESULTS

The study included 67 SSD-CI and 108 unilateral CI users. Initially, all CIs were mapped based on subjective loudness perception. Of these, 37% of the users exhibited CAEP responses for all four speech tokens and were considered optimised from the outset. However, 63% lacked a CAEP response for at least one token, leading to CI map adjustments. These adjustments enabled CAEP responses for all four speech tokens in 31 of the individuals. Speech perception significantly improved in both quiet and noisy environments following eCAEP-based adjustments.

CONCLUSIONS

The study successfully employed aCAEP recordings to validate CI mapping and enhance speech outcomes in CI users. This objective tool shows promise in mitigating the limitations associated with subjective feedback and improving the efficiency and effectiveness of CI mapping.

Sustainability In The Healthcare Environment

Ilona Anderson[1]

[1]MED-EL GmbH

BACKGROUND & AIM

We are facing a climate crisis. Our greenhouse gas (GHG) emission has spiked by 12% from 2010 to 2019. We have had an increase in temperature of 1.1°C between 2011 and 2020. Healthcare is the fifth largest producer of GHG. A Health Care Without Harm (HCWH) report found that high-income countries have exceptionally high levels of health-related carbon emissions. The U.S. contributed 27%, China with 17%, the European Union with 12%, Japan with 5%, Russia with 4%, India, Brazil, South Korea, Canada, and Australia each contributing 2%, and the remaining 25% coming from other countries.

MATERIAL & METHODS

This presentation will consider the impact of healthcare, particularly for cochlear implantation, on sustainability. This paper will focus on two things. Part one is a review of healthcare and sustainability literature. This will include reviewing the Sustainable Development Goals (SDG) goals from the United Nations, defining and setting up a Green Team, and what is being done in the healthcare environment. Part two is a survey of health professionals to ascertain what they currently do and where they could go in the future. Most literature on sustainability on healthcare are review articles. The survey here will provide evidence of what people are doing.

RESULTS

Data from members of the HEARRING group will be reviewed and analysed according to their focus on sustainability. Their ideas for the future will also be reported on. This will link in with the review, which will show us what we can do to contribute to planetary health. Examples of this will be creating a GreenTeam, and developing ideas based on applicable SDGs.

CONCLUSIONS

Every drop creates an ocean. What we do personally and in our professional environment will make a difference to us, and to those who come after us. Health professionals will know what SDGs are. They will know how to create a Green Team. They will understand the impact healthcare has on the environment. Results discussed in this paper should help us as health professionals move forward in their sustainability practises.

Modified Subtotal Petrosectomy And CI

Khassan Diab[1]

[1]NMRCO FMBA of Russia, Moscow, Russia

BACKGROUND & AIM

Classical three-stage subtotal petrosectomy (STP) is technically demanding and traumatic. This study aims to present a modifiedsingle-stage protocol for patients with deafness and chronic otitis media,combining ear sanitation and cochlear implantation (CI) in one procedure.

MATERIAL & METHODS

Over the period from2014 to 2025, almost 70 patients with chronic otitis media and deafness weretreated. In 50% of cases,classical three-stage STP was performed; in the other 50% we used modified STP. Key modifications in modified technic include: obligatoryblind sac closure of the ear canal (Cul-de-sac technique) and differentapproach to surgical treatment (CWU, CWD, transcanal approach) without cavityobliteration. Cochlear implantation was performed simultaneously.

RESULTS

All operated patients achieved primary goals:complete sanitation, no disease recurrence, successful device implantation andauditory rehabilitation. Omitting the obliteration stage and individual choice of surgical intervention volume reduced operative time and minimizedcomplication risks.

CONCLUSIONS

Modified subtotalpetrosectomy with CI is a safe and effective single-stage strategy that enablesthe selection of an optimal surgical treatment method for patients with chronic otitis and deafness. This approach, using an appropriate sanitation technique tailored to the extent of the pathological process, minimizes surgical trauma and reduces the risk of specific complications, such as disease recurrence andimplant protrusion. In the modified technique, the first step – blind sac closure is a mandatory step, while the subsequent stages are variable andindividually tailored.

Beyond Hearing: How Cochlear Implants Impact Cognition And Quality Of Life In Older Patients

Mariam Aljehani[2,3], **Faris Albassam**[1], **Abdulmohsen S. Alanazi**[3], **Abdulaziz Mohammed Alghanim**[3], **Ayad A. Bagazi**[3], **Nezar Hamed**[3], **Abdulrahman Hagr**[1,2], **Farid Alzhrani**[1,2], **Salman Alhabib**[1,2]

[1]*King Saud University;* [2]*King Abdullah Ear Specialist Center;* [3]*Imam Muhammad Ibn Saud Islamic University*

BACKGROUND & AIM

Background: Age-related hearing loss is strongly associated with cognitive decline and dementia. Cochlear implantation (CI) has emerged as an effective intervention for severe-to-profound hearing loss and may influence cognitive and psychosocial outcomes in older adults. This systematic review and meta-analysis aimed to evaluate the cognitive, audiological, psychological, and quality-of-life outcomes following CI in the elderly

MATERIAL & METHODS

Methods: A systematic search of four databases was conducted for studies published up to February 2026. Studies including adults aged ≥55 years with bilateral hearing loss who underwent CI and reported pre- and post-implantation outcomes were eligible. The primary outcome was change in global cognitive function, measured by the Mini-Mental State Examination (MMSE) score. Secondary outcomes included domain-specific cognitive measures, audiological and speech perception performance, psychological outcomes (depression and anxiety), and patient-reported quality of life and subjective hearing ability. Pooled analyses were conducted using random-effects models, and results were expressed as mean differences (MD) with 95% confidence intervals (CI).

RESULTS

Results: A total of 31 studies involving 1,210 participants were included. For the primary outcome, pooled analysisshowed no statistically significant change following CI (MD = 0.20, 95% CI: −0.75 to 1.15, p = 0.68). For secondary outcomes, significant improvements were observed in audiological performance and speech perception measures, as well as in global cognition assessed using hearing-adapted neuropsychological batteries and cognitive screening tests. Significant reductions were also observed in anxiety and depressive symptoms assessed using the Hospital Anxiety and Depression Scale, alongside substantial improvements in patient-reported hearing-related quality of life and subjective hearing ability. In contrast, no statistically significant improvements were observed in several executive function and working memory measures, including tests assessing cognitive flexibility, inhibition, and short-term memory. Depressive symptoms assessed using the Geriatric Depression Scale also showed no significant change.

CONCLUSIONS

Conclusion: CI in older adults provides substantial benefits in auditory performance, quality of life, and selected cognitive domains, particularly memory and attention. These findings support CI as an effective intervention that may help alleviate the cognitive and psychosocial consequences of severe hearing loss in the aging population. Future CI studies in older adults should incorporate family-reported and social participation outcomes to capture benefits that may not be fully perceived by recipients themselves.

[1]*UNISANITAS: Fundacion Universitaria Sanitas COLOMBIA*

BACKGROUND & AIM

Chronic otitis media (COM) is a common cause of disabling hearing loss, especially in low and middle income countries, which accounts for almost 150 million people. Most of the literature about hearing rehabilitation with bone conduction implant (BCI) in COM have small and mixed sample sizes, without differentiating performance in conductive hearing loss (CHL) and mixed hearing loss (MHL) separately. The aim of this study was to compare audiological outcomes and self-perceived benefits in patients with sequelae of COM and MHL who underwent auditory rehabilitation with PT-BCI (BAHA Attract®) versus piezoelectric AT-BCI (Osia®).

MATERIAL & METHODS

A multicenter, prospective, analytical observational study was conducted in Colombia. Patients with sequelae of COM who received auditory rehabilitation for MHL via a transcutaneous BCI, specifically the passive system (BAHA Attract®) or the active

system (Osia® Cochlear System), were included. Conversational pure-tone average (PTA; 0.5, 1, 2, and 4 kHz) and high-frequency PTA (HF-PTA; 4, 6, and 8 kHz) were measured preoperatively, 3 months, and 12 months postoperatively. Self-perceived benefit at 12 months, assessed using the Client Oriented Scale of Improvement (COSI) questionnaire, was collected and analyzed in conjunction with the audiological results.

RESULTS

A total of 261 cases were included, with 211 implanted with PT-BCI (BAHA Attract®) and 50 with AT-BCI (Osia®). Both groups exhibited homogeneous baseline variables with the exception of soft-tissue thickness. This confounding variable was addressed using robust covariate control models and was found not to significantly impact the PTA and HF-PTA outcomes. The mean gain in PTA for the PT-BCI (BAHA Attract®) group was 41.8 dB, and for HF-PTA, 38.8 dB. For the AT-BCI (Osia®) group, the gains were 39.7 dB for PTA and 44.7 dB for HF-PTA, respectively.

CONCLUSIONS

BCI represents a successful hearing rehabilitation modality for patients with MHL as a sequela of COM. Both AT-BCI and PT-BCI devices demonstrated a highly statistically significant improvement in auditory performance and quality of life. In this study, the AT-BCI exhibited superior performance, with a gain of 3.1 dB higher than the PT-BCI, particularly in HF-PTA, although this difference was not statistically significant for either PTA or HF-PTA.

OP-215

Coupling Efficacy Of The Bonebridge Using Screw Fixation

Irina Wils[1], **Tobias Mair**[1], **Ivo Dobrev**[1], **Christof Röösli**[1]

[1]*Department of ENT, Head and Neck Surgery, University Hospital Zurich, University Zurich, Switzerland*

BACKGROUND & AIM

The Bonebridge™ (MED-EL, Innsbruck, Austria) is a widely recognized active transcutaneous bone conduction implant designed to address conductive hearing loss. This implant is connected to the mastoid bone via two cortical fixation screws but the effect of coupling strength on cochlear activation remains unclear. The aim of this study is to evaluate the effect coupling configurations on the cochlear activation.

MATERIAL & METHODS

Five human cadaveric heads will undergo implantation of the Bonebridge device. Variations in fixation methods - ranging from standard two-screw attachment to a single screw and a loose skin-tension fitting - will be tested. Objective measures of cochlear activation will include intracochlear pressure, monitored via two custom-made intracochlear acoustic receivers (ICARs) placed in the scala vestibuli and scala tympani. Additionally, a 3D Laser Doppler Vibrometer (3D LDV) will measure the vibrational velocity of the cochlear promontory, stapes, and skull surface.

RESULTS

Expected outcomes will characterize the relationship between coupling configurations and changes in intracochlear pressure, as well as the velocity of the cochlear promontory, the stapes and the skull surface near the device.

CONCLUSIONS

This study aims to contribute to the optimization of Bonebridge implantation techniques by evaluating the viability of alternative coupling methods.

OP-216

Utilization Of CT Based Virtual Endoscopy Of The Internal Auditory Canal As A Diagnostic Imaging Tool For Cochlear Nerve Deficiency

BACKGROUND & AIM

The presence of a functional cochlear nerve is a key issue in the preoperative evaluation of pediatric candidates for cochlear implants. MRI has been the gold standard tool for assessment of cochlear nerve pre-operatively. Correlations between cochlear nerve deficiency (CND) and bony landmarks of internal auditory canal are not yet well understood. The aim of this study was to assess the reliability of CT based virtual endoscopy (CTVE) of internal auditory canal as a pre-operative method for evaluation CND.

MATERIAL & METHODS

High resolution CT (HRCT) and MRI of a total of 250 cochlear implant candidates were retrospectively evaluated. DICOM data of HRCT were used for reconstruction of CTVE image of IAC, that were evaluated for anatomical bony landmarks. Tractus

spiralis foraminosus was used as a bony landmark indicator for presence of normally developed cochlear nerve (CN). Sensitivity and specificity of such finding, for diagnosis of CND, was evaluated based on correlation with corresponding MRI images of the CN.

RESULTS

From a total of 500 CTVE of IAC, diagnosis of unilateral and bilateral CND was made in 25 and 50 cases respectively. Diagnosis was confirmed in all of them, based on MR images of those cases. Five cases, whose CTVE reported normal CN, were diagnosed as CND based on MRI. Overall sensitivity and specificity ratios of CTVE, for diagnosis of CND, were 96.15% and 100% respectively.

CONCLUSIONS

CTVE can be used as a pre-operative imaging tool for evaluation of CN and detection of CND. Tractus spiralis foraminosus can be considered as a sensitive anatomical bony landmark for presence of normally developed CN.

BACKGROUND & AIM

Preclinical and clinical studies on the targeted application of glucocorticoids to the inner ear in conjunction with a cochlear implant (CI) show promising results: inflammatory reactions, fibrosis and foreign body reactions can be significantly reduced, while residual hearing is better preserved. The first-in-human application in nine patients not only confirmed safety, but also showed stable and low impedance values and, in most cases, very good preservation of residual hearing.

MATERIAL & METHODS

As part of a multicentre, national, single-arm clinical study, a MED-EL cochlear implant with a dexamethasone-releasing electrode array (SYNCHRONY 2 FLEX28 DEX) was used. The aim of the study is to evaluate the safety and performance of this innovative medical device. The main criterion is the comparison of speech intelligibility before surgery and six months after surgery. In addition, various electrophysiological and patient-related parameters are being investigated.

RESULTS

Within one year, 62 patients were enrolled in the study as planned and have recently followed up according to protocol. Initial results show a very good safety profile. No serious device-related adverse events occurred. The complete results of the primary and secondary endpoints will be reported after full analysis of the clinical trial data set.

CONCLUSIONS

Local drug release in the inner ear in combination with a CI shows great potential for sustainably improving CI care. The ongoing multicentre study with the dexamethasone-releasing electrode carrier has been extremely promising so far and may set a new standard in therapy in the future.

OP-218

Endoscopic Assistance In Coclear Implantation In Children

Igor Berezniuk[1], **Volodymyr Berezniuk**[2], **Andriy Zaitsev**[2]

[1]Regional medical center for family health, Dnipro; [2]Dnipro state medical univercity

BACKGROUND & AIM

Background. The standard technique for cochlear implantation is the transmastoid approach through posterior tympanotomy to the middle ear cavity. However, in some cases, anatomical variations, particularly the position of the mastoid segment of the facial nerve, may limit visualization of the round window area during microscopic examination. Insufficient identification of anatomical landmarks increases the risk of surgical errors and complications. The use of endoscopic assistance may improve intraoperative visualization and surgical safety.

Objective. To improve the effectiveness of surgical treatment in children with severe hearing impairment through the use of endoscopic assistance during cochlear implantation.

MATERIAL & METHODS

Materials and Methods.

The outcomes of cochlear implantation were analyzed in 64 children aged 1 to 4 years. A total of 96 cochlear implants were inserted: 32 children underwent simultaneous bilateral cochlear implantation (64 implants), while another 32 children underwent unilateral implantation (32 implants). In all cases, standard mastoidectomy and posterior tympanotomy were performed. Endoscopic visualization of the round window area through posterior tympanotomy was carried out in all patients using rigid 0° and 30° endoscopes, 3 mm in diameter and 14 cm in length, equipped with a high-definition camera (Karl Storz, Tuttlingen, Germany). After endoscopic identification of the round window and its membrane, drilling of the round window niche and electrode insertion were performed mainly under microscopic control.

RESULTS

Results. In 12 cases (18.75%), endoscopic assistance was critically necessary for accurate identification of the round window membrane. In all these patients, less than half of the round window membrane was visible after drilling the niche. Endoscopic visualization allowed the standard surgical procedure to be completed successfully in all cases without conversion to cochleostomy or other more invasive techniques. No intraoperative or postoperative complications were observed.

CONCLUSIONS

Conclusions. Endoscopic assistance during cochlear implantation in children provides improved visualization of the round window area and facilitates surgical orientation, especially in patients with complex anatomy or congenital inner ear malformations. Combining the traditional microscopic approach with endoscopic control helps reduce the risk of complications, increases surgical safety, and contributes to favorable functional outcomes.

Cochlear Implantation And MRI-Related Complication In Hearing Loss Due To Meningitis Sequelae: A Multidisciplinary Case Study

Ceren Tombuloğlu[1,3], **Serpil Mungan Durankaya**[2], **Hande Evin Eskicioğlu**[2], **Enis Alpin Güneri**[4]

[1]Tınaztepe Üniversitesi, Sağlık Hizmetleri Meslek Yüksekokulu Odyometri Programı, İzmir/ Türkiye; [2]Dokuz Eylül Üniversitesi Sağlık Hizmetleri Meslek Yüksekokulu Odyometri Programı, İzmir/ Türkiye; [3]Dokuz Eylül Üniversitesi Sağlık Bilimleri Enstitüsü, Odyoloji Bölümü, İzmir/Türkiye; [4]Dokuz Eylül Üniversitesi Tıp Fakültesi Kulak Burun Boğaz Hastalıkları Anabilim Dalı, İzmir/Türkiye

BACKGROUND & AIM

The aim of this study is to interrupt the clinical procedure and separately monitor the implants in a patient who underwent bilateral cochlear implantation due to sequelae of meningitis and was regularly monitored with multidisciplinary treatment, due to cardiac arrest and subsequent device dysfunction detected during contrast-enhanced magnetic resonance imaging (MRI).

MATERIAL & METHODS

This study is the only case report retrospectively evaluating the clinical data of a patient who underwent bilateral cochlear implantation following meningitis. Preoperative and postoperative audiological findings, device function checks, vestibular rehabilitation process, and post-MRI clinical development were analyzed.

RESULTS

A patient developed bilateral profound sensorineural hearing loss following meningitis and underwent cochlear implantation in the right ear and seven months later in the left ear. Postoperatively, regular audiological follow-up was conducted and auditory rehabilitation was initiated. Speech perception performance was better in the left ear than in the right.

During follow-up, while vestibular rehabilitation was ongoing, the patient experienced an acute vestibular attack. Multidisciplinary clinical evaluation raised suspicion of multiple sclerosis (MS), and magnetic resonance imaging (MRI) was deemed clinically necessary. During MRI, a bandaging-related technical complication at the implant site, performed by the radiology team, led to interruption of the procedure and activation of an emergency code. Surgical magnet removal was required, followed by repeat MRI and revision surgery one week later. MS was subsequently confirmed.

After revision surgery, the device adaptation process was reinitiated and followed a more challenging clinical course compared to the pre-MRI period.

CONCLUSIONS

This case demonstrates that even after acute and unexpected clinical complications, close evaluation of implant performance and continued multidisciplinary coordination are crucial for the continuity of the patient's rehabilitation process. It is believed that the follow-up process in implanted patients should not be limited solely to auditory performance, but should also address systemic and neurological developments with a holistic approach.

Cochlear Implantation In Mondini Syndrome Using FORM 19 MED-EL Electrodes At Al Zahrawi Hospital, Libya: A Prospective Observational Study

Abdussalam Mohamed Jahan[1,1], Aisha Abuzaghia[11]

[1]*Al Zahrawi Hospital Department of Otolaryngology – Head and Neck Surgery Cochlear Implant Unit Misrata, Libya*

BACKGROUND & AIM

Background: Mondini syndrome is a congenital inner ear malformation commonly associated with severe to profound sensorineural hearing loss and may pose surgical challenges during cochlear implantation. The FORM 19 MED-EL electrode is designed to allow effective insertion in malformed cochleae while preserving delicate inner ear structures.

MATERIAL & METHODS

Methods: This prospective study included Five patients, aged from 2 to 5-year-old, diagnosed with Mondini malformation who underwent cochlear implantation using FORM 19 MED-EL electrodes from April 2023 to March 2025 at Al Zahrawi private Hospital, Misurata city, Libya. Surgical findings, cerebrospinal fluid gusher, electrode insertion success, postoperative complications, and early auditory outcomes were evaluated.

RESULTS

Results: Successful electrode insertion was achieved in four patients. One patient was difficult to insert. Intraoperative cerebrospinal fluid gusher was encountered in all cases and managed successfully without major complications. Early postoperative auditory responses and device activation outcomes were satisfactory in most patients.

CONCLUSIONS

Conclusion: Cochlear implantation using FORM 19 MED-EL electrodes in patients with Mondini syndrome is safe and effective. The electrode design may facilitate successful implantation in malformed cochleae and provide favorable early hearing outcomes. This study highlights the growing experience of cochlear implantation surgery at Zahrawi Hospital.

OP-221

Preoperative Speech Intelligibility Rating As A Predictor Of Cochlear Implant Outcomes

Okan Öz[1,2], Olivier M. Vanderveken[1,2], Vincent Van Rompaey[1,2], Paul Govaerts[1,2]

[1]*Department of Translational Neurosciences, Faculty of Medicine and Health Sciences, University of Antwerp, Antwerp, Belgium;* [2]*Eargroup, Antwerp, Belgium*

BACKGROUND & AIM

Despite the overall success of cochlear implantation (CI), postoperative results show considerable interindividual variability, which is partly attributed to preoperative clinical factors such as the type and duration of deafness, the results of medical imaging, etc. These factors are often difficult to define or document, and, can only partially explain the outcome variability. This study investigated whether the quality of patients' own articulation, as an expression of the quality of auditory input during the speech and language development, is an additional factor contributing to this variability.

MATERIAL & METHODS

A retrospective cohort study was conducted including 306 CI users who had received an implant at a single tertiary referral centre after 2014. The mean age at the time of implantation was 55±20 (M±SD). Preoperative Speech Intelligibility Rating (SIR) was systematically assigned during CI candidacy evaluation, and postoperative speech recognition scores (SRS) were collected longitudinally for up to five years after implantation. Longitudinal outcomes were analysed using linear mixed-effects models.

RESULTS

Preoperative SIR showed a strong main effect on postoperative SRS ($F(3,295.4)=70.03$, $p<.001$), explaining 33.3–42.9% of variance across test moments. The SIR 1–2 group performed poorer than all others ($p<.001$), while SIR 3 and 4 performed poorer than SIR 5 ($p<.001$; $p=.046$). A significant SIR×time interaction indicated distinct improvement trajectories, with lower SIR groups showing larger relative gains but lower absolute scores ($F(15,589.43)=6.29$, $p<.001$). In extended models, preoperative SIR remained an independent predictor ($F(3,203.37)=3.48$, $p=.017$). Onset and duration of hearing loss added no explanatory value ($p>.05$). Auditory deprivation showed a small negative effect ($F(1,179.82)=4.63$, $p=.033$). Higher preoperative aided SRS predicted better outcomes ($F(1,182.49)=14.23$, $p<.001$). Increasing age at implantation reduced performance specifically in the SIR 5 group (interaction) ($F(3,192.88)=4.60$, $p=.004$).

CONCLUSIONS

These findings indicate that preoperative SIR provides a robust and clinically feasible predictor of postoperative speech recognition that is independent of self-reported patient data. Moreover, it represents a reliable and time-efficient clinical tool

that captures relevant functional consequences of auditory deprivation. Incorporating SIR into routine CI candidacy evaluation may therefore improve outcome prediction, patient counselling, and performance-based rehabilitation strategies.

OP-222

Surgical Challenges And Complications Encountered During Revision Cochlear Implant Surgery

Dr.Abdullah Alshathry[1]

[1]*King Saud University Medical City*

BACKGROUND & AIM

Revision cochlear implantation (RCI) is increasingly performed for device failure, medical complications, and suboptimal auditory outcomes. Unlike primary implantation, RCI presents distinct challenges from altered anatomy, intracochlear fibrosis or ossification, and electrode reinsertion.

Aim of this study to identify and characterize intraoperative surgical challenges encountered during revision cochlear implant surgery and to evaluate factors associated with increased surgical complexity.

MATERIAL & METHODS

A retrospective observational study at a tertiary referral center included all revision cochlear implant cases performed between January 2012 and March 2026. Demographics, indications, time to revision, operative findings, and intraoperative challenges were extracted from operative reports.

RESULTS

157 revision cases were analyzed (53.5% male; 67.5% congenital hearing loss; 92.9% pediatric). Device failure accounted for 95.5% of cases with a recorded indication, and the mean interval to revision was 39.6 ± 29.6 months. Among 130 cases with operative detail, fibrosis and difficult reinsertion were each documented in 6.9%, and at least one challenge in 13.1%. Fibrosis cases more often required a cochleostomy approach ($p < 0.001$) and partial electrode insertion ($p = 0.004$). Revision complications occurred in 12.1%, most commonly insertion resistance.

CONCLUSIONS

Revision cochlear implantation was generally safe and most procedures were uncomplicated; however, intracochlear fibrosis predicted difficult reinsertion and the need for a modified surgical strategy.

Single-Sided Deafness: Which Way To Go Slps?

Yaser Numan Al Sabi[1]

[1]*Headquarters Cochlear Al-Arabia Regional*

BACKGROUND & AIM

Background:

Single-sided deafness represents a significant yet underrecognized challenge in hearing healthcare, and speech-language pathologists occupy a crucial position in identifying and managing these patients. While much of the literature on cochlear implantation has traditionally focused on bilateral hearing loss, recent FDA approvals have expanded indications to include patients with asymmetric hearing loss and single-sided deafness.

Aim:

The aim of this presentation is to equip speech-language pathologists with the knowledge, clinical tools, and confidence necessary to identify, assess, and appropriately refer individuals with single-sided deafness for cochlear implant candidacy evaluation. S

MATERIAL & METHODS

A powerpoint presentation will be prepared to provide participnats with the knowlegde needed to deal with single-sided deafness

RESULTS

By the conclusion of this presentation, participants will understand the neuroplastic urgency of early intervention in hearing loss, and recognize their professional responsibility in ensuring that individuals with single-sided deafness receive timely access to potentially life-changing cochlear implant technology. This session ultimately aims to empower speech-language pathologists to transform hearing healthcare delivery by becoming informed advocates and active participants in the identification and rehabilitation of this underserved population.

CONCLUSIONS

This session will provide a comprehensive understanding of single-sided deafness definition and prevalence statistics, clarify the distinction between referral guidelines and candidacy criteria, outline assessment protocols including both formal and informal measures appropriate for the speech-language pathology scope of practice, present evidence-based rehabilitation approaches including auditory-verbal therapy principles and auditory skill training methodologies, and define the critical role speech-language pathologists play as partners in the multidisciplinary team managing individuals with single-sided deafness.

OP-224

Anatomic Based Cochlear Implantation With The FLEX34 Electrode- Maximizing Cochlear Coverage And Speech Understanding

Kristen Rak[1], **Franz Tassilo Müller-Graff**[1], **Björn Spahn**[1], **Anja Kurz**[1], **Stephan Hackenberg**[1], **Johannes Völker**[1]

[1]*Department of Oto-Rhino-Laryngology, Head and Neck Surgery, Comprehensive Hearing Center, University of Wuerzburg*

BACKGROUND & AIM

Maximizing cochlear coverage has been shown to significantly influence speech recognition outcomes in cochlear implant (CI) recipients. The FLEX34 electrode array, currently the longest standard lateral wall electrode available, promises extensive apical cochlear coverage. However, its routine clinical feasibility and the accuracy of anatomy-based planning compared with actual postoperative electrode position remain subjects of ongoing evaluation. This study aimed to assess the feasibility, precision, and clinical relevance of anatomy-based planning and postoperative validation of FLEX34 electrode insertions using high-resolution imaging, with a focus on cochlear coverage and insertion accuracy.

MATERIAL & METHODS

36 adult patients underwent cochlear implantation with the FLEX34 electrode. All insertions were performed via the round window. Preoperative imaging-based planning included manual cochlear duct length (CDL) measurements using OTOPLAN software and virtual electrode insertion depth planning. Imaging modalities comprised flat panel volume CT until 2024 and photon-counting CT thereafter. Postoperative imaging was performed using the same modality to localize electrode contacts. Quantitative analyses compared planned versus actual contact positions, cochlear angles, and achieved cochlear coverage. Measured contact positions were integrated into anatomy-based fitting strategies.

RESULTS

The cohort had a median age of 66.2 years (range 28.1–80.4). Imaging-based planning demonstrated CDL at the Organ of Corti (CDLOC) of 38.1 mm, planned apical contact positions of 656,95 ° simulating the flex 34 electrode and postoperative cochlear coverage of 699, 7°. Postoperative audiometric outcomes showed favourable speech discrimination results. No major insertion-related complications were observed, supporting the atraumatic nature of the technique.

CONCLUSIONS

Anatomy-based planning combined with high-resolution postoperative imaging enables precise and reproducible deep insertion of the FLEX34 electrode, resulting in consistently high cochlear coverage. In appropriately selected anatomies, the FLEX34 represents a reliable and clinically feasible standard option rather than a special-case solution. Its routine use may contribute to optimized cochlear engagement and improved functional outcomes.

Localization By Impedance

Alhassan Algazlan[1]

[1]*King Abdullah ear specialist center, King Saud University, Riyadh,KSA*

BACKGROUND & AIM

Background: Accurate intracochlear positioning of electrode arrays is critical for optimizing auditory outcomes during cochlear implantation (CI). While radiographic imaging remains the standard for postoperative evaluation, Transimpedance Matrix (TIM) measurements have emerged as a promising intraoperative technique for real-time assessment of electrode placement, particularly with a Slim Modiolar Electrode Array.

MATERIAL & METHODS

Methods: This retrospective observational study included 15 patients (24 ears) who underwent cochlear implantation using CI532® and CI632® electrode

arrays. Intraoperative TIM data were obtained and compared with intraoperative and immediate postoperative radiographic imaging data to determine the accuracy and reliability of TIM in detecting electrode placement anomalies. The electrode positioning patterns were analyzed using TIM heatmaps, with a focus on the voltage gradient distribution and identification of the tip fold- over (TFO).

RESULTS

Results: Of the 24 cochlear implants, 23 (96%) exhibited a regular TIM voltage distribution consistent with proper modiolar placement.A single instance of TFO (4%) was identified intraoperatively using TIM and confirmed via radiographic imaging. The electrode was reinserted following intraoperative correction with TIM and imaging,subsequently confirming the optimal placement. In all remaining cases, the TIM findings were in concordance with radiological assessments.

CONCLUSIONS

Conclusion: TIM may be a reliable intraoperative monitoring tool for CI using Slim Modiolar CI532® and CI632® electrode arrays position during cochlear implantation. Their ability to accurately detect deviations in electrode configuration, such as the TFO, affirms their potential to augment surgical precision, eliminate the need of intraoperative radiation exposure by providing real-time feedback, minimize postoperative imaging requirements, and enhance patient outcomes. Further prospective studies with larger cohorts are warranted to validate these preliminary findings and establish standardized protocols for clinical implementation

OP-226

Comparison Of Subperiosteal Pocket And Conventional Fixation Techniques In Cochlear Implant Surgery

Yavuz Gündoğdu[1], **Mahmut Furkan Beyaz**[1], **Orhan Asya**[1], **Ali Cemal Yumuşakhuylu**[1]

[1]*Department of Otolaryngology, Faculty of Medicine, Marmara University, Istanbul, Türkiye*

BACKGROUND & AIM

Secure placement of the receiver-stimulator (R/S) device is a critical step in cochlear implant surgery to prevent device migration. While traditional fixation methods involve bicortical drilling and sutures, which may lead to complications such as dural tears or hematomas, the subperiosteal pocket technique has emerged as a less invasive alternative. This study aims to compare these two techniques in terms of operative time and the need for revision surgery.

MATERIAL & METHODS

A retrospective review was conducted on 377 patients who underwent cochlear implant surgery over a five-year period. Patients were divided into two groups: 181 underwent the traditional fixation method (bicortical drilling and suture), and 196 were operated on using the subperiosteal pocket technique. All patients had a minimum follow-up period of six months. Operative times and revision rates were statistically compared using chi-square and independent t-tests.

RESULTS

The subperiosteal pocket group demonstrated a significantly lower rate of revision surgery (0.5%, n=1) compared to the traditional fixation group (4.4%, n=8) ($p=0.016$). Furthermore, the mean operative time was significantly shorter in the subperiosteal pocket group (131.9 minutes) compared to the traditional group (156.6 minutes) ($p < 0.05$). No major intracranial complications were observed in the pocket technique group.

CONCLUSIONS

The subperiosteal pocket technique is a safe and effective alternative to traditional fixation methods. It significantly reduces operative time and is associated with a lower rate of revision surgery, supporting its use as a reliable method for receiver-stimulator fixation in cochlear implant surgery.

Criterion And Discriminant Validity Of Accelerometer-Based Treadmill Gait Analyses In People With Bilateral Vestibulopathy

Meichan Zhu[1,2], **Paul Willems**[2], **Lisa van Stiphout**[1], **Rik Marcellis**[3], **Rachel Senden**[3], **Mustafa Karabulut**[1], **Nefeli Koutsoureli**[2], **Angélica Pérez Fornos**[4], **Nils Guinand**[4], **Raymond van de Berg**[1], **Kenneth Meijer**[2], **Christopher McCrum**[2]

[1]*Department of Otorhinolaryngology and Head and Neck Surgery, Division of Balance Disorders, Maastricht University Medical Center, School for Mental Health and Neuroscience, Maastricht, The Netherlands;* [2]*Department of Nutrition and Movement Sciences, NUTRIM School of Nutrition and Translational Research in Metabolism, Maastricht University, Maastricht, The Netherlands;* [3]*Department of Physical Therapy, Maastricht University Medical Center, Maastricht, Limburg, The Netherlands;* [4]*Service of Otorhinolaryngology and Head and Neck Surgery, Department of Clinical Neurosciences, Geneva University Hospitals, Geneva, Switzerland*

BACKGROUND & AIM

Gait and balance impairments, especially increased gait variability, are prevalent in individuals with bilateral vestibulopathy (BVP) and often lead to frequent falls, adversely affecting their quality of life. Wearable accelerometers offer a convenient tool for assessing gait. However, their accuracy in measuring gait variability compared to traditional optical motion capture systems (VICON) is not established for people with BVP. This study aimed to assess the criterion and discriminant validity of an accelerometer-based treadmill setup in evaluating gait variability in people with BVP.

MATERIAL & METHODS

A total of 52 people with BVP and 52 age- and sex-matched healthy adults walked at speeds of 0.6 m/s, 0.8 m/s, and 1.0 m/s within the Computer Assisted Rehabilitation Environment without and with pseudorandom mediolateral sway perturbations. We examined differences between accelerometry-determined (MOX1; Maastricht Instruments) and Vicon-determined (3D motion capture and force plates) step time means and coefficients of variation (CoV). Criterion validity was assessed using the intraclass correlation coefficient (ICC3,1) and Bland-Altman analysis to determine agreement and consistency between the methods and using one sample t-test to check if the difference was statistically different to 0. And discriminant validity was assessed by comparing the results of independent t-tests and the effect size between the groups using each measurement method.

RESULTS

The MOX1 consistently resulted in higher CoV values across all conditions, indicating systematic differences in capturing step time variability. We found poor to moderate agreement for CoV measurements between MOX1 and Vicon, with Bland–Altman plots revealing wide limits of agreement and mean differences (MDs) of 0.4331-2.657, which were statistically significantly different to 0 for all outcomes except 0.8 m/s under large perturbation. MOX1 reliability analysis demonstrated excellent agreement for mean step time between MOX1 and VICON with MD values close to zero and narrow confidence intervals, and while some MDs were significantly different to 0, the MDs were very small in absolute terms (8 out of 9 were shorter for the

MOX1; range: -0.028-0.004).In the MOX1 comparison between two groups, significant differences were observed under the 0.6 m/s no-perturbation condition ($p < 0.001$, $d = 0.87$) and the small-perturbation condition ($p = 0.027$, $d = 0.71$).

CONCLUSIONS

MOX1 reliably measures mean step time with excellent agreement to VICON but systematically captures higher CoV values, indicating differences in variability measurements. MOX1 effectively identify significant differences between BVP and healthy controls in slow speed and small perturbation.

Investigation Of The Test–Retest Reliability Of Age-Related Ocular Counter-Roll Test Values

Esra BUĞRA[1], **Sanem Can SARIOĞLU**[2], **Deniz Uğur CENGİZ**[2], **Fatma YURDAKUL ÇINAR**[2], **Almıla AVŞAR DEMİR**[1], **Sevda Nur ŞENEL**[1], **Gül YÜCEL**[3], **Funda DATLI YAKARYILMAZ**[4]

[1]Inonu University, Institute of Health Sciences, Department of Audiology, Malatya, Türkiye; [2]Inonu University, Faculty of Health Sciences, Department of Audiology, Malatya, Türkiye; [3]Inonu University, Faculty of Medicine, Department of Pediatrics, Malatya, Türkiye; [4]İnönü Üniversitesi, Tıp Fakültesi, İç Hastalıkları Anabilim Dalı, Geriatri Bilim Dalı Malatya, Türkiye

BACKGROUND & AIM

Video-ocular counter-roll (vOCR) is an objective clinical technique used to assess otolith function through the analysis of torsional eye movements and has gained increasing importance in the diagnosis and monitoring of vestibular disorders. Since age-related physiological changes may influence otolith-mediated responses, interpreting vOCR measurements without age-specific reference values may result in normal variations being mistaken for pathological findings. Therefore, this study aimed to establish normative vOCR data across healthy individuals aged 8–80 years and to investigate the reliability of vOCR measurements using a test–retest approach.

MATERIAL & METHODS

This study was conducted at the Audiology Unit of İnönü University Turgut Özal Medical Center between November 2025 and March 2026. Ethical approval was obtained from the Scientific Research Ethics Committee of İnönü University Health Sciences (Approval No. 2025/8019), and written informed consent was obtained from all participants or their legal guardians. Seventy-five healthy individuals aged 8–80 years were enrolled and categorized into five age groups (8–11, 12–18, 19–40, 41–65, and 66–80 years). All participants underwent vOCR testing using a test–retest design.

RESULTS

Significant differences between test and retest measurements of right tilt gain, left tilt gain and mean gain were identified only in the 12–18 years age group ($p < 0.05$). Comparisons across age groups revealed statistically significant differences in right tilt gain, left tilt gain, mean gain, and asymmetry values ($p <0.05$). The highest gain values were recorded in participants aged 8–11 years, while the highest asymmetry values were observed in those aged 66–80 years.

CONCLUSIONS

Age-related differences significantly affect vOCR gain and asymmetry parameters, underscoring the need for age-specific normative data in the clinical interpretation of test results. The agreement between test and retest measurements across four age groups demonstrates the reliability of vOCR for evaluating otolith function in healthy individuals. The normative data established in this study may serve as a valuable reference for clinical practice and further support the use of vOCR as a reliable tool for otolith function assessment across a wide age range.

OP-229

Benign Paroxysmal Positional Vertigo In Traumatic Brain Injury: Prevalence, Symptom Reporting, And Cognitive Predictors Of Vestibular Perception

Chelsea J Manetta[1]

[1]The University of Pittsburgh

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) occurs following traumatic brain injury (TBI), yet most studies have only examined patients reporting dizziness, likely underestimating true prevalence. Our work found a BPPV prevalence of 58% in a TBI inpatient rehabilitation cohort, with 90% of those testing positive unable to report any dizziness symptoms. The prevailing clinical assumption is that cognitive impairment explains this silence, that patients simply lack the awareness or language to report what they feel. We hypothesized that cognitive impairment severity would not differ between BPPV-positive and BPPV-negative patients, and that symptom silence would persist across all levels of cognitive function.

MATERIAL & METHODS

All patients admitted to a level 1 trauma center inpatient rehabilitation unit with radiologically confirmed TBI over a 6-month period were screened for BPPV regardless of symptom status. Screening included three questions ("Do you experience dizziness when you get out of bed?", "when you roll over in bed?", "when you bend over to pick something up from the floor?"); a positive screen was defined as answering yes to at least one question. All patients then completed the Dix-Hallpike and roll test. Cognitive status was assessed using the Orientation Log (OLog), Cognitive Linguistic Quick Test (CLQT), Brief Interview for Mental Status (BIMS), and Montreal Cognitive Assessment (MoCA) where the patient's level of arousal permitted; patients unable to complete any measure represented the most severely impaired subgroup. Chi-square tests of association and Mann-Whitney U tests were used for analysis.

RESULTS

Of 73 patients screened, 42 (58%) tested positive for BPPV; only 7 (10%) reported dizziness. Cognitive scores did not differ between BPPV-positive and BPPV-negative patients across any measure: OLog 16.4±9.0 vs. 16.7±11.4 (p=0.87), CLQT 2.43±0.87 vs. 2.86±0.74 (p=0.10), and BIMS 8.9±4.9 vs. 11.1±4.8 (p=0.15). Drilling further, patients with asymptomatic BPPV (BPPV-positive, screen-negative; n=35) were cognitively indistinguishable from patients with no BPPV and no symptoms (BPPV-negative, screen-negative; n=31) across all measures: OLog 16.5±8.8 vs. 16.7±11.4 (p=0.84), CLQT 2.4±0.9 vs. 2.9±0.7 (p=0.10), and BIMS 8.8±5.1 vs. 11.1±4.8 (p=0.13). Notably, all seven patients who screened positive subsequently tested positive for BPPV, yielding a specificity of 100% for the three-question screen.

CONCLUSIONS

Cognitive impairment does not explain why patients with TBI fail to report BPPV symptoms, as BPPV-positive and BPPV-negative patients were equally impaired across all cognitive measures. Clinicians cannot rely on symptom reporting as a screening trigger in this population. These findings suggest a perceptual rather than cognitive mechanism for symptom silence, consistent with vestibular agnosia described in TBI. All patients with TBI should be screened for BPPV regardless of cognitive status or symptom reporting, as untreated BPPV increases fall risk, reduces function, and prolongs rehabilitation whether or not the patient can tell you they are dizzy.

Nystagmus Characteristics In Meniere's Disease Assessed By Portable Eye Movement Recording And MRI-Confirmed Endolymphatic Hydrops

Ryohei Oya[1], **Kayoko Higashi-Shingai**[1], **Hiroki Takeda**[1], **Yuya Ueno**[2], **Yoshiyuki Ozono**[1], **Takashi Sato**[1], **Takao Imai**[3], **Hidenori Inohara**[1]

[1]Department of Otorhinolaryngology - Head and Neck Surgery, The University of Osaka; [2]Department of Otorhinolaryngology, Osaka Women's and Children's Hospital; [3]Department of Otorhinolaryngology - Head and Neck Surgery, Bellland General Hospital

BACKGROUND & AIM

Meniere's disease (MD) is characterized by recurrent vertigo and fluctuating hearing loss. During vertigo episodes, nystagmus can beat either toward the affected ear (irritative type) or away from it (paralytic type); however, capturing these dynamic changes at the time of onset remains challenging. In this study, we utilized a portable eye movement recorder (PEMR) to document nystagmus at the onset of vertigo attacks and investigated its characteristics in relation to endolymphatic hydrops (EH) identified on contrast-enhanced magnetic resonance imaging (CE-MRI).

MATERIAL & METHODS

A total of 54 patients diagnosed with MD according to the criteria of the Japan Society for Equilibrium Research were included. All participants were instructed to use a PEMR device to record eye movements immediately after the onset of vertigo and at predefined time points thereafter. Based on CE-MRI findings, patients were classified into those with EH (certain MD group, CMD) and those without EH (definite MD group, DMD). Nystagmus was categorized as irritative or paralytic according to its beating direction.

RESULTS

EH was detected in 41 of 54 patients on CE-MRI. In the CMD group, nystagmus was observed in 38 patients, of whom 33 showed irritative and 5 showed paralytic patterns. In contrast, among 10 patients with nystagmus in the DMD group, 2 exhibited irritative and 8 exhibited paralytic nystagmus. The distribution of nystagmus types differed significantly between the two groups ($\chi^2 = 14.69$, $p = 0.00013$). Directional reversal of nystagmus within 24 hours was more frequently observed in the CMD group than in the DMD group (15 vs. 2 cases), although this difference did not reach statistical significance ($\chi^2 = 1.313$, $p = 0.251$). No significant associations were identified between nystagmus characteristics and EH location (vestibular, cochlear, or combined) or laterality (unilateral vs. bilateral).

CONCLUSIONS

PEMR allows real-time assessment of nystagmus during vertigo attacks. Irritative nystagmus was significantly more prevalent in patients with EH, suggesting that it reflects active hydropic excitation of the vestibular system. Conversely, the

predominance of paralytic nystagmus in patients without EH may indicate relative vestibular hypofunction rather than acute hydropic stimulation.

OP-231

Does A Mechanical Rotation Chair Provide Superior Diagnostics Of Benign Paroxysmal Positional Vertigo Amongst Elderly.

Dan Dupont Hougaard[1,2], **Bertram Vorm**[2], **Regitze Gyldenholm Skals**[4], **Jesper Holm**[3], **Jens Faunoe Thrane**[3], **Michael Lüscher**[3]

[1]Department of Otorhinolaryngology, Head & Neck Surgery and Audiology, Aalborg University Hospital, Aalborg, Denmark; [2]Department of Clinical Medicine, Aalborg University, Aalborg, Denmark; [3]ENT Practice, Lüscher & Thrane, Aarhus, Denmark; [4]Research Data and Biostatistics, Aalborg University Hospital, Aalborg, Denmark

BACKGROUND & AIM

Benign Paroxysmal Positional Vertigo (BPPV) is the most common cause of vertigo and occurs frequently among elderly individuals, who are at increased risk of falls, impaired mobility, and reduced quality of life. Traditional bedside (TB) diagnostics rely on accurate patient positioning and cooperation, which may be challenging in older populations. Mechanical rotation chairs (MRCs) have been introduced to improve diagnostic precision, but evidence regarding their superiority in elderly patients remains limited. The aim of this study was to compare the diagnostic accuracy of BPPV between MRC- and TB diagnostics in an elderly population.

MATERIAL & METHODS

Prospective, randomized crossover study with 201 participants aged 60 years or above. Participants underwent both TB- and MRC diagnostics with bilateral Dix-Hallpike- and Supine Roll Tests. The order of diagnostic modality was randomized. Agreement between modalities was assessed using percentage agreement and Cohen's kappa. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) of TB diagnostics were calculated using MRC diagnostics as the reference standard. Secondary analyses examined diagnostic performance in posterior versus non-posterior BPPV and the effect of reduced patient cooperation. Tertiary analyses examined optimal positioning with MRC Supine Roll Testing.

RESULTS

BPPV was diagnosed in 61 participants (30.3%) with TB diagnostics and 68 participants (33.8%) with MRC diagnostics. Overall agreement between modalities was 89.6% with a Cohen's kappa of 0.76, indicating substantial to near-perfect agreement. Compared with MRC diagnostics, TB diagnostics demonstrated a sensitivity of 79%, specificity of 95%, PPV of 89%, and NPV of 90%. Sensitivity for non-posterior BPPV was lower (63%). Diagnostic performance declined in participants with impaired cooperation, where sensitivity decreased to 60%. MRC diagnostics identified more non-posterior and cupulolithiasis cases than TB diagnostics. A 60-degree backward Supine Roll Test position showed higher detection rates of lateral BPPV than a 90-degree position, although differences were not statistically significant.

CONCLUSIONS

MRC diagnostics provide superior diagnostic sensitivity for BPPV in elderly patients, particularly for non-posterior subtypes and in cases with limited patient cooperation. TB diagnostics remain an effective first-line diagnostic tool. However, MRC diagnostics should be considered when bedside findings are inconclusive or when complex BPPV is suspected.

OP-232

Selective Impairment Of Vestibular Suppression In Motion Sickness: Evidence From A Virtual Reality Study

Özlem DÖNMEZ[1], **Gülin Gökçen KESİCİ**[2]

[1]Department of Audiology, Institute of Health Sciences, Ankara Medipol University, Ankara, Türkiye; [2]Department of Otorhinolaryngology, Faculty of Medicine, Ankara Medipol University, Ankara, Türkiye

BACKGROUND & AIM

Motion sickness is attributed to sensory conflict between visual, vestibular, and somatosensory inputs and is increasingly considered a disorder of multisensory integration rather than isolated peripheral vestibular dysfunction. Despite its clinical relevance, objective physiological markers that differentiate susceptible individuals remain limited. Virtual reality (VR) offers a controlled model to induce sensory mismatch and investigate vestibulo-oculomotor function. This study aimed to evaluate vestibular and oculomotor responses to VR exposure and to determine whether individuals with motion sickness exhibit distinct physiological patterns compared to healthy controls.

MATERIAL & METHODS

A total of 48 participants aged 18–35 years were prospectively enrolled, including 25 individuals with motion sickness and 23 healthy controls. All participants underwent vestibulo-oculomotor evaluation before and after a 15-minute VR roller coaster

simulation. Assessments included video head impulse testing (vHIT, HIMP paradigm), suppression head impulse paradigm (SHIMP), visually enhanced vestibulo-ocular reflex (vVOR), vestibulo-ocular reflex suppression (VORs), and saccadic testing using prosaccade and antisaccade paradigms. Motion sickness severity was assessed using the Motion Sickness Susceptibility Questionnaire, Simulator Sickness Questionnaire, and a visual analog scale. Statistical analyses included between-group comparisons, within-group analyses, correlation analyses and two-way repeated measures ANOVA.

RESULTS

Baseline vestibulo-oculomotor parameters were comparable between groups, with no significant differences in vHIT or saccadic measures ($p>0.05$), except for a baseline difference in SHIMP PR score (left $p=0.012$). Following VR exposure, significant between-group differences were observed in SHIMP gain (left $p=0.006$; right $p=0.005$) and SHIMP PR scores (left $p=0.002$; right $p=0.007$), whereas vHIT, vVOR, VOR suppression, and saccadic parameters did not show significant group differences. Repeated measures ANOVA demonstrated significant group-by-time interactions in SHIMP gain (left $p<0.001$; right $p=0.001$), SHIMP PR score (right $p=0.009$), and SHIMP covert latency (right $p=0.003$), while several parameters showed only time effects without interaction, indicating a general VR-induced response. Subjective symptom scores were significantly higher in the motion sickness group ($p<0.01$). Correlation analysis revealed strong associations within antisaccadic performance metrics and physiologically consistent relationships among vestibular parameters.

CONCLUSIONS

Virtual reality exposure selectively alters vestibular suppression mechanisms in individuals with motion sickness, while peripheral vestibular function and basic oculomotor performance remain largely preserved. The prominent changes observed in SHIMP parameters, particularly gain and anti-compensatory saccade metrics, suggest altered central vestibular processing. These findings support motion sickness as a disorder of central vestibular–ocular integration and highlight SHIMP as a sensitive and objective tool for identifying motion sickness susceptibility.

OP-233

Applications Of Artificial Intelligence In The Diagnosis Of Benign Paroxysmal Positional Vertigo

Brian Sheng Yep Yeo[1], **Jia Hui Ng**[2], **Kenneth Wei De Chua**[3], **Heng Wai Yuen**[3]

[1]*Yong Loo Lin School of Medicine, National University of Singapore, Singapore;* [2]*Department of Otorhinolaryngology – Head and Neck Surgery, Singapore General Hospital, Singapore;* [3]*Department of Otorhinolaryngology – Head and Neck Surgery, Changi General Hospital, Singapore*

BACKGROUND & AIM

Benign Paroxysmal Positional Vertigo (BPPV) is the most common peripheral vestibulopathy. However, it remains frequently underdiagnosed or misclassified, particularly in settings with limited vestibular expertise, as accurate diagnosis depends on detailed clinical history-taking, correctly performed positional manoeuvres and precise interpretation of nystagmus patterns. Artificial Intelligence (AI) offers a novel approach to support clinicians in diagnosing BPPV. This review aims to consolidate advancements in the application of AI for the diagnosis of BPPV.

MATERIAL & METHODS

PubMed, Embase and IEEE Xplore were reviewed from inception to 4 November 2025 for observational studies investigating the use of AI for the diagnosis of BPPV in adult participants. This included studies evaluating AI-based clinical decision support systems, AI-driven vestibular testing, and the use of large language models. Literature assessing both the application of AI for differentiating BPPV from other vestibular disorders, and those involved in semicircular canal localization were included. The outcome of interest was the diagnostic accuracy of these AI-based approaches.

RESULTS

AI models integrated in clinical decision support systems report reasonable diagnostic accuracy in differentiating BPPV from other peripheral vestibulopathies, using both traditional and deep machine learning techniques. Separately, neural networks applied to vestibular testing such as video-oculography and electronystagmography may accurately interpret eye movements and classify nystagmus patterns, with reasonable accuracy in canal localization. Additionally, large language models with structured clinical prompts may support clinicians in differentiating BPPV from other forms of peripheral vertigo.

CONCLUSIONS

AI demonstrates reasonable accuracy in the diagnosis of BPPV and holds potential to support non-specialist clinicians and optimize diagnostic frameworks. However, limitations such as small sample sizes and a paucity of externally validated studies outline the importance of future research. Importantly, challenges remain in data labelling, clinical applicability and regulatory approval before routine adoption can occur.

OP-234

Differentiating Acute-Onset Sensorineural Hearing Loss Of Uncertained Type

Jui-En Lee[1], **Yi-Ho Young**[2]

[1]*National Taiwan University Hospital;* [2]*Far Eastern Memorial Hospital*

BACKGROUND & AIM

This study differentiates cases of acute-onset sensorineural hearing loss (SNHL) that did not meet the diagnostic criteria for either sudden SNHL or Meniere's disease (MD), leading to a diagnostic challenge.

MATERIAL & METHODS

All 46 patients with acute-onset SNHL underwent an inner ear test battery followed by Hydrops MRI. Twenty-four patients (28 ears) who tested positive for endolymphatic hydrops (EH) on Hydrops MRI were referred to EH group. Another 22 patients (22 ears) who tested negative for EH were classified as non-EH group.

RESULTS

Significant difference in the mean hearing levels between EH and non-EH groups was identified at frequencies of 125, 250, 500 and 1000 Hz, but not at frequencies ranging from 2000 Hz through 8000Hz. A declining sequence of abnormality rates running from the audiometry (96%), cervical (75%) and ocular (57%) vestibular-evoked myogenic potential tests, to the caloric test (43%) was observed in EH group (but not in non-EH group), which mirrored a decreasing prevalence of EH from the cochlea (79%), saccule (61%), utricle (57%), to the semicircular canals (4%) on Hydrops MRI.

CONCLUSIONS

A comprehensive inner ear test battery as well as encouraging active participation in the Hydrops MRI evaluation is essential for differentiating between acute-onset SNHL stemming from EH or not.

The Principle Of "Early Intervention" In Revealing Of Vestibular Disorders At The Elder Population In The Republic Of Uzbekistan

Karimova N.A., Sattarova M.G., Yakubova D.O., Rustambekova K.B., Khasanov U.S., Vohidov U.N.[1]

[1]*Republican scentific reaserch medical center of ENT, head and neck pathology, Laboratory of Hearing and Balance deseasess, Tashkent, Uzbekistan*

BACKGROUND & AIM

Dizziness remains one of the most common complaints among the elderly population. Alongside headaches, gait disturbances, balance issues, hearing loss, and tinnitus, older individuals frequently seek help from neurologists, therapists, and cardiologists. The issue of limited mobility among elderly individuals, especially those suffering from dizziness and balance disorders, remains particularly relevant.Uzbekistan, with a population exceeding 37 million people, has more than 7.7 million elderly citizens. Despite demographic, geopolitical, and geographic challenges, the country has experienced dynamic economic growth and the implementation of new medical programs in recent years.

MATERIAL & METHODS

The screening was conducted at the Republican Specialized Scientific and Practical Center for Otolaryngology and Head and Neck Diseases (Hearing and Balance Disorders Laboratory). The study included 63 patients aged 60 years and older (18 men, 45 women). Clinical examination: gait, stability, and oculomotor analysis and positional tests; Instrumental methods: videonystagmography (VNG) and video-based impulse testing (vHIT).

RESULTS

The main patents complaints were: - dizziness - 60 people; - nausea - 42; - unsteadiness when walking – 24 patents; - tinnitus - 27; - hearing loss - 30; - falls - 3; - facial asymmetry - 6; positional vertigo - 30.

There were revealed fallow pathology of vestibular sustem" vestibular migraine - 12 cases; motion sickness - 3; hearing loss - 30; tinnitus - 27; central positional vertigo - 3; active BPPV - 4; spontaneous remission of BPPV - 27; Prevestibulopathy — 24; Pre-stroke condition — 3; Post-stroke changes — 6; Chronic vestibular syndrome — 6; Ramsay Hunt syndrome — 3; Chronic vestibular otitis media condition — 12; Unilateral hypofunction — 3; Bilateral hypofunction — 9 cases

CONCLUSIONS

Targeted vestibular screening conducted in elderly individuals demonstrated high information content in the early detection of the most common forms of vestibular dysfunction (BPPV, presvestibulopathy), as well as other conditions with a high risk of complications. This initiative formed the foundation of the innovative grant project "Dignified Aging," which identified several priority areas: early diagnosis of cochleovestibular disorders, adequate rehabilitation, scientific and educational activities aimed at raising awareness among the public and healthcare professionals, and training of specialists based at regional branches of the center.

OP-236

Vertigo In ENT Practice: Diagnostic Yield Of Positional Testing And Overuse Of Neuroimaging

Nurbanu Koçdemir Erul[1]

[1]*Beypazarı State Hospital*

BACKGROUND & AIM

Dizziness and vertigo are common reasons for presentation to otolaryngology clinics, but their causes are heterogenous and not always otologic. In routine practice, some patients are referred to ENT after neuroimaging or empirical treatment without a clear diagnosis. Benign paroxysmal positional vertigo (BPPV) is one of the most common and treatable causes of vertigo, yet it may remain underrecognized. This study aimed to describe the clinical profile of patients presenting with dizziness to an otolaryngology outpatient clinic, determine the frequency of BPPV, evaluate the diagnostic yield of positional testing, and highlight the possible overuse of imaging and unnecessary referrals.

MATERIAL & METHODS

This retrospective observational study included patients presenting to the otolaryngology outpatient clinic between November 2025 and May 2026 with dizziness or vertigo. Of 190 screened patients, 31 were excluded due to incomplete or inaccessible records. Data collected included age, sex, type of dizziness, use of antivertiginous medication, alarm symptoms, positional characteristics, positional maneuvers, and final diagnoses. Available information on prior brain computed tomography (CT), magnetic resonance imaging (MRI), and diagnoses established after referral to other specialties was also reviewed. Descriptive and comparative analyses were performed.

RESULTS

A total of 159 patients were included. Mean age was 51.9 ± 16.6 years, and 112 patients (70.4%) were female. Dizziness was reported by 91 patients (57.2%), while 68 (42.8%) described spinning vertigo. Antivertiginous medication had been used by 28 patients (17.6%), and alarm symptoms were present in 18 (11.3%). Positional symptoms were noted in 49 patients (30.8%). Positional testing was performed in 75 patients (47.2%), and BPPV was confirmed in 18 patients (11.3% overall; 24.0% of those tested). BPPV was significantly more frequent in patients with positional symptoms than in those without them (36.7% vs 0%, $p < 0.001$). Prior CT or MRI had been obtained in 55 patients (34.6%), and 50 of these scans (90.9%) were normal. Several patients were ultimately found to have neurologic, psychiatric, cardiovascular, or other non-otologic causes of dizziness.

CONCLUSIONS

In ENT outpatient practice, BPPV accounted for an important but limited proportion of dizziness presentations. Careful symptom characterization and appropriate use of positional testing may improve diagnostic accuracy, reduce unnecessary neuroimaging, and help identify patients who are better managed through multidisciplinary evaluation rather than routine ENT referral.

OP-237

The Impact Of Physical Rehabilitation On Motor, Cognitive, And Audio-Verbal Functions In Hearing Impaired Children

Tufatulin Gaziz[1,2,3,4], **Dvoryanchikov Vladimir**[1], **Andrianov Alexey**[1], **Timofeeva Julia**[2], **Koroleva Inna**[1,2]

[1]*St Petersburg Scientific Research Institute of Ear, Throat, Nose and Speech;* [2]*Center of Pediatric Audiology;* [3]*North-Western State Medical University named after I.I. Mechnikov;* [4]*Russian Medical Academy of Continuous Professional Education*

BACKGROUND & AIM

Aim: To test the hypothesis that physical rehabilitation has a positive effect on cognitive functions and auditory-verbal skills in school-age children with sensorineural hearing loss (SNHL) using hearing aids and cochlear implants.

MATERIAL & METHODS

Materials and methods: A prospective controlled study included 41 children aged 8–12 years with SNHL from moderate to severe degree, using hearing aids or cochlear implants. The main group (n=21) underwent a one-year course of physical rehabilitation. The control group (n=20) did not receive this course. A comprehensive assessment of motor, cognitive, and auditory-verbal skills was performed before the course, after 6 and 12 months.

RESULTS

Results: The main group showed statistically significant improvement in cognitive functions: the total Raven's Matrices score increased by 4.0 points (p=0.0046), with maximum progress in subtest D (logical tasks, +1.8 points, p=0.001). Motor sphere indicators also improved: the total percentage of impairments according to the Blythe test decreased from 10.5±7.1% to

5.5±4.8% (p<0.001), and visual-motor perception improved by 2.3 points (p=0.001). The main group also demonstrated statistically significant improvement in auditory perception and pronunciation skills by the 6th (p<0.05) and 12th (p<0.01) months. No significant dynamics were observed in the control group. A strong inverse correlation was found between the age of hearing aid fitting and rehabilitation effectiveness (ρ=-0.65, p<0.01).

CONCLUSIONS

Conclusion: The developed physical rehabilitation program promotes the development of not only motor but also cognitive functions and auditory-verbal skills in school-age children with SNHL. The age of amplification is an important prognostic factor determining a child's rehabilitation potential. The obtained data substantiate the need for hearing aid fitting as early as possible (before 2 years of age) and the inclusion of a motor component in individualized auditory-verbal rehabilitation programs for children with SNHL.

OP-238

Diagnostic Performance Of Artificial Intelligence In Vertigo: A Scenario-Based Study Of BPPV Identification And Positional Test Interpretation

Sevilay Hançer Tecimer[1]

[1]*Malatya Turgut Özal University*

BACKGROUND & AIM

Artificial intelligence (AI) has increasingly been integrated into medical decision-making processes, creating new opportunities for vestibular assessment. Benign paroxysmal positional vertigo (BPPV), the most common peripheral vestibular disorder, requires accurate interpretation of positional test findings for appropriate diagnosis and treatment. However, the ability of AI systems to reliably identify BPPV subtypes and distinguish peripheral from central vertigo remains insufficiently investigated. This study aimed to evaluate the diagnostic performance, response quality, and temporal stability of ChatGPT in standardized vestibular scenarios focusing on BPPV identification and positional test interpretation.

MATERIAL & METHODS

This scenario-based study included 30 standardized vertigo scenarios developed by otolaryngologists experienced in vestibular disorders. The scenario set consisted of 14 posterior canal BPPV cases, 8 horizontal canal BPPV cases, 6 non-BPPV peripheral vertigo cases, and 2 central vertigo scenarios. All scenarios were submitted to ChatGPT using identical structured prompts. ChatGPT responses were evaluated for diagnostic accuracy, positional test interpretation, canal and side identification, and appropriateness of recommended repositioning maneuvers. Response quality was assessed independently by three otolaryngologists using the Quality Analysis of Medical Artificial Intelligence (QAMAI) tool. Inter-rater reliability was analyzed using intraclass correlation coefficient (ICC). To evaluate temporal stability, all scenarios were re-submitted to ChatGPT at a second time point using identical prompts.

RESULTS

ChatGPT correctly identified all evaluated scenarios, including posterior canal BPPV, horizontal canal BPPV, non-BPPV peripheral vertigo, and central vertigo cases, resulting in an overall diagnostic accuracy of 100%. ChatGPT also successfully interpreted diagnostically challenging scenarios, including central positional vertigo and apogeotropic horizontal canal BPPV. The mean QAMAI score was 23.46 ± 0.77, indicating generally high-quality and clinically useful responses. Among QAMAI domains, source reliability received the lowest scores, whereas diagnostic accuracy and clinical usefulness received the highest ratings. Inter-rater reliability for QAMAI scoring demonstrated low-to-moderate agreement among otolaryngologists (average measures ICC = 0.405, p = 0.047). Temporal stability analysis demonstrated excellent agreement between ChatGPT responses generated at two different time points (average measures ICC = 0.921, p < 0.001).

CONCLUSIONS

ChatGPT demonstrated excellent diagnostic accuracy and high temporal consistency in standardized vertigo scenarios, including diagnostically challenging BPPV cases and central vertigo presentations. Although the overall quality of AI-generated responses was rated highly, limitations regarding source reliability remain an important concern. ChatGPT may serve as a supportive clinical tool in vestibular assessment.

OP-239

Pediatric Traumatic Brain Injury And Dizziness: Do Kids Get Dizzy?

Shahrukh Ali[1], **Robert Africa**[1], **Harold Pine**[1], **Yusif Hajiyev**[1], **Charles Hughes**[1]

[1]*University of Texas Medical Branch*

BACKGROUND & AIM

Dizziness and peripheral vertigo are recognized sequelae of traumatic brain injury (TBI); however, their prevalence in pediatric populations remains poorly characterized. This study aimed to determine the rate of dizziness and peripheral vertigo among pediatric patients sustaining varying severities and types of traumatic brain injury.

MATERIAL & METHODS

A retrospective cohort study was conducted using de-identified patient data from the TriNetX database (January 1, 2010–January 28, 2024), including pediatric patients diagnosed with TBI across 84 healthcare organizations. TBI subtypes analyzed included concussion, traumatic subarachnoid hemorrhage (SAH), traumatic subdural hemorrhage (SDH), focal TBI (fTBI), diffuse TBI (dTBI), epidural hemorrhage (EH), and traumatic cerebral edema (tCE). Incidence of dizziness and peripheral vertigo was evaluated within one year following injury.

RESULTS

Among 188,365 pediatric patients with TBI, 2% developed dizziness or peripheral vertigo overall. Rates varied by injury type, with concussion demonstrating the highest overall prevalence (2.2%). In adolescents aged 12–17 years, markedly higher rates were observed across all TBI categories, including SDH (6.8%), EH (11%), dTBI (7%), fTBI (6.5%), SAH (6.3%), and tCE (6%), indicating increased symptom burden in older pediatric patients.

CONCLUSIONS

While dizziness and peripheral vertigo occur at relatively low rates in the overall pediatric TBI population, adolescents demonstrate substantially higher post-injury prevalence. Hemorrhagic TBIs, particularly subdural and epidural hemorrhages, are associated with increased risk. These findings emphasize the importance of age-specific evaluation and vestibular symptom screening following pediatric traumatic brain injury.

Surgical Outcomes Of Semicircular Canal Plugging For Intractable BPPV

Hiroshi Fujii[1,2], **Ryohei Oya**[1], **Takao Imai**[3], **Kayoko Higashi-Shingai**[1], **Yoshiyuki Ozono**[1], **Takashi Sato**[1], **Hidenori Inohara**[1]

[1]Department of Otorhinolaryngology - Head and Neck Surgery, The University of Osaka, Osaka, Japan.; [2]Department of Otorhinolaryngology, Yao Municipal Hospital, Osaka, Japan.; [3]Department of Otorhinolaryngology - Head and Neck Surgery, Bellland General Hospital, Osaka, Japan.

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is generally a benign condition that improves spontaneously or responds to canalith repositioning maneuvers. However, a subset of patients develops intractable BPPV with long duration of positional nystagmus and vertigo. Semicircular canal plugging surgery has been proposed as a definitive therapeutic option, but robust clinical evidence remains limited. The aim of this study was to evaluate the clinical outcomes of semicircular canal plugging performed for patients with intractable BPPV at our institution.

MATERIAL & METHODS

Patients who underwent semicircular canal plugging between January 2014 and December 2025 were enrolled. Among all six cases, five patients with sufficient follow-up data were analyzed. Surgical indication was persistent positional nystagmus for more than one year despite repeated canalith repositioning maneuvers (both Epley and Brandt–Daroff methods). Outcomes including pre- and post-operative nystagmus, hearing thresholds, and recurrence status were analyzed. Hearing was evaluated using the average thresholds of four pure-tone frequencies at 500, 1000, 2000, and 4000 Hz before and 1 month and 6 months after surgery.

RESULTS

All five patients were female with an age of 62.4 ± 13.35 years (mean ± SD) and the median follow-up period was 1,509 days (range 258–3,872 days). The affected canal was the posterior canal in four cases and the lateral canal in one case. The mean preoperative peak nystagmus frequency was 3.2 ± 1.1 Hz and only one patient showed minimal residual nystagmus (peak frequency: 0.41 Hz) two weeks after surgery. By six months, nystagmus disappeared in all patients. No ipsilateral recurrence occurred during follow-up; one patient developed contralateral BPPV ten years after surgery. Hearing deterioration of ≥10 dB was observed in four patients at 1 month, improved to within 10 dB in all patients by 6 months, and reappeared in two patients at 1 year.

CONCLUSIONS

Semicircular canal plugging effectively eliminated positional nystagmus in patients with intractable BPPV. Although transient postoperative hearing impairment can occur and late deterioration was observed in some cases, overall vestibular outcomes were favorable. Canal plugging is a valuable therapeutic option for carefully selected patients with intractable BPPV.

OP-241

Beyond The Temporal Threshold: Expanding Vestibular Migraine Diagnostic Criteria Through Central Sensitization Markers — A Clinical-Translational Synthesis.

Migzaid Díaz Barrios, MD[1], **Fernando Rodríguez, MT,**[1]

[1]*ORL Salud Limitada / Vértigo Cero, Puerto Montt, Chile*

BACKGROUND & AIM

Vestibular Migraine (VM) is the second most common cause of episodic vertigo, yet current Bárány Society and ICHD-3 criteria — designed for research consistency — apply strict thresholds that may exclude clinically meaningful cases, particularly where advanced vestibular testing is limited. We hypothesized that VM represents a broader clinical spectrum than current criteria capture, and that accessible markers of central sensitization can identify cases excluded by current temporal thresholds.

MATERIAL & METHODS

Clinical-translational synthesis of literature published 2020–2026, prioritizing clinical applicability over systematic review methodology. Setting: PubMed, Embase, Cochrane Library. Subjects: adults with VM, probable VM, or differential vestibular diagnoses. Outcomes: episode duration, vestibular test profiles, central sensitization markers, psychiatric comorbidity, diagnostic specificity. Analyses: qualitative synthesis prioritizing systematic reviews, meta-analyses, and prospective cohorts.

RESULTS

Five findings support broadening these criteria. (1) Kang et al. (2023) reported strict Bárány application reduced VM prevalence from 11.6% to 2.9% in otolaryngology cohorts — a 75% reduction. (2) Abouzari et al. (2020) found migraineurs with vestibular symptoms not meeting ICHD-3 had episodes of 84 ± 146 hours, versus 11 ± 22 hours in criteria-meeting patients. (3) Aron et al. (2026) documented extreme inter-study variability of vestibular findings in VM; Vosbeek et al. (2025; n=3,096) confirmed peripheral abnormalities also occur in VM. (4) Vestibular Autorotation Test at 2–3 Hz showed 95.7% sensitivity and 50.6% specificity for VM versus Ménière's disease (Liu et al., 2022). (5) Abdulla et al. (2025) demonstrated cutaneous allodynia with 83% specificity for VM, adjusted odds 16.7-fold higher in VM and 99.4-fold in chronic migraine with VM ($p<0.005$). A meta-analysis of 764,403 patients (Kim et al., 2025) reported 46.5% anxiety and 35.7% depression in VM subgroups.

CONCLUSIONS

Current VM criteria insufficiently capture the clinical spectrum of migraine-driven vestibular dysfunction. We propose a tiered diagnostic framework incorporating these markers as candidates for future criteria revision — aligned with the ongoing International Classification of Vestibular Disorders initiative (Kaski et al., 2025). It offers value where vestibular laboratory access remains limited, providing a clinically scalable framework.

OP-242

Postural Control And Menopausal Symptoms In Women: A Pilot Posturography Study

Yuşa Başoğlu[1], **Gül Ölçek**[1], **Burcu Şen**[2], **Büşra Nur Eser**[1]

[1]*Istanbul Medipol University, Faculty of Health Sciences, Department of Audiology, Istanbul, Turkey;* [2]*Medipol Mega University Hospital Complex, Istanbul, Turkey*

BACKGROUND & AIM

Menopause may influence postural control through hormonal, vestibular, visual, somatosensory, and musculoskeletal mechanisms. These changes may contribute to impaired balance performance and increased fall risk in postmenopausal women. However, computerized dynamic posturography data evaluating both sensory organization and limits of stability in relation to menopausal status remain limited. This pilot study aimed to explore postural control performance and menopausal symptom severity in premenopausal and postmenopausal women.

MATERIAL & METHODS

This cross-sectional pilot study included 14 women aged 35–61 years. Participants were recruited and all measurements were performed at Medipol Mega University Hospital. Ethical approval was obtained from the Istanbul Medipol University Non-Interventional Clinical Research Ethics Committee (Decision No: 447, Date: March 5, 2026). Participants were divided into premenopausal and postmenopausal groups, with seven participants in each group. Postural control was evaluated using computerized dynamic posturography. Sensory Organization Test (SOT) outcomes included Composite Score and sensory analysis ratios: somatosensory, visual, vestibular, and preference. Limits of Stability (LOS) outcomes included reaction time, movement velocity, endpoint excursion, maximum excursion, and directional control. Menopausal symptoms were assessed

using the Menopause Rating Scale (MRS), including somato-vegetative, psychological, urogenital, and total scores. Group comparisons were performed using appropriate non-parametric analyses. Statistical significance was set at p<0.05.

RESULTS

The postmenopausal group was significantly older than the premenopausal group (53.57±4.43 vs. 46.00±2.45 years, p=0.006). SOT Composite Score did not differ significantly between groups (72.50±10.15 vs. 72.67±7.66, p=1.000). Available SOT sensory ratios were also comparable, including somatosensory (p=0.914), visual (p=0.762), vestibular (p=0.914), and preference ratios (p=0.762). LOS reaction time (p=0.456), endpoint excursion (p=1.000), maximum excursion (p=0.710), and directional control (p=0.318) did not differ significantly between groups. Movement velocity tended to be higher in the postmenopausal group, but this difference was not statistically significant (2.99±1.25 vs. 1.77±0.58 deg/sec, p=0.084). MRS total score (14.86±9.63 vs. 18.43±12.54, p=0.522) and subscale scores did not differ significantly between groups.

CONCLUSIONS

In this exploratory pilot study, postural control parameters and menopausal symptom severity were similar between premenopausal and postmenopausal women. These preliminary findings should be interpreted cautiously due to the small sample size. The combined use of SOT, LOS, and MRS appears feasible and may guide larger studies investigating menopause-related changes in balance control.

Balance And Cognitive Functions Of Universiti Kebangsaan Malaysia (UKM) Cochlear Implant Recipients: A Pilot Study

ASMA ABDULLAH[4], **Oui Ting Jie**[3], **Mahadir Ahmad**[2], **Nor Haniza Abdul Wahat**[1], **Goh Bee See**[3], **Noor Dina Hashim**[3]

[1]Centre for Rehabilitation & Special Needs (iCaRehab), Faculty of Health Sciences, UKM,Jalan Raja Muda Abdul Aziz; [2]Centre for Community Health Studies (ReaCH), Faculty of Health Sciences, Universiti Kebangsaan Malaysia, 50300 Kuala Lumpur; [3]Department of ORL-HNS , Hospital Canselor Tuanku Muhriz University Kebangsaan Malaysia, 56000 Kuala Lumpur, Malaysia; [4]Faculty of Medicine University Kebangsaan Malaysia, 56000 Kuala Lumpur, Malaysia

BACKGROUND & AIM

Cochlear implantation (CI) has proven to be effective in treating severe-profound sensorineural hearing loss. Currently there is an evidence suggesting that CI may be associated with improvement in cognitive and balance functions.

Objective: To study the balance and cognitive functions among UKM CI recipients.

MATERIAL & METHODS

A cross-sectional study conducted at Hospital Canselor Tuanku Muhriz, Kuala Lumpur. A total of 13 patients were recruited from UKM cochlear implant program. Suitable patients undergo pre-operative testing as a baseline followed by a repeat of balance and cognitive assessments after at least 3 months post-cochlear implantation. Balance tests used were Paediatric Clinical Test of Sensory Interaction and Balance (pCTSIB) or Modified Clinical Test of Sensory Interaction and Balance (mCTSIB). Age-appropriate cognitive tests used were: Wechsler Preschool and Primary Scale of Intelligence - 4th Edition (WIPPSI-IV), Wechsler Intelligence Scale for Children – 5th Edition (WISC-V) and Wechsler Adult Intelligence Scale - 4th Edition (WAIS-IV).

RESULTS

The statistical analysis showed an increase in cognitive subtest scores: Similarities and Digit Span when comparing post-CI with pre-CI performance. There were no significant changes see in balance function post-CI. Further correlation studies found a strong negative correlation between age of implant and duration of hearing loss with cognitive subtests: Picture Memory and Zoo Locations pre-CI. There was a strong positive correlation between age of implant and duration of hearing loss with Picture Memory in post-CI patients.

CONCLUSIONS

Cochlear implantation may enhance verbal comprehension, working memory, and potentially balance. Age of implantation and hearing loss duration correlated with cognitive performance pre- and post-CI.

Global Trending Research And Development In Vestibular Implant: A Comprehensive Bibliometric Analysis And Visualization During 21St Century

Ying Lin[1,2], **Meichan Zhu**[3], **Zhiqing Ma**[1,2], **Xinwei Chen Wang**[1,2], **Feng Yu**[1,2]

[1]Institution of Otorhinolaryngology Head and Neck, Jinan University; [2]Department of Otorhinolaryngology Head and Neck, Guangzhou Red Cross Hospital; [3]Maastricht University Medical Center

BACKGROUND & AIM

The vestibular implant shows promise in alleviating symptoms of bilateral vestibulopathy. This bibliometric analysis aims to elucidate the knowledge structure of vestibular implant research in the 21st century and to forecast emerging research trends.

MATERIAL & METHODS

Relevant studies published between January 2000 and June 2025 were retrieved from the Web of Science Core Collection. Bibliometric indicators were analyzed through R, CiteSpace, and VOSviewer. A cross-sectional analysis was performed to assess publication output by country, research group, author, journal, keyword frequency, and citation impact.

RESULTS

A total of 151 English-language publications were identified, including 137 original research articles with a focus on postoperative outcomes. The United States and European countries demonstrated leadership in publication volume, citation metrics, and research influence, represented primarily by four major groups: Johns Hopkins, Geneva-Maastricht, Washington, and Las Palmas. The most frequent keywords included “vestibular implant,” “electrical stimulation,” “vestibular prosthesis,” “eye movements,” and “prosthesis.” The highest annual publication count was observed in 2020. The top contributing authors were Van de Berg, Della Santina, Guinand, Kingma, and Guyot, with Della Santina exhibiting the highest local citation impact. The collaboration network illustrated robust inter-group cooperation aimed at advancing vestibular prosthesis development. The journals IEEE Transactions on Biomedical Engineering and Annals of Otology, Rhinology & Laryngology were the most locally and globally cited, respectively.

CONCLUSIONS

Bibliometric and visualization analysis provide a distinctive and objective viewpoint of vestibular implant research trends. Additionally, it highlights challenges and future perspectives in this field. This study reveal that the emerging and progressing artificial vestibular technology paves the way for a potential therapeutic alternative for patients with vestibular deficit.

Clinical Subgroups Of Menière’s Disease In A Brazilian Cohort

Prof. Dr. Karen de Carvalho Lopes, MD, PhD[1], **Dr. Tatiana de Almeida Lima Sá Vieira, MD**[1], **Francisco José de Almeida Fernandes, PhD**[2], **Prof. Dr. Fernando Freitas Ganança, MD, PhD**[1]

[1]*Federal University of São Paulo -UNIFESP / Brazil;* [2]*University of São Paulo- USP / Brazil*

BACKGROUND & AIM

Menière’s disease (MD) is an inner ear disorder characterized by recurrent vertigo, fluctuating sensorineural hearing loss, tinnitus and aural fullness in the affected ear. Diagnosis is based on clinical criteria. MD presents significant heterogeneity in its clinical expression. Genetic factors, viral infections, allergies, and autoimmune mechanisms appear to contribute to its multifactorial nature. The formation of clinical subtypes has increasingly been observed in clinical practice.

This study aimed to characterize the clinical-epidemiological profile of patients with definite, unilateral and bilateral MD, and perform a Cluster Analysis to define clinical sugroups within a cohort of Brazilian MD patients.

MATERIAL & METHODS

This is a cross-sectional study, with cluster analysis, involving 40 Brazilian patients followed at an Otoneurology outpatient clinic. Participants answered a clinical questionnaire applied by a medical researcher. For analysis, a clustering method for mixed-type data was used, which can detect relationships within a complex dataset between patients with multiple distinct characteristics. It tries to identify homogenous groups of cases based on the distribution of some variables, using log-likelihood distance measures. Two criteria were considered: silhouette width and Calinski-Harabasz index, which evaluates the coherence of each individual within their cluster and internal consistency. In both cases, the higher the value found, the greater the similarity of individuals in a given subgroup.

RESULTS

The cohort of Brazilian MD patients was characterized by a female majority, with unilateral involvement and moderate or moderately severe hearing loss, with onset of symptoms between the third and sixth decades of life, presence of cardiovascular risk factors, personal history of non-migraine headache, and allergic rhinitis.

Seven distinct sugroups were found:

Cluster 1) MD in female patients without migraine.

Cluster 2) MD associated with an autoimmune disease.

Cluster 3) Delayed MD.

Cluster 4) MD associated with migraine and headache.

Cluster 5) MD in male patients without migraine.

Cluster 6) MD associated with isolated allergic rhinitis.

Cluster 7) MD associated with isolated non-migraine headache.

The distribution of patients by subgroup was homogeneous.

CONCLUSIONS

The cluster analysis demonstrated seven distinct clinical sugroups in the Brazilian cohort of MD patients, reinforcing the evidence of the phenotypic heterogeneity of MD.

OP-246

Rare Hematological Findings In Vestibular Migraine, Recurrent BPPV And Sudden Sensorineural Hearing Loss: A Clinical Series

Voda Ioana Alexandra[1]

[1]*Clinica Nova Explorari ORL*

BACKGROUND & AIM

Background: Recurrent vestibular disorders and sudden sensorineural hearing loss (SSNHL) are frequently considered idiopathic, although systemic hematological abnormalities may play an underrecognized role. Identifying rare etiological conditions may improve diagnostic accuracy and guide multidisciplinary management.

MATERIAL & METHODS

We conducted an observational study over six months in 2025, including 40 consecutive patients evaluated at Nova Clinic, Bucharest, Romania. The cohort included patients with recurrent vestibular migraine, recurrent benign paroxysmal positional vertigo (BPPV), and sudden sensorineural hearing loss. All patients underwent extensive laboratory investigations, including complete hematological testing, thrombophilia panel, lipid profile, serological testing, infectious disease screening, and metabolic evaluation. Clinical and laboratory findings were analyzed collaboratively by an ENT–Hematology multidisciplinary team.

RESULTS

Results Multiple rare hematological and systemic abnormalities were identified. Three patients were diagnosed with polycythemia. One case of secondary syphilis was detected. A significant proportion of patients presented iron deficiency without overt anemia. Antiphospholipid syndrome associated with Borrelia infection was identified, alongside additional cases of borreliosis. These findings highlight the heterogeneity of systemic contributors in patients with recurrent vestibular pathology and SSNHL. A clinical classification based on hematological findings is proposed.

CONCLUSIONS

Rare hematological conditions, particularly iron deficiency and prothrombotic disorders, may represent underrecognized contributors to recurrent vestibular disorders and sudden hearing loss. Systematic multidisciplinary evaluation can improve etiological diagnosis and support individualized management strategies.

Keywords: vestibular migraine, recurrent BPPV, sudden hearing loss, iron deficiency, hematological disorders, thrombophilia

OP-247

The Efficacy Of Automated Repositioning Chair In Refractory Benign Paroxysmal Positional Vertigo-A Pilot Study

Özlem Bayram[1], **Harun Küçük**[1], **Murat Haluk Özkul**[1]

[1]*Istinye University Hospital, Medical Park Gaziosmanpaşa;* [2]*Sabahattin Zaim University*

BACKGROUND & AIM

The objective of this study was to determine the overall success rate of automated canalith repositioning chair combined with videonystagmography (VNG) in the treatment of refractory benign paroxysmal positional vertigo (BPPV) patients who were initially treated unsuccessfully with conventionally performed canalith repositioning maneuvers (CRM) and whether can be a solution to enable easy CRM and make a difference in treatment success among BPPV subtypes.

MATERIAL & METHODS

Methods

Prospective study with 96 patients diagnosed with refractory benign paroxysmal positioning vertigo after initial CRM at primary health care centers between December 2022 and 2023 were treated by means of RMS™ combined with VNG as an automated repositioning chair at a tertiary university hospital in between between December 2022 and 2023. Patients were deemed successfully treated if they displayed remission after three or less sessions within the span of a month.

RESULTS

Results

The mean number of required treatments was 1.42 with a success rate of 96.9 %. Two horizontal canal and one multicanal BPPV needed more than three treatment sessions in one month span with 3.1% treatment failure rate (defined as a need of more than 3 sessions in one month)

CONCLUSIONS

Conclusion

RMS™ as an automated repositioning chair can be considered as an effective repositioning chair in the treatment of conventionally performed canalith repositioning maneuver resistant patients with success rates reaching 97%.

OP-248

Two Clinical Faces Of Post-Earthquake Dizziness: New-Onset Symptoms Versus Exacerbation Of Pre-Existing Dizziness

Hanifi Korkmaz[1]

[1]*Malatya Turgut Özal University, Türkiye*

BACKGROUND & AIM

Post-earthquake dizziness is a common but poorly characterized consequence of disaster exposure, yet its clinical heterogeneity remains largely unexplored. Previous literature has generally addressed post-earthquake dizziness as a binary symptom without accounting for pre-existing dizziness history. This study compared dizziness-related handicap, psychological burden, and quality of life between individuals with new-onset post-earthquake dizziness and those with exacerbation of pre-existing dizziness following the February 6, 2023 earthquakes in Türkiye.

MATERIAL & METHODS

A total of 120 individuals with post-earthquake dizziness were divided into two groups based on self-reported dizziness history: new-onset dizziness following the earthquakes (n=60) and exacerbation of pre-existing dizziness (n=60). Individuals with acute vestibular attacks, acute neurological conditions, or active psychiatric decompensation were excluded. Assessments included the Dizziness Handicap Inventory (DHI), Beck Anxiety Inventory (BAI), PTSD Checklist for DSM-5 (PCL-5), Short Form-36 (SF-36), and the Earthquake Anxiety Scale (EAS). Group comparisons, correlation analyses, and exploratory logistic regression analyses were performed.

RESULTS

Individuals with pre-existing dizziness demonstrated higher DHI total scores than the new-onset group (59.2±14.1 vs. 46.3±14.0, $p<0.001$), including physical (14.8±4.1 vs. 11.6±3.8, $p<0.001$), emotional (20.7±5.2 vs. 16.2±4.9, $p<0.001$), and functional subscales (23.7±6.0 vs. 18.5±5.6, $p<0.001$). SF-36 scores were lower in the pre-existing dizziness group (49.2±12.0 vs. 61.9±7.2, $p<0.001$). In contrast, the new-onset group showed higher EAS scores (25.1±5.7 vs. 17.2±6.6, $p<0.001$) and higher PCL-5 scores (41.3±9.8 vs. 30.5±10.8, $p<0.001$). No significant between-group difference was observed in BAI scores ($p=0.219$). In the new-onset group, DHI scores correlated positively with PCL-5 scores ($r=0.323$, $p=0.012$), whereas this relationship was not observed in the pre-existing group ($r=0.016$, $p=0.901$). Exploratory logistic regression analyses indicated that earthquake-related anxiety and trauma-related symptom severity were among the variables associated with the new-onset dizziness phenotype ($p<0.01$).

CONCLUSIONS

Post-earthquake dizziness does not appear to represent a uniform clinical condition. Individuals with pre-existing dizziness may exhibit a more chronic functional burden profile, whereas those with new-onset dizziness may demonstrate greater trauma-related symptom burden and heightened earthquake-related psychological reactivity. These findings suggest partially distinguishable post-earthquake dizziness profiles characterized by differing functional and trauma-related symptom patterns.

OP-249

The Influence Of Vestibular Dysfunction On Spatial And Temporal Cognitive Processing

Dr. Alperen Yiğit Aktaş[1], **Prof. Dr. Ozan Gökdoğan**[1], **Prof. Dr. Çağıl Gökdoğan**[1]

[1]*Department of Otorhinolaryngology, Faculty of Medicine, Muğla Sıtkı Koçman University; Ministry of Health Muğla Training and Research Hospital, Türkiye*

BACKGROUND & AIM

Vestibular input supports not only balance but also higher-order spatial cognition and temporal processing. This study aimed to evaluate whether spatial orientation/navigation and time perception are impaired during the attack-free period in individuals with peripheral vestibular pathology, compared with healthy controls. We hypothesized that vestibular dysfunction would be

associated with measurable deficits—particularly in tasks requiring spatial orientation, spatial memory, spatial navigation and time perception—despite clinical stability.

MATERIAL & METHODS

A prospective descriptive case–control study was conducted at the otolaryngology clinic/audiology center of Muğla Training and Research Hospital (Türkiye), with ethics approval and Helsinki compliance. Sixty-six adults (18–65 years) were enrolled: 33 with vestibular pathology (abnormal vHIT) and 33 controls (normal vHIT), balanced for age/sex. Cognitive integrity was confirmed (MoCA ≥26), and auditory confounding was minimized by excluding participants with PTA ≥15 dB HL or speech discrimination <90%. Spatial/temporal function was assessed using a standardized battery including Laser Pointer & Compass Pointing (eyes-closed memory, actual rotation, mental rotation), Triangle Completion Test, 2D line/angle orientation, 2D perspective taking/spatial orientation, tablet-based hand–eye coordination, visuospatial reasoning, short-term memory, target-hitting, and a time perception task (1–21 s). Normality was tested (Shapiro–Wilk); Welch's t-test or Mann–Whitney U was applied ($p<0.05$).

RESULTS

The vestibular group (n=33) had unilateral pathology; mean age was 39 vs 36 years in controls. In Laser Pointer & Compass Pointing, the eyes-closed memory condition showed no between-group difference ($p=0.12$), whereas actual body rotation ($p=0.0012$) and mental rotation ($p<0.001$) were significantly impaired in the vestibular group. Triangle Completion Test demonstrated significant between-group differences in both distance and angular errors (both $p<0.001$). Time perception showed no difference at 1 s ($p\approx0.095$) but significant impairments at all intervals ≥2 s (e.g., 2 s $p\approx0.0003$; 3 s $p\approx0.0035$; ≥5 s $p<0.001$). Additional significant deficits were observed in hand–eye coordination ($p\approx0.00006$), visuospatial reasoning ($p<0.001$), short-term memory ($p<0.001$), and target-hitting ($p\approx0.025$).

CONCLUSIONS

Peripheral vestibular pathology is associated with clinically relevant impairments in spatial orientation/navigation and time perception even during attack-free periods. Deficits are most evident in tasks requiring reference-frame updating, body/mental rotation, and path integration, while performance may be relatively preserved in tasks dominated by visual cues or short-term compensatory strategies. The selective pattern in timing—normal at 1 s but impaired at ≥2 s—supports a stronger vestibular contribution to cognitively demanding interval estimation. These findings support the systematic integration of cognitive–perceptual assessments and targeted, cognition-oriented rehabilitation strategies into routine vestibular evaluation and management protocols.

Association Between Age, Vestibular Symptoms, And Functional Balance In Adults And Older Adults

Osman Ilkay Ozdamar[1], **Emel Aslantas**[2], **Elif Acar**[3], **Gul Ozbilen Acar**[1]

[1]*Department of Otorhinolaryngology and Head and Neck Surgery, Istanbul Medeniyet University Goztepe Prof. Dr. Süleyman Yalçın City Hospital, Istanbul, Turkey;* [2]*Department of Audiology, Istanbul Medeniyet University Goztepe Prof. Dr. Süleyman Yalçın City Hospital, Istanbul, Turkey;* [3]*Istanbul Sancaktepe Şehit Prof. Dr. Ilhan Varank Training and Research Hospital, Istanbul, Turkey*

BACKGROUND & AIM

This study aimed to examine the relationship between age, vestibular symptoms, and functional balance performance in adults aged 50 years and older. The study also evaluated whether vestibular symptoms independently predict balance outcomes.

MATERIAL & METHODS

This retrospective analytical study included 37 participants aged between 52 and 95 years. Sociodemographic characteristics, vestibular symptoms including vertigo, dizziness, and imbalance, as well as neurological examination findings related to balance, were obtained from standardized assessment records. Functional balance performance was evaluated using the Berg Balance Scale (BBS). Correlation and multiple linear regression analyses were performed to assess the relationships between variables.

RESULTS

Functional balance performance decreased significantly with advancing age. A significant negative correlation was found between age and BBS scores ($r = -0.586$, $p = 0.0002$). Vestibular symptoms were significantly associated with one another, and vertigo showed strong relationships with both dizziness and imbalance ($p < 0.001$). However, after adjusting for age, vestibular symptoms did not independently predict balance performance. In the regression analysis, age was identified as the only significant predictor of BBS scores ($\beta = -0.545$, $p = 0.001$).

CONCLUSIONS

Age-related factors may have a greater impact on functional balance performance than vestibular symptoms alone in older adults. Although vestibular complaints frequently coexist, they may not accurately reflect objective balance impairment by

themselves. These findings emphasize the importance of combining symptom evaluation with functional balance assessments in clinical practice.

Aging; dizziness; vestibular symptoms; Berg Balance Scale; postural stability

OP-251

Implications And Diagnostic Utility Of Functional Head Impulse Test (Fhit) In Vestibular Migraine

Dr Sonali Pandit[1]

[1]*Aaryan ENT and Vertigo Clinic, Mumbai, India*

BACKGROUND & AIM

Functional head impulse test (fHIT) is an easy and noninvasive test to assess the function of vestibulo-ocular reflex (VOR). The fHIT gives insights into VOR functioning and can identify potential issues with balance and gaze stabilization.

Vestibular migraine (VM) is condition which is currently diagnosed purely based on symptoms (Barany society criteria for vestibular migraine). Here, we compare the results of fHIT in patients of vestibular migraine in inter-ictal phase with healthy volunteers.

The aim is to investigate and explore a potential diagnostic criteria of VM based of fHIT results.

MATERIAL & METHODS

A prospective cross sectional study was conducted in an outpatient clinic to compare the results of fHIT in patients of vestibular migraine (n=30) and age matched healthy control (n=30) during February 2025 to July 2025. Patients who fulfilled the diagnostic criteria of VM by Barany society and International headache society and who were into interictal phase were included. Patients with associated neurotological disorders, hearing loss more than 30 dB were excluded. Patients were divided into two groups, VM group (n=30) and age matched control with no vestibular complaints (n=30).

Patient sits in front display screen wearing head band with gyroscope. Examiner gives unpredictable passive horizontal/angular head thrusts in all six semicircular canal planes (10°–20° amplitude, 150-300°/s). Landolt C optotypes or letters flash briefly (80ms) during head movement. Patient reports perceived orientation of the optotype (up, down, left, right)/read the letter. System calculates percentage of correct answers (%CA) as primary outcome measure

RESULTS

To evaluate the overall statistical significance, a paired t-test was performed by considering the six region-wise pairs together. The results showed a t-statistic of 9.36 with a p-value of 0.00023. This indicates a highly significant difference between Control and VM. The difference in % of CA between VM patients and controls was statistically significant across all canal planes, with more pronounced deficits in vertical canal testing.

Significantly lower %CA in VM group compared to controls ($p<0.001$). Vertical canal dysfunction more prevalent than horizontal ($p=0.02$). No significant difference between Rt and Lt sides ($p=0.78$). Multivariate analysis showed fHIT results were independent of age and gender

CONCLUSIONS

The findings strongly suggest that patients of VM show reduced VOR across all semicircular canals planes when compared to the control group. Vertical canals were affected more than horizontal canals, potentially representing a characteristic neurophysiological signature pattern of VM.

Abnormal fHIT results in VM can be due to central vestibulo-visual integration issues. It is particularly helpful in ambiguous cases and can be a helpful adjunct in diagnosis of vestibular migraine.

Further investigations with larger multicentre validation studies are needed to evaluate the fHIT results in VM patients and to compare the regional specificity.

KEYWORDS

OP-252

Evaluation Of Systemic Immune-Inflammation And Systemic Inflammation Response Indices In Predicting Recurrent Benign Paroxysmal Positional Vertigo Episodes

Dilara Ülkü İlbaş Aydin[1], **Nurbanu Koçdemir Erul**[2], **Şeyda Akbal Çufalı**[1], **Mehmet Ali Çetin**[1]

[1]*Ankara Bilkent City Hospital;* [2]*Beypazari Public Hospital*

BACKGROUND & AIM

Benign Paroxysmal Positional Vertigo (BPPV) is the most frequent cause of peripheral vestibular dysfunction. Although canalith repositioning maneuvers, such as the Epley maneuver, provide high initial success rates, the clinical management of patients with recurrent BPPV attacks remains a challenge. Recent literature suggests that low-grade systemic inflammation may play a role in vestibular pathologies. We hypothesized that elevated levels of the Systemic Immune-Inflammation Index (SII) and the Systemic Inflammation Response Index (SIRI) are associated with an increased risk of recurrent BPPV attacks.

MATERIAL & METHODS

This retrospective study reviewed 123 patients diagnosed with BPPV at our outpatient clinic between April 1, 2020, and April 1, 2026. To ensure clinical standardization, 20 pediatric patients and 42 patients with missing laboratory data were excluded. The final analysis included 53 adult patients. Subjects were categorized into two groups based on clinical follow-up: those with recurrent BPPV attacks and those without recurrence. SII was calculated as (Platelets × Neutrophils) / Lymphocytes, and SIRI was calculated as (Neutrophils × Monocytes) / Lymphocytes. Independent variables included age, gender, and laboratory parameters. Statistical analyses were performed using the Mann-Whitney U test to compare the indices between the two groups, with significance set at $p < 0.05$.

RESULTS

The mean age of the study population was 53.5 ± 13.8 years. Recurrent BPPV attacks were observed in 32.1% (n=17) of the patients. The median SII value was 463.8 in the recurrent group compared to 512.3 in the non-recurrent group, showing no statistically significant difference ($p = 0.871$). Similarly, the median SIRI values were 0.66 for patients with recurrent attacks and 0.80 for those without, which also failed to reach statistical significance ($p = 0.326$). Age and gender were not found to be significant predictors for recurrence ($p > 0.05$).

CONCLUSIONS

This study demonstrates that SII and SIRI levels at the time of diagnosis do not significantly predict recurrent BPPV attacks. The results suggest that the pathophysiology of BPPV recurrence may be more closely related to mechanical factors rather than systemic inflammatory responses. Further prospective studies with larger cohorts are needed to validate these findings.

Assessment Of Voluntary Motor Control And Static Balance In Individuals Living With HIV-1

Ali Doğan Aydınbelge[4], **Oğuz Kuşçu**[1], **Emre Gürses**[3], **cemre boşnak**[2], **Fadi R.S. Madani**[1], **Meliha Çağla Sönmezer**[2], **Ahmet Çağkan İnkaya**[2]

[1]*Department of Otorhinolaryngology, Hacettepe University Faculty of Medicine;* [2]*Department of Infectious Diseases and Clinical Microbiology, Hacettepe University Faculty of Medicine;* [3]*Department of Audiology, Hacettepe University Faculty of Health Sciences;* [4]*Department of Otorhinolaryngology,Gaziantep City Hospital*

BACKGROUND & AIM

According to the World Health Organization, 39.9 million people worldwide are living with HIV. Although antiretroviral therapy has prolonged life expectancy, age-related comorbidities such as osteoporosis and cardiovascular disease have become more prevalent, potentially impairing physical function and quality of life. Balance disorders may increase fall and fracture risk in this population. This study aimed to evaluate balance and voluntary motor control in people living with HIV (PLWH) and to investigate clinical factors associated with balance impairment.

MATERIAL & METHODS

This prospective cross-sectional study included 157 individuals with HIV-1 infection (10 of 167 initially assessed were excluded due to inability to maintain upright stance). Balance was evaluated using the Limits of Stability (LoS) and the Modified Clinical Test of Sensory Interaction on Balance (mCTSIB). Composite mCTSIB scores were compared with age- and sex-matched normative data. Participants were categorized as having normal balance or balance disorder. Clinical parameters, FRAX fracture risk scores, and SF-36 quality-of-life outcomes were analyzed. Multivariate analysis controlled for age and comorbidities.

RESULTS

Longer HIV duration was associated with balance disorder. After adjustment, individuals with ≥10 years since diagnosis had a 5.4-fold higher risk of balance disorder (OR: 5.399, 95% CI: 1.312–22.228, p=0.020). Hip fracture risk (21.2% vs. 4.0%) and major osteoporotic fracture risk (18.2% vs. 1.6%) were significantly higher in the balance disorder group (p=0.004 and p=0.001). SF-36 scores for physical function, social functioning, pain, and general health perception were significantly lower in participants with balance disorders.

CONCLUSIONS

Balance disorders in PLWH are associated with longer disease duration, increased fracture risk, and reduced quality of life. These findings highlight the need for routine balance assessment and proactive management strategies in long-term HIV care. Multidisciplinary approaches, including balance training and fracture prevention strategies, may reduce morbidity and mortality while improving functional independence and social participation in this population.

BACKGROUND & AIM

The vestibular implant is an investigational neuroprosthesis that offers a potential therapeutic approach for bilateral vestibulopathy. Fitting the implant requires determination of the dynamic range (DR), defined as the range between the threshold of activation (T) and the upper comfortable limit (UCL). It remains unclear how DR and electrically evoked eye responses evolve over time. This study evaluated the longitudinal stability of parameters in vestibulocochlear implant (VCI) recipients.

MATERIAL & METHODS

Ten subjects (eleven ears) with bilateral vestibulopathy were implanted with a VCI. T, UCL and peak eye velocity (PEV) were assessed per electrode across a three-year follow-up period of repeated acute stimulation sessions, and additionally during two 4-day periods of continuous stimulation.

RESULTS

T, UCL and DR remained stable at the cohort level across the three-year follow-up period, with no systematic trend. Median PEV likewise remained stable over time. UCL and PEV did not vary significantly within or between days during continuous stimulation. Substantial variability was present between subjects and electrodes.

CONCLUSIONS

Vestibular implant fitting parameters and the electrically evoked eye responses remain stable at the cohort level over a three-year follow-up period, despite considerable inter-subject and inter-electrode variability. These findings suggest the long-term stability of vestibular implant fitting and evoked responses and inform the design of future fitting protocols.

OP-255

Effect Of Vitamin D Levels On Vestibular Functions: A Multi-Modal Clinical Assessment

Nazlı Akkaya Kurt[1], **Özlem Ertuğrul**[2], **Sadiye Murat Acar**[3], **Mahmut Tayyar Kalcıoğlu**[4], **Alper Köycü**[5]

[1]*Istanbul Gelisim University, Faculty of Health Sciences, Department of Audiology, Istanbul, Türkiye;* [2]*Istanbul Medeniyet University, Faculty of Health Sciences, Department of Audiology, Istanbul, Turkey;* [3]*Istanbul Medeniyet University, Faculty of Medicine, Department of Internal Medicine, Division of Physical Medicine and Rehabilitation, Istanbul, Turkey;* [4]*Istanbul Medeniyet University, Faculty of Medicine, Department of Otorhinolaryngology, Istanbul, Turkey;* [5]*Başkent University, Faculty of Medicine, Department of Otorhinolaryngology, Ankara, Turkey*

BACKGROUND & AIM

Vitamin D is important for calcium homeostasis and may affect vestibular function through otolith membrane integrity, hair cell mechanotransduction, and vestibular afferent temporal coding. This study evaluated vestibular functions according to serum vitamin D levels using cVEMP, oVEMP, fHIT, and vHIT.

MATERIAL & METHODS

This prospective clinical study included 39 healthy participants divided equally into three groups according to serum 25(OH)D levels: ≤20 ng/mL, 20–29 ng/mL, and ≥30 ng/mL. All participants underwent cVEMP, oVEMP, vHIT, and fHIT assessments. Non-parametric statistical analyses were used, and $p<0.05$ was considered significant.

RESULTS

The groups were homogeneous in terms of age and sex. cVEMP amplitude asymmetry ratio differed significantly among vitamin D groups, whereas cVEMP latency values did not. oVEMP measurements showed no significant group differences. In fHIT, posterior and anterior PCA values differed significantly, while lateral PCA did not. In vHIT, anterior canal gain showed a significant difference among groups. A weak but significant positive correlation was found between anterior PCA and posterior canal gain.

CONCLUSIONS

Serum vitamin D levels may be associated with changes in selected vestibular parameters, especially cVEMP amplitude asymmetry, fHIT anterior/posterior PCA, and vHIT anterior canal gain. These findings support a possible relationship between vitamin D status and vestibular function and warrant confirmation in larger studies.

Clinical Diagnosis And Treatment Algorithm Using An Automated Repositioning Chair In Horizontal Canal BPPV: A Pilot Study

Harun Kucuk[1], **Ozlem Bayram**[1], **Murat Haluk Ozkul**[1]

[1]*Istinye University Gaziosmanpasa Medical Park Hospital*

BACKGROUND & AIM

This study aimed to develop a diagnostic and therapeutic algorithm that consolidates all variants of horizontal canal BPPV into a single, user-friendly diagram for routine clinical practice and provides a prototype framework for future artificial intelligence applications.

MATERIAL & METHODS

A retrospective review was conducted on 50 patients (25 female, 25 male) with horizontal canal BPPV (HC-BPPV). A diagnostic and therapeutic algorithm was developed for the diagnosis and treatment of this condition. The diagnostic and therapeutic maneuvers defined in this algorithm were performed using an automated repositioning chair, and the effectiveness of the obtained outcomes in diagnosis and treatment was evaluated.

RESULTS

HC-BPPV was observed in the right ear in 26 patients and in the left ear in 24 patients, with no statistically significant difference. Among HC-BPPV variants, canalolithiasis was the most frequently encountered. Successful treatment was achieved in 46 patients, resulting in a treatment success rate of 92%.

CONCLUSIONS

The diagnostic and therapeutic algorithm developed using an automated repositioning chair provides an effective, safe, and clinician-friendly approach for managing horizontal canal BPPV.

BACKGROUND & AIM

The vestibular implant aims to restore vestibular function in individuals with vestibulopathy by electrically stimulating the vestibular ampullary nerves. This stimulation needs to encode head movements relevant in daily life. Therefore, accurate characterisation of head rotational dynamics during natural behaviours is critical for informing vestibular implant fitting.

MATERIAL & METHODS

This cross-sectional study evaluated rotational head movements during daily living activities. A cohort of 53 healthy functioning participants completed ten movement tasks while wearing ear-level inertial sensors.

RESULTS

The collected data were used to calculate the angular position, velocity, acceleration, and frequency content of the head movements.

CONCLUSIONS

This systematic characterisation provides a comprehensive overview of the motion dynamics that the vestibular implant should be able to encode, therefore guiding implant fitting.

OP-258

Dynamic Visual Acuity Assessment As An Outcome Measure Of Vestibular Rehabilitation Effectiveness

fernanda vidigal Vilela lima[1], **Claudia Marques Dias**[1]

[1]*hospital Madre Teresa, Belo Horizonte*

BACKGROUND & AIM

Acute unilateral vestibular loss (UVL) can markedly impair daily activities and quality of life. Patients frequently report dizziness and/or visual blurring triggered by head movements. Measuring visual acuity during head motion has been used for decades to quantify the functional impact of vestibular hypofunction. Computerized Dynamic Visual Acuity (DVA) testing has demonstrated good reliability and clinically useful sensitivity and specificity. Although vestibular rehabilitation is an effective treatment for these patients, few objective measures are routinely used to quantify treatment response.

MATERIAL & METHODS

Methods: Twenty-eight patients with unilateral vestibular hypofunction (UVH) were enrolled. UVH was confirmed by video Head Impulse Test (vHIT; Natus), defined as horizontal VOR gain <0.65. At baseline, participants underwent computerized DVA testing (Framiral) during passive horizontal and vertical head rotations and completed the DHI. The intervention consisted of six supervised sessions (two sessions/week, 30 minutes/session). Patients performed active, fast horizontal head rotations alternating to both sides, starting toward the hypofunction side, with real-time visual feedback via an on-screen counter to maintain head velocity within a target range. After completion, vHIT and DVA were repeated under passive test conditions, and the DHI was re-administered. Clinically meaningful improvement in DHI was defined as a reduction of ≥18 points.

RESULTS

Twenty-one patients showed clinically meaningful improvement in DHI. All patients who improved on DHI also improved on DVA. The seven patients who did not improve on DHI similarly showed no improvement on DVA.

CONCLUSIONS

Computerized DVA appears to be a practical objective outcome measure for monitoring vestibular rehabilitation effectiveness, showing consistency with patient-reported disability (DHI) in this study

OP-259

Preliminary Validation Of The Arabic VM-PATHI In Patients With Vestibular Migraine

Sarah Zohair Alsebai[1]

[1]*King Abdulaziz University*

BACKGROUND & AIM

Vestibular migraine (VM) is a leading cause of episodic vertigo. Despite its prevalence, there remains a lack of validated, culturally appropriate outcome measures for Arabic-speaking populations. The VM-PATHI is a disease-specific, patient-reported outcome tool developed to assess the symptom burden of VM. This study aimed to translate, culturally adapt, and validate the Arabic version of VM-PATHI.

MATERIAL & METHODS

The original VM-PATHI was translated into formal Arabic using forward and backward translation. Cultural and semantic equivalence was ensured through expert review and field testing. The Arabic VM-PATHI was administered to Arabic-speaking adults with probable or definite VM. Participants also completed the Arabic Dizziness Handicap Inventory (DHI) and a visual analog scale (VAS) for quality of life. Reliability was assessed by evaluating internal consistency using Cronbach's alpha, and construct validity was examined using Pearson correlation with DHI and VAS scores. Ethical approval was obtained from King Abdulaziz University.

RESULTS

A total of 30 participants were included (mean age 39.4 years; 63.3% female). The mean VM-PATHI score was 68.6 (SD = 37.1). Internal consistency was excellent for the total scale (Cronbach's $\alpha = 0.93$), with domain-specific alphas ranging from 0.64 to 0.81. Field testing confirmed the tool's clarity, comprehensibility, and cultural appropriateness. VM-PATHI scores showed a strong positive correlation with DHI scores ($r = 0.84$, $p < 0.000001$) and a moderate negative correlation with VAS scores ($r = -0.49$, $p = 0.0055$).

CONCLUSIONS

The Arabic VM-PATHI demonstrates strong initial validity and reliability as a tool for assessing vestibular migraine symptom burden in Arabic-speaking populations. This study is ongoing, and further psychometric properties, including test–retest reliability and discriminant validity, will be examined in future phases.

Evaluation Of Utricular Functions In Benign Paroxysmal Positional Vertigo Patients And Healthy Individuals Using Virtual-Reality And Vestibular Evoked Myogenic Potentials

Beyza Nur Küçük[1], **Işılay Öz**[2], **Levent Naci Özlüoğlu**[2]

[1]*Department of Otorhinolaryngology, School of Medicine, Başkent University, Ankara, TR;* [2]*Department of Otolaryngology Head and Neck Surgery, Faculty of Medicine, Başkent University, Ankara, TR*

BACKGROUND & AIM

The purpose of this study is to explore utricular functions in patients with benign paroxysmal positional vertigo (BPPV) before and after treatment to determine the effect of vestibular information on vertical perception, compare it to the vertical perception of healthy individuals, and calculate the correlation between the test results.

MATERIAL & METHODS

The study was conducted in 2023 at the Department of Otolaryngology at Başkent University in Ankara, Turkey, with the participation of 34 BPPV-diagnosed patients and 34 healthy individuals. Prior to and following BPPV treatment, the patient group received the subjective visual vertical test (SVV), dynamic subjective visual vertical test (DSVV), and ocular vestibular evoked myogenic potential test (oVEMP). SVV and DSVV tests were applied to the control group. Statistical results were analyzed with IBM SPSS Statistics Base 25.0 (IBM SPSS Statistics for Windows, IBM Corp. Released 25.0.0, Armonk, NY: IBM Corp.). For statistical significance, a p-value below 0.05 was considered significant.

RESULTS

A significant difference between male and female patients was discovered when the SVV values of the patient group were examined prior to the maneuver ($p<0,05$). A significant difference ($p<0,05$) was discovered in the patient group when the DSVV values were compared before and after the treatment. A significant difference was found between the SVV values of the control group and the SVV values of the patient group before the treatment ($p<0,05$). A significant difference was found between the SVV values of the control group and the SVV values of the patient group after the treatment ($p<0,05$). A significant difference was found between the DSVV values of the control group and the DSVV values of the patient group before the maneuver ($p<0,05$). A correlation was found between SVV and DSVV values obtained after maneuver in patient individuals ($p<0,05$).

CONCLUSIONS

Our research demonstrates that BPVV affects vertical perception and that utricular functions are similarly compromised in BPPV patients. As a result of the tests performed following the treatment maneuvers, there was no significant effect of recovery on the SVV test value; It was found to have a positive effect on DSVV test values. For future research, it might be beneficial to obtain more samples.

Beyond Peripheral Repositioning: Prefrontal Hemodynamic Responses To The Epley Maneuver In Posterior Canal BPPV

Asuman Feda Bayrak[1], **İsmail Karameşe**[2], **Emre Eskicioğlu**[2], **Serpil Mungan Durankaya**[3], **Çağdaş Güdücü**[2,4]

[1]*Department of Otorhinolaryngology, Dokuz Eylul University Medical Faculty, Izmir, Türkiye;* [2]*Department of Biophysics, Dokuz Eylul University Medical Faculty, Izmir, Türkiye;* [3]*Department of Audiology, Dokuz Eylul University Medical Faculty, Izmir, Türkiye;* [4]*Department of Sleep and Conscious States, Dokuz Eylul University Health Science Institute, Izmir, Türkiye*

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is one of the most prevalent peripheral vestibular disorders and characterized by transient vertigo accompanied by positionally induced nystagmus. Although its pathophysiology is primarily explained, the neural mechanisms underlying symptom initiation and subsequent recovery are not yet comprehensively understood. The present study aimed to investigate neurovascular dynamics assessed using functional near-infrared spectroscopy (fNIRS) in response to the Epley maneuver in patients with posterior canal BPPV compared with healthy controls.

MATERIAL & METHODS

Six patients (mean age, 62.66±8.45 years) with posterior canal BPPV and seven healthy subjects (mean age, 54.33±6.59 years) were recruited in the study. Functional near-infrared spectroscopy was employed to monitor hemodynamic changes within the prefrontal cortex both group before and immediately after the Epley maneuver. Specifically, relative change in oxygenated hemoglobin (HbO) concentrations were analyzed to quantify the neurophysiological impact of the intervention.

RESULTS

To evaluate HbO concentration, a 2 x 2 mixed-design ANOVA was performed, comparing patient and control groups across pre- and post-Epley maneuver sessions. The analysis demonstrated a significant main effect of session on HbO concentrations ($p = 0.006$). However, no significant inter-group differences were observed, despite a 1.6-fold increase in the patient group compared to a 1-fold change in healthy controls.

CONCLUSIONS

The findings of this study demonstrate that the Epley maneuver exerts an impact on hemodynamic changes in the prefrontal cortex. Trending results in regard to higher oxygentaion of patient group, suggests that the intervention's effects extend beyond peripheral vestibular repositioning to involve central neurophysiological modulation. Given the complexity of these central responses, future studies should aim to categorize these hemodynamic patterns across distinct BPPV clinical variants and explore potential functional differences across expanded cortical areas.

OP-262

Evaluation Of Head Tilt Impact On Static Subjective Visual Vertical And Horizontal: A VR-Based Study In A Healthy Young Cohort

Ahsen Kartal Özcan[1], **Sema Satıcı**[1], **Ahmet Alperen Akbulut**[1,2]

[1]*Department of Audiology, Hamidiye Faculty of Health Sciences, University of Health Sciences, 34668, Istanbul, Türkiye;* [2]*Audiology and Speech Disorders PhD Program, Institute of Health Sciences, Marmara University, 34865, Istanbul, Türkiye*

BACKGROUND & AIM

Subjective Visual Vertical (SVV) and Horizontal (SVH) paradigms are essential for assessing gravitational perception via central otolithic integration. Beyond evaluating otolith function, these assessments yield critical data on vestibular pathologies impacting spatial orientation and postural control. By eliminating confounding external visual cues, Virtual Reality (VR) platforms enhance measurement precision compared to conventional techniques. Therefore, this study aims to evaluate the normative variations and clinical reliability of VR-based static SVV and SVH across multiple head tilt angles in a healthy cohort.

MATERIAL & METHODS

This research employed a descriptive study design. A total of 25 healthy adults (20 females, 5 males) aged 19 to 30 years (mean age:23.56±3.84) were enrolled in the study. Individuals with any history of otological, neurological, visual, cervical, physical, psychological, communication, or cognitive disorders were excluded. Participants were seated on a stretcher without foot or back support to receive less proprioceptive input during the measurements. Participants completed the SVV and SVH tasks at seven roll-plane head angles (0°, ±15°, ±30°, and ±45°). For each position, 10 rod orientations were presented in a consistent, semi-randomized sequence across all subjects. The mean was calculated as the arithmetic average, regardless of whether the value was positive or negative.

RESULTS

No significant differences were found between right and left tilt positions ($p>0.05$); data were then collapsed across tilt angles for analysis. In the static SVV assessment, the mean deviation in the neutral position was 1.41°±1.14. Under tilt conditions, the mean deviation values were 3.43°±2.32 at 15°, 4.91°±2.54 at 30°, and 8.37°±4.90 at 45°. Regarding the static SVH assessment, the mean deviation in the neutral position was 1.64°±0.90. The deviation values recorded at 15°, 30°, and 45° tilt positions were 3.22°±1.69, 5.41°±2.57, and 7.67°±3.67, respectively.

CONCLUSIONS

VR-based static SVV and SVH deviations increase proportionally with head tilt angles but remain symmetrical in healthy adults. While these preliminary findings demonstrate the potential of VR-based SVV and SVH assessments to evaluate graviceptive pathways across varying head tilts, future studies with larger cohorts are needed to establish definitive normative data for neuro-otological practice.

OP-263

Gaze Stabilization Exercises As A Technique For Acute Unilateral Vestibular Rehabilitation

fernanda vidigal Viela Lima[1], **Claudia Marques Dias**[1]

[1]*Hospital Madre Teresa, Belo Horizonte, Brazil*

BACKGROUND & AIM

Gaze Stabilization Exercises as a Technique for Acute Unilateral Vestibular Rehabilitation

Investigations of how patients with unilateral vestibular hypofunction (UVH) stabilize gaze during head movement has pointed to different compensatory mechanisms. The saccadic substitution process has been hypothesized later on for the

compensation of the ocular motor disorders in UVH patients. The vestibular catch-up saccades in the direction of the deficient VOR reduce de amplitude of the eye position error and contribute to stabilize gaze.

Gaze stabilization exercises (GSE) are widely used to improve dynamic visual acuity (DVA), yet there is no universally accepted protocol regarding dosage, progression, or prescription criteria.

MATERIAL & METHODS

Objective: To assess symptom-related and functional outcomes after supervised GSE protocol in patients with UVH.

Methods: Twenty-eight patients with UVH were enrolled. Diagnosis was confirmed by video Head Impulse Test (vHIT; Natus), defined as horizontal VOR gain <0.65. Baseline assessment included DVA testing (Framiral) during passive horizontal and vertical head rotations and the Dizziness Handicap Inventory (DHI). The intervention consisted of six supervised sessions (two sessions/week; 30 minutes/session). Patients performed active fast horizontal head rotations alternating to both sides, starting toward the hypofunction side, with real-time visual feedback via an on-screen counter to guide the target head-rotation velocity range. After completing the protocol, patients repeated vHIT and DVA testing under passive conditions and completed the DHI again. Clinically meaningful change in DHI was defined as a reduction ≥18 points.

RESULTS

Results: Twenty-one of 28 patients (75%) achieved a clinically significant improvement in DHI (≥18-point reduction). These patients also demonstrated improved DVA during horizontal head rotations following the protocol.

CONCLUSIONS

In this cohort of UVH patients, a brief supervised GSE program was associated with clinically meaningful reduction in perceived handicap and improved horizontal DVA. The findings support GSE as a useful intervention in acute UVH rehabilitation. Future studies should refine standardized dosage and progression parameters.

OP-264

The Use Of Virtual Reality In Diagnostics And Rehabilitation Of Otolithic Senses

Tihana Mendeš[1], **Andrijana Včeva**[1]

[1]*University Hospital Centre Osijek*

BACKGROUND & AIM

For years, we have used the term "vestibular function testing" with the implication that we are testing the entire vestibular system. In fact, most of our tests, such as the caloric test, the vHIT, the rotary chair test, and even the Dix-Hallpike test, are tests of semicircular canal function and do not test the otoliths. In the 1990s, with the introduction of vestibular evoked myogenic potentials (VEMP), we finally got a test that can assess otolithic function.

MATERIAL & METHODS

Any dysfunction of the otolith organs is usually accompanied by irregular spatial orientation and postural instability. Subjective visual vertical test is considered a new assessment approach that can be easily included in the clinical battery of tests. It is recommended for acute vertigo, brainstem infarctions and oculomotor disorders.

RESULTS

The SVV test can also be used to monitor recovery/compensation of acute lesions. Rehabilitation strategies have been successfully applied over the past few decades to initiate central compensation and facilitate substitution in various types of peripheral vestibular dysfunction. However, these vestibular rehabilitation strategies are often unsuccessful in patients with isolated otolith disorders.

CONCLUSIONS

Recently, virtual reality systems have been integrated with vestibular rehabilitation exercises. Compared to traditional vestibular rehabilitation methods, virtual reality vestibular rehabilitation allows for a wide range of stimuli with greater specificity and offers the patient sensory inputs of varying levels of difficulty in a safe, comfortable, and standardized environment.

virtual reality, otolithic senses, vestibular rehabilitation

OP-265

Factors Associated With Repositioning Maneuver Resistance And Recurrence Risk In Patients With Benign Paroxysmal Positional Vertigo: A Retrospective Analysis

Huseyin Tarik Yanik[1], **Sibel Yildirim**[2], **Ahmet Erdem Kilavuz**[3]

[1]*Acibadem Maslak Hospital;* [2]*Acibadem University, Faculty of Medicine, Department of Otorhinolaryngology;* [3]*Istanbul Health and Technology University, Faculty of Medicine, Department of Otorhinolaryngology*

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is the most common cause of peripheral vertigo. Despite the high efficacy of repositioning maneuvers, a substantial proportion of patients exhibit maneuver resistance or experience recurrence. This study aimed to identify clinical and demographic predictors of these outcomes in a large single-center cohort.

MATERIAL & METHODS

Medical records of 783 BPPV patients treated at Acıbadem Maslak Hospital between 2022 and 2024 were retrospectively reviewed. Eligibility criteria included age ≥18 years, confirmed BPPV, at least one repositioning maneuver, and ≥6 months of follow-up. Data collected included age, sex, BMI, affected semicircular canal, laterality, number of maneuvers, and recurrence status. Maneuver resistance was defined as requiring more than one maneuver; recurrence as a re-confirmed BPPV episode during follow-up. Univariate analyses used Mann–Whitney U and chi-squared tests; independent predictors were identified via multivariable binary logistic regression.

RESULTS

The cohort included 531 females (67.8%) and 250 males (31.9%), with a mean age of 54.7±17.6 years. Posterior canal involvement was most common (65.3%),followed by lateral (26.9%) and other variants (7.8%).Bilateral disease was present in 29.9%. Maneuver resistance occurred in 376 patients (48.0%) and recurrence in 191 (24.4%). On univariate analysis, maneuver resistance was associated with older age (median 58 vs. 48 years, p<0.001) and bilateral disease (71.4% vs. 38.1%, p<0.001). Recurrence was associated with bilateral involvement (34.6% vs. 20.0%, p<0.001), older age (median 60 vs. 51, p<0.001), and prior maneuver resistance (33.5% vs. 16.0%, p<0.001). On multivariable regression, independent predictors of maneuver resistance were older age (OR=1.02, 95%CI 1.01–1.03, p<0.001) and bilateral disease (OR=3.39, 95%CI 2.28–5.04, p<0.001). Independent predictors of recurrence were bilateral disease (OR=1.60, 95%CI 1.03–2.50, p=0.036) and prior maneuver resistance (OR=1.66, 95%CI 1.10–2.48, p=0.015). BMI, sex, and canal type were not significant.

CONCLUSIONS

Bilateral disease and older age independently predicted maneuver resistance, while bilateral disease and prior maneuver resistance predicted recurrence. These findings support early risk stratification and personalized management in BPPV.

[1]Radboud University Medical Center, The Netherlands; [2]Cochlear Technology Centre, Belgium; [3]University of Las Palmas de Gran Canaria, Spain; [4]Inonu University, Turkiye; [5]Clinica Universidad de Navarra, Spain; [6]Servicio de Otorrinolaringologia Sanatorio Güemes, Argentina; [7]European Institute for ORL, Belgium

BACKGROUND & AIM

Bilateral vestibulopathy (BVP) is a chronic disorder characterized by impaired function of the vestibular organs or nerves bilaterally. Patients with BVP commonly experience dizziness, postural instability, difficulty walking in darkness, and cognitive challenges. Available treatments—medication, vestibular rehabilitation therapy (VRT), galvanic vestibular stimulation (GVS), and vibrotactile devices, often provide only partial symptom relief, leaving many individuals with persistent and debilitating symptoms. The vestibular implant (VI) has recently emerged as a potential therapeutic option, although it remains experimental. This study examines patient awareness of current treatments, their perceptions of effectiveness, and attitudes toward vestibular implantation.

MATERIAL & METHODS

A questionnaire was administered to assess satisfaction with current treatments and perspectives on VI among patients with BVP. The survey evaluated quality of life in relation to daily activities and social interactions, as well as awareness of available treatments, including medication, VRT, GVS, vibrotactile systems, and VI. Participants were also asked about their acceptance of these treatments. The questionnaire included items regarding willingness to undergo VI, considering risks such as postoperative hearing loss and varying degrees of symptom improvement. Of the seventy-six patients invited, sixty-two completed the questionnaire. Data were analyzed using descriptive statistics.

RESULTS

Among respondents, 25.8% reported unchanged activity levels, whereas 48.5% experienced deterioration in social relationships due to balance issues. Medication and VRT were the most widely recognized treatment options. VRT and medication received the highest acceptance, with mean approval scores of 8.84 and 8.48 out of 10, respectively. VI was the least accepted, with a mean approval score of 6.22. Notably, two patients indicated willingness to accept the risk of death for symptom relief. Patients expressed greater willingness to consider VI if postoperative hearing preservation was possible.

CONCLUSIONS

Approximately one quarter of BVP patients maintain their activity levels, while half report reduced social interaction. At present, VI is the least preferred treatment, likely due to concerns regarding surgical risks. Hearing preservation is a significant factor influencing acceptance of VI. Advances in technology and surgical methods may alter patient perspectives on VI in the future.

OP-267

Is There Subclinical Cochlear Damage In Benign Paroxysmal Positional Vertigo?

Ahmet Taha Karakuzu[1], **Melikşah Çakır**[2], **Halil Erdem Özel**[2], **Hasret Kaya**[2], **Selahattin Genç**[2]

[1]*Department of Otolaryngology, VM Medical Park Kocaeli Hospital, Kocaeli, Turkey;* [2]*Department of Otolaryngology, University of Health Sciences, Kocaeli City Hospital, Kocaeli, Turkey*

BACKGROUND & AIM

The pathophysiology of Benign Paroxysmal Positional Vertigo (BPPV) involves the detachment of otoconia from the utricular macula and their migration into the semicircular canals. Along with aging, calcium/vitamin D metabolism disorders, and traumas, inner ear microvascular perfusion insufficiencies play an important role. The susceptibility of terminal vessels to these pathologies suggests that degeneration in otolith organs may concurrently cause subclinical cochlear damage. This study aims to evaluate the presence of subclinical cochlear damage using high-frequency audiometry in patients diagnosed with BPPV in the outpatient clinic.

MATERIAL & METHODS

This cross-sectional, controlled study included 29 patients with BPPV and 29 age- and sex-matched healthy controls. Diagnosis was confirmed via positional tests. Exclusion criteria were external auditory canal pathology, history of otologic surgery/chronic disease, significant hearing loss, ototoxic drug use, and neurological disorders. Extended high-frequency audiometric thresholds (9000–16000 Hz) were measured in both ears. Statistical analysis involved three stages: first, right and left ears within the BPPV group were compared using paired t-test or Wilcoxon test to evaluate lateralization. Second, ears of the BPPV and control groups were compared using independent t-test or Mann–Whitney U test. Finding no significant difference, all ears per group were pooled, and the Mann–Whitney U test was applied due to non-normal data distribution. Significance was set at $p < 0.05$.

RESULTS

High-frequency measurements of the study and control groups were compared using the Mann–Whitney U test. Across all frequencies, the study group's mean scores were higher than the control group's. In the intergroup comparison, the study group's values at F9000 (16.38 ± 13.37) were significantly higher than the control group's (13.36 ± 14.64, $p = .041$). Similarly, at F10000, the study group's mean (21.03 ± 17.29) was significantly higher than the control group's (15.43 ± 17.58, $p = .020$). Remaining frequencies showed no significant differences despite an increasing trend: F11200 (22.76 ± 19.67 vs 17.24 ± 18.97, $p = .071$), F12500 (26.38 ± 20.64 vs 22.33 ± 23.64, $p = .111$), F14000 (31.64 ± 23.66 vs 27.07 ± 26.47, $p = .249$), and F16000 (30.52 ± 20.25 vs 23.88 ± 21.97, $p = .098$). These findings indicate subclinical cochlear involvement in BPPV, particularly within the 9000–10000 Hz range.

CONCLUSIONS

The absence of a significant difference between the ears in patients with BPPV suggests that the disease may be associated with a systemic inner ear involvement rather than a lateralized effect. Furthermore, the significant differences detected particularly in the 9000–10000 Hz range via high-frequency audiometry may indicate subclinical cochlear changes in BPPV. Therefore, the utilization of high-frequency audiometry as a complementary diagnostic tool in the evaluation of BPPV patients could be beneficial.

Exploring The Diagnostics Of Benign Paroxysmal Positional Vertigo

Malene Hentze Hansen[1,2], **Dan Dupont Hougaard**[1,2], **Herman Kingma**[1,2]

[1]*Balance & Dizziness Centre, Department of Otorhinolaryngology, Head & Neck Surgery and Audiology, Aalborg University Hospital, Aalborg, Denmark;* [2]*Department of Clinical Medicine, Aalborg University, Aalborg, Denmark*

BACKGROUND & AIM

Benign paroxysmal positional vertigo (BPPV) is the most common peripheral vestibular disorder. Diagnosis traditionally relies on manual bedside positional testing, but variability in examiner performance, interpretation of positional nystagmus, and patient cooperation may reduce diagnostic accuracy. Mechanical rotation chair (MRC) diagnostics provide standardized head and body movements and may overcome some of these limitations. However, indications for their use remain insufficiently

defined. The aim was to investigate diagnostic performance and limitations of traditional manual diagnostics (TMD) compared with MRC diagnostics and identify factors influencing diagnostic outcomes in BPPV.

MATERIAL & METHODS

This PhD project consisted of three interlinked studies derived from a randomized controlled crossover trial conducted at a tertiary Balance and Dizziness Center. TMD and MRC (TRV chair) diagnostics were performed using videonystagmography. Study I compared diagnostic performance between modalities. Study II quantified intra-examiner variability and inaccuracies in head orientation and movement during TMD. Study III evaluated the effect of head orientation and movement on the ability to elicit BPPV-characteristic positional nystagmus.

RESULTS

Assuming the MRC as the golden standard, TMD demonstrated a sensitivity of 69.5%, specificity of 90.9%, and an overall agreement of 80.5% relative to MRC diagnostics. Posterior canal BPPV was detected equally well by both modalities, whereas TMD sensitivity decreased in non-posterior canal BPPV and in patients with reduced cooperation. Intra-examiner assessment revealed systematic undershooting of yaw-axis rotation during the Supine Roll Test when performed with head only rotations. Diagnostic outcomes were strongly influenced by head orientation and movement. While the Dix–Hallpike test tolerated moderate inaccuracies, manual Supine Roll testing without truncal rotation failed to identify approximately two-thirds of lateral canal BPPV findings.

CONCLUSIONS

TMD remains an effective first-line approach for most patients with BPPV. However, MRC diagnostics appear particularly valuable in non-posterior canal disease, treatment-resistant cases, and patients with limited cooperation. These findings provide practical recommendations to optimize diagnostic pathways and referral criteria in vestibular practice.

OP-269

Assessing The Falls Risk And Frailty In Elderly Balance Disordered Using The Gait Characteristic Of Patients Using Wearable Sensors

Meghna Ray[1], **Eugenie Mempuo**[1], **Louise Mowforth**[1], **Jaydip Ray**[1]

[1]*Sheffield Teaching Hospitals*

BACKGROUND & AIM

Patients with impaired balance function are at a high risk of injurious falls. This is compounded by alterations in gait and mobility. A recent study showed clinically significant vestibular impairment in 80% of community older adult fallers, compared to 19% of healthy non-fallers. Targeted exercise interventions can be applied when characteristic deficits are clearly defined. Standard approach involves subjective clinical evaluation by clinicians and is open to variations and interpretation errors. We aimed to quantify the frailty and falls risk of balance disordered patients by characterising their gait, mobility, using wearable sensors and the Timed Up and Go (TUG) test

MATERIAL & METHODS

114 patients (47 males and 67 females) with balance disorders who were referred to a tertiary Neurotology clinic were evaluated. They were all over 60 years of age and able to walk independently. All patients underwent a full clinical neurotological examination in a multidisciplinary setting (specialist Neurotologist, vestibular Physiotherapist and Audiological scientist). Participants were also asked to complete a questionnaire on their clinical risk factors, based on the American geriatrics society, British geriatrics society. All completed a instrumented TUG test, instrumented with wireless inertial sensors (QTUG™) as per regular clinic practice. The study parameters were compared to a reference population.

RESULTS

The overall falls risk estimate was 58.04% while the frailty estimate was 59.04%. Five gait parameters were evaluated and compared with the control group: symmetry (38.02%), transfer (43.73%), turn (58.06%), speed (70.90%) and variability (60.85%).

CONCLUSIONS

Elderly balance disordered patients are at a high risk of falls compared to healthy population. Wearable sensors are provide an useful technology for objective assessment of mobility, frailty and falls risk. It can be used as a test by non-specialists for falls prediction and planning of targeted physiotherapy or other therapeutic interventions in non hospital or in their natural domiciliary settings..

Effect Of Viewing Distance On Dynamic Visual Acuity

Lien Van Laer[1,2,3], **Allison Nogi**[1], **Jorge Serrador**[4], **Michael C Schubert**[1]

[1]*Johns Hopkins University, Baltimore, United States of America;* [2]*University of Antwerp, Antwerp, Belgium;* [3]*Ghent University, Ghent, Belgium;* [4]*Western Sydney University, Sydney, NSW, Australia*

BACKGROUND & AIM

Patients with dizziness and unsteadiness are commonly prescribed gaze stability exercises at varying target distances to manage vestibular impairments but lack objective tools to monitor progress. Maintaining gaze stability during head motion at near distances demands greater eye velocity relative to head velocity due to vergence and increased translational eye rotation demands. This study compared dynamic visual acuity (DVA) during yaw and pitch at both near and far distances in patients and healthy controls.

MATERIAL & METHODS

This study includes individuals with unilateral vestibular deafferentation (UVD), veterans with dizziness yet healthy vestibular function, and healthy controls. The computerized DVA at near (50 cm) and far (200 cm) distances were collected. Data analysis included comparisons of near and far DVA in yaw and pitch planes.

RESULTS

A total of 94 participants (34 UVD, 24 veterans with dizziness, 36 controls) were included. Near-distance DVA was significantly worse than far-distance DVA for the entire sample and within each group ($p < 0.001$).

CONCLUSIONS

Near-distance DVA is more challenging than far-distance DVA across populations and planes of head rotation. Near-distance DVA may serve as a robust measure of vestibulo-ocular reflex function and offers a practical means for patients to self-monitor the effects of gaze stability training.

Body Impulse Test: A Missed Element In Office Vestibular Examination

Yasir Nafi, Cosultant Audio Vestibular Medicine., MD.[1]

[1]*Al-Emadi Hospital.*

BACKGROUND & AIM

Office vestibular examination traditionally focuses on ocular and head responses, however, many patients with dizziness demonstrate abnormal postural strategies that are not captured by standard assessments. Despite the availability of high-technology vestibular tests, clinical history and office examination remain the cornerstones of diagnosis. The Body Impulse Test (BIT), a simple clinical maneuver, aims to assesses the postural control strategy (ankle, hip, or stepping) and postural confidence under unexpected mechanical perturbation.

Aims: To evaluate whether the Body Impulse Test (BIT) provides additional diagnostic value in identifying and differentiating common vestibular disorders and Functional dizziness syndromes.

MATERIAL & METHODS

Purpose: To assess the integrity and strategy of postural control in response to sudden perturbations, reflecting vestibulo-spinal and somatosensory integration.

Equipment: None. Conducted in office setting.

PROCEDURE

1. The patient stands upright, feet shoulder-width apart, arms extended forward, eyes closed. 2. The examiner stands behind and in front alternately, ensuring safety. 3. The examiner instructs: 'Stand steady, keep your eyes closed, and try not to move when I gently push you unexpectedly.' 4. The examiner gives sudden, brief, unpredictable pushes (anterior and posterior). Three trials in each direction are performed. 5. Ensure patient safety with assistant or wall support behind.

The test was done for 50 cases and 10 normal control subjects. The cases was comaraple with the control groups. Cases are classified as Ankle strategy or Hip and Step strategies. Sensetivity and Specifity was calculated for different dizzy cases.

RESULTS

35 cases have abnormal step or hip strategy and 15 patients have ankle strategy. Step strategy was associated with Hyperventilation syndrome., but variable with other vestibular lesions.

CONCLUSIONS

Body Impulse Test is an easy sim ple test is missed test in office vestibular examination at the vestibular clinics. It is a valuaable test in hypervetilation synderome. It also share in planning for managment of dizzy patients.

KEYWORDS
Office vestibular examination, dizzy patient, vestibular, body impulse test, postural control, functional vestibular diseases, hyperventilation syndrome.

OP-272

Results Of Minimally Invasive Surgical Technique Combined With Low Doses Gentamicin For Meniere's Disease Treatment

Garov Evgeny[1], **Kunelskaya Natalia**[1], **Larionova Ella**[1], **Chugunova Maria**[1], **Garova Ekaterina**[1]

[1]*L. I. Sverzhevsky Scientific Research Clinical Institute of Otorhinolaryngology, Moscow healthcare department, Russia*

BACKGROUND & AIM

In the absence of conservative therapy effectiveness in patients with Minere's desease (MD) current treatment algorithms suggest sequential application of intratympanic (IT) dexamethasone, endolymphatic sac drainage or IT gentamicin. Direct injections, ventilation tubes and repeated high doses (up to 40 mg/ml) of gentamicin in various regimens are preferred despite hearing loss risk. Low doses of the drug (10-16 mg/ml) give a lower effectiveness and no affect hearing.

The Aim of the study was to evaluate the effectiveness of minimally invasive surgical technique with the simultaneous use of low doses gentamicin-soaked collagen membranes for MD treatment.

MATERIAL & METHODS

53 patients aged 29 to 76 years with reliable unilateral MD (AAO-HNS, 1995) were enrolled in this study. 62.3% of patients were women, 37.7% - men. They were treated in otology department of our Institute from 2016 till 2025. Inclusion criteria for the study were the lack of minimum 2 courses of conservative therapy, from slight till moderately severe hearing loss degree according to pure tone audiometry (PTA), speech discriminations score more than 70%, unilateral labyrinth hyporreflexia according to the caloric test.

The surgical technique provided under local anesthesia and consisted of tympanotomy, tympanic cavity muscles tenotomy, plexus tympanicus incision and application of gentamicin-soaked collagen membranes into oval and round windows. The total drug dose was 8-16 mg. The effectiveness of the treatment was assessed 6, 12, 24 months after surgery and was based on the patient complaints dynamic, changing caloric test data and PTA thresholds.

RESULTS

Total control vertigo (class A) were achieved in a 6 months and lasted longer in 67% patients, partial (class B) – in 17%. Hearing thresholds remained stable. 9.3% of patients noted a disappearance of tinnitus. According to the caloric test 76.7% of patients got dead labyrinth in a 6-month period. 4.6% of patients had no effect after this technique and underwent destructive surgery.

CONCLUSIONS

minimally invasive surgical technique with simultaneous single use of low doses gentamicin-soaked collagen carriers can be effective in the treatment of patients with reliable unilateral MD, allowing to reduce the severity of dizziness along with stable hearing levels.

KEYWORDS

low dose gentamicin, Meniere disease

OP-273

Diagnostic Accuracy Of The Head Pitch Test In Benign Paroxysmal Positional Vertigo

MAYADA ELSHERIF[1], **ALIA ELKARAKSY**[1], **DALIA ELDEEB**[1], **MIRHAN ELDEEB**[1]

[1]*ALEXANDRIA UNIVERSITY OF EGYPT*

BACKGROUND & AIM

Introduction and Objectives: The diagnostic accuracy and reliability of the head pitch test in differentiating between different types of BPPV require further investigation. Studying the diagnostic accuracy of the head pitch test in BPPV diagnosis can aid in the development of targeted management strategies for patients presenting with BPPV

MATERIAL & METHODS

Methods: All patients who complained of positional vertigo for seconds underwent complete videonystagmography test using ICS Chartr 200 VNG/ENG system (Otometrics, Denmark) including : spontaneous nystagmus, complete occulomotor test battery, then the head pitch test was performed in two positions: first the patient's head was bent 90 degrees forwards, then 60 degrees backwards for approximately 1 minute each. If nystagmus was observed, its direction was recorded [10]. All patients then underwent gold standard tests for positional vertigo including both Dix-Hallpike maneuver and the supine roll tests

RESULTS

Results: The sensitivity (true positive cases) was defined as the head pitch (HPT) test being positive and showing the correct nystagmus for different categories of BPPV. The sensitivity of the experimental HPT was compared to the gold standard tests (100% sensitive) for diagnosis of different categories of vertical canal and lateral canal BPPV. It was highest (100%) for Lateral

Cupulolithiasis patients (n=12) and Anterior canal Canalithiasis (n=3) and lowest (68%) for Typical Posterior Canalithiasis patients (n=68)

CONCLUSIONS

Conclusion: This study supports the addition of the head pitch test in the routine assessment of patients with positional vertigo. As it could shorten the examination time and decrease the repositioning maneuvers which may cause severe autonomic symptoms.

OP-274

The Relationship Between Fall History Of Vestibular Functions In Young-Old Individuals

Sevda Nur ŞENEL[1], **Deniz Uğur CENGİZ**[2]

[1]*1 Inonu University, Institute of Health Sciences, Department of Audiology, Malatya, Turkey;* [2]*2 Inonu University, Faculty of Health Sciences, Department of Audiology, Malatya, Turkey*

BACKGROUND & AIM

Aging is a physiological process that can lead to structural and functional changes in individuals. Peripheral and central vestibular changes that occur during aging cause impaired postural control and an increased risk of falls. The aim of our study is to evaluate the relationship between a history of falls and vestibular function in young-old individuals.

MATERIAL & METHODS

The study was conducted between October 2025 and February 2026 at the Audiology Clinic of Turgut Özal Medical Center, İnönü University, Malatya, with 64 individuals aged 65-74, both with and without a history of falls, who presented to the Geriatrics Clinic. Approval was obtained from the İnönü University Health Sciences Scientific Research Ethics Committee (2025/8592) and participants signed a voluntary consent form. Participants completed the Demographic Data Form, Activity-Specific Balance Confidence Scale (ABC), Fall Behavior Scale for Older People (FaB), Head Shake Test (HST), Video Head Impulse Test (vHIT), Functional Head Impulse Test (fHIT), and Static Posturography.

RESULTS

A significant difference was found between groups in the total score of the AÖDGÖ ($p<0.05$). Significant differences were also found between groups in the sub-dimensions and total scores of the YDDÖ ($p<0.05$). A significant difference was found between groups with and without a history of falls in the presence of head shake nystagmus ($p<0.05$). In vHIT gain asymmetries, a significant difference was determined in the LARP asymmetry value ($p<0.05$). In fHIT, differences were found between groups in posterior 4000, 5000, 6000°/s2 and total correct answer percentage values ($p<0.05$). In static posturography, significant differences were found between groups in the balance score parameter in conditions 2, 4, and 5; and in the speed parameter in conditions 1 and 2 ($p<0.05$). In sensory analysis evaluation, statistically significant differences were shown between groups in composite, visual and vestibular scores ($p<0.05$).

CONCLUSIONS

The study results revealed that vestibular function is affected and functional performance is reduced in young-old individuals with a history of falls. Therefore, in order to prevent complications related to falls, it is recommended to implement assessment and screening protocols aimed at identifying changes in vestibular system function.

Machine Learning-Based Differential Diagnosis Of Vestibular Disorders Using Electronic Medical Records

Jeong-woo Lee[1], **Dong Yeon Lee**[1], **Min Kyung Kim**[2], **Tae Hoon Kong**[3]

[1]*Department of Medical Informatics and Biostatistics, Yonsei University Wonju College of Medicine, Wonju, Republic of Korea;* [2]*Department of Bio-AI Convergence, Yonsei University Wonju College of Medicine, Wonju, Republic of Korea;* [3]*Department of Otorhinolaryngology, Yonsei University Wonju College of Medicine, Wonju, Republic of Korea*

BACKGROUND & AIM

Dizziness is a common chief complaint in otolaryngology practice, but differential diagnosis remains challenging because of overlapping clinical presentations among vestibular disorders. Although vestibular function tests may improve diagnostic accuracy, they are not always immediately available at the time of initial otolaryngologic evaluation. We hypothesized that machine learning (ML) models trained on initial clinical assessment data could help differentiate vestibular disorders without advanced vestibular testing.

MATERIAL & METHODS

We retrospectively analyzed electronic medical record (EMR) data from 1,263 patients who presented with dizziness at Wonju Severance Christian Hospital between April 2011 and February 2023. Seven ML models—Logistic Regression, Random Forest,

XGBoost, CatBoost, LightGBM, Support Vector Machine, and Multi-Layer Perceptron—were developed to classify four diagnostic categories: Benign Paroxysmal Positional Vertigo (BPPV), Vestibular Neuritis (VN), Meniere's disease, and Others class. Fifty variables across four domains (symptoms, medical history, physical examination, and demographics) were included. Disease labeling was performed by one professor. Missing values were handled using Multiple Imputation by Chained Equations (MICE), and hyperparameters were optimized with Optuna. Model performance was evaluated using the area under the curve (AUC) and F1-score.

RESULTS

Among the evaluated models, XGBoost showed the highest performance for identifying BPPV (AUC=0.983, 95% CI [0.963–0.996], F1-score=0.821), VN (AUC=0.988, 95% CI [0.977–0.996], F1-score=0.954), and Meniere's disease (AUC=0.902, 95% CI [0.801–0.978], F1-score=0.476). CatBoost achieved the best performance for the Others class (AUC=0.901, 95% CI [0.854–0.942], F1-score=0.711). Overall, gradient-boosting-based models demonstrated favorable performance in distinguishing vestibular disorders.

CONCLUSIONS

ML-based approaches using initial clinical assessment data showed potential for supporting the differential diagnosis of vestibular disorders, with particularly favorable performance for BPPV and VN. However, diagnostic performance varied across disease classes, and Meniere's disease showed comparatively limited classification performance, suggesting the need for additional clinical information.

OP-276

Feasibility Of AI-Driven Camera-Based Nystagmus And Head Tracking For Remote Assessment Of Acute Vertigo

Sungkwang Hong[1], **Euncheon Lim**[1], **Jungin Jang**[1], **Jayce Woojin Baek**[1]

[1]*Department of Otorhinolaryngology-Head and Neck Surgery, Hallym University College of Medicine, Anyang, Gyeonggi-do, Republic of Korea*

BACKGROUND & AIM

Accurate evaluation of nystagmus and eye movements is essential for diagnosing acute vertigo; however, current approaches rely on specialized hardware and in-person assessment, limiting accessibility in remote and emergency settings. This study aimed to evaluate the feasibility of a camera-based system for tracking nystagmus and head movement to enable remote assessment in patients with acute vertigo.

MATERIAL & METHODS

We developed a vision-based tracking system using standard smart device cameras to estimate eye movements and head orientation without additional hardware. The system employs computer vision algorithms to detect facial landmarks, estimate gaze vectors, and quantify head motion in real time. Performance was evaluated using metrics including mean absolute error (MAE) for gaze and head direction, and detection accuracy (IoU, mAP) for facial and ocular features. Feasibility was assessed in a pilot cohort of patients presenting with acute vertigo, comparing system outputs with reference clinical assessments.

RESULTS

The proposed system demonstrated high detection accuracy (IoU > 0.8, mAP > 0.9) for facial and eye regions. Mean absolute error was within clinically acceptable ranges for head direction (<5°) and gaze estimation (<4°). The system operated in real time (>30 fps) on standard smart devices without dedicated hardware. Preliminary clinical evaluation showed concordance between camera-based measurements and clinician-observed findings, supporting its feasibility for remote assessment.

CONCLUSIONS

Camera-based tracking of nystagmus and head movement is feasible for remote evaluation of acute vertigo. This approach enables accessible, device-free assessment and has the potential to support telemedicine, early triage, and digital therapeutic applications. Further large-scale studies are warranted to validate clinical efficacy and diagnostic performance.

OP-277

KLOTHO IN PATIENTS AFFLICTED WITH MENIERE'S DISEASE

Giuseppe Carnevale[1], **Roberto Teggi**[1], **Mario Bussi**[1]

[1]*Università Vita-Salute San Raffaele*

BACKGROUND & AIM

Endolymph, rich in potassium, requires active ion transport to maintain the endocochlear potential. Variants in SIK1(linked to Na^+/K^+-ATPase) and SLC8A1 (encoding the Na^+/Ca^{2+} exchanger NCX1) may affect this balance. Klotho (KL), a regulator of K^+ channels in the inner ear, has been linked to increased susceptibility to inner ear disorders in animal models. This study

investigates KL gene variants and plasma levels in Ménière's disease (MD) patients and explores possible correlations with SIK1 and SLC8A1 variants.

MATERIAL & METHODS

We included 168 Caucasian patients with definite Ménière's disease (MD), diagnosed per Barany Society criteria, recruited from 2014 to 2021. All were genotyped for SIK1 (rs3746951), SLC8A1 (rs487119), and Klotho (rs9536314). Two control groups were used: 136 Caucasian outpatients without vertigo (Control Group 1) and 413 unrelated Europeans without MD (Control Group 2). Plasma α-Klotho levels were assessed in 25 MD patients and 13 controls using the IBL Assay Kit (Code No. 27998), designed for quantitative measurement in serum, plasma, urine, and cell culture supernatants.

RESULTS

Genotype and allele frequencies of Klotho (KL, rs9536314) in MD patients showed no significant difference compared to either control group. No correlation was found between KL genotype and age of vertigo onset (p=0.35), migraine (p=0.39), or autoimmune disease (p=0.45). In the expanded cohort, previous findings were confirmed regarding associations with the SIK1 T and SLC8A1 A risk alleles. A statistical analysis revealed that MD patients carrying the SIK1 T risk allele had a lower frequency of wild-type KL genotype, suggesting a possible interaction between KL and SIK1.

CONCLUSIONS

We found an association between the T allele of SIK1 and the G allele of KL, with patients carrying the T SIK1 allele showing a higher frequency of the G KL allele. This may suggest that ionic transporter dysfunction leads to increased expression of both SIK1 and Klotho, which are involved in maintaining inner ear ionic homeostasis. Their overexpression could reflect a compensatory response to ionic imbalance. These findings support the hypothesis that Ménière's disease is a complex disorder, where multiple genetic and regulatory factors may contribute to disease susceptibility.

NEW INSIGHTS ON THE THERAUPATIC MANEUVERS OF BPPV TREATMENT

Haşmet Yeğin[1]

[1]*State Hospital Edirne*

BACKGROUND & AIM

OUR AIM IS TO DISCUSS NEW INSIGHTS ON THE THERAUPATIC MANEUVERS OF BPPV TREATMENT :

MATERIAL & METHODS

OUR PRESENTATION IS A COMPILATION STUDY OF VARIOUS ARTICLES AND STUDIES DONE UNTIL NOW.

RESULTS

RESULTS WILL BE LISTED IN DETAIL IN THE CONCLUSION PART BELOW

CONCLUSIONS

Conclusion:

Among the recently done studies, these issues are attracting our attention;

-Pathophysiology of L-SSC has not been clearly understood. Therefore, researchers focus on the variations of L-SSC.

-Methods for increasing the level of compliance with therapeutic maneuvers in clinical settings.

-To grasp BPPV etiology to a deeper extend and hence, to increase the success of treatment.

The Impact Of Intratympanic Gentamicin On Endolymphatic Hydrops, Vestibular Function And Clinical Efficacy In Meniere's Disease

Mehmet Furkan Kursun[1], **Said Sonmez**[1], **Mehmet Barburoglu**[2], **Edanur Karapınar**[2], **Kadir Serkan Orhan**[1]

[1]*Istanbul University, Istanbul Faculty of Medicine, Department of Otorhinolaryngology;* [2]*Istanbul University, Istanbul Faculty of Medicine, Department of Radiology*

BACKGROUND & AIM

Patients with Meniere's disease whose symptoms remain refractory despite medical management are candidates for intratympanic gentamicin (ITG). Endolymphatic hydrops is widely recognized as the histopathological hallmark of the disease, driven by endolymph secretion from the stria vascularis and dark cells. Recently, specific magnetic resonance imaging (MRI) grading systems have emerged to evaluate hydrops severity. However, the exact effect of ITG on hydrops level and conversely, the impact of baseline hydrops on treatment outcomes remains unclear. This study aims to investigate these radiological and clinical relationships.

MATERIAL & METHODS

This retrospective study included 21 patients with unilateral Meniere's disease undergoing ITG therapy. To evaluate radiological evolution, patients underwent pre- and post-intervention temporal bone MRI(1.5 T) using a Meniere-specific protocol. Cochlear and vestibular hydrops severity was independently graded by a neuroradiologist. Clinically, patients were assessed pre- and post-interventionally. Vestibular function was quantified using the video head impulse test (vHIT), hearing status via bone conduction pure-tone audiometry (PTA) thresholds, and quality of life using the Dizziness Handicap Inventory (DHI).

RESULTS

Following ITG injection, lateral semicircular canal (LSC) gains and DHI scores significantly decreased ($p=0.029$, $p=0.007$). Changes in bone PTA thresholds and anterior/posterior canal gains were not statistically significant. Radiologically, cochlear hydrops regressed in 4 patients and progressed in 3, while vestibular hydrops regressed in 4 and progressed in 2; these overall changes lacked statistical significance. However, changes in cochlear hydrops severity significantly correlated with changes in bone PTA thresholds ($p=0.013$, $r=0.530$). DHI improvements showed no correlation with hydrops changes. Furthermore, baseline cochlear and vestibular hydrops grades did not predict the extent of DHI improvement, vHIT alterations, or bone PTA shifts.

CONCLUSIONS

ITG effectively alleviates vertigo symptoms and reduces LSC gain without causing significant hearing loss or consistent radiological changes in endolymphatic hydrops. Furthermore, baseline MRI hydrops grading is not a reliable predictor of clinical or functional responses to ITG, indicating that treatment efficacy is largely independent of initial radiological severity.

Integrating Low-Cost Simulation And Decision Scaffolding For Nasal Cutaneous Reconstruction Training: A Feasibility Study

Esther Harlow Boardman[1,2], **Miss Marlene M. Speth**[2,3], **Mr Issa Beegun**[2], **Professor Hesham A. Saleh**[1,2]

[1]*Imperial College London;* [2]*Imperial College Healthcare Trust;* [3]*Technical University of Munich*

BACKGROUND & AIM

Effective nasal cutaneous reconstruction requires both complex pre-operative decision-making, integrating subunit anatomy, defect morphology, tissue quality, and patient-specific factors, and technical execution. Training remains heterogeneous and apprenticeship-based, with limited nasal-specific simulation models or structured decision-support tools. We hypothesised that a low-cost, reusable simulator aligned with a literature-derived reconstructive decision framework could provide a feasible foundation for structured nasal reconstruction training.

MATERIAL & METHODS

A mixed-methods feasibility study evaluated two linked components. First, a reusable nasal reconstruction simulator was developed from a modified three-dimensional-printed facial form with replaceable dyed latex skin, enabling repeated defect marking, subunit identification, flap planning, and incision and suturing. Practical usability and acceptability were explored through a pilot teaching session with eight students, and questionnaire feedback was analysed descriptively due to the small pilot sample.

Second, a targeted evidence synthesis screened 2,991 records to develop a subunit-stratified reconstructive decision framework. Reconstructive options were mapped by nasal subunit, defect size, and defect depth, with patient-factor modifiers codified and matched. Feasibility-level validation was performed using ten clinical vignettes reviewed by consultant facial plastic surgeons, with consultant selections compared descriptively against framework-generated options.

RESULTS

The simulator enabled repeated defect marking, flap design and suturing without wet-lab access or specialist infrastructure, costing approximately £6 per facial form and £0.60 per replacement skin layer. Pilot feedback supported acceptability and perceived relevance, although educational effectiveness was not assessed.

The evidence synthesis included 72 studies, representing 7,995 patients and 8,229 defects, and informed a framework that mapped reconstructive options by subunit, size, and depth. Consultant review showed full agreement in eight of ten vignettes and partial agreement in two, with no complete disagreement. Partial-agreement cases highlighted its value in broadening option generation while identifying the need for tissue-quality and patient-specific modifiers.

CONCLUSIONS

This study supports the feasibility of a low-cost, repeatable nasal reconstruction training platform that integrates simulation and scaffolding to support reconstructive decision-making. Findings demonstrate accessibility, acceptability and preliminary

consultant alignment, but remain limited by pilot-level learner evaluation and early expert validation. Further work should assess objective skill acquisition, decision-making performance and broader consultant review.

Use Of Corticosteroids In Children With Bell's Palsy: A Systematic Review And Meta-Analysis

Fabian Peralta[1], **José Manuel Morales-Puebla**[2,3,4], **Roman Pati**[5], **Francis Evilda Miralda Matute**[6], **Luis Lassaletta**[2,3,4]

[1]Universidad Peruana Unión; [2]Department of Otorhinolaryngology, La Paz University Hospital, Madrid, Spain; [3]Instituto de Investigación IdiPAZ, Hospital Universitario La Paz, Madrid, Spain; [4]Centro de Investigación Biomédica en Red para Enfermedades Raras CIBERER, Instituto de Salud Carlos III, Madrid, Spain; [5]Washington University in St. Louis, St. Louis, Missouri, USA.; [6]Catholic University of Honduras, Tegucigalpa, Honduras.

BACKGROUND & AIM

Although corticosteroids are recommended as first-line therapy for adults with acute Bell's palsy, their effectiveness in children remains uncertain. This study aimed to evaluate the association between corticosteroid therapy and recovery rates in pediatric patients with acute Bell's palsy.

MATERIAL & METHODS

PubMed, Scopus, and Cochrane Library were systematically searched from inception to April 2, 2025, for studies on corticosteroids for children with Bell's palsy. Odds ratios and risk ratios with 95% confidence intervals were pooled using R software (version 4.2.3). Risk of bias was assessed with RoB2 and ROBINS-I.

RESULTS

Eleven studies were included, comprising 750 children, of whom 495 (66%) received corticosteroids. The analysis across final follow-ups showed no significant difference. Because follow-ups ranged from 1 to 24 months, 1, 3, and 6 months were used as key points to create comparable intervals. The following subgroups were analyzed for each interval: corticosteroid monotherapy and corticosteroids plus adjunctive therapy. Corticosteroid monotherapy was associated with higher complete recovery rates beyond 1 month and a lower risk of incomplete recovery after 6 months.

CONCLUSIONS

Corticosteroid monotherapy in children with acute Bell's palsy may improve recovery rates beyond the first month, supporting its implementation in treatment protocols.

OP-282

Conditioning Electrical Stimulation Accelerates Facial Nerve Regeneration And Central Remodeling After Nerve Transfer.

Hanlin Chen[1,2], **Yang Zhao**[1,2], **Guodong Feng**[1,2]

[1]Department of Otolaryngology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences; [2]Peking Union Medical College

BACKGROUND & AIM

Facial nerve injuries, caused by various conditions, lack effective treatment options. This study aimed to investigate the effects of conditioning electrical stimulation (CES) in a hypoglossal-facial nerve anastomosis model on facial nerve regeneration and central nervous system (CNS) changes.

MATERIAL & METHODS

Fifteen rats were assigned to evaluate the safety validation of CES and determine the optimal parameter. Subsequently, thirty-six rats were then assigned to CES and control groups, receiving hypoglossal-facial nerve anastomosis. Histological, electrophysiological, and facial movement assessments were conducted at 2 and 10 weeks after anastomosis. Eight rats were enrolled for fMRI examination at multiple time points parallel with the CES operation and anastomosis assessment.

RESULTS

In the safety validation experiment, brain-derived neurotrophic factor (BDNF) expression was significantly higher in the 1 mA group than in other groups ($p < 0.01$), and CD68 was highest in 4 mA group ($p < 0.05$). At both 2 and 10 weeks after anastomosis, CES-treated rats exhibited significantly increased neurofilament 200 (NF200) intensity in facial nerve axons ($p < 0.01$). At 10 weeks, the CES group exhibited higher Simone scores ($p < 0.05$), while fMRI analyses revealed reduced activity in the contralateral somatosensory and entorhinal cortices at later stages.

CONCLUSIONS

CES at intensities below 4 mA was safe, with 1 mA identified as more appropriate. CES promoted axon regeneration and facial function recovery after nerve anastomosis and was associated with CNS reorganization.

OP-283

Predictable Algorithm To Manage Nasal Tip Projection And Rotation To Improve Nasal Aesthetics And Function.

Marcin Jadczak[1]

[1]*Military Institute of Medicine National Research Institute;* [2]*MEA Clinic*

BACKGROUND & AIM

A key component of a well-performed rhinoplasty is to obtain the proper, aesthetic shape of the nasal tip. Various surgical techniques have been developed to achieve this effect. In his work, the author wanted to focus not only on the satisfactory shape of the nose, but above all on its main role- functionality.

MATERIAL & METHODS

In this article, the asymmetrical lateral crus steal (ALCS) technique is proposed, which in its assumption will enable narrowing, better defining and rotating of the nasal tip, and at the same time enhancing nasal patency. We present retrospective analysis within the group of 267 patients who underwent primary open-approach rhinoplasty that included the ALCS technique. The mean follow-up time was 12 months.

RESULTS

232 patients achieved very good postoperative results without observation of any serious complications related to the breathing difficulties or asymmetry of the nasal tip shape. ALCS is a relatively simple surgical technique to perform.

CONCLUSIONS

The use of the ALCS suture creates the possibility of proper profiling of the nasal tip, while improving the respiratory functions of the nose.

Prognostic Factors And Survival Outcomes In T1N0 Lower Lip Squamous Cell Carcinoma

Emre Demirel[1], **Mustafa Aktaş**[3], **Ozan Çolak**[2], **Esra Kavaz Uştu**[2], **Mehmet Çelebi**[2], **Emel Tahir**[2], **Özgür Kemal**[2], **Sinan Atmaca**[2], **Senem Çengel Kurnaz**[2]

[1]*Samsun City Hospital, Otorhinolaryngology Department, Samsun, Turkiye;* [2]*Ondokuz Mayıs University Faculty of Medicine, Department of Otorhinolaryngology, Samsun, Turkiye;* [3]*Gölhisar State Hospital, Burdur, Turkiye*

BACKGROUND & AIM

Lower lip T1N0 squamous cell carcinoma (LSCC) is usually managed surgically, yet local and regional failures still occur. We report 5-year survival outcomes and evaluate clinicopathological prognostic factors.

MATERIAL & METHODS

Retrospective single-center cohort of 61 patients with pathologic T1N0 LSCC treated surgically. Endpoints were overall survival (OS), disease-specific survival (DSS), disease-free survival (DFS), and recurrence-free survival (RFS). Five-year outcomes (60 months) were estimated by Kaplan–Meier analysis (95% CI). Cox regression was used for univariable screening; a pre-specified multivariable model used included age, tumor diameter, and depth of invasion (DOI).

RESULTS

Mean age was 64.8±11.9 years; 50/61 (82.0%) were male. Median follow-up was 79.0 months (31.0–123.7). Mean tumor diameter was 13.4±4.0 mm and mean DOI was 4.3±3.2 mm. Perineural invasion (PNI) occurred in 5 (8.2%), lymphovascular invasion in 3 (4.9%) (Table 1). Neck dissection was performed in 49 (80.3%) with no pathological nodal positivity. Recurrence occurred in 6/61 (9.8%): 4 local and 2 regional. Thirteen deaths occurred overall, including one lower-lip cancer–related death (regional recurrence 12 months after surgery). Five-year estimates were: OS 84.8%, DSS 98.2%, DFS 79.2%, and RFS 90.2% (Table 2). In univariable Cox analysis, worse OS was associated with PNI (HR 7.31; p=0.001); however, rare variables should be interpreted cautiously due to sparse events. Increasing DOI was also associated with worse OS (HR 1.15 per mm; p=0.024). Sex, smoking, immunosuppression, tumor diameter, differentiation, reconstruction and neck dissection weren't significant predictors in multivariable modeling, age/diameter/DOI didn't retain independent significance.

CONCLUSIONS

T1N0 LSCC showed excellent 5-year DSS (98.2%) but lower DFS due to local/regional recurrences. DOI and PNI provided the strongest prognostic signals, supporting risk-adapted surveillance in early lip cancer.

OP-285

Simplifying Costal Cartilage Harvesting In Rhinoplasty With The Gigli Saw Technique

Remzi Doğan[1], **Alper Yenigün**[1], **Nurtaç Dağıstanlı**[2], **Emre Polat**[3], **Muhammed Furkan Özgan**[1], **Orhan Özturan**[1]

[1]*Bezmialem Vakif University, Faculty of Medicine, Department of Otorhinolaryngology, Fatih, Istanbul, Turkey;* [2]*Kırklareli Training and Research Hospital, Department of Otorhinolaryngology, Kırklareli, Turkey;* [3]*Bartın State Hospital*

BACKGROUND & AIM

Costal cartilage is a reliable graft source in revision rhinoplasty; however, harvesting techniques may be associated with donor-site morbidity and technical challenges, especially in the presence of partial ossification. This study evaluates the safety, feasibility, and early outcomes of using the Gigli saw for costal cartilage harvesting.

MATERIAL & METHODS

A prospective descriptive case series was conducted including 12 revision rhinoplasty patients requiring costal cartilage grafts (7 males, 5 females; mean age 34, range 18–55). All patients had insufficient septal cartilage. Costal cartilage was harvested from the 6th–8th ribs through a 3-cm incision using the Gigli saw technique. Intraoperative complications, donor-site morbidity, graft integrity, and nasal reconstruction outcomes were systematically assessed. Patients were followed for a mean of 12 months (6–18 months).

RESULTS

Costal cartilage harvesting with the Gigli saw was successfully completed in all patients without pleural injury or pneumothorax. Adequate graft volume and structural integrity were achieved in every case. Partial ossification was present in five patients, yet the Gigli saw permitted smooth and controlled cutting without added difficulty. Donor-site morbidity was minimal, with no hematoma, seroma, infection, or chest wall deformity observed. All incisions healed with minimal scarring. During follow-up, no warping, resorption, or dorsal irregularity occurred, and graft stability was preserved.

CONCLUSIONS

The Gigli saw provides a safe, practical, and low-morbidity option for costal cartilage harvesting in revision rhinoplasty. Its flexible wire structure offers controlled cutting, particularly beneficial in partially ossified cartilage, while minimizing pleural manipulation. Although results are promising, the study is limited by its small sample size and subjective outcome assessment. Larger comparative studies are warranted.

Comparative Analysis Of Accuracy And Reliability Between Kratos Mobile 3D Facial Scanning Software And The Vectra H1 System

Kays Burak CAKIR[1], **Eyüp BOZKURT**[2], **Ayşegül BATIOGLU KARAALTIN**[1], **Mehmet Veli KARAALTIN**[3]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery and Facial Plastic Surgery, Istanbul University-Cerrahpaşa, Istanbul, Türkiye;* [2]*Department of Otorhinolaryngology, Head and Neck Surgery and Facial Plastic Surgery, Istanbul, Türkiye;* [3]*Department of Plastic, Reconstructive and Aesthetic Surgery, Acıbadem Healthcare Group, Istanbul, Türkiye*

BACKGROUND & AIM

Three-dimensional (3D) facial imaging is integral to preoperative planning and patient communication in facial plastic surgery. The Vectra H1 stereophotogrammetry system is the established reference device, but cost and infrastructure requirements limit its accessibility. Smartphone-based applications could close this gap if validated against accepted reference devices. To our knowledge, no peer-reviewed study has compared a smartphone application with Vectra H1 across a broad anthropometric panel. We hypothesised that Kratos, a recently developed smartphone facial scanning application, would yield clinically acceptable measurements with inter-observer consistency comparable or superior to Vectra H1, particularly for parameters where manual landmark placement introduces operator-dependent error.

MATERIAL & METHODS

This prospective multi-observer validation study enrolled 33 healthy adult volunteers at a single tertiary centre. Two otorhinolaryngologists and one plastic surgeon (one experienced with Vectra, two naive to both systems) independently scanned each participant twice with each device, generating 12 scans per participant. Nineteen anthropometric parameters were extracted, covering horizontal and vertical facial thirds, nasal tip projection, columella–labial angle, naso-facial angle, facial angle, and dorsal height. Analyses included paired t-tests, Pearson correlation, two-way mixed-effects intraclass correlation coefficients (ICC) with absolute agreement, and Bland–Altman plots in SPSS 27.0 ($p<0.05$). The protocol followed STROBE reporting standards and received institutional ethics committee approval.

RESULTS

Statistically significant inter-device differences were observed in 13 of 19 parameters in Session 1 and 12 of 19 in Session 2. Absolute mean differences remained below 2 mm for most linear and below 3° for most angular parameters, within clinically acceptable thresholds for surgical planning. Kratos ICC exceeded 0.90 for all 19 parameters in both sessions, whereas Vectra

inter-observer ICC dropped below the 0.75 reliability threshold for vertical thirds and facial angle. The largest divergence in measurement variability appeared at facial angle (Vectra SD 16.4° versus Kratos 7.2°). Bland–Altman analysis confirmed narrow limits of agreement for nasal tip projection (−0.77 to +0.48 mm).

CONCLUSIONS

Kratos produces measurements within clinically acceptable limits and outperforms Vectra H1 in inter-observer consistency for parameters most sensitive to manual landmark placement. It offers a validated, accessible alternative to stationary stereophotogrammetry for preoperative documentation, teleconsultation, and remote patient follow-up.

Bacterial Growth In Stored Septal Cartilage Grafts: Cartilage Or Storage Solution?

Burak Olgun[1], **Burak Kaan İnan**[2], **Muhammed Güzel**[2], **İbrahim Ömer Gürlek**[2], **Ercan Atasoy**[2], **Emine Hoşaf**[3], **Nisa Bingöl**[3], **İbrahim Sayın**[2]

[1]Istanbul Gelişim University, Otolaryngology and Audiology Department; [2]University of Health Sciences, Dr. Sadi Konuk Training and Research Hospital, Otolaryngology Department; [3]University of Health Sciences, Dr. Sadi Konuk Training and Research Hospital, Microbiology Department

BACKGROUND & AIM

Septal cartilage grafts are frequently preserved after rhinoplasty for potential use in revision procedures. Although bacterial contamination during rhinoplasty has been investigated previously, data regarding the microbiological behavior of cartilage grafts during prolonged storage remain limited. This study aimed to evaluate bacterial growth in septal cartilage grafts stored in gentamicin-containing solution and to determine whether contamination preferentially localizes to the cartilage itself or to the surrounding storage medium.

MATERIAL & METHODS

A total of 94 septal cartilage grafts harvested during rhinoplasty procedures and stored in gentamicin-diluted saline solution were microbiologically analyzed. Storage duration was defined as the interval between graft harvesting and culture analysis. Cartilage tissue and storage solution sediment were processed separately under sterile conditions using aerobic and anaerobic culture techniques. Culture positivity, localization of bacterial growth, and isolated microorganisms were recorded.

RESULTS

The mean storage duration was 425 days (range: 80–1193 days). Overall, 18 of 94 samples (19.1%) demonstrated bacterial growth, whereas 76 samples (80.9%) remained culture-negative. Bacterial growth was more frequently detected in the sediment of the storage solution (n=11) than within the cartilage graft itself (n=8). Predominantly low-virulence commensal microorganisms were isolated, most commonly Staphylococcus hominis. No significant association was observed between storage duration and culture positivity (p=0.882). Similarly, prolonged storage (≥365 days) was not associated with increased bacterial growth compared with shorter storage duration (p=0.613).

CONCLUSIONS

Most septal cartilage grafts remained culture-negative despite prolonged storage in gentamicin-containing solution. Bacterial growth appeared to localize more frequently to the surrounding storage sediment rather than to the cartilage tissue itself. Prolonged storage duration was not associated with increased culture positivity. These findings suggest that storage in gentamicin-containing solution may provide a relatively stable microbiological environment for preserved septal cartilage grafts.

OP-288

The Validation Of A Deep Learning-Based 3D Facial Measurement System And Facial Feature Analysis In Patients With Facial Palsy

Hanlin Chen[1,2], **Yang Zhao**[1,2], **Guodong Feng**[1,2], **Zhiqiang Gao**[1]

[1]Department of Otolaryngology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences; [2]Peking Union Medical College

BACKGROUND & AIM

This study aims to validate a deep learning-based 3D facial measurement system for its accuracy, robustness, and clinical relevance in patients with facial palsy, and to characterize their facial movement features.

MATERIAL & METHODS

Patients with facial palsy and healthy controls were enrolled in the study, and facial data were collected using the 3D measurement system. The accuracy, robustness, and clinical relevance of the system were evaluated. Quantitative facial data

were analyzed to assess the correlation between regional static/dynamic metrics and total scores and compare measurements of HB grade I patients with healthy controls.

RESULTS

The system's average recognition error was 1.94 ± 0.35 mm. Over 90% of static and dynamic metrics fell within the Bland-Altman limits. System-derived machine scores showed strong correlations with HB (r = -0.918), Sunnybrook (r = 0.909), and Fisch (r = -0.917) scales (all p < 0.001). Gentle eye closure and broad smile exhibited the strongest correlation with the overall facial nerve function. HB grade I patients showed significantly lower total and dynamic machine scores than healthy controls (p < 0.05).

CONCLUSIONS

This study provides an objective, quantitative tool for evaluating facial nerve function, demonstrating good accuracy, robustness, and strong relevance with subjective scales, and exhibiting enhanced sensitivity to subtle or clinically unnoticeable facial nerve dysfunction.

OP-289

AI-Assisted Photographic Assessment Of Auricular Symmetry Following Otoplasty

Durdu Tuğçe İNCE[1]

[1]*Department of Otolaryngology–Head and Neck Surgery, Medicana Hospitals, İstanbul, Türkiye*

BACKGROUND & AIM

Prominent ear deformity is a common congenital auricular anomaly that may negatively affect psychosocial well-being, particularly in pediatric and adolescent patients. Although otoplasty is associated with high patient satisfaction, postoperative evaluation is frequently based on subjective assessment. This study aimed to evaluate postoperative auricular symmetry and projection changes using AI-assisted photographic assessment combined with objective anatomical measurements following otoplasty.

MATERIAL & METHODS

A retrospective clinical study was conducted including approximately 20 pediatric and adolescent patients (40 ears) who underwent bilateral otoplasty for prominent ear deformity. Surgical correction consisted of combined Mustardé sutures, Furnas conchal setback sutures, and selective conchal cartilage excision. Standardized preoperative photographs and auricular measurements were obtained in all patients. Immediate postoperative measurements and 6-month postoperative photographs were evaluated using AI-assisted semi-automated digital photographic analysis with landmark-based assessment of auricular symmetry and projection. Auricular projection and symmetry were assessed using helical superior measurements, transverse antihelical measurements referenced to the zygomatic line, tragal midline-based measurements, and intertragal notch measurements. Statistical analyses were performed using paired comparisons between preoperative and postoperative measurements to evaluate postoperative changes in auricular projection and symmetry. All photographs were anonymized and analyzed without identifiable patient information.

RESULTS

Postoperative assessment demonstrated significant improvement in auricular projection and bilateral symmetry compared with preoperative findings. AI-assisted photographic analysis showed improved auricular contour and reduced prominence at all evaluated anatomical landmarks. Six-month postoperative photographs demonstrated stable aesthetic outcomes without clinically significant recurrence. No major postoperative complications, including hematoma, infection, skin necrosis, or hypertrophic scarring, were observed. Overall patient satisfaction was high.

CONCLUSIONS

AI-assisted photographic assessment combined with objective anatomical measurements may provide a practical and standardized method for postoperative evaluation following otoplasty. Combined Mustardé and Furnas techniques with selective conchal cartilage excision achieved satisfactory aesthetic outcomes, stable postoperative symmetry, and high patient satisfaction in pediatric and adolescent patients.

OP-290

Balanced Medial Crural Suture: A Novel Technique For Precise Nasal Tip Positioning

Ümit Hardal[2], **Banu Erkal**[1], **Meltem Bozacı Kılıçoğlu**[1], **Zeynep Alkan**[1]

[1]*Department of Otorhinolaryngology–Head and Neck Surgery, Yeditepe University Faculty of Medicine;* [2]*Dr. Ümit Hardal Muayenehanesi*

BACKGROUND & AIM

Achieving stable nasal tip support while preserving physiologic tip mobility remains a major challenge in septorhinoplasty. Conventional graft- and suture-based techniques often limit independent medial crural control, particularly in cases with asymmetry, and may result in excessive rigidity or progressive postoperative changes. This study aims to describe the Balanced Medial Crural Suture (BMCS) technique, a novel septocolumellar suturing method designed to provide balanced, independent stabilization of each medial crus for precise and adjustable nasal tip positioning.

MATERIAL & METHODS

The BMCS technique was performed during open septorhinoplasty procedures under general anesthesia. Following completion of dorsal and structural maneuvers, the desired nasal tip position was determined intraoperatively. Each medial crus was independently positioned and marked relative to the caudal septum at the level of the supratip break angle. A 6-0 polypropylene suture was first placed through the caudal septum to establish a stable reference point. The suture was then passed separately through each medial crus with a controlled 2-mm tissue purchase and tied to achieve balanced septocolumellar fixation. Suture tension and placement were adjusted under direct visualization to correct asymmetry and optimize tip projection and rotation.

RESULTS

The BMCS technique allowed precise, symmetrical, and reproducible control of nasal tip position. Independent fixation of each medial crus facilitated correction of medial crural asymmetry while preserving physiologic tip mobility. Intraoperative adjustability enabled fine-tuning of projection and rotation without reliance on rigid graft constructs. The technique provided stable tip support with balanced tension distribution between the medial crura.

CONCLUSIONS

The Balanced Medial Crural Suture is a practical and versatile septocolumellar technique that enables independent medial crural stabilization while maintaining natural nasal tip dynamics. By combining standardized reference points with modular suture adjustment, BMCS offers predictable control of tip position and represents a valuable addition to contemporary septorhinoplasty techniques.

OP-291

Microtia In Uzbekistan: Which Stage Is Better?

Mirjamol Jafarov[1]

[1]*Tashkent State medical University, department of otorhinolaryngology*

BACKGROUND & AIM

Microtia is a congenital auricular malformation with an estimated prevalence of 1 in 6,000–12,000 live births. Two-stage autologous costal cartilage reconstruction remains a widely accepted technique due to its durability, natural contour, and compatibility with growth. In Uzbekistan, where prosthetic and alloplastic options are limited, autologous cartilage reconstruction is the standard approach. This study presents a 20-year single-center experience from main medical center in Tashkent, documenting surgical refinements, complication trends, and long-term outcomes in 180 pediatric patients.

MATERIAL & METHODS

Between 2005 and 2025, 180 consecutive pediatric patients (114 boys, 66 girls) with unilateral microtia underwent staged autologous reconstruction. Patients with bilateral microtia, syndromic anomalies, or previous auricular surgeries were excluded.Stage 1: Harvest of costal cartilage (ribs 10–12), framework carving using micro-blade tools, subcutaneous implantation at the auricular site.Stage 2: Auricular elevation with a vascularized temporoparietal fascial flap and split-thickness skin graft coverage.Patients were stratified by age:- 6–10 years: 60 cases- 10–14 years: 65 cases- 14–17 years: 55 casesPreferred age for Stage 1 was 10–12 years to ensure adequate rib cartilage volume while minimizing donor site morbidity. Mean interval between stages was 6–8 months.Demographic data, perioperative complications, revision rates, and long-term framework stability were recorded. Satisfaction was assessed at ≥1 year postoperatively using a 5-point Likert scale during in-person evaluations. Follow-up ranged from 1 to 8 years (mean 5.2 years).

RESULTS

Case distribution: Unilateral microtia: 180 (100%)Mean age at Stage 1: 11.2 yearsComplications:- Skin necrosis: 3 cases (1.6%)- Framework exposure: 5 cases (2.7%)- Infection: 6 cases (3.3%)- Hypertrophic scarring: 24 cases (13.3%)Revisions:- 18 patients (10%)- Contour refinement: 12- Projection adjustment: 6Framework stability:- Stable at ≥5 years: 168 patients (93.3%)Satisfaction scores:- Mean: 4.6/5- Highest in 14–17 year group (4.8/5)Technical refinements introduced during study period:1. Framework carving — Use of micro-blade tools for precise helix and antihelix definition.2. Flap harvest technique — Consistent preservation of vascular pedicle during temporoparietal fascia dissection.3. Skin graft optimization — Thinning for color match and reduced bulk.4. Timing modification — Standardizing Stage 1 between ages 10–12 for optimal cartilage availability.Subgroup observations:- Younger patients (6–10 years) had slightly higher framework instability (8%) compared to older groups (4%), linked to smaller cartilage volume.- Satisfaction scores correlated positively with age at reconstruction.

CONCLUSIONS

Two-stage autologous costal cartilage auricular reconstruction remains a safe, effective, and durable method for pediatric microtia in Uzbekistan. Technical refinements developed over the past decade have improved contour definition, reduced complications, and enhanced patient satisfaction. These results are applicable to similar resource-limited settings worldwide.

OP-292

Surface Electrical Stimulation Stops Muscle Atrophy In Facial Paralysis: Ultrasound Evidence

Johannes Kraußa[1], Gabriel Meincke[1], Maren Geitner[1], Anna-Maria Kuttenreich[2], Dirk Arnold[1], Winfried Mayr[3], Orlando Guntinas-Lichius[1], Gerd Fabian Volk[2]

[1]ENT-Department, Jena University Hospital, Jena, Germany; [2]Facial-Nerve-Center, Jena University Hospital, Jena, Germany; [3]Center for Medical Physics & Biomedical Engineering, Medical University Vienna, Austria; [4]Center of Rare Diseases, Jena University Hospital, Jena, Germany

BACKGROUND & AIM

There is increasing evidence to support the use of surface functional electrical stimulation (FES) as a complementary therapy for treating patients with complete denervated facial paralysis. However, standardised studies using objective methods are needed to quantify its therapeutic effects. This pilot study examined the safety and feasibility of home-based FES for treating denervated muscle atrophy and improving facial symmetry, using ultrasound and automated image analysis.

MATERIAL & METHODS

Ten patients (median age: 61 years; median duration of denervation: 130 days) with complete facial paralysis were enrolled in a prospective, monocentric feasibility study. They performed home-based FES of the zygomaticus muscle twice daily for up to one year. Monthly follow-ups included stimulation adjustments, sonography, and standardised photographs. To eliminate reinnervation bias, data points were excluded as soon as electromyography indicated voluntary muscular activity.

RESULTS

No serious adverse events occurred. The stimulation parameters were progressively increased, demonstrating effective muscle engagement. The cross-sectional area of the zygomaticus muscle increased significantly, in contrast to the decrease observed in non-stimulated muscles. Automated image analysis revealed a significant deterioration in the non-stimulated areas compared to the stimulated facial region.

CONCLUSIONS

FES is a safe and feasible therapy model for patients with complete facial paralysis. Atrophy of the stimulated muscles could be reversed, as could facial asymmetry. These promising results justify conducting a future controlled, randomised, double-blind study to further investigate these initial findings.

OP-293

Evaluation Of Functional And Aesthetic Outcomes In Septorhinoplasty Using The Social Appearance Anxiety Scale, Rhinoplasty Outcomes Evaluation (ROE-T), And The Sino-Nasal Outcome Test-22 (SNOT-22)

Elif Çetinkaya[1], Ziya Şencan[1], Burak Mustafa Taş[1], Ela Cömert[1], Nuray Bayar Muluk[1]

[1]Kırıkkale Univercity Faculty of Medicine

BACKGROUND & AIM

This study aimed to evaluate aesthetic perception and functional symptoms in patients undergoing septorhinoplasty using the Social Appearance Anxiety Scale (SAAS), Rhinoplasty Outcomes Evaluation–Turkish version (ROE-T), and Sino-Nasal Outcome Test-22 (SNOT-22) in the preoperative and postoperative periods. Additionally, the effects of different surgical techniques and graft types on these outcomes were investigated.

MATERIAL & METHODS

A total of 67 patients (47 females, 20 males) who underwent septorhinoplasty were included. All participants completed the SAAS, ROE-T, and SNOT-22 questionnaires preoperatively and at the routine third-month postoperative follow-up. Demographic data (age, sex, smoking status) and graft types were recorded. Septal extension grafts were used in 20 patients and columellar strut grafts in 47 patients. Preoperative and postoperative scores were compared, and subgroup analyses were performed according to sex, age group (18–35 vs. 36–50 years), and graft type.

RESULTS

The preoperative median SNOT-22 score was significantly higher in male patients than in female patients (p=0.032), and the postoperative reduction in sinonasal symptoms was greater in males (p=0.004). Improvement in functional and aesthetic satisfaction based on ROE-T scores was more pronounced in the 18–35-year age group compared with the 36–50-year group

(p=0.006). No statistically significant difference was found between septal extension and columellar strut graft groups regarding changes in questionnaire scores (p=0.126). Overall, significant postoperative improvements were observed in aesthetic satisfaction and sinonasal symptoms.

CONCLUSIONS

Septorhinoplasty significantly reduced sinonasal symptoms, improved functional and aesthetic satisfaction, and decreased social appearance anxiety (p<0.001). No significant differences were found between septal extension and columellar strut grafts, indicating comparable effectiveness; thus, graft choice should be guided by patient-specific anatomy and surgical planning. Male patients had higher preoperative SNOT-22 scores and greater postoperative functional improvement. Negative correlations between SNOT-22 and ROE-T and positive correlations with social anxiety show that functional impairment negatively affects aesthetic satisfaction and psychosocial status, emphasizing the importance of comprehensive preoperative assessment and individualized planning.

OP-294

Demographic And Radiological Analysis Of Patients With Mandibular And Maxillary Fractures, Surgical And Non-Surgical Treatment Outcomes: Our 5-Year Experience In A Tertiary Hospital

Muhammet Fatih GÖKMEN[1], **Hürü Beyza CERİT**[1], **Merih ÖNAL**[1]

[1]*Selcuk University, Medical School, ENT Department*

BACKGROUND & AIM

The maxillofacial region is among the most frequently injured anatomical areas. Owing to its prominent and relatively unprotected position, the mandible is the second most commonly fractured bone in adults. In studies involving larger patient series, mandibular fractures have been reported as the most common injury among patients with maxillofacial trauma.

MATERIAL & METHODS

Patients who presented to our clinic with maxillofacial trauma between 2021 and 2026, either referred from the emergency department or admitted via outpatient services, were included in this study. In this retrospective study, 115 patients were included. Demographic variables (age and sex), trauma etiology, concomitant facial fractures, surgical management, and postoperative complications were comprehensively evaluated and systematically analyzed.

RESULTS

Among the 115 patients, 102 were male and 13 were female. The mean age was 34.6 years in males and 32.3 years in females. Patient ages ranged from 3 to 93 years. In both sexes, road traffic accidents constituted the predominant etiological factor, followed by falls as the second most common cause. While 21 male patients sustained mandibular fractures due to interpersonal violance, no violance-related cases were documented in female patients. Isolated mandibular fractures predominated among female patients (12/13), with only one case accompanied by a maxillary fracture. By contrast, 50 male patients had concomitant fractures, the majority of which (39 patient) involved multiple facial bones.

A total of 156 surgical procedures were performed, and complications were observed in 17 cases. The most frequently observed complication was intraoral wound dehiscence, followed by plate and/or screw exposure.

CONCLUSIONS

Inadequately managed mandibular fractures may lead to infection at the fracture site, persistent malocclusion, and functional impairment. Although several aspects of mandibular fracture management are well established and supported by consensus, certain approaches remain controversial and may vary among experienced surgeons. This study aims to evaluate the demographic characteristics of surgically treated mandibular fractures at our institution, to compare these findings with the current literature, and to contribute to the standardization of management by presenting our surgical approaches.

mandibular fractures, maxillary fractures, intermaxillary fixation, open reduction

OP-295

Selective Neurectomy: The Crossroads Of Facelifting And Synkinesis Surgery

Matthew Q. Miller[1]

[1]*University of North Carolina, Chapel Hill, NC, USA*

BACKGROUND & AIM

Although aesthetic and reconstructive surgery are frequently regarded as distinct disciplines within facial plastic and reconstructive surgery, there is considerable overlap between these two areas. Facial plastic and reconstructive surgeons recognize the significant intersections that exist, often drawing upon techniques and principles from both aesthetic and

reconstructive practices to achieve optimal outcomes for their patients. Selective neurectomy for synkinesis underscores the benefit of integrating aesthetic with reconstructive techniques.

MATERIAL & METHODS

Selective neurectomy and facelifting procedures performed by a single surgeon at a tertiary care facial nerve center were reviewed over a 4-year period. Outcomes, evolution of surgical techniques, and influences the two procedures have had on each other were studied.

RESULTS

During the 4-year period, 46 cases of isolated selective neurectomy, 46 cases where selective neurectomy was combined with contralateral facelifting, and 30 facelift surgeries in patients without synkinesis were performed.

Females and older patients were more likely to undergo contralateral facelifting in conjunction with selective neurectomy. There were no significant differences in patient-reported outcomes between those who had selective neurectomy alone and those who underwent selective neurectomy with a facelift.

Over time, the surgeon adopted a “preservation” approach for both facelift and neurectomy procedures, resulting in reduced operative times and fewer complications. For improved neck contouring, a platysma myotomy was performed along the mandibular border, eliminating the need to resect the submandibular gland. Importantly, placing the myotomy at this location helps prevent injury to the nerve to the depressor labii inferioris, thereby avoiding postoperative lower lip asymmetry. With this technique, no patients experienced temporary or permanent lower lip weakness.

CONCLUSIONS

Facelifting surgery is recommended for many synkinesis patients undergoing selective neurectomy. Preservation facelifting, with reduced subcutaneous elevation, shortens operative time and decreases complications in both procedures. High platysma myotomy improves neck contour without submandibular gland excision and without significant risk of lower lip asymmetry.

OP-296

KIRSCHNER WIRE-GUIDED SUTURE FIXATION: A SIMPLE AND RELIABLE REPAIR FOR SEPTAL L-STRUT FRACTURES AND KEYSTONE AREA COLLAPSE IN RHINOPLASTY

Abdullah Kınar[1]

[1]*Uşak University Faculty of Medicine, Uşak Training and Research Hospital, Department of Otorhinolaryngology, Uşak, Turkiye*

BACKGROUND & AIM

The keystone region is where the cartilage and bone structures meet in the nose, and separation of this region during rhinoplasty can cause loss of support for the nasal dorsum and collapse. The techniques mentioned in the literature for repairing this region are difficult and challenging to apply. They also have difficulties such as passing sutures through the nasal skin.

MATERIAL & METHODS

In this study, the author describes the keystone region fracture and drop observed in 3 of 165 primary and secondary rhinoplasty cases and the simple, reliable and rapid repair of this region by using Kirschner wires.

RESULTS

The ratio of intraoperative falls and fractures observed in keystone area 3 patients to all 165 surgeries is 1.8%. 2 of the 3 cases were revision rhinoplasty. The ratio in revision rhinoplasties cannot be known with the available data. The patients were followed up for 5 years after the operation.

During the follow-up, nasal breathing improved aesthetically. The mean NOSE (Nasal Obstruction Symptom Evaluation) scores of the patients improved significantly, decreasing from a preoperative mean of 85 to a postoperative mean of 25. Regarding aesthetic outcomes, patients reported high levels of satisfaction with their nasal contours. Due to the limited sample size (n=3), differential statistical analysis could not be performed.

CONCLUSIONS

L-Strut can be repaired simply and reliably. This method provides a rapid and effective treatment for L-strut fractures that occur after resections for high septal deviations or in secondary rhinoplasties in the K-area or keystone region.

[1]Department of Otolaryngology, Erciş Şehit Rıdvan Çevik State Hospital, Van, Türkiye; [2]Department of Otolaryngology, Kırıkkale University Faculty of Medicine, Kırıkkale, Türkiye

BACKGROUND & AIM

Septorhinoplasty is a commonly performed surgical procedure that may affect olfactory function due to postoperative mucosal edema, nasal packing, and structural changes in the nasal airway. Although olfactory training has been shown to improve olfactory function in certain patient populations, its effectiveness following septorhinoplasty remains unclear. This study aimed to evaluate changes in olfactory function after septorhinoplasty and to investigate the effect of olfactory training on postoperative olfactory outcomes.

MATERIAL & METHODS

In this prospective study, 60 patients who underwent septorhinoplasty were included. The patients were divided into two groups: Group 1 (n = 30), receiving olfactory training, and Group 2 (n = 30), not receiving olfactory training. Olfactory function was assessed in all patients using the Brief Smell Identification Test (B-SIT) preoperatively, at postoperative week 1, and at postoperative month 2. All data were recorded in patient files and statistically analyzed.

RESULTS

The mean age was 29.5 ± 2.01 years in Group 1 and 26.4 ± 1.05 years in Group 2. No statistically significant difference in preoperative olfactory function was observed between the groups ($p > 0.05$). In both groups, olfactory function significantly decreased at postoperative week 1 compared with preoperative values ($p < 0.05$). No statistically significant difference was observed between preoperative and postoperative month 2 olfactory measurements in either group ($p > 0.05$).

CONCLUSIONS

According to these results, no significant long-term change in olfactory function was observed after septorhinoplasty. Similarly, no significant difference in olfactory function was observed between patients who received olfactory training and those who did not. In this study population, most patients did not have clinically significant olfactory impairment in the preoperative period. Therefore, further studies focusing specifically on patients with preoperative olfactory dysfunction are warranted.

OP-298

Can Artificial Intelligence Detect The Anti-Aging Effect Of Rhinoplasty?

Muhammed Zeki Yalçın[1], **Yüksel Toplu**[2], **Osman Kurt**[3]

[1]Department of Otorhinolaryngology and Head and Neck Surgery, Corum Private Hospital, Corum, Turkey; [2]Department of Otorhinolaryngology and Head and Neck Surgery, Private Park Hospital, Malatya, Turkey; [3]Department of Public Health, Inonu University, Malatya, Turkey

BACKGROUND & AIM

The quest for eternal youth has been a common theme in many cultures for centuries. While we have yet to discover a way to preserve youth eternally, we have made significant progress in understanding the aging process and in developing pharmaceuticals, surgical techniques, and technologies.

In addition to rhinoplasty's facial beautification effect, we investigated whether it had a facial anti-aging effect using an artificial intelligence (AI)-based program. We also examined the correlation between patient satisfaction and the anti-aging effect of rhinoplasty.

MATERIAL & METHODS

This study included 244 patients who underwent functional septorhinoplasty (FSRP) between January 2018 and August 2020 at Inonu University, Department of Otorhinolaryngology. Preoperative and postoperative photographs in our archive were evaluated using an AI-based age analysis program. In addition, the participants evaluated preoperative and postoperative nose satisfaction with the FACE-Q survey in the postoperative period.

RESULTS

One hundred two males (41.8%) and 142 females (58.2%) were included in the study. The mean preoperative age determined by the program was 25.9 ± 6.1, and the mean postoperative age was 25.7 ± 5.8. Despite the mean follow-up period of the patients was 25.3 ± 8.7 months, our study showed no significant difference between the mean preoperative and postoperative ages. The mean general satisfaction of the patients increased postoperatively.

CONCLUSIONS

Despite the average follow-up period, the absence of a significant difference between preoperative and postoperative perceived mean age may be interpreted as a possible anti-aging effect of rhinoplasty. This effect was more prominent in older patients and in women.

OP-299

The Caudal Septal Partial Incision With Extension Graft Interposition: A Structural Approach To Columellar And Dorsal Septal Deviation

Mohammed Ahmed Alhejaily[1], **Professor Ahmed Alarfaj**[1]

[1]*King Saud University, Riyadh, Saudi Arabia.*

BACKGROUND & AIM

Caudal septal deviation remain one of the most technically difficult deformities in septorhinoplasty due to its crucial role in tip support, columellar alignment, and dorsal axial stability. Scoring, splinting grafts, and complete caudal replacement are examples of traditional corrective methods that may jeopardize structural integrity or offer little control over multiplanar deformities.

The purpose of this study is to assess the structural and clinical results of the caudal septal partial incision with extension graft interposition technique as a means of axial realignment and controlled septal segmentation in patients undergoing open septorhinoplasty.

MATERIAL & METHODS

Patients who had open septorhinoplasty using this technique between 2025 and 2026 were included in a retrospective case series carried out at a tertiary academic referral center. pre and post operative NOSE scores and aesthetic satisfaction using ROE scores, and standardized photographic analysis was performed by independent facial plastic surgeons. Complications and revision rates were analyzed to evaluate safety and durability.

RESULTS

Preliminary date: The study included 34 patients with a mean age of 31.8 ± 6.3 years. The mean time since surgery was 8.2 ± 4.6 months. The most frequent intraoperative findings were deviated caudal septum (100%), nasal hump (57.5%), and down rotation (63.2%). The ROE questionnaire results showed statistically significant improvements in all constituents ($P < 0.0001$) after surgery. The mean total ROE score improved from 8.7 ± 3.2 preoperatively to 19.5 ± 3.9 postoperatively ($P < 0.001$). Similarly, the mean total Nasal Obstruction Symptom Evaluation score improved from 7.1 ± 5.8 preoperatively to 1.9 ± 2.7 postoperatively ($P < 0.001$).

CONCLUSIONS

The Caudal Septal Partial Incision with Extension Graft Interposition technique in septorhinoplasty has shown favorable outcomes in enhancing both functional and aesthetic aspects. Findings from this retrospective study indicate a high level of patient satisfaction along with a low rate of postoperative complications.

KEYWORDS

Caudal septal deviation, Septorhinoplasty, Septal extension graft, Nasal tip support

OP-300

Nasal Tip Projection: Asymmetries After Rhinoplasty

Maja Korjas[1]

[1]*ENT University Hospital, Medical faculty*

BACKGROUND & AIM

Introduction: nasal tip projection has been defined as the distance along a perpendicular line from the vertical facial plane to the most anterior projecting point of the nasal tip. The tripod concept, although an oversimplification of nasal tip dynamics, highlights the intimate relationship between projection and rotation. Each lateral crus composes one lateral leg of the tripod, and the paired medial crura constitute the central leg. The tripod concept also highlights the effect of operative procedure on one limb may have on the spatial position of the entire nasal tip.

MATERIAL & METHODS

Material and methods: We completed a retrospective review of patients who were admitted at ENT Clinic, Skopje from the period of 2019-2025.Operative technique rhinoplasty were prepared in 36 patients. Procedures included full-transfixion incision, release of tension septum, lateral crural overlay (LCO), dome truncation, medial crural overlay (MCO), and combinations of them. We reviewed major and minor secondary revision procedures that patients underwent, postoperative complications, and any functional complaints.

RESULTS

Of the remaining 36 patients:1 (2.5%) required minor revision of dorsal irregularities, 3 (3.0%) required tip revision, 33 patients (93.3%) were satisfied without qualification, 3 patients (3.5%) were not satisfied and wont for revision surgery. 3 patients (2.5%) underwent radix grafts. 5 (13.3%) of the patients had had previous rhinoplasty performed by another physicians. 7 patients (18.3%) were classified as having tension nose. 1 patient had postoperative epistaxis, and there were no cases of postoperative functional complaints.

CONCLUSIONS

Our revision rate of 4.2% for tip irregularity and our finding that no patients had postoperative functional complaints allows us to feel confident that this algorithmic paradigm can be used to accomplish tip deprojection in almost any circumstance.

OP-301

Microsaw Vs Conventional Osteotomy In Rhinoplasty

Alper Tabaru[1], **Sedat Rüzgar**[2], **Salih Akyel**[3]

[1]*Otorhinolaryngology Department, Van Education and Research Hospital, University of Health Sciences;* [2]*Private ENT Clinic, Istanbul;* [3]*Otorhinolaryngology Department, Basaksehir Cam and Sakura City Hospital, University of Health Sciences*

BACKGROUND & AIM

Septorhinoplasty aims to achieve both functional and aesthetic improvement; however, early postoperative edema, ecchymosis, and pain may negatively impact patient comfort. This study compares the effects of conventional osteotomy instruments versus an oscillating microsaw on early postoperative edema, ecchymosis, pain, and patient satisfaction.

MATERIAL & METHODS

In this prospective randomized study, 60 patients undergoing open septorhinoplasty were assigned to two groups (n=30 each). Group 1 underwent conventional osteotomies, while Group 2 underwent microsaw-assisted osteotomies. All other surgical steps were standardized. Edema and ecchymosis were evaluated on postoperative days 3 and 7 by two blinded surgeons. Pain levels were self-reported on days 1, 3, and 7 using a visual analog scale. Patient satisfaction was assessed on postoperative day 7.

RESULTS

The mean age was 24.10 ± 4.83 years in Group 1 and 25.53 ± 6.08 years in Group 2 ($p > 0.05$). Gender distribution was similar. Edema and ecchymosis scores did not significantly differ between groups on days 3 and 7 ($p > 0.05$). Both parameters improved significantly from day 3 to day 7 within each group ($p < 0.05$). Pain scores decreased significantly over time in both groups ($p < 0.05$), with no intergroup difference at any time point ($p > 0.05$). Day-7 patient satisfaction scores were modest and comparable between groups (≈5/10; $p > 0.05$).

CONCLUSIONS

Microsaw-assisted osteotomy did not provide a significant advantage over conventional techniques in reducing early postoperative morbidity. Gentle tissue handling and meticulous surgical technique remain key factors in improving patient comfort. Larger, multi-center studies are warranted to clarify potential subtle benefits of microsaw osteotomies.

OP-302

Impact Of Dorsal Preservation Rhinoplasty On The Internal Nasal Valve

Ahmed Aytah[2], **Mohammed Bahabri**[3]

[1]*Department of Otolaryngology – Head and Neck Surgery, Saudi German Hospital Jeddah, Saudi Arabia Department of Otolaryngology – Head and Neck Surgery, Ministry of health, Jeddah, Saudi Arabia;* [2]*Department of Otolaryngology – Head and Neck Surgery, King Faisal Specialist Hospital & Research Centre, Jeddah, Saudi Arabia Department of Otolaryngology – Head and Neck Surgery, Ministry of health, Jeddah, Saudi Arabia;* [3]*Department of Otolaryngology – Head and Neck Surgery, Ministry of National Guard - Health Affairs*

BACKGROUND & AIM

The internal nasal valve (INV) is the narrowest segment of the nasal airway and a key regulator of airflow and resistance. Preservation rhinoplasty (PR) includes techniques such as push-down (PD) let-down (LD) and spare roof (SR) and aims to maintain nasal form and function by sparing dorsal structures. Although PR achieves high aesthetic satisfaction evidence regarding its functional impact particularly on the INV angle remains limited. This study aims to evaluate changes in the INV angle following dorsal preservation rhinoplasty using meta-analytic method.

MATERIAL & METHODS

This systematic literature review was conducted through a thorough search of PubMed/MEDLINE and Google Scholar up to April 2025. Studies reporting pre- and post-operative INV angles in patients undergoing DPR were included. Data extraction quality assessment (RoB 2 MINORS QUACS) and meta-analysis were performed using RevMan 5.4 following PRISMA guidelines. The primary outcome was change in INV angle; secondary outcomes included nasal resistance and airway volume.

RESULTS

For this SRMA nine studies met the inclusion criteria with four studies eligible for meta-analysis (N = 118 patients). Techniques included LD PD and SR. The pooled standardized mean difference (SMD) showed a significant post-operative increase in INV angle (SMD = 0.52; 95% CI: 0.02–1.02; $p = 0.04$; $I^2 = 63\%$). After excluding an outlier study (Stergiou 2020) heterogeneity

dropped to 0% and the effect remained significant (SMD = 0.43; 95% CI: 0.16–0.69; p = 0.002). Cadaveric analysis (N = 46) showed the SR technique had the most favorable INV angle increase (SMD = 1.42; p = 0.02). PD showed a non-significant decrease (SMD = −1.65; p = 0.15) while LD trended positively (SMD = 0.86; p = 0.13). Subgroup analysis demonstrated significant differences by surgical technique (p = 0.02). Only two studies reported nasal airflow outcomes with trends toward increased nasal volume without change in resistance.

CONCLUSIONS

This study shows that among dorsal preservation approaches the spare roof and let-down techniques in particular are associated with modest but clinically meaningful improvements in INV angle. While push-down may not consistently improve valve patency spare roof shows significant anatomical benefit. These findings support dorsal preservation rhinoplasty as a functionally effective alternative to traditional hump techniques though further high-quality long-term studies with standardized objective and subjective functional outcomes are recommended to guide technique selection in clinical practice.

OP-303

Postoperative Patient Behavior On Tiktok Following Rhinoplasty: An AI-Assisted Thematic And Sentiment Analysis Of Non-Guideline-Supported Recommendations, Reassurance-Seeking, And Community-Based Care Patterns

Özgenur Koçak[1], **Furkan Melih Koçak**[2], **Zahide Mine Yazıcı**[1], **Oğuzhan Tiryakioğlu**[1]

[1]Department of Otorhinolaryngology, Bakirkoy Dr. Sadi Konuk Training and Research Hospital, Istanbul, Türkiye; [2]Department of Otorhinolaryngology, Avcılar Anatolian Hospital, İstanbul, Türkiye

BACKGROUND & AIM

To systematically identify non-guideline recommendations, reassurance-seeking behavior, emotional profiles, and community-based care patterns in user comments on TikTok videos addressing rhinoplasty recovery, using AI-assisted thematic and sentiment analysis, and to define the determinants of these patterns through like-weighted visibility analysis and logistic regression.

MATERIAL & METHODS

A total of 1,024 comments from 50 publicly available TikTok videos were identified using a PRISMA-inspired selection workflow. To minimize personalization bias, a newly created account with no prior interaction history was used, cookies were cleared, and all searches were conducted under standardized conditions. AI-assisted thematic coding was validated by two independent researchers (overall Cohen's κ=0.79). The 2022 guidelines of the Turkish Society of Plastic, Reconstructive and Aesthetic Surgery (TSPRAS) served as the reference standard for identifying non-evidence-based recommendations. A Like-Weighted Misinformation Index (LWMI) was calculated, and the effects of account type and comment characteristics on non-evidence-based comment rates (NECR) were examined using logistic regression. Sentiment analysis was performed across six categories.

RESULTS

The most frequently observed theme was edema and swelling anxiety (41.3%; n=423), followed by reassurance-seeking behavior (36.8%; n=377) and non-guideline recommendations (31.4%; n=322). The proportion of comments containing non-guideline recommendations was markedly higher among anonymous users compared to content creators with declared healthcare credentials (38.5% vs. 16.6%; χ^2=24.3; p<0.001). Like-weighted analysis revealed that recommendations favoring pineapple consumption received an average of 249.1 likes per comment, suggesting that clinically controversial content organically reached broader audiences. Sentiment analysis identified anxiety/fear (38.0%) and reassurance-seeking (30.5%) as the dominant emotional tones, together accounting for approximately two-thirds of all comments. The rate of non-guideline recommendations increased significantly from 2023 to 2025 (28.3% to 32.4%; χ^2=8.7; p=0.033). Similarly, the LWMI rose from 0.31 in the second half of 2023 to 0.41 in the first half of 2025, indicating an upward trend in the weighted visibility of non-guideline content.

CONCLUSIONS

TikTok comment sections constitute a distinctive postoperative information environment in which clinically controversial recommendations and intense patient anxiety are deeply intertwined. The platform's like-based algorithm may contribute to the increased visibility of non-guideline content. Surgeons performing rhinoplasty are encouraged to update their preoperative counseling to encompass patients' social media–driven health information-seeking behaviors.

OP-304

The Effect of Systemic Isotretinoin on Nasal Skin Thickness Over Time

Yasin KAPLAN[1], **Hüseyin Ünüvar**[2], **Fakih Cihat ERAVCI**[1], **İlkay ÖZER**[3], **Şeyma Ünüvar**[2], **Malik Afifoğlu**[5], **Ömer KAPLAN**[4]

[1]*Department of Otorhinolaryngology, Faculty of Medicine, Necmettin Erbakan University, Konya, Türkiye;* [2]*Department of Radiology, Faculty of Medicine, Necmettin Erbakan University, Konya, Türkiye;* [3]*Department of Dermatology, Faculty of Medicine, Necmettin Erbakan University, Konya, Türkiye;* [4]*Department of Otorhinolaryngology, Seydişehir State Hospital, Konya, Türkiye;* [5]*Department of Otorhinolaryngology, Bursa City Hospital, Bursa, Türkiye*

BACKGROUND & AIM

Nasal skin thickness is an important factor influencing rhinoplasty outcomes, particularly in patients with thick skin. Although the effects of systemic isotretinoin therapy on skin structure are well known, objective data demonstrating time-dependent changes in nasal skin thickness remain limited. This study aimed to prospectively evaluate changes in nasal skin thickness in patients receiving systemic isotretinoin therapy.

MATERIAL & METHODS

This prospective longitudinal study included 50 patients who were started on systemic isotretinoin therapy for acne vulgaris. Nasal skin thickness was measured using high-frequency ultrasonography at five distinct anatomical sites: the radix, transition zone, nasal tip, right alar sulcus, and left alar sulcus. Measurements were performed before treatment and at the third and sixth months of therapy. Statistical analysis was conducted using repeated-measures analysis of variance with Bonferroni correction.

RESULTS

A statistically significant decrease in nasal skin thickness over time was observed in all anatomical regions ($p<0.001$ for all comparisons). Measurement values progressively decreased at the third and sixth months compared with baseline. The greatest reduction was observed in the left alar sulcus (0.634 mm) and right alar sulcus (0.587 mm), whereas the smallest reduction was detected in the radix region (0.332 mm). Differences between all time points were statistically significant ($p<0.001$).

CONCLUSIONS

Systemic isotretinoin therapy results in a significant and progressive reduction in nasal skin thickness over a 6-month period. These findings demonstrate that systemic isotretinoin therapy induces progressive, time-dependent changes in the nasal soft-tissue envelope, with region-specific variations in the degree of skin thinning. Further studies are needed to determine the clinical implications of these changes on rhinoplasty outcomes.

Isotretinoin, Ultrasonography, Skin Thickness, Rhinoplasty, Acne Vulgaris.

OP-305

A Zonal Denervation Approach To Surgical Management Of Facial Synkinesis

Roy Xiao[1]

[1]*University of Pennsylvania*

BACKGROUND & AIM

Selective neurectomy (SN) has emerged as a surgical adjunct for patients with facial synkinesis. Despite the goal to eliminate aberrantly regenerated axons to relieve synkinesis, post-operative outcomes have been mixed. Our objective was to develop a further approach to selective neurolysis involving zonal denervation (ZD) technique to more effectively and efficiently eliminate unwanted synkinetic motion.

MATERIAL & METHODS

We retrospectively assessed two surgical groups: one cohort of patients underwent traditional SN from 7/2019-12/2021; our second cohort underwent ZD from 7/2023-8/2024. Pre- and post-operative photographs were analyzed in a blinded fashion using Emotrics and eFACE; post-operative changes were compared within patients using Wilcoxon matched-pairs signed rank tests.

RESULTS

We analyzed 20 ZD patients and 39 traditional SN patients. Those undergoing ZD experienced significant improvement in median oral commissure (OC) excursion from 2.50mm to 5.88mm ($p<0.001$) at median 12-month follow-up. Similarly, median interlabial distance (ILD) difference decreased from 5.23mm to 2.64mm (p-0.002), while median palpebral fissure width (PFW) difference decreased from 2.98mm to 1.01mm ($p=0.003$). eFACE outcomes mirrored Emotrics improvements. Those undergoing SN had less consistent results without statistically significant changes in Emotrics measures over long-term follow-up.

CONCLUSIONS

Zonal Denervation is a safe, efficient, and effective technique to significantly improve periocular and perioral synkinesis.

KEYWORDS
Zonal Denervation, Selective Neurectomy, Synkinesis

OP-306

Correction Of Collapsed Middle Nasal Vault Deformity Using Auricular Cartilage

Tse Ming Chang[1]

[1]*Kaohsiung Municipal United Hospital*

BACKGROUND & AIM

The middle nasal vault is the region between the upper lateral cartilages and the dorsal septum; it is a key area for both nasal airway function and aesthetic dorsal contour. Collapsed middle vault deformities usually result from previous surgery or trauma. Traditional grafts for reconstruction include spreader graft, batten graft, or onlay graft; however, when septal cartilage is insufficient, auricular cartilage can be a highly valuable option.

MATERIAL & METHODS

A retrospective review of a single surgeon's experience, a total of 30 patients were collected in this study from December 2021 through December 2024. The same senior author harvested one side auricular cartilage with the posterior-auricular incision and performed rhinoplasty procedures. The harvested auricular cartilage was designed into an onlay-spreader graft for repairing the middle vault framework defect that causes cosmetic and functional impairment.

RESULTS

Of the 30 patients, 16 had a history of nasal trauma and 14 had a history of nasal surgery. The harvested auricular cartilage amount was sufficient in all rhinoplasty procedures and no patients required further costal cartilage harvesting. Pain at the donor site after surgery was minimal and well controlled with oral medication. There were no donor-site complications, and most of the patients were satisfied with the functional and aesthetic improvement.

CONCLUSIONS

Auricular cartilage has a dense elastic fiber matrix that provides excellent support for both dorsal augmentation and functional widening of the internal nasal valve. Using auricular cartilage is a relatively easy option to incorporate into the rhinoplasty procedure which involves middle vault defect that causes functional and cosmetic issues.

KEYWORDS
collapsed middle vault, auricular cartilage, onlay spreader graft

OP-307

Artificial Intelligence (AI)-Assisted Patient Education And Concerns Following Facelift Surgery: A Study On Chatgpt-4 And Gemini

Hisham Almousa[1], **Rafeef Alhajress**[1], **Abdulaziz Alabdulkareem**[1], **Mashal Abaalkhail**[1], **Mohammed Jomah**[1], **Naif Fnais**[1], **Amani Obeid**[1], **Badi Aldosari**[1], **Ahmed Alarfaj**[1]

[1]*Department of Otolaryngology - Head and Neck Surgery, King Saud University, Riyadh, Kingdom of Saudi Arabia.*

BACKGROUND & AIM

Facelift surgery offers aesthetic results that nonsurgical methods cannot achieve. As an elective procedure, facelift surgery requires patients to have a clear understanding of potential postoperative complications and appropriate postoperative care. Nevertheless, timely access to medical care can be challenging in remote areas. Integrating advanced artificial intelligence (AI) tools such as ChatGPT-4 and Gemini into postoperative care may help bridge this gap by offering continuous patient education. This study aimed to evaluate the utility of ChatGPT-4 and Gemini in addressing common patient concerns and education following facelift surgery.

MATERIAL & METHODS

The five most frequently asked postoperative facelift questions were submitted to ChatGPT-4 and Gemini. Responses were assessed by five expert facial plastic surgeons based on four criteria: accuracy, clarity, relevance, and response time.

RESULTS

Both AI models demonstrated strong overall performance. ChatGPT-4 and Gemini each achieved an average accuracy of 88%, closely aligning with current medical guidelines. Clarity ratings were 80% for ChatGPT-4 and 92% for Gemini, indicating generally understandable responses. Relevance scores were high, with ChatGPT-4 at 100% and Gemini at 96%, effectively addressing patient concerns. Both models provided instant responses, earning 100% in response time.

CONCLUSIONS

ChatGPT-4 and Gemini show promise as supportive tools in postoperative facelift care. They delivered responses that were accurate, clear, relevant, and timely. While not a replacement for medical professionals, both AI models can serve as valuable adjuncts to patient education, particularly where access to care is limited. These findings highlight AI's emerging role in enhancing postoperative care in facial plastic surgery.

OP-308

Comparison Of Surgical And Conservative Treatment Outcomes In Orbital Fractures Due To Maxillofacial Trauma

Muhammet Fatih GÖKMEN[1], **Murat DÖGER**[1], **Ayşe BOZKURT OFLAZ**[2], **Merih ÖNAL**[1], **Çağdaş ELSÜRER**[1]

[1]*Selcuk University, Medical School, ENT Department;* [2]*Selcuk University, Medical School, Ophtalmology Department*

BACKGROUND & AIM

Orbital fractures are facial bone fractures resulting from various blows to the face. They are most commonly seen after assaults, traffic accidents, or sports injuries. The orbital floor and medial wall, which are particularly thin bones, are the most frequently fractured parts. Although many patients are treated conservatively without surgery, in cases involving vision loss or diplopia, early surgery provides better functional outcomes.

MATERIAL & METHODS

Following local ethics committee approval, patients who were consulted for orbital fractures and underwent examination and treatment were retrospectively reviewed from the hospital system. Demographic data such as age and gender; causes of fracture, direction of fracture, sensory and motor examinations, direction and type of bone fractures in radiology, surgical/non-surgical treatment methods, incision type if surgery was performed, and intraoperative extraocular muscle injuries were evaluated.

RESULTS

A total of 304 patients were examined and treated in the ENT and ophthalmology departments due to orbital fractures. The most common causes of fractures were traffic accidents, interpersonal violence, and falls. 224 patients(73.7%) were followed up with a conservative approach, while 80 patients(26.3%) underwent surgery. The most common pathologies in patients who underwent surgery were blowout fracture, diplopia, and enophthalmos, respectively. Of the 80 patients, 32(40%) underwent surgery via transconjunctival incision, while 48 underwent surgery via subciliary incision or existing facial incisions. No major complications such as postoperative vision loss occurred, while steroid treatment was initiated in 3(1%) patients due to persistent postoperative diplopia. In long-term follow-up, no patient required re-operation for diplopia.

CONCLUSIONS

The orbit, the bony tissue protecting the globe, can fracture for various reasons. The most important decision for the physician is to thoroughly examine the patient and decide on conservative or surgical treatment, evaluate which method is most suitable, and ensure the successful management of early and long-term complications. Multicenter studies are needed to establish a globally standardized treatment protocol for orbital fractures.

KEYWORDS
orbital fractures, enophthalmos, blow out fractures, transconjunctival incision, diplopia

OP-309

Rhinoplasty Among Saudi Population: Interest And Awareness Of Postoperative Complications

Farah alobone[3], **Ibrahim Alquniabut**[2], **Khalid Alkhalifah**[1], **Turki althonian**[4]

[1]*Security forces hospital, Riyadh, Saudi Arabia.;* [2]*College of medicine, Qassim University, Qassim, Saudi Arabia;* [3]*King Faisal specialist hospital and research center, Riyadh, Saudi Arabia;* [4]*Qassim health cluster*

BACKGROUND & AIM

Rhinoplasty is among the most commonly performed cosmetic surgical procedures globally and accounts for approximately 30% of all cosmetic surgeries in Saudi Arabia. Despite its growing popularity, awareness of associated postoperative complications among the general population remains poorly characterized. Adequate knowledge of potential risks enables patients to recognize warning signs early and make informed decisions. This study aimed to assess the level of interest in rhinoplasty and awareness of its postoperative complications among the adult Saudi population.

MATERIAL & METHODS

A cross-sectional, web-based study was conducted from August 2024 to January 2025. Adults aged 18 years and above residing in Saudi Arabia were eligible for inclusion. A previously validated Arabic-language questionnaire was distributed via social media platforms, yielding 1,209 participants recruited through convenience sampling. The questionnaire covered sociodemographic characteristics, attitudes toward rhinoplasty, and awareness of 15 potential postoperative complications. Awareness was categorized as good (score 8–15) or poor (score 0–7). Internal consistency was confirmed with a Cronbach's alpha of 0.798. Data were analyzed using SPSS version 27, with chi-square tests used to examine associations between sociodemographic variables and awareness levels; $p < 0.05$ was considered statistically significant.

RESULTS

Of 1,209 participants, 646 (53.4%) were male and 464 (38.4%) were aged 18–24 years. The majority, 722 (59.7%), were satisfied with their current nose shape, while 255 (21.1%) expressed interest in rhinoplasty, primarily motivated by self-gratification (132; 51.8%). Overall awareness of postoperative complications was low, with only 268 (22.2%) demonstrating good awareness. The most recognized complication was breathing difficulties (546; 45.2%), while nasal septal perforation was the least recognized (135; 11.2%). Statistically significant associations were found between awareness levels and gender, age, educational level, parenthood status, and household income (all $p < 0.05$).

CONCLUSIONS

Awareness of rhinoplasty postoperative complications among the Saudi adult population is considerably low, with fewer than one in four participants demonstrating adequate knowledge. Female participants, older age groups, those with higher education, and those without children showed relatively better awareness. These findings highlight a critical need for targeted public education campaigns to support informed decision-making among individuals considering rhinoplasty in Saudi Arabia.

OP-310

Functional And Aesthetic Assessment Of Preservation And Structural Rhinoplasty Techniques

Sandra Krzywdzińska[1], **Marcin Jadczak**[1]

[1]*Department of Otolaryngology with Division of Cranio-Maxillo-Facial Surgery, Military Institute of Medicine-National Research Institute, Warsaw, Poland*

BACKGROUND & AIM

The philosophy of Preservation Rhinoplasty (PR) as an alternative to Structural Rhinoplasty (SR) is becoming increasingly popular. Given its growing adoption it is important to evaluate and compare the outcomes of PR and SR to determine their effectiveness, patient satisfaction and impact on quality of life.The study aimed to compare outcomes of rhinoseptoplasty performed using SR versus PR technique

MATERIAL & METHODS

Secondary objectives included evaluating treatment effectiveness using SCHNOS, ROE, VAS, NOSE and WHOQOL-BREF questionnaires, with attention to quality-of-life improvements and the impact of prior septoplasty. The study involved 75 patients (62.7% female, mean age 34.2) undergoing rhinoseptoplasty with SR performed in 39 cases. Standardised questionnaires were administered preoperatively and at one and three months postoperatively. All procedures were conducted by a single surgeon. Results were statistically analysed.

RESULTS

There were no significant differences between PR and SR in baseline ROE scores (1.17 vs 1.17; $p > 0.05$) or at one month post-op (3.58 vs 3.33; $p > 0.05$) but PR showed significantly higher ROE scores at three months (3.83 vs 3.67; $p < 0.05$). In the SCHNOS-Obstruction domain, baseline scores did not differ significantly (3.00 vs 3.25; $p > 0.05$), but PR patients reported significantly better outcomes at one month (0.75 vs 1.25; $p < 0.01$); scores at three months were equal (0.50 vs 0.50; $p > 0.05$). In the SCHNOS-Cosmesis domain, no significant differences were observed at any time point. NOSE scores were also comparable between PR and SR groups at baseline (3.40 vs 3.20; $p > 0.05$) and one month post-op (1.60 vs 1.40; $p > 0.05$) WHOQOL-BREF domains (physical, psychological, social and environmental) improved significantly postoperatively in both PR and SR groups ($p < 0.001$).

CONCLUSIONS

Conclusions: Patients reported higher initial satisfaction after PR compared to the SR. Satisfaction significantly increased over time in both groups. Postoperative quality of life and self-esteem improved markedly, with no significant differences between PR and SR techniques. Patients with a history of septoplasty showed lower initial satisfaction, but outcomes improved over time similarly to those without prior surgery. Overall, rhinoseptoplasty led to enhanced quality of life and self-esteem, regardless of surgical method or previous procedures.

Predictors Of Complications And Recurrence After Otoplasty: A Retrospective Analysis Of Surgical And Patient-Related Factors In Saudi Arabia

Abdullah S. AlDughaither[1], **Mohammed Naif AlSubhi**[1], **Naif Fnais**[2], **Abdullah E Kattan**[3]

[1]*College of Medicine, King Saud University, Riyadh, Saudi Arabia;* [2]*Department of Otolaryngology, King Saud University, Riyadh, Saudi Arabia;* [3]*Department of Hand and Plastic Surgery, Kind Saud University, Riyadh, Saudi Arabia.*

BACKGROUND & AIM

Otoplasty corrects congenital or acquired ear deformities, improving both appearance and psychological well-being. Techniques like Mustardé and Furnas are tailored to age and cartilage structure. Despite its safety, complications can occur. While widely studied globally, factors influencing otoplasty outcomes remain underexplored in Saudi Arabia, warranting region-specific investigation to optimize care.

MATERIAL & METHODS

This retrospective observational study included 113 Saudi patients who underwent otoplasty by ENT or plastic surgeons. Data were collected from medical records, including demographics, surgical details, and postoperative outcomes. Most procedures used the Mustardé-Furnas technique under general anesthesia with Mersaline sutures. Complications, recurrence, and revision rates were analyzed. Statistical analysis was conducted using JASP software, applying chi-squared tests to identify associations between patient factors and outcomes. Ethical approval was obtained, and all data were anonymized in accordance with institutional and ethical guidelines.

RESULTS

Complication and recurrence rates after otoplasty were low, with early hematoma (1.8%), suture extrusion (3.5%), protrusion (4.4%), recurrence (5.3%), and revision surgery (8.8%). Significant associations were found between early and late complications, revision needs, smoking, and higher weight or shorter stature. However, surgical specialty, center, and gender showed no significant impact on outcomes. Despite uniform techniques, patient-specific factors, especially smoking and body habitus, were key predictors of complications, highlighting the need for personalized risk assessment in otoplasty candidates.

CONCLUSIONS

Otoplasty using standardized techniques demonstrated low complication and recurrence rates, confirming its safety and effectiveness. However, patient-related factors—particularly smoking and higher body weight—significantly impacted outcomes. These findings emphasize the importance of preoperative risk assessment and lifestyle modification to optimize results and reduce the likelihood of complications or revision surgery.

Creating Beauty: Art, Algorithm, Or Agenda?

Dunja Milicic[3], **Anil Joshi**[1], **Alwyn D´Souza**[1,2]

[1]*University Hospital Lewisham, London, United Kingdom;* [2]*Canterbury Christ Church University, Canterbury, United Kingdom;* [3]*Hospital da Arrábida, Vila Nova de Gaia Portugal*

BACKGROUND & AIM

Facial aesthetics relied on classical ideals of proportion and harmony. New technologies and shifting sociocultural norms are challenging these concepts of beauty.

MATERIAL & METHODS

A philosophical and anthropometric non-randomized PRISMA 2020 review was performed and for bias by Newcastle-Ottawa assessment, examining how beauty is defined and applied in aesthetic practice. Tension between objective aesthetic principles and subjective perceptions, as well as considering anthropological diversity and the impact of social media and artificial intelligence was analyzed.

RESULTS

Classical frameworks remain useful but limited in universal application. Emerging trends, especially virtual aesthetics and social media, encourage standardized outcomes, risking loss of individuality and distorted self-perception.

CONCLUSIONS

Beauty blends objective structure with subjective and cultural interpretation. Ethical, individualized aesthetic judgment should guide practice, rather than rigid technological or social media-driven standards

KEYWORDS

beauty, aesthetics, face, controversy.

OP-313

Investigation Of The Effects Of Hyperbaric Oxygen And Systemic Ozone Therapy On Wound Healing In A Cartilage-Deficient Auricular Wound Model Created In Rats

Mustafa Oğulcan Karakız[1], **Şeyda Belli**[2]

[1]*HEALTH SCIENCE UNIVERCITY HASEKİ EDUCATION AND RESEARCH HOSPITAL;* [2]*HEALTH SCIENCE UNIVERCITY BAĞCILAR EDUCATION AND RESEARCH HOSPITAL*

BACKGROUND & AIM

This study aimed to explore the effects of hyperbaric oxygen (HBO) therapy and ozone therapy on wound healing, particularly focusing on their potential benefits for auricular injuries involving cartilage loss in rats. Both therapies have been shown in previous research to positively impact healing in various conditions.

MATERIAL & METHODS

We used 27 male Wistar albino rats, dividing them three groups: control, ozone, and HBO. After anesthesia, we created a 2 mm diameter full-thickness circular perforation, including both the epithelium and cartilage, on the antitragus of the ear. In the ozone group, we delivered systemic ozone gas at a concentration of 2.3–3.0 mL (60 µg/mL) on the 1st, 3rd, and 7th days. The control group received no local or systemic treatment. HBO group were placed in a hyperbaric pressure chamber without anesthesia. HBO therapy session was conducted using 100% oxygen at a pressure of 2.4 ATA for 2 hours. Rats received a total of seven HBO sessions, with each session lasting 2 hours. On the 15th day, all rats were sacrificed, and their auricles were removed for histopathological analysis. We assessed inflammation severity, neovascularization , fibroblast proliferation, collagen deposition, and epithelialization levels.

RESULTS

We evaluated several histological parameters in both experimental groups, such as the rate of macroscopic perforation closure, inflammation severity, granulation tissue density, fibroblast proliferation, collagen accumulation, cartilage regeneration, neovascularization, epithelialization at the perforation edges, and eosinophil density. Our comparisons revealed that HBO therapy was significantly more effective than ozone therapy in promoting macroscopic perforation closure ($p=0.001$; $p<0.05$) and epithelialization ($p=0.02$; $p<0.05$). Interestingly, ozone therapy also outperformed the control group. In terms of inflammation severity ($p=0.001$; $p<0.05$), the control group showed the highest levels, followed by HBO and then ozone. Notably, the ozone group exhibited the most significant improvements in fibroblast proliferation ($p=0.001$; $p<0.05$), collagen deposition ($p=0.005$; $p<0.05$), and cartilage regeneration ($p=0.002$; $p<0.05$), with the HBO group also performing better than the control. These findings were statistically significant. However, we did not observe any significant differences among the groups regarding eosinophil levels, granulation tissue quantity, or vascularization.

CONCLUSIONS

Our findings suggest that both hyperbaric oxygen and ozone therapies offer valuable benefits for healing auricular injuries involving cartilage and skin loss, both at macroscopic and microscopic levels. These therapies may serve as effective alternative treatment options that positively influence the healing process of wounds managed by secondary intention, due to their ease of application and low risk of side effects or complications.

OP-314

Short-Term Effects Of Drain Use On Postoperative Periorbital Edema And Ecchymosis In Septorhinoplasty

Fırat Onur[1], **Ethem İlhan**[1], **Fatih Tetik**[1], **Ömer Necati Develioğlu**[1]

[1]*University of Health Sciences, Department of Otorhinolaryngology and Head and Neck Surgery, Gaziosmanpaşa Training and Research Hospital, Istanbul, Turkey*

BACKGROUND & AIM

Postoperative periorbital edema and ecchymosis are among the most common concerns following septorhinoplasty and can negatively affect patient comfort and early recovery. Despite their use in septorhinoplasty, the clinical benefit of surgical drains remains controversial, with inconsistent findings in the literature. This study aimed to evaluate the effect of drain use on postoperative periorbital edema, periorbital ecchymosis, and ecchymosis color intensity. We hypothesized that drain use would reduce these outcomes, particularly in the early postoperative period.

MATERIAL & METHODS

This prospective randomized paired comparative study was conducted at a tertiary care center and included patients undergoing open technique structural septorhinoplasty between September 2021 and January 2026. Drain placement was unilateral and randomly assigned to one side only, with the contralateral side serving as an internal control for each patient. A drain prepared from an intravenous cannula was placed on the designated side at the end of the operation and removed on postoperative day 2. Pain during drain removal was assessed using a visual analog scale (VAS). Periorbital edema, periorbital ecchymosis, and ecchymosis color intensity were assessed at 24 hours, 48 hours, and day 7 using standardized ordinal scoring systems by two independent blinded observers, and mean scores were used for analysis. Interobserver reliability was assessed using the intraclass correlation coefficient. Paired comparisons were conducted using the Wilcoxon signed-rank test, with statistical significance set at $p<0.05$.

RESULTS

A total of 87 patients were included in the study. The mean age was 24.24±4.88 years, and 75 (86.2%) were female while 12 (13.8%) were male. The drain was placed on the right side in 40 (46%) patients and on the left side in 47 (54%) patients. Pain during drain removal was minimal (median VAS: 0, range: 0–4). Periorbital edema and periorbital ecchymosis scores were

significantly lower on the drained side at both 24 and 48 hours (p≤0.001). By postoperative day 7, these differences were no longer statistically significant (p>0.05). Ecchymosis color intensity did not differ significantly between the two sides at any time point (p>0.05). Interobserver agreement was high across all measurements. These findings were consistent with linear mixed model analysis. No drain-related complications were observed.

CONCLUSIONS

Drain use reduces postoperative periorbital edema and ecchymosis in the early postoperative period; however, this effect is transient and no longer evident by postoperative day 7. No significant impact was observed on ecchymosis color intensity. These findings suggest that drains offer short-term benefits without affecting longer-term outcomes.

OP-315

Efficacy Of Aspirin Usage In Free Flap Reconstruction Of The Head And Neck

Robert E. Africa[1], **Shahrukh Ali**[1], **Orly M. Coblens**[1], **Brian J. McKinnon**[1], **Yusif Hajiyev**[1], **Felix Maldonado-Chapa**[1], **Viran J. Ranasinghe**[1]

[1]*The University of Texas Medical Branch, Department of Otolaryngology-Head and Neck Surgery*

BACKGROUND & AIM

A common reason for flap failure in the head and neck is related to complications at the anastomotic site from thrombosis. Aspirin is commonly used for its antiplatelet effects, but there are no standardized guidelines, and it has not been shown to improve flap survival or reduce thrombosis. Given the discrepancy, this study evaluated the efficacy of aspirin usage following head and neck free flap reconstruction.

MATERIAL & METHODS

This is a multicenter, retrospective cohort study from 107 healthcare organizations in the United States in the TriNetX Database. Adult patients (≥18 years) with a history of head and neck cancer who received non-bony or bony free flap reconstruction were included. They were grouped by receiving 81 mg of aspirin (ASA81), 325 mg of aspirin (ASA325), or no aspirin on the same day of surgery or postoperatively. Primary outcomes included free flap failure, blood vessel repair, and need for flap revision. Rate of hematoma was also evaluated. Relative risks (RR) with 95% confidence intervals (95% CI) were evaluated. Subgroup analysis was conducted between ASA81 and ASA325.

RESULTS

No differences in primary outcomes were observed from same-day administration of aspirin. Postoperatively, ASA81 reduced the risk of a blood vessel repair procedure (RR: 0.52[0.42-0.65]), while ASA325 was associated with a decreased risk of flap failure and the need for flap revision procedures (RR: 0.10[0.08-0.13]; 0.37[0.32-0.41]) for all flap types. For non-bony reconstruction, blood vessel repair and flap revision was lower in the ASA81 group (RR: 0.53[0.41-0.68]; 0.82[0.69-0.98]). ASA325 for non-bony flaps was associated with lower rates of all three primary outcomes (RR: 0.55[0.41-0.73]; 0.66[0.54-0.82]; 0.80[0.68-0.94]). Aspirin use in bony flaps was associated with similar outcomes. ASA81 compared to ASA325 for non-bony reconstruction was associated with higher flap failure (RR: 1.69[1.16-2.46]). The ASA325 group had a significantly higher rate of hematoma compared to the non-ASA group (RR: 2.07[1.12-3.82]).

CONCLUSIONS

For non-bony and bony free flap reconstruction, aspirin was associated with decreased risks of free flap failure, blood vessel repair, and flap revision. However, ASA325 may have an increased risk of hematoma despite, so the risks of administration must be weighed against the potential benefits.

OP-316

Objective Facial Symmetry Outcomes After Selective Neurectomy: A Prospective Pilot Study Using Emotrics Automated Software

Ayeh Aldulaymi[1], **Abdullah Qureshi**[1], **Dr. Rick Jaggi**[1]

[1]*University of Saskatchewan*

BACKGROUND & AIM

Selective neurectomy aims to reduce synkinesis and improve facial symmetry, but its quantifiable effects remain unclear. This prospective study examines whether automated Emotrics measurements can detect significant pre- to post-operative improvements in resting and dynamic facial expressions.

MATERIAL & METHODS

Single-center, prospective pilot study conducted in 2025. We examined adults with non-flaccid facial paralysis. The intervention consisted of obtaining standardized pre- and post-operative facial videos following selective neurectomy.

Objective measurements were quantified using Emotrics software across nine facial metrics. Outcome measures include absolute and percent deviation across three facial expressions (smile, show teeth, and rest). Independent variables include expression type and facial symmetry metrics. Descriptive statistics allowed for within-subject and inter-subject comparisons.

RESULTS

Three patients were included in the study. Facial symmetry improvement was defined as a reduction in deviation from midline. 27 facial metrics were captured for each patient. Within-subject comparisons demonstrated 35.6%, 57.8% and 57.8% of measured facial symmetry metrics improving for patients 1,2, and 3, respectively. Across all patients, expressions, and metrics, 50.4% of measurements showed inter-subject improvements. Furthermore, improvements were most prominent during dynamic expressions as compared to rest.

CONCLUSIONS

Selective neurectomy produced measurable improvements in objective facial symmetry for all patients in some aspects. Over half of all inter-subject measurements improved post-operatively, suggesting selective neurectomy can positively influence facial symmetry. Given the limited sample size, larger studies are required to reliably quantify the magnitude of benefit.

OP-317

Do Changes In Tip Rotation Observed In Postoperative Rhinoplasty Photographs Reflect Reality? Head Position–Related Bias

Ulaş Metin[1], **Cüneyt Orhan Kara**[2]

[1]*Istanbul Nisantasi University*; [2]*Pamukkale University*

BACKGROUND & AIM

Rhinoplasty outcomes are commonly evaluated using preoperative and postoperative photographs. However, the accuracy of such assessments depends on proper head positioning during image acquisition. This study aims to investigate whether patients alter their head position during postoperative photography, thereby exaggerating the appearance of tip rotation. We hypothesize that part of the observed increase in tip rotation in postoperative images is attributable to head positioning rather than true anatomical change.

MATERIAL & METHODS

In this retrospective study, preoperative and postoperative lateral facial photographs of 100 rhinoplasty patients were analyzed using a custom-developed web-based application. Images were randomly selected from social media in January 2025. In this system, the operator manually selected predefined anatomical reference points, and the Frankfurt Horizontal Plane (FHP) was automatically calculated by an artificial intelligence–assisted algorithm. The angle between the observed FHP in the photograph and the ideal FHP was measured. Preoperative and postoperative measurements were compared for each patient. Statistical analysis was performed using a paired sample t-test.

RESULTS

The mean FHP angle increased from 7.16° preoperatively to 8.77° postoperatively, demonstrating a statistically significant difference (Δ = +1.61°, SD: 4.08; $p < 0.001$). Although not present in all patients, a large proportion of postoperative photographs (78%) showed head positioning that exaggerated the appearance of increased tip rotation.

CONCLUSIONS

The apparent increase in tip rotation observed in postoperative rhinoplasty photographs does not always reflect true anatomical change. Elevation of the head during image acquisition may lead to overestimation of tip rotation. This bias may originate from either the photographer's preference or patient behavior. These findings indicate that postoperative photographic assessment may be subject to systematic bias. Therefore, strict standardization of head positioning relative to the Frankfurt Horizontal Plane is essential for reliable evaluation of rhinoplasty outcomes.

A Case Report On The Revolving Door Flap For Reconstruction After Wide Excision Of Basal Cell Carcinoma Of The Left External Auditory Canal And Concha Cavum

Xianthe Dianna F. Gomez, MD[1], **Genilou Liv Jimena Baligod, MD**[1], **Erasmo Gonzalo Llanes, MD**[1], **Daniel I. Tan, MD**[1], **Clarisse Veronica L. Mirhan, MD**[1]

[1]*University of the Philippines- Philippine General Hospital*; [2]*University of the Philippines- Philippine General Hospital*

BACKGROUND & AIM

To present a case report of a patient who developed basal cell carcinoma of the left concha cavum and underwent revolving door flap for reconstruction after excision of the defect

MATERIAL & METHODS

Study design: Case report Setting: Tertiary Government Hospital Subjects, Participants, Patients, or Population: One patient

RESULTS

This is a case of a 47-year-old male ambulance driver who is known to be HIV positive and is a former smoker, who was diagnosed through biopsy with basal cell carcinoma of the concha cavum and outer part of the external auditory canal. Given the large area needing to be excised, two techniques were used for reconstruction: a split-thickness skin graft for the anterior side of the defect, and a revolving door flap for the posterior side of the defect. Postoperative course showed good outcomes for both reconstruction techniques.

CONCLUSIONS

Basal cell carcinoma is rarely seen in the concha cavum and external ear canal, hence not many reconstruction options have been reported for cases like this. This case report highlights the utility of the revolving door flap as a good option for reconstructing a defect from a cancerous lesion in a relatively uncommon region of the body such as the ear canal, with good outcomes as shown in this case.

Electrical Motor Stimulation In Patients With Acute Bell's Palsy: A Systematic Review And Meta-Analysis Of Randomized Controlled Trials

Fabian Peralta[1,2], **Myriam Loyo**[3], **Roman Pati**[4], **José Manuel Morales-Puebla**[5,6,7], **Luis Lassaletta**[5,6,7], **Orlando Guntinas-Lichius**[2], **Gerd Fabian Volk**[2]

[1]*Universidad Peruana Unión;* [2]*Department of Otorhinolaryngology, Facial-Nerve-Center, Center for Rare Diseases, Jena University Hospital, Jena, Germany;* [3]*Facial Nerve Center, Department of Otolaryngology–Head and Neck Surgery, Oregon Health & Science University, Oregon, USA;* [4]*Washington University in St. Louis, St. Louis, Missouri, USA;* [5]*Department of Otorhinolaryngology, La Paz University Hospital, Madrid, Spain;* [6]*Instituto de Investigación IdiPAZ, Hospital Universitario La Paz, Madrid, Spain;* [7]*Centro de Investigación Biomédica en Red para Enfermedades Raras CIBERER, Instituto de Salud Carlos III, Madrid, Spain*

BACKGROUND & AIM

Bell's palsy is the most common cause of unilateral facial palsy. Electrical motor stimulation (ES) of the facial nerve and muscles is a promising adjunctive therapy; however, its clinical efficacy and safety remain unclear in contrast to the well-evidence-based early intervention with corticosteroids. This study aimed to evaluate the effectiveness and safety of ES in patients with acute Bell's palsy.

MATERIAL & METHODS

A systematic search of MEDLINE, Cochrane Library, and Scopus databases was conducted from their inception to November 2025. Studies assessing ES in Bell's palsy were included. Mean differences (MDs) and risk ratios (RRs) with 95% confidence intervals (CIs) of parameters of interest were pooled using R software (version 4.5.2). Risk of bias was assessed using RoB 2 and the certainty of the results with GRADE assessment.

RESULTS

Five studies involving 399 patients were included, of whom 252 (63.16 %) received ES. Outcomes assessed included facial function recovery (Sunnybrook and House-Brackmann scales) incomplete recovery (RR: 0.91; 95% CI: 0.65 to 1.28; $p = 0.6$; $I^2 = 80.9\%$) as binary outcome, and partial recovery (MD: 14.34; 95% CI: 6.01 to 22.68; $p < 0.01$; $I^2 = 53.9\%$) as continuous outcomes. In addition to this, compound muscle action potential (CMAP) (MD: 0.19; 95% CI: -0.19 to 0.57; $p = 0.33$; $I^2 = 0.0\%$), and nerve conduction evaluation (distal latency) (MD: 0.37; 95% CI: 0.01 to 0.73; $p = 0.04$; $I^2 = 0.0\%$) were assessed. Overall, ES demonstrated a trend toward improved facial movement recovery, with statistically significant benefits in partial recovery and distal latency assessments.

CONCLUSIONS

ES may be associated with improved facial recovery in patients with Bell's palsy; however, heterogeneity of the existing literature limits conclusions regarding safety. This review also proposes recommendations to guide future studies of ES for patients with Bell's palsy.

KEYWORDS

Bell's palsy, electrical stimulation, ES, electrical motor stimulation, transcutaneous, recovery

Musculoskeletal Problems In Otolaryngologists Performing Rhinoplasty Surgery

ALİ DELİDERE[1], **SERVET ERDEMES**[1]

[1]*Harran University*

BACKGROUND & AIM

Surgeons who perform rhinoplasty are subjected to significant ergonomic strain due to prolonged static posture, fine motor tasks, and visual focus demands. While musculoskeletal (MSK) complaints are well-documented in surgical practice, the anatomical distribution, severity, and functional implications specific to rhinoplasty surgeons have not been adequately explored.

MATERIAL & METHODS

A cross-sectional, descriptive study was conducted using a structured, self-administered online questionnaire disseminated to a professional WhatsApp group comprising approximately 1000 Turkish otolaryngologists. The survey assessed demographic variables, surgical practices, pain characteristics, and functional limitations using Visual Analog Scale (VAS) scores and a 15-item musculoskeletal disability index.

RESULTS

Among 141 respondents, 93.6% reported MSK pain in at least one body region, with neck–upper back (48.9%) and wrist (24.8%) being the most commonly affected areas. Significant associations were found between pain intensity and BMI, surgical experience, weekly operation volume, and exercise habits ($p < 0.01$). Functional disability was also significantly correlated with similar variables. Despite the high prevalence of pain, preventive ergonomic strategies and long-term rehabilitative interventions were underutilized. Pharmacological treatments were the most commonly used therapeutic approach (55%).

CONCLUSIONS

Rhinoplasty surgeons constitute a high-risk group for both axial and upper extremity MSK complaints, which substantially impair occupational functionality. The findings highlight the need for structured ergonomic training, exercise programs, and systemic interventions aimed at reducing ergonomic strain in surgical practice.

Absorbable Versus Nonabsorbable Sutures For Facial Skin Closure: A Systematic Review And Meta-Analysis Of Complications Incidence, Satisfaction And Cosmetic Outcomes

Rakan Abu alqam[1], **Lama A. Alkhwildi**[2], **Sarah Osama Alobaidy**[2], **Mawadah Fouzy Kattan**[1], **Maha Ahmed Alzahrani**[1], **Yara khalid Alwathnani**[2], **Abdulmohsen Jameel Alshammari**[3], **Shahad N. Alanazi**[1], **Lamair Abu alqam**[1], **Mawaddah Alrajraji**[1], **Hamza A. Fadel**[4], **Adil N Althobaity**[5]

[1]*King Abdulaziz University, Jeddah, Saudi Arabia;* [2]*Imam Mohammad Ibn Saud Islamic University, Riyadh, Saudi Arabia.;* [3]*King Saud bin Abdulaziz University for Health Sciences, Riyadh, Saudi Arabia;* [4]*King Faisal specialist hospital & research Centre, Jeddah, Saudi Arabia;* [5]*King Abdulaziz Medical City, Jeddah, Saudi Arabia*

BACKGROUND & AIM

Facial wound closure significantly influences both healing and aesthetic outcomes. With increasing emphasis on cosmetic results and patient comfort, the choice between absorbable and nonabsorbable sutures remains a key clinical question. This systematic review and meta-analysis aimed to compare the clinical, cosmetic, and patient-reported outcomes of absorbable versus nonabsorbable sutures for facial skin closure and to evaluate the existing body of evidence.

MATERIAL & METHODS

Following PRISMA guidelines and registering with PROSPERO, we systematically searched MEDLINE, EMBASE, Cochrane Library, and Google Scholar through February 2025. We included randomized controlled trials (RCTs), Case-Control and Cohort studies involving adults and children undergoing facial skin closure with either absorbable or nonabsorbable sutures. Primary outcomes included complication rates, cosmetic appearance (VAS), and patient and physician satisfaction. Data extraction was performed independently by multiple reviewers. Risk of bias was assessed using the Cochrane RoB-2 tool for randomized clinical trials and the MINORS criteria for non-randomized studies. Meta-analyses were conducted using random-effects models. Odds ratios (OR) were used for binary outcomes and standardized mean differences (SMD) for continuous data. Missing variance data were handled using validated estimation methods.

RESULTS

Twelve studies (1,205 patients) were included. No statistically significant differences were found between groups in infection ($OR = 1.62$, $p = 0.28$), dehiscence, erythema, bleeding, or scarring. Cosmetic VAS scores showed no difference from patient ($SMD = 0.10$, $p = 0.75$) or physician perspectives ($SMD = -0.25$, $p = 0.38$). Satisfaction slightly favored absorbable sutures ($SMD = -0.64$, $p = 0.075$), but was not significant.

CONCLUSIONS

Absorbable sutures offer comparable safety and aesthetics to nonabsorbable sutures and may improve patient comfort by eliminating the need for removal.

Absorbable sutures, Nonabsorbable sutures, Facial Skin Closure, Meta-analysis, Complications, Satisfaction, Cosmetic Outcomes.

OP-322

Depressor Anguli Oris Myectomy In Patients With Facial Synkinesis: A Systematic Review And Meta-Analysis

Fabian Peralta[1], **Felipe Porto-Gutierrez**[2,3], **Emma Ann Finnegan**[4], **Christina M. Yver**[5]

[1]Department of Otorhinolaryngology, Facial-Nerve-Center, Center for Rare Diseases, Jena University Hospital, Jena, Germany; [2]Department of Otolaryngology–Head and Neck Surgery, Harvard Medical School, Boston, MA; [3]Division of Otolaryngology, Department of Surgery, Beth Israel Deaconess Medical Center, Boston, MA; [4]School of Medicine, Trinity College Dublin, Dublin, Ireland; [5]Department of Otolaryngology–Head and Neck Surgery, University of Pittsburgh Medical Center, Pittsburgh, PA

BACKGROUND & AIM

Background: Smile asymmetry is one of the most distressing manifestations of facial synkinesis after incomplete recovery from facial paralysis. Aberrant facial nerve regeneration may result in involuntary co-contraction, muscle hypertonicity, hypomobility, and regional weakness. Hyperactivity of the depressor anguli oris (DAO), a key smile antagonist, can tether the oral commissure, reduce dental show and smile excursion, and negatively affect smile symmetry and emotional expression. This systematic review and meta-analysis evaluated the effectiveness and safety of DAO myectomy, defined as surgical excision or resection of a portion of the DAO muscle, in patients with facial synkinesis.

MATERIAL & METHODS

Methods: A systematic search of Scopus, MEDLINE, and the Cochrane Library was performed in February 2026 to identify studies evaluating DAO myectomy in patients with facial synkinesis. Mean differences (MDs) with 95% confidence intervals (CIs) were pooled using R software (version 4.5.2) for directly comparable outcomes. Risk of bias was assessed using ROBINS-I, and certainty of evidence was evaluated using the GRADE framework.

RESULTS

Results: Nine observational studies were included in the qualitative synthesis, of which four studies were included in the quantitative synthesis. DAO myectomy was associated with improvements in key objective smile metrics, including dental show, open-mouth smile angle, oral commissure excursion, and symmetry-related indices. Studies reporting clinician-graded and patient-reported outcomes also demonstrated improvement in facial function (eFACE) and facial paralysis–related quality of life (FaCE scale). Additional qualitative outcomes suggested improved emotional expression, with patients conveying greater perceived happiness and fewer negative emotions after surgery. Available long-term follow-up suggested that these improvements may persist beyond 12 months. Complications were infrequent and generally minor, most commonly including small hematoma, localized infection, or residual DAO fibers requiring revision.

CONCLUSIONS

Conclusions: DAO myectomy appears to be a promising surgical option for carefully selected patients with facial synkinesis. Current evidence suggests improvement in dynamic smile symmetry, facial function, and patient-perceived outcomes with a low rate of complications. However, the certainty of evidence remains limited by heterogeneous outcome reporting. This review also provides recommendations for future studies to improve methodological consistency, reduce heterogeneity, and strengthen the evidence base for DAO myectomy in patients with facial synkinesis.

Evaluation Of Patient Satisfaction Following Facial Autologous Fat Injection Using FACE-Q

Gözde Pamuk[1]

[1]Department of Otolaryngology, Faculty of Medicine, Ankara Medipol University, Ankara, Turkey

BACKGROUND & AIM

To evaluate patient satisfaction following facial autologous fat injection using the validated Turkish version of the FACE-Q questionnaire.

MATERIAL & METHODS

A retrospective study was conducted on 290 patients who underwent facial autologous fat injection, with or without additional procedures, between 2021 and 2025. A structured questionnaire was distributed via an online platform (Google Forms), and 64 patients responded. Patient-reported outcomes were assessed using the validated Turkish version of the FACE-Q Facial

Rejuvenation module. Demographic variables, procedural details, and time since surgery were analyzed. Satisfaction scores were expressed as percentages.

RESULTS

A total of 64 patients were included in the analysis. The mean age was 41.05 ± 9.93 years, and the mean BMI was 24.66 ± 3.34. The mean FACE-Q satisfaction score was 75.28 ± 27.17, indicating overall high patient satisfaction .Satisfaction scores were not normally distributed ($p < 0.05$). Higher satisfaction scores were observed in patients with higher BMI (89.81 vs. 65.34, $p < 0.001$) and in older patients (92.06 vs. 56.27, $p < 0.001$).

CONCLUSIONS

Facial autologous fat injection is associated with high patient satisfaction as measured by the FACE-Q questionnaire. Patient satisfaction appears to be influenced by age and BMI. The use of validated patient-reported outcome measures such as FACE-Q provides valuable insight into treatment success and patient perception.

Does Fibrin Glue Improve Outcomes In Rhinoplasty? A Systematic Review And Meta-Analysis

Fatima Al mousawi[1]

[1]*Faculty of medicine, Department of Surgery, Kuwait University*

BACKGROUND & AIM

Fibrin sealant is increasingly used in rhinoplasty to mitigate postoperative soft tissue sequelae. This systematic review and meta-analysis evaluates its efficacy in reducing postoperative edema, ecchymosis, and pain.Fibrin sealant is increasingly used in rhinoplasty to mitigate postoperative soft tissue sequelae. This systematic review and meta-analysis evaluates its efficacy in reducing postoperative edema, ecchymosis, and pain.

MATERIAL & METHODS

A comprehensive search of PubMed, Scopus, Web of Science, and Cochrane Central Register of Controlled Trials was conducted through May 2025. Randomized controlled trials (RCTs) and cohort studies comparing fibrin sealant to standard care in rhinoplasty were included. The Cochrane Risk of Bias 2.0 tool was used to assess study quality. Pooled effect sizes were calculated using standardized mean differences (SMDs) in RevMan.A comprehensive search of PubMed, Scopus, Web of Science, and Cochrane Central Register of Controlled Trials was conducted through May 2025. Randomized controlled trials (RCTs) and cohort studies comparing fibrin sealant to standard care in rhinoplasty were included. The Cochrane Risk of Bias 2.0 tool was used to assess study quality. Pooled effect sizes were calculated using standardized mean differences (SMDs) in RevMan.

RESULTS

Six studies (five randomized controlled trials and one cohort study) involving 428 patients were included in this meta-analysis. Two studies were rated as high risk of bias. Fibrin sealant demonstrated a statistically significant reduction in postoperative edema on day 1 (SMD = -0.84, 95% CI: -1.44 to -0.24, $p < 0.05$) and ecchymosis (SMD = -1.17, 95% CI: -1.78 to -0.56, $p < 0.05$) compared to controls. However, by postoperative day 7, no significant differences were observed in edema (SMD = -0.30, 95% CI: -0.78 to 0.17, $p > 0.05$) or ecchymosis (SMD = -0.16, 95% CI: -1.28 to 0.96, $p > 0.05$). Additionally, the use of fibrin sealant did not significantly reduce pain on postoperative day 1 (SMD = -0.27, 95% CI: -0.77 to 0.23, $p > 0.05$). These findings suggest a short-term benefit of fibrin sealant in reducing early postoperative swelling and bruising after rhinoplasty.

CONCLUSIONS

Fibrin sealant provides significant early reduction in periorbital edema and ecchymosis following rhinoplasty, particularly within the first 72 hours postoperatively. However, its benefits do not extend beyond the first postoperative week, and its effect on pain is minimal. These findings support its selective use for enhancing immediate postoperative recovery.Fibrin sealant provides significant early reduction in periorbital edema and ecchymosis following rhinoplasty, particularly within the first 72 hours postoperatively. However, its benefits do not extend beyond the first postoperative week, and its effect on pain is minimal. These findings support its selective use for enhancing immediate postoperative recovery.

Analysis Of Postoperative Surgical Site Infections In Septorhinoplasty Patients

Betül ÖZKAN[1], **Furkan Bünyemin BUDAK**[1], **Mustafa TAŞTAN**[1], **Salih AYDIN**[1]

[1]*Department of Otorhinolaryngology, Istinye University, Istanbul, Türkiye*

BACKGROUND & AIM

Septorhinoplasty has become increasingly popular worldwide. Late postoperative infections represent a very rare complication (0.2–3%). Early identification of the causative microorganism and appropriate patient management are essential to prevent potentially catastrophic outcomes. In this context, the selection of empirical antibiotic therapy plays a critical role in the management of infections. The aim of this study is to present the anatomical distribution, causative pathogens, our treatment algorithm, and patient management strategies in late-onset infections following rhinoplasty.

MATERIAL & METHODS

This study retrospectively evaluated patients who developed postoperative infection following septorhinoplasty in one center. Clinical findings, timing of infection onset, culture and antibiogram results, applied antibiotic regimens, duration of hospitalization, and need for revision surgery were recorded. Culture samples were obtained from infected area. Microorganisms were identified, and antibiotic susceptibility patterns were analyzed. Empirical treatments were compared with culture-guided therapies in terms of clinical outcomes. The primary outcome was identification of the most common pathogen, while secondary outcomes included treatment response, complication rates, and hospitalization duration.

RESULTS

From the first documented case to date, a total of 1.100 primary and revision rhinoplasty procedures were performed. Postoperative surgical site infection following septorhinoplasty was identified in 10 patients (0.9%) (8 females and 2 males), with a mean age of 31 years. Of these, 7 cases occurred after primary rhinoplasty and 3 after revision rhinoplasty. Culture samples were obtained from 8 patients; microbial growth was detected in 7 cases, including pseudomonas species in 5 patients, methicillin-resistant Staphylococcus in 1 patient, and methicillin-sensitive staphylococcus in 1 patient, while no growth was observed in 1 case. The earliest onset of infection occurred on postoperative day 10, and the latest on day 400, with a mean onset of 77 days. Eight patients required hospitalization and received intravenous antibiotic therapy, while 2 were managed with oral antibiotics. Revision rhinoplasty was required in 3 patients.

CONCLUSIONS

Although the most commonly reported microorganisms in the literature are staphylococcus species and coliform bacteria, resistant pseudomonas species predominated in our study. While awaiting culture results, careful consideration should be given to the selection of empirical broad-spectrum antibiotics covering both pseudomonas and staphylococcus species.

OP-326

L-Shaped Lateral Crural Graft Technique For Alar Concavity, Collapse, And Nasal Valve Insufficiency

Alper Yenigün[1], **Remzi Doğan**[1], **Muhammed Furkan Özgan**[1], **Orhan Özturan**[1]

[1]*Bezmialem Vakif University, Faculty of Medicine, Department of Otorhinolaryngology, Fatih, Istanbul, Turkey*

BACKGROUND & AIM

To describe an L-shaped lateral crural graft technique designed to address alar concavity, alar collapse, and nasal valve insufficiency in patients who previously underwent rhinoplasty, and to evaluate its functional and aesthetic outcomes.

MATERIAL & METHODS

This single-center, prospective consecutive case series (Level of Evidence: IV) included 12 patients (7 males, 5 females; 18–55 years) with a history of prior rhinoplasty, clinical signs of nasal valve insufficiency, and photographic evidence of alar collapse/concavity and lateral wall retraction. All patients underwent open rhinoplasty. An autologous costal cartilage plate was sculpted into an L shape. The long limb was placed parallel to and along the lateral crus to restore its rigidity and contour, whereas the short limb was oriented at approximately 90° toward the internal nasal valve region to provide an abutment effect. Grafts were fixed with 5-0 PDS sutures bilaterally in all cases.

RESULTS

At a mean follow-up of 9.5 months, all patients showed clinical improvement in nasal valve insufficiency and correction of alar collapse/concavity on photographic assessment. Subjective nasal obstruction complaints decreased in all cases. Aesthetic evaluation demonstrated improved alar contour, symmetry, and alar groove continuity. No major complications, such as infection, graft resorption, warping, or contour deformity, and no need for revision surgery were observed.

CONCLUSIONS

The L-shaped lateral crural graft technique appears to be a safe and effective option for simultaneously addressing alar deformity and nasal valve insufficiency in revision rhinoplasty patients, providing combined functional and aesthetic improvement.

Automated Nasal Aesthetic Subunit Classification Using Convolutional Neural Networks: Proof-Of-Concept Validation On Simulator Images

Esther Harlow Boardman[1,2], **Dr Luís Rita**[1], **Mr Issa Beegun**[2], **Miss Marlene M. Speth**[2,3], **Professor Hesham A. Saleh**[2]

[1]*Imperial College London;* [2]*Imperial College Healthcare Trust;* [3]*Technical University of Munich*

BACKGROUND & AIM

Accurate recognition of nasal aesthetic subunits is central to cutaneous reconstruction, influencing flap choice, incision placement and contour restoration. Artificial intelligence may support standardised anatomical recognition and future image-guided decision support for reconstructive procedures. However, early validation should occur in controlled settings prior to clinical translation. We hypothesised that ImageNet-pretrained convolutional neural networks (CNNs) could classify nasal aesthetic subunits from standardised simulator-image datasets with high internal performance.

MATERIAL & METHODS

A labelled simulator-image dataset was generated from nasal reconstruction models, comprising 627 original images across 115 class-specific patient groups. Images were classified into six anatomical categories: ala, columella, dorsum, sidewall, tip, and no defect. Eight ImageNet-pretrained CNN architectures were trained for multi-class classification under clean-only and clean-plus-augmented training regimes. Augmentation included geometric, intensity and image-degradation transformations. Models were evaluated using 15 patient-grouped cross-validation folds to reduce leakage between related images. Outcomes included balanced accuracy, overall accuracy, macro F1 score, per-class recall and macro one-vs-rest area under the receiver operating characteristic curve (AUC).

RESULTS

DenseNet121, trained on both clean and augmented images, was the best-performing CNN model. Across 15 patient-grouped cross-validation folds, it achieved strong multi-class performance, with a mean balanced accuracy of 0.887, macro F1 score of 0.882 and macro one-vs-rest area under the receiver operating characteristic curve of 0.984. Performance was consistent across anatomical subunits, with recall ranging from 0.84 to 0.92 and high class-level discrimination across all six categories. Augmentation improved balanced accuracy across all tested architectures, supporting its value in improving model robustness. Residual errors were anatomically interpretable, occurring mainly between neighbouring or visually similar regions, particularly the sidewall and dorsum, rather than reflecting random misclassification. Image-quality subgroup analysis showed comparable performance between high- and low-quality images, suggesting early robustness within the simulator dataset.

CONCLUSIONS

CNNs demonstrated proof-of-concept feasibility for automated nasal aesthetic subunit classification using simulator-image datasets. Positive findings include strong internal discrimination, balanced multi-class performance and anatomically interpretable error patterns. Limitations include the use of simulator-only images and the absence of external clinical validation. Further work should expand datasets, incorporate multi-rater ground-truth labels, and validate performance on mixed simulator and clinical images within a human-in-the-loop framework.

OP-329

Qualitative And Quantitative Assessment Of Four Artificial Intelligence Systems For Nasal Deformity Analysis In Rhinoplasty

Abdullah ALQAHTANI[1], **Dario EBODE**[2], **Martin PENICAUD**[1], **Stephane GARGULA**[2], **Justin MICHEL**[2], **Thomas RADULESCO**[2]

[1]*Aix Marseille University, APHM, La Conception University Hospital, Oto-Rhino-Laryngology and Head and Neck Surgery Department, Marseille, France;* [2]*Aix Marseille University, APHM, CNRS, IUSTI, La Conception University Hospital, Oto-Rhino-Laryngology and Head and Neck Surgery Department, Marseille, France.*

BACKGROUND & AIM

To evaluate the performance of four artificial intelligence (AI) systems in analyzing nasal deformities compared with expert opinions.

MATERIAL & METHODS

Four artificial intelligence chatbots (ChatGPT 4o, Claude 3.7, Gemini 2.0, and Grok 2) were compared to experts in terms of their ability to analyze nasal deformities. A quantitative analysis using standardized photographs compared the scores of the validated nasal dysmorphique assessment scale MIRA, across three views (frontal, profile, basal). A qualitative assessment was conducted using a 5-point Likert scale to characterize the main type of nose (tension nose, saddle nose, deviated nose, etc.).

RESULTS

Fifty adult patients seeking rhinoplasty were evaluated by chatbots and two experts based on standardized photographs. The assessments by the two surgeons showed very strong agreement (ICC = 0.997) for nasal analysis according to the MIRA scale. Only Claude 3.7 and the experts had comparable overall MIRA score evaluations ($p>0.05$). The analysis of MIRA sub-scores by incidence showed a significant difference between chatbots and experts for all models ($p<0.05$). Grok 2 ($p<0.001$) had the poorest performance. The qualitative description of the nose by ChatGPT4o achieved the best results, with a correct response rate reaching 70%.

CONCLUSIONS

None of the models achieves interesting performance during the quantitative analysis of nasal deformities. Qualitative assessment indicates that ChatGPT 4.0 could assist, under supervision, in rhinoplasty evaluations when analyzing nose types. However, it has only been effective in two-thirds of cases. AI can overestimate, miss, or be unresponsive. Expert surgeons are still needed to ensure the most accurate and trustworthy results. To date, AI tools are not reliable for the analysis of nasal dysmorphoses.

Raising The Brow: Open Versus Endoscopic Lift, An Evidence-Based Systematic Review.

Jonathan Abou Chaar[1], **Jad Hosri**[1], **Omar Aboul Hosn**[1], **Giovanni Gerges**[2], **Pierre Abi Akl**[1]

[1]*Department of Otolaryngology-Head & Neck Surgery, American University of Beirut Medical Center, Beirut, Lebanon.;* [2]*Department of Otolaryngology-Head & Neck Surgery, Lebanese University Faculty of Medicine, Beirut, Lebanon.*

BACKGROUND & AIM

Brow lift surgery is a cornerstone of upper facial rejuvenation, evolving from traditional open techniques to minimally invasive endoscopic approaches. Despite widespread use of both methods, consensus regarding their comparative outcomes and optimal indications remains lacking. The aim of the study is to understand the surgical principles, indications, outcomes, and complications of open and endoscopic brow lift techniques, and to apply evidence-based data to individualized surgical decision-making. The goal of this study is to systematically compare traditional (open) and endoscopic brow lift techniques with respect to aesthetic outcomes, complication rates, success, and patient satisfaction.

MATERIAL & METHODS

This study is a Systematic Review. A PRISMA 2020–compliant systematic review was conducted using PubMed, MEDLINE, Embase, Cochrane Library, Scopus, and Web of Science from March 2005 to August 2025. Comparative studies reporting

outcomes of open versus endoscopic brow lift were included. Data extraction and risk-of-bias assessment were performed independently by two reviewers. Quantitative analyses were weighted by cohort size.

RESULTS

Fifteen study cohorts were analyzed. Endoscopic techniques demonstrated significantly lower complication rates compared with open approaches ($p<0.001$). Open brow lifts achieved higher aesthetic scores at the midpupil and lateral canthus, slightly higher success rates, and marginally greater patient satisfaction. While these differences were statistically significant for most outcomes, overall satisfaction remained high for both techniques.

CONCLUSIONS

Both open and endoscopic brow lift techniques are effective and safe. Endoscopic approaches offer lower morbidity, while open techniques provide greater aesthetic correction in selected patients. Optimal results depend on careful patient selection, anatomy, and surgical goals rather than a single preferred technique.

OP-331

Botulinum Toxin A For Improving Cosmetic Outcomes In Facial Wound Healing: A Systematic Review, Meta-Analysis, And Dose-Response Evaluation

Dr. Thamer Albilasi[1,2], **Dr. Philip Solomon**[2]

[1]*Riyadh First Health Cluster, Riyadh, Saudi Arabia.*; [2]*University of Toronto*

BACKGROUND & AIM

Facial wound healing often results in unsatisfactory scarring with significant aesthetic and psychological impact. Botulinum toxin A (BTX-A) has appeared as a promising intervention to improve cosmetic outcomes by reducing muscle tension during wound healing. This systematic review and meta-analysis aimed to evaluate the efficacy and safety of BTX-A in facial wound management.

MATERIAL & METHODS

We conducted a detailed scientific literature database from inception to 15th of May, 2025, following PRISMA 2020 guidelines. All eligible studies comparing BTX-A with control interventions for facial wound healing were included. Primary outcomes were visual analog scale (VAS) scores and scar width measurements. Secondary outcomes included Vancouver Scar Scale scores, patient satisfaction, and adverse events. Meta-regression investigated dose-response relationships.

RESULTS

Fifteen studies with total of 607 participants met inclusion criteria. Botulinum toxin A significantly improved VAS scores (standardized mean difference 0.87, 95% CI: 0.45-1.29, P-value < 0.001) and reduced scar width by 0.35 mm (95% CI: −0.52 to −0.18, P-value < 0.001). Meta-regression (R^2 = 24%, P-value = 0.032) demonstrated a dose-response relationship with effect size increasing by 0.08 SMD units per U/cm. The 5 to 15 U/cm range was identified through safety-efficacy modeling, where doses <5 U/cm showed suboptimal efficacy (SMD 0.65), 5 to 15 U/cm achieved optimal balance (SMD 0.78–1.18, adverse events 1.1%–6.2%), and > 15 U/cm showed diminishing returns with increased adverse events. Adverse event rates were comparable between groups (3.9% versus 3.4%, P-value = 0.75), with no serious complications reported.

CONCLUSIONS

Botulinum toxin A demonstrates significant efficacy in improving facial wound cosmetic outcomes with an excellent safety profile. Evidence-based dosing of 5 to 15 U/cm provides the best benefit-risk ratio. On the basis of cost-effectiveness evaluation of included studies, the intervention demonstrates favorable benefit-risk ratios for wounds in high-visibility facial areas, with economic modeling suggesting better utility for longer wounds where scar prevention outweighs treatment costs.

OP-332

Impact Of Injectable Filler, Biostimulants, And Microneedling On Outcomes Following Deep Plane Facelift

Kimya Manouchehri, MD[2], **Ahmed Saleem, MD**[1], **Philip Solomon, MD, FRCSC**[2], **Richard Rival, MD, FRCSC**[2]

[1]*King Abdulaziz University, Jeddah, Saudi Arabia;* [2]*University of Toronto, Toronto, ON, Canada*

BACKGROUND & AIM

Background: The rising popularity of minimally invasive facial rejuvenation techniques as first-line treatments for aging skin has led to a growing subset of facelift patients having had these interventions in the past. Concerns persist regarding potential altered tissue planes and increased complication rates, however, objective data remains limited.

Objective: To evaluate the safety, post-operative outcomes, and satisfaction rates of primary deep plane facelifts in patients who have had prior injectables, biostimulants, or radiofrequency microneedling treatments.

MATERIAL & METHODS

Retrospective review of patients with a history of previous injectables, biostimulants and/or radiofrequency microneedling treatments who underwent deep plane facelift with a single high-volume surgeon. Outcomes assessed included postoperative complications, need for revision surgery, intraoperative assessment of tissue planes, and patient satisfaction.

RESULTS

A total of 228 patients (mean age 56, 90.3% female) were included in the study. The most popular minimally invasive procedures were injectable fillers (85.5%), followed by radiofrequency microneedling (19.3%) and biostimulants (13.2%). The average time from minimally invasive treatment to facelift was 2 years. Post-operative complications occurred in 13 patients (5.7%), and revision surgery was required in 19 patients (8.3%) for mostly scar-related aesthetic concerns. Patient satisfaction was high, with 96.1% reporting being extremely satisfied. Intraoperatively, there was increased resistance during superficial dissections; however, deep planes demonstrated comparable tissue quality to injectable or biostimulant-naive patients.

CONCLUSIONS

Prior minimally invasive facial rejuvenation techniques do not appear to
significantly compromise outcomes of deep plane facelift when performed by an experienced surgeon.

OP-333

Changes In Social Media Behavior Following Rhinoplasty: A Retrospective Analysis Of Psychosocial And Digital Behavioral Outcomes

Deniz Odluyurt[1], **Salih Akyel**[1], **Zeliha Kapusuz Gencer**[1]

[1]*Department of Otorhinolaryngology – Head and Neck Surgery, Basaksehir Cam and Sakura City Hospital, University of Health Sciences, Istanbul, Turkey*

BACKGROUND & AIM

To prospectively compare social media usage patterns, facial filter behavior, and self-confidence perception before and after primary aesthetic rhinoplasty, and to evaluate whether postoperative changes in digital behavior may serve as indirect indicators of patient satisfaction.

MATERIAL & METHODS

Patients who underwent primary aesthetic rhinoplasty at our institution between January 2021 and January 2026 were retrospectively identified. A structured telephone survey was administered to 315 candidates; 202 were excluded due to unreachable contact information or refusal to participate, yielding a final analytic cohort of n = 113 (response rate: 35.9%). The survey instrument captured the following pre- and postoperative parameters: daily social media usage duration (hours/day), weekly selfie-sharing frequency, weekly non-shared selfie frequency, facial filter use (five ordinal categories: never, rarely, sometimes, often, always), profile photo update frequency (times/month), self-confidence perception (5-point Likert scale), nose-concealment behavior in photographs (5-point Likert scale), social media platform preference, and engagement monitoring behavior (likes/comments; 5-point Likert scale). Pre- and postoperative comparisons were performed using the Wilcoxon signed-rank test; statistical significance was set at $p < 0.05$.

RESULTS

A total of 113 patients completed the survey (response rate: 35.9%). Rhinoplasty was associated with significant improvements in self-confidence (2.71 ± 1.57 vs. 4.61 ± 0.84, $p < 0.001$) and a marked reduction in nose-concealment behavior (3.77 ± 1.63 vs. 1.63 ± 1.11, $p < 0.001$). Facial filter use declined substantially postoperatively; the proportion of patients who never used filters rose from 48.2% to 66.4%, while those reporting always or often using filters fell from 36.6% to 11.5% ($p < 0.001$). Selfie-sharing frequency increased modestly (1.15 vs. 1.62 per week, $p = 0.002$), and non-shared selfie capture frequency also rose

significantly (5.20 vs. 9.46 per week, p < 0.001). In contrast, daily social media usage duration, profile photo update frequency, and engagement monitoring behavior remained unchanged. Instagram was the predominant platform across both time points (>87%).

CONCLUSIONS

Primary aesthetic rhinoplasty is associated with significant improvements in self-confidence perception and nose-concealment behavior, accompanied by a marked reduction in facial filter use and increased selfie capture frequency. In contrast, overall social media engagement duration, profile update frequency, and engagement monitoring are unaffected by surgery. These findings suggest that rhinoplasty extends beyond its physical dimensions to meaningfully transform patients' digital self-presentation. Changes in social media behavioral patterns may represent a novel and non-invasive surrogate measure of postoperative psychosocial satisfaction following rhinoplasty.

OP-334

Beyond The Procedure: Outcomes Of Ear Correction Surgery

Catarina Pinto[1], **Duarte Morgado**[1], **Ines Veloso**[1], **João Rodrigues**[1], **Sergio Caselhos**[1], **Rui Fonseca**[1], **Mariana Borges Santos**[1]

[1]*Uls alto ave*

BACKGROUND & AIM

Prominent ears are the most common congenital variation affecting the auricle. They can have a meaningful impact on a child's emotional and psychosocial well-being, particularly during the school years, a stage when self-image is actively developing. However, perceptions regarding the need for correction may differ between parents and children, potentially shaping the decision-making process around treatment. Our goul is evaluate the impact of pediatric otoplasty on mental health and quality of life, and to analyze differences in perception between parents and children regarding these outcomes.

MATERIAL & METHODS

Prospective study including pediatric patients who underwent otoplasty between June 2023 and December 2025. The Glasgow Children's Benefit Inventory (GCBI) was administered to parents to assess caregiver-reported benefit following surgery, and a visual analogue scale (VAS) was used with the children to capture their subjective perception of the outcome.

RESULTS

Twelve children who underwent otoplasty were analyzed, with a mean age of 9.3 years during this period. The mean GCBI score was 45, with no differences observed between sexes, indicating a significant impact of otoplasty in this group. Comparison between the parent-reported GCBI and the child-reported VAS showed no statistically significant differences between the two groups ($p<0.05$).

CONCLUSIONS

This study is relevant for understanding differences between parents' and children's perceptions of the impact of otoplasty, addressing an important gap in the literature. The findings may help guide more informed clinical and therapeutic decisions, improve postoperative follow-up, and contribute to strategies that promote the emotional well-being of children undergoing surgery.

OP-335

Assessment Of Satisfaction Rate Of The Patients Underwent Closed Reductions Of Nasal Bone Fracture; A Cross Sectional Study

ahmad saad alharthi[1]

[1]*Alhada hospital for armed forces*

BACKGROUND & AIM

Background: The nose is the central and most protruded part of the face, most vulnerable to facial trauma. Treatment for nasal bone fractures involves open reduction and closed reduction. Closed nasal reduction is a simple procedure that can be performed under local or general anesthesia with an acceptable success rate.

Aim: The current study aimed to assess the patient's satisfaction following the closed reduction of nasal bone fractures, both in aesthetic and functional values, and causes of dissatisfaction.

MATERIAL & METHODS

Methodology: A community-based descriptive cross-sectional study was conducted in Al-Noor Specialist Hospital, Makkah, Saudi Arabia, targeting all patients who underwent close reduction of nasal bone fracture between December 2021 and December 2022. The severity of the nasal obstruction was assessed using the validated Nasal Obstruction Symptom Evaluation (NOSE) scale, and selected questions from the Glasgow Benefit Inventory (GBI) were used to assess the change in general

health status. The final questionnaire was distributed to the eligible patients through Google Forms (Google LLC, Mountain View, California, United States).

RESULTS

Results: A total of 55 patients with reduced nasal bone fractures were included. Patients' ages ranged from 20 to 55 years with a mean age of 33.1±12.9 years. Precisely 39 (70.9%) patients were male. A total of 17 (30.9%) nasal injuries were due to accidents, and 15 (27.3%) were due to slips/falls. After closed reduction surgery, 42 (76.4%) were satisfied with their nose cosmesis, but nine (16.3%) were unsatisfied. For unsatisfied cases after surgery, the main reason was their own perception (61.5%), opinion of relatives/friends (30.8%), or medical opinion (7.7%). A significant relation between postoperative complaints and the severity of nasal symptoms was reported ($P < 0.05$).

CONCLUSIONS

Conclusions: The study revealed a high satisfaction rate for the closed reduction method, mainly in married older patients. Clinical complaints, severity of symptoms, and associated health changes decreased after undergoing closed reduction.

Profile Of Otorhinolaryngology-Related Emergency Department Visits And Revisits In A Tertiary Care Center In Riyadh, Saudi Arabia

Othman Ibrahim Alabdalwahab[1,2,3], Fahad Waleed Bin Aziz[1,2,3], Abdulmohsen Jameel Alshammari[1,2,3], Mohammed Abdullah Bayounis[1,2,3], Bander Fahad Aljarallah[1,2,3], Jawad Yousef Alhabeeb[1,2,3], Hessah Ibrahim Alsarra[1,2,3], Muhnnad Abdulaziz Alghamdi[4,5], Meshary Binhotan[2,6,7], Abdullah Alshibani[2,6,7]

[1]College of Medicine, King Saud bin Abdulaziz University for Health Sciences, Riyadh 11481, Saudi Arabia; [2]King Abdullah International Medical Research Center, Riyadh 11481, Saudi Arabia; [3]Ministry of National Guard Health Affairs, Riyadh 14611, Saudi Arabia; [4]College of Medicine, King Saud bin Abdulaziz University for Health Sciences, Jeddah 22384, Saudi Arabia; [5]King Abdullah International Medical Research Center, Jeddah 22384, Saudi Arabia; [6]Emergency Medical Services Department, College of Applied Medical Sciences, King Saud bin Abdulaziz University for Health Sciences, Riyadh 11481, Saudi Arabia; [7]Department of Emergency Medicine, King Abdulaziz Medical City, Ministry of National Guard Health Affairs, Riyadh 14611, Saudi Arabia

BACKGROUND & AIM

Otorhinolaryngologic (ENT) complaints constitute a substantial proportion of emergency department (ED) visits, ranging from minor to life-threatening problems. The patterns and frequency of these presentations in Saudi Arabia remain poorly described. This study, therefore, aimed to address this gap by examining the most frequent ENT-related presentations to the ED at a tertiary center in Riyadh, Saudi Arabia, to identify common diagnoses, describe patient demographics, and evaluate annual trends in ED visits.

MATERIAL & METHODS

A retrospective study of all consecutive ENT-related emergency department visits between January 2019 and December 2024 was conducted at King Abdulaziz Medical City, a tertiary care center in Riyadh, Saudi Arabia. Diagnosis classification used the International Classification of Diseases, 10th Revision (ICD-10). Data on patient demographics, presenting complaints, and hospital admissions were extracted. Descriptive analyses were performed to assess annual trends and common diseases.

RESULTS

A total of 22,014 patients were included in the present study, with a slight male (54%) predominance. Across 34,290 ED visits, annual presentations were the highest in 2019 (23.9%) and lowest in 2020 (9.2%). Most patients were discharged from ED (91.9%). The most frequent diagnoses were acute pharyngitis (29.1%), acute tonsillitis (26.2%), and otitis media (22.3%).

CONCLUSIONS

The study examined the otorhinolaryngology conditions most frequently encountered in an ED setting. The findings highlight a range of ENT disorders that are commonly seen in this setting. Recognizing these prevalent conditions and their patterns can improve ED physicians' preparedness, triage, and management of patients presenting with ENT emergencies.

OP-337

Building ENT Subspecialist Capacity In Africa: Outcomes Of The University Of Cape Town Fellowship Programme

Professor Johannes Fagan[1], **Professor Shazia Peer**[1], **Professor Darlene Lubbe**[1], **Associate Professor Tashneem Harris**[1]

[1]*University of Cape Town*

BACKGROUND & AIM

Sub-Saharan Africa faces a major shortage of ENT surgeons with subspecialist expertise, limiting access to advanced otolaryngology care. The University of Cape Town established African-focused ENT fellowship programmes in Rhinology, Head and Neck Surgery, Pediatric ENT, and Otology to strengthen regional subspecialist capacity. While individual fellowship outcomes have previously been reported, a comprehensive evaluation across ENT subspecialties has not been performed. This study aims to evaluate the effectiveness of the UCT African ENT fellowship model in developing sustainable subspecialist services, training capacity, and clinical leadership across Africa

MATERIAL & METHODS

A cross-sectional observational study will be conducted using an electronic questionnaire distributed to graduates of the University of Cape Town African ENT subspecialist fellowship programmes. Eligible participants include ENT surgeons who completed fellowship training at least 12 months prior to the study. The survey will assess establishment of subspecialist services, training activities, barriers to implementation, and perceived fellowship impact. Quantitative data will be analysed descriptively using frequencies and percentages, while qualitative responses will undergo thematic analysis

RESULTS

Data collection and analysis are currently underway. Preliminary findings are anticipated to demonstrate that the UCT African ENT fellowship programme has contributed to the development and expansion of ENT subspecialist services across multiple African countries. The study is expected to identify improvements in surgical capacity, local training initiatives, and regional leadership, while also highlighting persistent barriers including resource limitations, infrastructure constraints, and workforce shortages.

Data analysis and interpretation will be completed by the end of June 2026

CONCLUSIONS

The UCT African ENT fellowship programme is anticipated to represent a sustainable and scalable model for strengthening ENT subspecialist capacity in resource-limited settings. By supporting service development, surgical training, and regional leadership, the programme may contribute meaningfully to improving access to advanced ENT care across Africa, while also identifying key challenges that must be addressed to support long-term sustainability and wider replication.

Global Barriers To Research In Otolaryngology–Head And Neck Surgery: A Scoping Review

Fabian Peralta[1], **Felipe Porto-Gutierrez**[2,3], **Luis Peralta**[4]

[1]*Department of Otorhinolaryngology, Facial-Nerve-Center, Center for Rare Diseases, Jena University Hospital, Jena, Germany;* [2]*Department of Otolaryngology–Head and Neck Surgery, Harvard Medical School, Boston, MA;* [3]*Division of Otolaryngology, Department of Surgery, Beth Israel Deaconess Medical Center, Boston, MA;* [4]*Universidad Peruana Unión, Lima, Perú*

BACKGROUND & AIM

Research is essential for innovation and improved patient care in Otolaryngology–Head and Neck Surgery (OHNS). However, research participation and academic productivity remain unevenly distributed worldwide, suggesting that barriers may limit opportunities for many investigators. This scoping review aims to identify and synthesize barriers affecting research participation, productivity, and academic advancement in OHNS worldwide.

MATERIAL & METHODS

A scoping review was conducted using PubMed, Scopus, and Cochrane Library from inception through May 2026. Peer-reviewed OHNS publications evaluating barriers related to research participation, productivity, authorship, funding, mentorship, or academic advancement were included. Eligible studies underwent qualitative thematic synthesis.

RESULTS

Ten studies were included, comprising international surveys, bibliometric analyses, and institutional productivity studies. Four major themes emerged. First, limited protected time and competing clinical workload were consistently identified as the most

frequent barriers to research participation across trainees and faculty. Second, financial and institutional barriers were more prominent in low- and middle-income settings, including inadequate funding, limited infrastructure, restricted access to research resources, and challenges related to publication costs. Third, insufficient research training and mentorship reduced engagement in scholarly activity, particularly among residents lacking formal research education and methodological support. Fourth, structural inequities in authorship and academic advancement persisted globally, with high-income countries dominating publication leadership in major journals and women remaining underrepresented in senior authorship, leadership positions, and research funding.

CONCLUSIONS

Barriers to research in OHNS are largely driven by structural limitations rather than lack of interest. Improving protected research time, mentorship, training, institutional support, equitable funding, and fair collaborative practices may strengthen global research capacity and improve representation in OHNS scholarship.

BACKGROUND & AIM

Tonsillectomy is the most common pediatric surgery, yet little is known about how outcomes vary worldwide. Although generally considered a safe surgery, tonsillectomy carries significant risks. Approximately 3% of US children require hospital readmission within 30 days for life-threatening complications. While mortality rates in high-income countries are low (~0.0005%), those in low- and middle-income countries (LMICs) are poorly characterized. OtoSurg 1 aims to 1) quantify global variation in 30-day major postoperative complications and mortality following pediatric tonsillectomy across World Health Organization (WHO) regions and to 2) characterize global variation in pediatric tonsillectomy surgical indications and operative techniques across WHO regions.

MATERIAL & METHODS

This submission outlines the OtoSurg 1 research protocol, as data collection has not yet begun. OtoSurg 1 will be an international, multi-site, prospective cohort study. The central IRB is approved and hosted by Emory University (IRB ID: STUDY00009113). All healthcare facilities globally that perform pediatric tonsillectomy will be invited to participate. Participating investigators will be trained to collect data on patients undergoing primary tonsillectomy over a 90-day period at their respective institutions. Site-based teams will record demographic data, surgical indication(s), surgical technique(s), postoperative complications, and mortality directly into a global de-identified tonsillectomy outcomes data registry. We will leverage existing relationships and professional networks to recruit participants from 30 sites in each of the six WHO regions, targeting 180 partner sites.

RESULTS

We will use multilevel mixed-effects logistic regression to account for clustering of patients within hospitals and hospitals within countries. For each primary outcome, we will fit a sequence of prespecified models. First, we will fit an unconditional (null) model with random intercepts for hospital and country to quantify baseline between-hospital and between-country variation. Second, we will add prespecified patient- and procedure-level covariates to evaluate the extent to which case-mix explains outcome variation. Third, we will include country income classification as a fixed effect to estimate the adjusted association between income setting and outcomes while retaining the hierarchical random-effects structure. Model fit will be assessed using the Akaike information criterion. Intraclass correlation coefficients will be calculated to quantify the proportion of outcome variance attributable to clustering at the hospital and country levels for dichotomous outcomes using the logistic distribution variance. Adjusted odds ratios with 95% confidence intervals will be reported.

CONCLUSIONS

OtoSurg 1 will highlight potential opportunities for intervention to standardize and improve outcomes for the world's most common pediatric surgery, with a focus on LMICs. Beyond the primary objectives, this project will also seek to 1) recruit and train a collaborative research network of otolaryngology surgeons from around the world and to 2) build the digital infrastructure necessary to support this network sustainably. This collaborative research network will serve as the foundation for future large-scale research initiatives and for the development and implementation of novel, data-driven interventions.

BACKGROUND & AIM

Objective: Describe the design, goals, and perceived impacts of global otolaryngology–head and neck surgery (OHNS) training programs, with emphasis on institutional factors shaping workforce development and surgeon retention in low- and middle-income countries (LMICs).

MATERIAL & METHODS

Study Design: Cross-sectional qualitative study conducted from October 2024 to October 2025.
Setting: Focused, semi-structured interviews.
Methods: Participants were program directors and faculty involved in training otolaryngologists from LMICs. Transcripts were analyzed using an iterative grounded theory approach to develop a codebook and identify emergent themes.

RESULTS

Sixteen otolaryngologists representing 15 fellowship-level programs in seven countries were interviewed. Collectively, programs had trained 49 fellowship graduates and nine current fellows from 23 countries. Program directors emphasized shared goals of sustainable workforce development and the avoidance of brain drain, while describing substantial regulatory, financial, and structural constraints influencing trainee selection and post-training mobility. Among LMIC trainees trained by these programs, 75% returned to their home country; health system limitations, economic pressures, and credentialing barriers hindered reintegration. For faculty, the inclusion of foreign trainees fostered reciprocal learning environments that influenced perspectives on training adaptability and resource-conscious care.

CONCLUSIONS

Understanding the shared motivations and barriers shaping international OHNS training programs may inform future program design strategies that support sustainable workforce development and successful trainee reintegration within LMIC health systems.

OP-341

Patient-Initiated Follow-Up In Head And Neck Cancer: Opportunity Or Risk? A Mixed-Methods Service Evaluation

Sarah McBrinn[1], **Jonathan Bernstein**[1]

[1]*Imperial College London NHS Foundation Trust*

BACKGROUND & AIM

Patient-Initiated Follow-Up (PIFU) is increasingly adopted across oncology to reduce outpatient burden and enhance patient autonomy. However, its applicability in head and neck cancer (HNC), a cohort characterised by complex disease trajectories, high recurrence risk, and significant functional morbidity, remains underexplored. This research aims to explore multidisciplinary healthcare professionals' perspectives on the barriers and enablers to implementing PIFU in HNC follow-up.

MATERIAL & METHODS

A mixed-methods service evaluation was conducted in a tertiary cancer centre. An online survey was distributed to 22 members of the multidisciplinary team (MDT), including surgeons, oncologists, specialist nurses, and allied health professionals. This was followed by semi-structured interviews with 10 participants purposively sampled across the MDT to capture diverse professional perspectives. Survey data were analysed using descriptive statistics, while interview transcripts underwent reflexive thematic analysis.

RESULTS

Six key themes were identified: (1) understanding and current use of PIFU; (2) perceived benefits, including improved patient autonomy and reduced clinic burden; (3) risks and equity considerations, particularly concerns regarding delayed recurrence detection and digital exclusion; (4) patient selection criteria, with consensus around suitability for low-risk, well-engaged patients; (5) multidisciplinary roles in decision-making; and (6) infrastructure requirements, including access pathways, patient education, and administrative support. While there was cautious support for PIFU, participants emphasised that safe implementation requires robust safety-netting systems and clear escalation pathways.

CONCLUSIONS

PIFU represents a promising approach to optimising follow-up in selected HNC patients. However, its successful implementation depends on careful patient stratification, strong multidisciplinary engagement, and investment in infrastructure to ensure timely access and equitable care. These findings provide practical insights to inform future service design and evaluation in HNC follow-up pathways.

Predictive Value Of Drain Amylase And Pepsin Levels For Pharyngocutaneous Fistula After Total Laryngectomy

Mehmet Salih Parça[1], **Berra Şerefoğlu**[1], **Büşra Nur Coşan**[1], **Tuğba Arlı**[1], **Ruçhan Seçgin**[1], **Şahin Öğreden**[1], **Özgür Yiğit**[1], **Yalçın Alimoğlu**[1]

[1]*Başakşehir Çam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Turkey*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) is one of the most common and serious complications following total laryngectomy, leading to prolonged hospitalization and delayed adjuvant treatment. Early prediction of PCF remains challenging. This study aimed to evaluate the relationship between drain fluid amylase and pepsin levels and PCF development and to assess their predictive value in the postoperative period.

MATERIAL & METHODS

A total of 50 patients who underwent total laryngectomy for laryngeal squamous cell carcinoma were included in this study. Demographic data, tumor characteristics, and postoperative PCF development were recorded. Amylase and pepsin levels were measured in right and left wound drain fluids. The association between biomarker levels and fistula development was analyzed, and diagnostic performance was evaluated using receiver operating characteristic (ROC) curve analysis.

RESULTS

The mean age was 63.2 ± 8.3 years, and 92% of patients were male. PCF developed in 28% of patients, with a mean onset time of 7.21 ± 2.60 days. No significant association was found between PCF development and age, gender, or tumor localization ($p > 0.05$). In side-based analysis, left drain amylase levels were significantly higher in the PCF group ($p = 0.04$) and showed the best discriminative ability (AUC = 0.68). No significant differences were observed for right drain amylase or pepsin levels ($p > 0.05$). In side-independent analysis, although amylase levels were higher in the PCF group, the difference was not statistically significant ($p = 0.173$; AUC = 0.603). Pepsin levels were not associated with PCF development.

CONCLUSIONS

Drain amylase levels may have limited clinical utility in predicting PCF development following total laryngectomy. However, neither amylase nor pepsin alone appears to be a reliable prognostic marker. Drain amylase may still serve as an early warning indicator in postoperative monitoring.

OP-343

The Mysteries Of Cervical Lymphadenopathy: Efficacy Of The Lymph Node Reporting And Data System (LN-RADS) In Assessing Cervical Lymphadenopathy

Aysha Albastaki[1], **Rula Naqi**[1], **Hiba Abduljawad**[1], **Fahad Sinan**[2], **Hassan Alansari**[1]

[1]*Royal Medical Services - Kingdom of Bahrain;* [2]*Royal College of Surgeons in Ireland – Medical University of Bahrain*

BACKGROUND & AIM

Cervical lymphadenopathy is abnormally enlarged cervical lymph nodes which could be benign or malignant. Imaging and laboratory investigations are used in the diagnosis. However, in suspicious cases a biopsy is required which might have complications. A new system, the Lymph Node Reporting and Data System (LN-RADS), has been established to improve the quallity of lymph node assessment and provide a scale to determine the likelihood of malignancy, thus guiding physicians for the optimal management, which include biopsy.

MATERIAL & METHODS

This is a retrospective multicenter cohort study included all ultrasound-guided tru-cut biopsy or excised cervical lymph nodes with previous ultrasound performed between 2015 and 2026. Demographical data and oncology history were collected. LN-RAD system applied to each lymph node, including the assessment of shape, cortex regularity, thickness and echogenicity, hilum, architecture, vascularity borders and extracapsular infiltration. Accordingly each lymph node given a score of 1-5. Finally, correlation was done between the LN-RADS score and pathology results. Analysis was performed in R, with descriptive statistics calculated in SPSS25.

RESULTS

A total of 280 patients were included, with a mean age of 49±19.2 years; 56.1% were female. Most patients(60%) had no known prior history of malignancy. Tru-cut biopsy was the predominant sampling method (73.6%), followed by fine needle aspiration cytology(27.5%) and excisional biopsy (2.5%). According to LN-RADS classification, most cases were categorized as 3–5, with even distribution across categories. On final pathology, reactive lymph nodes were most common(30.7%), followed by hematological malignancies(20.7%) and other cancers(15.4%). A progressive increase in malignancy risk was observed across LN-RADS categories, suggesting good internal validity and effective separation between low-risk and high-risk groups. The system demonstrated 91.4% sensitivity, 82.9% specificity, 79.1% positive predictive value and 93.2% negative predictive. Diagnostic accuracy was 86.4%. The discriminatory ability using receiver operating characteristic analysis demonstrated an

area under the curve(AUC) of 0.917, indicating excellent ability to differentiate malignant from benign nodes across all thresholds.

CONCLUSIONS

In conclusion, our study showed high efficacy of LN-RADS system in distinguishing benign, reactive and malignant lymph nodes with high diagnostic accuracy. Therefore, it has the potential to aid decision making and optimize the management of patients with cervical lymphadenopathy.

OP-344

Evaluation Of The Suspected Head And Neck Cancer Pathway In A Study Of More Than 5,000 Patients: Referral Behaviour, Clinical Management, And The Diagnostic Utility Of NICE 2-Week Wait Guidance

Mr Husham Barrak[1], **Syed Zohaib Maroof Hussain**[1], **Mariam Asif Malik**[1]

[1]*Warwick Hospital*

BACKGROUND & AIM

The 2-week wait referral pathway was introduced in the UK to support earlier cancer diagnosis and improve survival outcomes. In hLaryngopharyngealer, its effectiveness has been questioned because many referrals do not lead to a malignancy diagnosis. This is largely because head and neck cancers often present with non-specific throat and voice symptoms that may overlap with benign conditions, making careful clinical assessment essential. Laryngopharyngeal reflux is one of the most common alternative diagnoses in this pathway and is often suitable for management in primary care with a trial of proton pump inhibitors

MATERIAL & METHODS

Retrospectively analysed data of 5610 patients were identified from the regional cancer pathway coding system. A small group of patients were excluded due to the wrong hospital number, and no information was identifeid on the system. Data was extracted from the online hospital system. Data was collected from 01st Decemvber 2022 till 30th Nov 2025.

RESULTS

A total of 5535 patients were included in the final analysis. More than 90% of the patients had benign conditions, and no cancer was diagnosed. The remaining 10% of 10% patinets either malignat and needing conditions, and they were treated accordingly. A large cohort was presented with LPR and discharged home dame say.

CONCLUSIONS

If laryngopharyngeal reflux is recognised earlier in primary care, low-risk patients may be treated without being sent straight into a cancer pathway. This could reduce unnecessary referrals, ease pressure on specialist services, and spare patients avoidable worry.

Elevated Risk Of Second Primary Cancer Following Sinonasal Carcinoma

Carl Korsström[1], **Elli Hirvonen**[2], **Rayan Nikkilä**[1,2,4], **Nea Malila**[2], **Markus Lilja**[1], **Antti Mäkitie**[1,3,4], **Aaro Haapaniemi**[1]

[1]*Department of Otorhinolaryngology - Head and Neck Surgery, University of Helsinki and HUS Helsinki University Hospital, Helsinki, Finland;* [2]*Finnish Cancer Registry, Institute for Statistical and Epidemiological Cancer Research, Helsinki, Finland;* [3]*Division of Ear, Nose and Throat Diseases, Department of Clinical Sciences, Intervention and Technology, Karolinska Institutet and Karolinska University Hospital, Stockholm, Sweden;* [4]*Research Program in Systems Oncology, Faculty of Medicine, University of Helsinki, Helsinki, Finland*

BACKGROUND & AIM

Sinonasal cancer is rare and accounts for 3-5% of head and neck malignancies. It exhibits relatively low survival rates despite advances in treatment. An increased risk of second primary cancer (SPC) has been suggested as a contributing factor to the poor prognosis. However, the literature on the SPC risk following sinonasal cancer, particularly in European populations, is scarce.

MATERIAL & METHODS

Data on 1,161 patients diagnosed with primary sinonasal carcinoma during 1953-2023 were obtained from the Finnish Cancer registry (covering 96% of solid tumors diagnosed in Finland). Standardized incidence ratios (SIRs) and excess absolute risk (EAR) per 1,000 person-years were calculated to compare SPC risk with that of the general population. Results were stratified by age, sex, time period of diagnosis, time since diagnosis, stage and SPC site. Subpopulations based on the site of the primary cancer (nasal cavity, maxillary sinus, ethmoids, and other sites) were also analyzed separately.

RESULTS

In total, 158 patients (13.6%) were diagnosed with an SPC, corresponding to an SIR of 1.52 (95% CI: 1.29–1.77) and an EAR of 7.35 per 1000 person-years (95% CI: 4.65–11.62). The risk remained significantly elevated for up to 20 years after the primary diagnosis and remained relatively stable over the study period. SPCs in respiratory and intrathoracic organs exhibited the highest significant risk, with an SIR of 2.99 (95% CI: 2.22–3.94), and an EAR of 4.25 (95% CI: 2.80–6.45). In site-specific analyses, both nasal cavity (n = 556) and maxillary sinus (n = 529) primary cancers were associated with an increased SPC risk, with SIRs of 1.56 (95% CI: 1.27–1.91) and 1.51 (95% CI: 1,15–1.96), respectively. SPC rates for primary cancers of the ethmoids (n = 14) and other sites (n = 62) did not reach statistical significance.

CONCLUSIONS

Patients with primary sinonasal carcinoma exhibited a 52% excess risk of developing an SPC compared to the general population. This risk remained elevated for up to 20 years after the primary diagnosis. These results highlight the importance of long-term post-treatment follow-up.

head and neck cancer, sinonasal carcinoma, second primary cancer, second primary malignancy

OP-346

Facial Nerve Variations In Parotidectomy: Is There A Correlation With Facial Anthropometric Proportions?

Zeliha Kapusuz Gencer[1], **Pınar Kundi**[1], **Mehmet Keskin**[1], **Salih Akyel**[1], **Serhat Bayrak**[1], **İskender Bayram**[1]

[1]*Department of Otorhinolaryngology-Head and Neck Surgery, Basaksehir Cam and Sakura City Hospital*

BACKGROUND & AIM

Facial nerve injury remains one of the most significant complications of parotidectomy, often resulting in functional and cosmetic morbidity. Although various anatomical landmarks have been described to facilitate facial nerve identification, interindividual variability in facial nerve branching patterns continues to pose surgical challenges. This study aims to investigate the relationship between facial nerve anatomical variations and patients' facial anthropometric proportions, potentially providing a predictive framework for safer surgical dissection.

MATERIAL & METHODS

This prospective observational clinical study includes 30 patients aged 30–70 years undergoing parotidectomy. Intraoperative measurements were performed using a sterile surgical ruler without altering standard surgical procedures. The recorded parameters included distances between key anatomical landmarks: mandibular angle to mentum, facial nerve trunk to mandibular angle, facial nerve trunk to inferior temporal line, trunk to bifurcation distance, and bifurcation to zygomatic process distance. Facial nerve branching patterns were also classified intraoperatively. Collected data were analyzed using SPSS and R statistical software. Continuous variables were expressed as mean ± standard deviation, and categorical variables as frequencies and percentages. Statistical significance was set at $p < 0.05$.

RESULTS

Preliminary findings suggest a potential correlation between facial anthropometric proportions and facial nerve branching patterns. Variations in trunk location and branching morphology demonstrated measurable relationships with specific facial dimensions. These findings indicate that individual facial morphology may serve as a predictive factor in identifying facial nerve anatomy during parotid surgery.

CONCLUSIONS

Understanding the association between facial anthropometry and facial nerve variations may enhance intraoperative orientation and reduce the risk of nerve injury during parotidectomy. This study contributes to the growing body of literature aiming to improve surgical safety through personalized anatomical assessment. Further studies with larger cohorts are warranted to validate these findings.

OP-347

Primary Pleomorphic Liposarcoma Of The Parotid Gland: A Systematic Review Of Clinical Features, Treatment Outcomes, And Prognosis

Yılmaz kılar[1], **Levent Renda**[1]

[1]*Akdeniz Üniversitesi*

BACKGROUND & AIM

Bu çalışma, primer pleomorfik liposarkom (PLPS) üzerine odaklanan bir olgu sunumu ve sistematik derleme niteliğindedir. Pleomorfik liposarkom, parotis bezinin nadir ve agresif bir malignitesidir. Tükürük bezi sarkomları tüm tümörlerin %1,5'inden azını oluştururken, PLPS alt tipi mevcut literatürde son derece nadirdir.

MATERIAL & METHODS

Olgu Sunumu: 69 yaşında kadın hasta, sol parotis bölgesinde iki aydır hızla büyüyen, ağrısız ve fikse bir kitle ile başvurdu. MRI'da 2,5 santimetrelik heterojen bir kitlenin saptanmasının ardından hastaya total parotidektomi uygulandı. Kapsamlı patolojik değerlendirme, pleomorfik lipoblastların varlığını ve %25'lik yüksek proliferasyon indeksini ortaya koyarak PLPS tanısını doğruladı. Başlangıçta cerrahi sınırlar negatif olmasına rağmen, postoperatif birinci ayda malignitenin nüksetmesi nedeniyle hasta ikinci bir cerrahi girişim geçirdi.

RESULTS

Sistematik Derleme: PRISMA 2020 kılavuzlarına uygun olarak kapsamlı bir tarama yapılmış ve belirlenen kriterleri karşılayan altı olgu literatürden elde edilerek analiz edilmiştir. İncelenen olgular ağırlıklı olarak ileri yaş grubunda olup yüksek nüks potansiyeli göstermektedir. Perinöral invazyonönemli bir prognostik faktör olarak saptanmıştır.

CONCLUSIONS

Sonuç: Agresif doğası nedeniyle parotis pleomorfikliposarkomu (PLPS), cerrahi sınırlar negatif olsa bile yüksek lokal nüks riski taşır. Tanısal güçlükler ve standart bir tedavi protokolünün olmaması göz önüne alındığında, bu nadir tümörler için multidisipliner yaklaşım ve uzun dönem takip zorunludur.

OP-348

Post-Operative Outcomes In Robot-Assisted Head And Neck Surgery (RAHNS): A Three-Year Experience At A Scottish Tertiary Centre (2022–2025)

Mustafa Shah[1], **Mr Faizan Shah**[1,2], **Mr Jaiganesh Mannickavasagam**[1,2]

[1]*University of Dundee;* [2]*Ninewells Hospital, Dundee*

BACKGROUND & AIM

Traditional open surgery for head and neck oncology often results in significant morbidity. Transoral Robotic Surgery (TORS) offers a minimally invasive alternative with superior visualization. While robot-assisted head and neck surgery (RAHNS) improves quality of life, success is often dictated by patient-specific risk factors rather than technique alone, necessitating a clearer understanding of recovery predictors. This study evaluates factors influencing post-operative complications and functional recovery to establish evidence-based predictors for RAHNS outcomes.

MATERIAL & METHODS

A retrospective review was conducted on 58 consecutive patients undergoing RAHNS between 2022 and 2025. Data included demographics, albumin levels, pathology, and TNM staging. Primary outcomes measured were length of stay (LOS), Clavien-Dindo complications, swallowing status, and return-to-work timelines. Statistical analysis was preformed using SPSS with $p < 0.05$ being classed as significant.

RESULTS

The cohort (n=58) had a mean age of 57.1 years; 44.8% had malignant pathology. From this cohort 78% of patients had only surgery (no adjuvant therapy) and the mean LOS was 4.69 days. Malignancy was the strongest predictor of outcomes, correlating significantly with impaired swallowing, increased complications, and extended LOS ($p<0.001$). Age and advanced T-staging also predicted prolonged LOS ($p=0.04$; $p=0.05$). Lower pre-operative albumin (mean 29.23 g/L) was significantly associated with major adverse events and return to theatre ($p=0.04$). While 88% maintained a normal swallow (post-procedural recovery), return to work was significantly delayed by smoking ($p=0.006$) and high BMI ($p= 0.039$). TORS identified the primary tumour in 55.6% of occult cases.

CONCLUSIONS

RAHNS demonstrates high efficacy and faster recovery than traditional approaches. However, outcomes are heavily modulated by malignancy and nutritional status. These findings highlight the necessity of pre-operative nutritional optimization, specifically targeting albumin and the early involvement of the speech and language therapy team. Incorporating these factors into selection criteria will enhance the functional success of robotic head and neck programs.

OP-349

Navigating The Complexities Of Redo Surgery For Parapharyngeal Tumors.

Jabir Alharbi[1]

[1]*King Abdullah Medical City - Makkah*

BACKGROUND & AIM

Parapharyngeal tumors are rare and pose significant diagnostic and surgical challenges due to their deep location and proximity to vital neurovascular structures. Redo surgeries in this region are even more complex, often complicated by

scarring, distorted anatomy, and risk of incomplete excision. This case-based presentation aims to highlight the clinical course, surgical approach, and key considerations in managing recurrent parapharyngeal tumors, emphasizing the importance of preoperative planning and multidisciplinary decision-making.

MATERIAL & METHODS

We report the case of a 33-year-old male who initially presented with snoring, dysphagia, and muffled voice, and was found to have a left parapharyngeal mass. The patient underwent transcervical excision with complete symptom resolution. Ten years later, he re-presented with subcutaneous nodules on the same side. Comprehensive imaging with contrast-enhanced CT and MRI was performed. A second transcervical surgery was planned with careful consideration of prior operative changes. Intraoperative findings, surgical approach, and postoperative management were documented and reviewed.

RESULTS

Imaging confirmed multifocal recurrence of the parapharyngeal tumor on the same surgical side. The second surgery was performed via a transcervical approach, with successful resection of the recurrent nodules. The facial nerve remained intact, and the patient experienced no significant complications. Postoperative MRI demonstrated complete tumor excision. Histopathology confirmed recurrent benign parapharyngeal tumor. The case was reviewed in a multidisciplinary tumor board, and adjuvant radiotherapy was considered due to the multifocal nature of recurrence.

CONCLUSIONS

Redo surgery for parapharyngeal tumors is technically demanding due to altered anatomy, fibrosis, and proximity to critical structures. Careful preoperative imaging review, meticulous surgical planning, and multidisciplinary coordination are essential to achieving safe and effective outcomes. Awareness of recurrence patterns and considering adjuvant therapy in multifocal cases can further improve long-term management.

Predictors Of Severe Complications And Airway Intervention In Deep Neck Infections: A 10-Year Retrospective Cohort

Ceren Öztürk[1], **Fırat Tevetoğlu**[1], **Aleyna Elburz**[1], **Harun Cansız**[1]

[1]*Istanbul University – Cerrahpasa, Cerrahpasa Faculty of Medicine, Department of Otorhinolaryngolgy*

BACKGROUND & AIM

Deep neck infections (DNI) remain potentially life-threatening conditions with airway compromise, descending mediastinitis, and septic complications. We aimed to identify independent predictors of severe complications and airway intervention in a 10-year single-center retrospective cohort, with particular attention to morbidity profile, biomarker performance, and pediatric subgroup characteristics.

MATERIAL & METHODS

We retrospectively analyzed 91 consecutive patients with DNI between 2016 and 2026 at our tertiary referral otolaryngology department. Demographics, comorbidities, anatomic localization, multispace involvement, admission laboratory parameters (white blood cell count, C-reactive protein, neutrophil-to-lymphocyte ratio [NLR]), microbiology, drainage method, airway management, intensive care unit (ICU) admission, and outcome were recorded. The primary composite outcome was severe complication (ICU admission and/or mortality); a secondary expanded major-complication endpoint additionally incorporated airway intervention. Predictors were assessed by univariate and multivariable logistic regression; biomarker thresholds were derived using Youden's index from ROC analysis. Pediatric (<18 years) versus adult comparisons were also performed.

RESULTS

Median age was 38 years (IQR 20–52); 58.2% were male. Peritonsillar abscess(50.5%) was the leading diagnosis, followed by Ludwig/submandibular abscess(18.7%). ICU admission occurred in 8 patients(8.8%), mortality in 3(3.3%); all deaths involved sepsis with major comorbidities. Eight patients(8.8%) required airway intervention ; within this subgroup mortality reached 37.5%. On multivariable analysis, diabetes mellitus(aOR 9.32; 95% CI 1.49–58.4; p=0.017), multispace involvement(aOR 7.26; 95% CI 1.26–41.8; p=0.027), and NLR(aOR 1.15 per unit; 95% CI 1.01–1.30; p=0.029) emerged as independent predictors of severe complications(model AUC=0.893). NLR demonstrated the highest single-biomarker discrimination(AUC=0.811, threshold ≥5.1), outperforming CRP(AUC=0.738) and age(AUC=0.751, threshold ≥41 years); WBC was not discriminative. For airway intervention, multispace involvement was the strongest univariate predictor(OR 17.75; 95% CI 3.20–98.5; p<0.001). Length of stay was markedly prolonged in complicated cases(median 22 vs 5 days; p<0.001). Among 21 pediatric patients(23.1%), no mortality occurred and tonsillogenic etiology dominated, with no diabetes mellitus in this subgroup.

CONCLUSIONS

Diabetes mellitus, multispace involvement, and elevated NLR are independent predictors of severe complications in DNI. NLR ≥5.1 provides a simple, accessible early-warning biomarker. Multispace involvement is the strongest signal for impending airway intervention. The favorable pediatric outcome appears partly attributable to the absence of diabetes — our most

powerful predictor. These findings support a risk-stratified management algorithm incorporating early imaging-based space mapping, NLR-guided monitoring, and proactive airway planning for diabetic and multispace cases

Diagnostic Utility Of US And FNAC In Thy3A Nodules: A Regional 5-Year Retrospective Review

Joshua Michaels[1], **Haroon Khokher**[1], **Lamees Arbi**[1], **Zeba Bashir**[1], **Vishaka Lokesh**[1], **Sarah Law**[1], **Laxmi Mantha**[1], **Tarun Sood**[1]

[1]*Bedfordshire Hospitals NHS Foundation Trust*

BACKGROUND & AIM

Thyroid nodules are prevalent in 68% of the population, with malignancy rates under 10%. While fine needle aspiration cytology (FNAC) is a standard diagnostic tool, 15–48% of results are indeterminate (Thy3a), limiting its role in ruling out malignancy. High-quality evidence for managing indeterminate thyroid nodules is lacking, leading to variability in current guidelines (ATA, BAHNO, BTA, NICE).

We hypothesised that ultrasound and FNAC poorly assess Thy3a malignancy. This study evaluated their diagnostic yield, determined malignancy rates of Thy3a nodules across the regional multidisciplinary team (MDT), reviewed conservative management outcomes and compared local practice with current guidelines.

MATERIAL & METHODS

A retrospective cohort of 624 patients (78.7% female) undergoing US-guided thyroid FNAC from 2019 - 2024 within a regional MDT was analysed, including 140 Thy3a cases. Data included demographics, imaging, cytology, MDT decisions, management, histology and follow-up. Outcomes were FNAC adequacy, malignancy rates following diagnostic lobectomy and conservative management. Descriptive statistical analysis was performed.

RESULTS

Repeat FNAC of Thy3a remained indeterminate in 67.1% of cases. Ultrasound (U) grading showed higher malignancy rates in U3–U5 nodules. Among patients undergoing diagnostic lobectomy, the overall malignancy rate was 22.2% (12/54). Malignancy yield was higher in single Thy3a nodules (25%) compared to double Thy3a nodules (18.2%). Follicular thyroid carcinoma (14.8%) and papillary thyroid carcinoma (7.41%) were the predominant malignancies. In patients managed non-operatively, no cases of subsequent thyroid malignancy were identified during follow-up.

CONCLUSIONS

Thy3a nodules have a significant malignancy rate (22.2%), reinforcing the need for a structured management framework. Conservative management appears safe in selected patients, although long-term surveillance is essential. Limitations in FNAC accuracy and variability in MDT decisions have led to a standardized regional approach: diagnostic lobectomy (on cancer pathway) or active surveillance (off cancer pathway). Surveillance includes ultrasound-based review at 6 months, 3 years, and 5 years, with repeat FNAC for changes in nodule size or morphology. Ultrasound and cytology alone may fail to reliably predict malignancy, emphasizing the emerging role of genetic markers such as BRAF in risk stratification.

OP-352

The Incidence Of Right Non-Recurrent Laryngeal Nerve Predicted By Computed Tomography: A Large-Scale Retrospective Study

Chichak Mammadzada[1], **Hatice Seçil Akyıldız**[1], **Mustafa Kürşat Gökcan**[1]

[1]*Ankara University Faculty of Medicine*

BACKGROUND & AIM

The non-recurrent laryngeal nerve (NRLN) is a rare but clinically significant anatomical variation that increases the risk of nerve injury during thyroid and other cervical surgeries. It is closely associated with an aberrant right subclavian artery (ARSA), a vascular anomaly that can be reliably detected using computed tomography (CT). Preoperative identification of ARSA may therefore enable prediction of NRLN and improve surgical safety.

MATERIAL & METHODS

In this retrospective study, preoperative neck, maxillofacial, and thoracic CT scans of 115,030 patients evaluated between January 2015 and September 2024 were analyzed. The presence of ARSA was assessed as a radiological surrogate marker for right NRLN. In patients who subsequently underwent surgery, intraoperative findings were reviewed to confirm the presence of NRLN.

RESULTS

ARSA was identified in 627 of 115,030 patients, corresponding to a prevalence of 0.545%. Among patients who underwent surgery, right NRLN was confirmed in those with ARSA, supporting the strong anatomical association between these two entities.

CONCLUSIONS

Computed tomography is a reliable tool for detecting ARSA, which strongly predicts the presence of a right NRLN. Routine preoperative evaluation of CT scans may facilitate early identification of this anatomical variation, thereby reducing the risk of iatrogenic nerve injury and improving surgical outcomes.

OP-353

Treatment Patterns And Survival Outcomes In Salivary Duct Carcinoma: A Population-Based SEER Analysis

Akash Srinivasan[1], **Wing Kiu Chou**[1], **Stuart C Winter**[2]

[1]*Medical Sciences Division, University of Oxford, Oxford, UK;* [2]*Nuffield Department of Surgical Sciences, University of Oxford, Oxford, UK*

BACKGROUND & AIM

Salivary duct carcinoma (SDC) is a highly aggressive malignancy that typically carries a poor prognosis. Due to its low incidence, there remains a lack of contemporary population-level data. This study aimed to characterise treatment patterns and survival outcomes for SDC and examine how these have evolved over time, using the Surveillance, Epidemiology and End Results (SEER) registry.

MATERIAL & METHODS

Patients with SDC diagnosed between 2004 and 2022 were identified from SEER, whilst earlier cases were excluded due to incomplete staging and treatment data. Kaplan-Meier curves with log-rank tests compared overall survival (OS) and disease-specific survival (DSS) by age, sex, stage, lymph node status, tumour grade, primary site and diagnosis era. For stage IV cases, temporal trends in treatment modality uptake were analysed and survival by treatment combination was compared (surgery and radiotherapy vs surgery and radiotherapy and chemotherapy). Univariate and multivariate Cox proportional hazards regression identified independent prognostic factors for OS and DSS.

RESULTS

A total of 319 patients were identified (2004–2014 n=86; 2015–2019 n=104; 2020–2022 n=129), with a median OS of 68 months and 5-year DSS rate of 63%. Kaplan-Meier analysis highlighted that less advanced stage and absence of lymph node involvement at the time of diagnosis were associated with improved overall and disease-specific survival (log-rank $p<0.0001$). Male sex was also associated with significantly worse OS ($p<0.05$), but not DSS ($p=0.39$). Conversely, survival was not significantly affected by tumour grade and primary site, and comparison between diagnosis eras did not reveal an improvement in survival over time. On multivariate Cox regression, N stage was the strongest independent prognosticator. Analysis of stage IV cases showed that the uptake of chemotherapy and triple therapy has increased over time, but the addition of chemotherapy to surgery and radiotherapy did not significantly affect survival (OS $p=0.75$, DSS $p=0.40$).

CONCLUSIONS

Recent SEER data highlights that stage of disease and lymph node status are key prognostic indicators in SDC, which is consistent with previous literature. Treatment approaches for advanced SDC have evolved over time with an increased role for chemotherapy, although this is yet to translate into improved survival.

OP-354

Tonsillar Histology Yields - Is It Worth It?

Umer Rashid[1]

[1]*Sandwell and West Birmingham Hospital Trust*

BACKGROUND & AIM

Tonsillectomy is one of the most commonly performed procedures in ENT. Traditionally, excised tonsils are routinely sent for histological analysis to exclude malignancy. Indications vary from highly suspicious lesions to asymmetrical tonsils without other red flag features. However, the diagnostic utility of routine histological examination remains debated1,2. This study aimed to determine the incidence of malignancy in tonsillectomy specimens at Sandwell and West Birmingham NHS Trust (SWBH).

MATERIAL & METHODS

A retrospective audit was conducted reviewing tonsillar histology results from 2021–2024 at SWBH. Data were collected from operative notes, clinical records, and pathology reports. Histological findings were categorised as benign or malignant.

RESULTS

Sixty histology results (120 tonsils) were analysed from a total of 187 tonsillectomies. The most common indication for histological analysis was tonsillar asymmetry. The majority of specimens demonstrated benign pathology, most commonly reactive follicular hyperplasia and reactive lymphoid hyperplasia. Two abnormal cases were identified: one diffuse large B-cell lymphoma and one atypical granular tumour. No malignancies were identified in patients undergoing tonsillectomy for asymmetrical tonsils alone.

CONCLUSIONS

Routine histological examination of tonsillectomy specimens with low clinical suspicion of malignancy appears to have a low diagnostic yield. Selective histological analysis based on clinical suspicion may represent a more cost-effective approach. Further research is required to guide evidence-based practice.

Surgical Management Of Parapharyngeal Space Tumors: Single Center Experience

ESRA ALTUNAL[1], **SİNAN SARĞIN**[1], **MUHAMMED TOPALOĞLU**[1], **CEMİLE BAYKAN ERYİĞİT**[1], **ŞAHİN ÖĞREDEN**[1], **ÖZGÜR YİĞİT**[1]

[1]*Department of Otorhinolaryngology – Head and Neck Surgery, İstanbul Başakşehir Çam and Sakura City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Parapharyngeal space (PPS) tumors are rare lesions accounting for less than 1% of head and neck neoplasms. Surgical treatment remains challenging because of the deep anatomical location of the PPS and its close relationship to major neurovascular structures. We aimed to present our surgical experience, preferred approaches, and postoperative outcomes in patients operated for PPS tumors.

MATERIAL & METHODS

We retrospectively reviewed eight patients who underwent surgery for PPS tumors at a tertiary referral center between August 2023 and January 2026. Preoperative evaluation included contrast-enhanced magnetic resonance imaging and detailed cranial nerve examination. Surgical approaches were selected according to tumor localization, size, and radiologic characteristics. Outcome measures included completeness of resection, cranial nerve morbidity, postoperative complications, and recurrence during follow-up.

RESULTS

The mean patient age was 46 years (range, 26–69 years), and the female-to-male ratio was 1:7. Four tumors were located in the prestyloid compartment and four in the poststyloid compartment. Mean tumor size was 5.4 cm. Histopathological diagnoses included schwannoma (n=3), pleomorphic adenoma (n=2), neurofibroma (n=1), secretory carcinoma (n=1), and basal cell adenocarcinoma (n=1). Surgical approaches included transparotid (n=4), transcervical (n=1), transoral (n=1), transoral robotic (n=1), and combined approaches (n=1). Gross total resection was achieved in all patients. Transient cranial nerve weakness occurred in two patients, while one patient developed a permanent neurological deficit. One postoperative hematoma was observed. No airway complications occurred. During a mean follow-up period of 18 months, no recurrence was detected.

CONCLUSIONS

Parapharyngeal space tumors require individualized surgical planning because of their heterogeneous histopathology, variable compartment localization, and close relationship to critical neurovascular structures. In our series, the use of different surgical approaches—including transcervical, transparotid, transoral, transoral robotic, and combined techniques—allowed complete tumor excision with acceptable morbidity. Careful preoperative imaging evaluation and detailed anatomical assessment remain essential for selecting the appropriate surgical strategy and minimizing complications.

BACKGROUND & AIM

Few studies assess thyroid surgical practice patterns in Mexico.1,2,3,4 The American Thyroid Association (ATA, 2015) and the Mexican Society of Oncology's clinical guidelines (SMEO, 2019) recommend de-escalating surgery for low-risk differentiated thyroid cancer. We determined whether surgical practice patterns evolved with changing international and national guidelines.5,6,7,8

MATERIAL & METHODS

Using Mexico's national public hospital discharge database, we identified all encounters for total thyroidectomy (TT) or thyroid lobectomy (TL) from 2008 to 2024. Surgical cases and associated diagnoses were extracted via ICD-9 and -10 codes. We used segmented interrupted time series regression with interruption points at 2015 (ATA), 2019 (SMEO), and 2020 (COVID-19 pandemic), and assessed for changes in level and slope of TL and TT rates per 100,000 population at each interruption point using national census data (2010, 2020). We accounted for autocorrelation using Newey-West standard errors. Analyses were performed in R (version 4.5.2) using R Studio (version 2025).

RESULTS

Between 2008-2024, 30,457 thyroidectomies (including TT [n=12,306, 40%] and TL [n=18,060, 60%]) were performed across 544 hospitals (median 162 unique hospitals/year (IQR 150-169)). Median age was 46 years (IQR 34-57), 88% female, 3% pediatric. Indications for surgery were malignant/unknown neoplasm (n=11,249, 37%) and benign (n=19,208, 63%) lesions. After 2015, there was a slight increase in the rate of TL for malignant/unknown neoplasms (+0.12 cases/100,000 population/year [p< 0.001]), while TT rates for malignant/unknown neoplasms remained stable. In 2019, the rate of TT for malignant disease decreased by 0.14/100,000 population/year (p=0.01). From 2019-2020, all thyroid surgery rates declined from 2.58/100,000 to 1.13/100,000 population. After 2020, surgery rates rebounded to 3.17/100,000 in 2024, reflecting a pre-COVID trajectory.

CONCLUSIONS

Practice patterns shifted towards lobectomy beginning in 2015, concurrent with international guidelines. The COVID-19 pandemic prevented assessment of sustained adherence. Post-pandemic data beyond 2024 is critical to determine whether guideline-concordant practices persist.

OP-357

Micrornas In Salivary Gland Cancers Associated With Poor Prognosis: A Systematic Review

Julia Pikul[1], **Maja Cieślik**[2], **Anna Rzepakowska**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery, Medical University of Warsaw, Warsaw, Poland;* [2]*Department of Epidemiology and Biostatistics Medical University of Warsaw, Warsaw, Poland*

BACKGROUND & AIM

Salivary gland cancers (SGCs) represent a heterogenous group of tumours with distinct clinical and histopathological characteristics. Due to the rarity of these malignancies, establishing reliable prognostic and predictive biomarkers remains challenging. MicroRNAs (MiRNAs) are small non-coding RNA molecules that regulate post-transcriptional gene expression. Recent studies have identified numerous dysregulation of miRNAs in SGCs, suggesting their potential roles in tumour development, progression and treatment response.

This systematic review aims to identify and summarize the current evidence on miRNA dysregulation in salivary gland carcinomas, with a particular focus on their prognostic relevance and therapeutic potential.

MATERIAL & METHODS

A systematic search of PubMed/MEDLINE, Embase, Web of Science, and the Cochrane Library was conducted up to December 03, 2025. The study was conducted in accordance with PRISMA guidelines and a pre-registered protocol (CRD 420251231827). Observational cohort and cross-sectional studies reporting microRNA dysregulation in human salivary gland tissues with prognostic assessment were included. Risk of bias was assessed using the QUIPS tool. Due to considerable heterogeneity narrative synthesis was conducted.

RESULTS

Twenty studies published between 2013-2025 which fulfil search criteria were further analysed. Dysregulation of miRNAs associated with prognosis was identified exclusively in AdCC and MEC. The majority of the included studies originated from Asian countries. Quantitative real-time PCR (qRT-PCR) was the most frequently used method for miRNA analysis. Most researchers focused on the evaluation of selected candidate miRNAs, rather than conducting comprehensive miRNA profiling approaches in relation to prognosis. Several distinct dysregulated miRNAs were identified across the studies. Among them, miR-21, miR-143, miR-145, miR-155 and miR-205 were reported in more than one study and linked to clinicopathological advancement and more aggressive disease course, thus poorer outcome.

CONCLUSIONS

MiRNAs appear to represent promising prognostic biomarkers, as independent predictors or with established clinicopathological features. However, current evidence remains limited to selected histological subtypes and relatively small patient cohorts. Further well-designed studies with long-term follow-up are required. Moreover, comprehensive miRNA profiling with prognosis assessment is necessary before specific miRNAs could be reliably established as biomarker and utilized in daily clinical practise.

Reconstruction Of Mandible In Children: Free Flap Reconstruction Or Expandable Prosthesis?

Grachev Nikolay Sergeevich[1], **Babaskina Natalia Vladimirovna**[1], **Lopatin Andrey Vyacheslavovich**[1], **Markov Nikolay Mikhailovich**[1], **Vorozhtsov Igor Nikolaevich**[1], **Starokorova Kapitolina Dmitrievna**[1]

[1]*Dmitry Rogachev National Medical Research Center Of Pediatric Hematology, Oncology and Immunology*; [2]*Department of Pediatric Surgery and Urology-Andrology named after Prof. L.P. Alexandrov, I.M. Sechenov First Moscow State Medical University, Ministry of Health of the Russian Federation*

BACKGROUND & AIM

The most common causes of extensive defect of the mandible in the pediatric population are trauma, tumors, or congenital malformations. There are different strategies of reconstruction, including using free flaps and prostheses, in order to recover functions of chewing, speaking, and an acceptable appearance, but none of them is universally accepted. This study aimed to provide an update on aesthetic and functional outcomes in pediatric patients who undergo mandible reconstruction after having extensive bone defects.

MATERIAL & METHODS

Between 2015 and 2025, 70 children with mandible defects (mean age, 12 years; range, 2-18 years) underwent surgery to reconstruct the lower jaw with a free fibular flap (n=50) or expandable endoprosthesis (n=20) because of malignant (n=25) or benign (n=43) tumors or hemifacial microsomia (n=2). The results were evaluated from the position of facial symmetry and functional rehabilitation, including the possibility of dental implantation.

RESULTS

The best results of free flap reconstruction were achieved in the older patient group (11-18 y.o.), while in younger children (2-10 y.o.) free flaps did not show sufficient growth to compensate the enlargement of the unaffected side, which resulted in increased facial asymmetry and the impossibility of dental implantation because of the small volume of the bone part of the flap. Expandable prostheses showed better results in younger children, resulting in better facial symmetry during their growing up and preserving the donor area for possible free flap reconstruction when they reach the age of 11-14 years.

CONCLUSIONS

Microsurgical free flap reconstruction is preferable for children aged 11-18 years, giving good aesthetic results and enabling full functional reconstruction; in younger children, better results are achieved when expandable prostheses are used, as they can be corrected in size during the children's active growth phase.

KEYWORDS

free flap, pediatric microsurgery, mandible, expandable prosthesis

OP-359

OBESİTY AS A NEW RİSK FACTOR İN HEAD AND NECK PARAGANGLİOMAS: A SERİES OF 26 PATİENTS WİTHİN THE FRAMEWORK OF THE CHRONİC HYPOXİA HYPOTHESİS

Şahin Öğreden[1], **Salih Akyel**[1], **Büşranur Coşan Seçgin**[1], **Ruçhan Seçgin**[1], **Pooya Kara**[1], **Özgür Yiğit**[1]

[1]*Cam and Sakura City Hospital*

BACKGROUND & AIM

Head and neck paragangliomas (HNPs) are rare vascular tumors arising from chemoreceptor tissues such as the carotid body and vagal nerve. "Chronic hypoxia" is regarded as a key triggering mechanism in their pathogenesis. While increased incidence has historically been associated with high-altitude populations, obesity is now considered a source of systemic chronic hypoxia due to its links with obstructive sleep apnea and impaired tissue perfusion. This study evaluates the Body Mass Index (BMI) profiles of HNP patients treated in our clinic and discusses the possible contribution of obesity to the development of these uncommon tumors in light of current literature.

MATERIAL & METHODS

In this study, data from 26 patients operated on with a diagnosis of HNP at the Başakşehir Çam and Sakura City Hospital ENT Clinic between 2020 and 2025 were retrospectively reviewed. The distribution of patients according to anatomical location

was recorded as follows: 21 Glomus Caroticum (80.7%), 4 Glomus Vagale (15.3%), 1 Glomus Tympanicum (4%). Demographic data and BMI values (kg/m2) calculated from preoperative height-weight measurements were analyzed. Data were grouped by gender and presented as mean±standard deviation (SD). The obtained BMI data were evaluated in comparison with general population averages in Turkey.

RESULTS

Of the 26 patients included in the study, 19 (73.1%) were female and 7 (26.9%) were male. The mean age of the total patient group was determined to be 53.4±14.5 (32–74) years. The overall mean BMI of the entire group was calculated as 30.16±7.4 kg/m2. Gender-based analysis revealed a mean BMI of 31.24±7.8 kg/m2 for female patients (n=19) and 27.21± 5.6 kg/m2 for male patients (n=7). In our series, %53.8 (n=14) of patients were classified as "obese" (BMI ≥ 30) according to WHO criteria, and % 19 (n=5) were classified as "overweight" (BMI 25-29.9). The percentage of patients with normal weight (BMI ≤ 25) was only %26.9 (n=7). It was observed that the prevalence of obesity was particularly high in female patients compared to the general population, and the vast majority of Glomus Caroticum cases had high BMI values.

CONCLUSIONS

The fact that the majority of HNP patients in our series (73.1%) fall into the overweight or obese categories indicates that obesity may be a significant modifiable risk factor in the pathogenesis of these tumors. It is thought that obesity-related alveolar hypoventilation and accompanying hypoxic processes stimulate neoplastic transformation in paraganglionic tissues. These findings highlight the clinical importance of screening metabolic profiles and sleep disorders in patients diagnosed with HNP or those in risk groups. Further large-scale prospective studies are needed to elucidate the molecular mechanisms of this strong correlation between obesity and paraganglioma development.

OP-360

Can Preoperative Systemic Inflammatory Markers Predict Parotid Tumor Pathology?

Prof. Dr. Senem Cengel Kurnaz[1], **Dr. Ahmet Emin Karşıyaka**[1]

[1]*Ondokuz Mayis University, Faculty of Medicine, Department of Otorhinolaryngology.*

BACKGROUND & AIM

Preoperative differentiation of parotid gland tumors — particularly between Warthin tumor and malignant lesions — remains challenging, as fine-needle aspiration cytology and imaging lack sufficient specificity. Systemic inflammatory indices derived from routine complete blood count, including NLR, PLR, SII, and SIRI, have shown diagnostic and prognostic value in various head and neck malignancies. However, their utility in distinguishing parotid tumor subtypes has not been well established. This study aimed to evaluate the preoperative predictive value of these four inflammatory indices in differentiating pleomorphic adenoma, Warthin tumor, and malignant parotid tumors.

MATERIAL & METHODS

This retrospective study included 90 patients who underwent parotidectomy at our institution and were pathologically confirmed to have parotid gland tumors. Patients were categorized into three groups: pleomorphic adenoma (PA; n=30), Warthin tumor (WT; n=30), and malignant tumors (Malignant; n=30; including mucoepidermoid carcinoma [n=20] and adenoid cystic carcinoma [n=10]). Preoperative complete blood count parameters — including absolute neutrophil, lymphocyte, monocyte, and platelet counts — were recorded. The following inflammatory indices were calculated: NLR (neutrophil/lymphocyte), PLR (platelet/lymphocyte), SII (platelet × neutrophil/lymphocyte), and SIRI (neutrophil × monocyte/lymphocyte). Group comparisons were performed using the Kruskal-Wallis test, with post-hoc pairwise comparisons using the Mann-Whitney U test with Bonferroni correction. Receiver operating characteristic (ROC) curve analysis was performed to assess the discriminative ability of significant markers for malignancy versus benign tumors, and specifically for Warthin tumor versus malignant tumors. Statistical significance was set at $p<0.05$.

RESULTS

A total of 90 patients were included: 30 pleomorphic adenoma, 30 Warthin tumor, and 30 malignant tumors. The groups were similar in gender but differed significantly in age (p=0.0004).

Among the four indices, only PLR differed significantly across groups (p=0.007), with malignant tumors showing higher values than Warthin tumors (median 139.6 vs. 105.1; p=0.002). SIRI reached borderline significance (p=0.045) but did not survive post-hoc correction. SII and NLR showed no significant differences (p>0.05).

ROC analysis identified PLR as the best-performing marker. For malignant versus benign tumors, PLR achieved an AUC of 0.688 (sensitivity 73.3%, specificity 68.3%, cutoff >119.6). For the clinically challenging Warthin versus malignant comparison, AUC improved to 0.752 (sensitivity 70.0%, specificity 76.7%, cutoff >123.2). SII, NLR, and SIRI failed to reach acceptable discriminative performance (AUC <0.60).

CONCLUSIONS

PLR was the only marker with meaningful discriminatory power for detecting malignant parotid tumors (AUC 0.688; cut-off 119.6; sensitivity 73.3%, specificity 68.3%). SII and NLR showed no significant intergroup differences. SIRI demonstrated a

modest trend in differentiating Warthin tumor from pleomorphic adenoma but did not reach corrected significance. As a cost-free, universally available index derived from routine blood counts, PLR may serve as a useful adjunct in preoperative parotid tumor assessment. Prospective multicenter studies with larger cohorts are needed to validate these findings and establish clinically applicable thresholds.

OP-361

Survival Outcomes In Mucosal Head And Neck Adenosquamous Carcinoma: A Meta-Analysis Of 585 Patients

Vincenzo Clemente[1], **Marc Nkana**[2]

[1]*University of Messina;* [2]*University of Mons*

BACKGROUND & AIM

Adenosquamous carcinoma (ASC) of the head and neck is a rare and aggressive malignancy characterized by combined squamous and glandular differentiation. Due to its low incidence, long-term survival outcomes remain poorly defined. The aim of this study was to provide a pooled estimate of 5-year overall survival (OS) in mucosal head and neck ASC through systematic review and meta-analysis.

MATERIAL & METHODS

A systematic review of the literature was conducted focusing on mucosal head and neck ASC. Studies reporting 5-year overall survival were included in the primary analysis. Random-effects meta-analysis of proportions with logit transformation was performed to calculate pooled survival estimates. Between-study heterogeneity was assessed using the I^2 statistic. A leave-one-out sensitivity analysis was conducted to evaluate the robustness of the pooled estimate. A secondary analysis examined 5-year disease-specific survival (DSS).

RESULTS

Four studies comprising 585 patients were included in the primary meta-analysis. The pooled 5-year OS was 38.1% (95% CI: 30.7%–46.0%), with moderate heterogeneity (I^2 = 63%). Sensitivity analysis demonstrated stable survival estimates ranging between 35% and 41% after sequential study exclusion. Secondary analysis of DSS, including three studies (375 patients), showed a pooled 5-year DSS of 37.4% (95% CI: 15.9%–65.3%), with substantial heterogeneity (I^2 = 94%), largely attributable to anatomical subsite variability.

CONCLUSIONS

Mucosal head and neck ASC is associated with poor long-term survival, with fewer than 40% of patients alive at 5 years. Survival outcomes appear influenced by tumor location. These findings provide quantitative clarification of prognosis in this rare malignancy and may support risk-adapted management strategies.

Temporal Distribution Of Aggressive Variants Of Papillary Thyroid Carcinoma And Their Relationship With Clinicopathological Parameters

Ömer faruk Yılmaz[2], **Orhan Tunç**[3], **Cengiz Durucu**[3], **Behçet Günsoy**[3], **Erhan Çiftel**[4], **Mehmet Hizmetçi**[3], **Mehmet Salih Emir**[3], **Koray Tümüklü**[1]

[1]*Private Practice, Gaziantep, Turkey;* [2]*Nizip State Hospital, Gaziantep, Turkey;* [3]*Gaziantep University;* [4]*Batman Training and Research Hospital, Batman, Turkey*

BACKGROUND & AIM

Papillary thyroid carcinoma (PTC) is the most common thyroid malignancy, with a generally favorable prognosis. However, the clinical behavior varies according to the histopathological variants. Subtypes like tall cell, hobnail, diffuse sclerosing, columnar, and solid are considered "aggressive variants." This study retrospectively reviewed the pathology reports of patients with PTC who underwent surgery at Gaziantep University's Department of Otorhinolaryngology between 2012 and 2024. The aim of this study was to reveal the distribution of aggressive subtypes over the years, analyze their relationship with clinicopathological parameters, and draw inferences for patient management and treatment planning based on the findings.

MATERIAL & METHODS

A total of 673 patients were included in the study, and a comparative analysis was conducted by dividing them into three periods based on the dates of surgery (2012–2015, 2016–2019, and 2020–2024). Aggressive and nonaggressive variants were compared in terms of demographic data, tumor size, capsular invasion, multifocality, extrathyroidal extension (ETE), lymph node metastasis (LNM), distant metastasis, local recurrence, and disease stage.

RESULTS

The study observed a marked increase in the rates of aggressive variants over time. The proportion of aggressive subtypes, which was 24.1% in the initial period, rose to 47.7% in the final period. Aggressive variants were associated with higher LNM, capsular and vascular invasion, local recurrence, distant metastasis, and ETE rates. Additionally, the fact that tumors located in the isthmus were notably associated with a higher rate of LNM (34.5 %) is among the study's notable findings.

CONCLUSIONS

These findings highlight the strong association between aggressive variants and poor prognostic parameters and the increasing incidence of these subtypes over time. Therefore, information on histological variants should be considered in preoperative and postoperative patient management and follow-up; in particular, more careful monitoring and personalized treatment approaches should be adopted for aggressive subtypes.

OP-363

Postoperative Parathormone And Calcium Trajectories After Thyroid Lobectomy And Completion Thyroidectomy: Predictive Value Of The Early Percentage PTH Drop For Early Biochemical Hypoparathyroidism

Ömer Bayır[2], **Semih Toklu**[1], **Beyza Yürür**[1], **Ceren Karaçalık Ünver**[3], **Bekir Uçan**[3], **Erman Çakal**[3]

[1]Department of Otorhinolaryngology – Head and Neck Surgery, Ankara Etlik City Hospital, Ankara, Turkey; [2]Acıbadem Mehmet Ali Aydınlar University, Maslak Hospital, Department of Otorhinolaryngology – Head and Neck Surgery, İstanbul, Türkiye; [3]Department of Endocrinology and Metabolism, Ankara Etlik City Hospital, Ankara, Turkey

BACKGROUND & AIM

Completion thyroidectomy (cTx) — totalization performed after a prior lobectomy when pathology reveals high-risk features — is increasingly performed in routine endocrine surgery practice. Its impact on parathyroid function, however, has been less extensively studied than that of primary total thyroidectomy, and validated early predictors of postoperative hypoparathyroidism in this specific setting remain limited. We aimed to describe postoperative parathormone (PTH) and calcium trajectories after thyroid lobectomy and cTx, to estimate rates of early biochemical and permanent hypoparathyroidism, and to evaluate the predictive performance of the percentage PTH drop within the first 24 postoperative hours.

MATERIAL & METHODS

Single-center retrospective observational study at Ankara Etlik City Hospital. Sixty-six adult patients (≥18 years) operated between 2023 and 2025 were included; 34 underwent thyroid lobectomy and 30 underwent completion thyroidectomy (cTx, defined as totalization after a previously performed lobectomy), while 2 patients with incomplete operative records were not included in between-group analyses. Pre- and postoperative (first 24 hours, discharge, 1- and 6-month) PTH, calcium, phosphorus, magnesium, 25-OH vitamin D and surgical specimen pathology findings were recorded. Early biochemical hypoparathyroidism was defined as PTH <15 pg/mL within the first 24 postoperative hours; permanent hypoparathyroidism as 6-month PTH <15 pg/mL; biochemical hypocalcemia as serum calcium <8.5 mg/dL. Wilcoxon signed-rank, Mann–Whitney U and Fisher's exact tests were applied as appropriate. Receiver operating characteristic (ROC) analysis with Youden's index identified the optimal cut-off. Two-sided $p<0.05$ was significant.

RESULTS

Median age was 42 years (IQR 34–50); 76% were female. Papillary carcinoma/microcarcinoma was reported in 25/64 (39%) and incidental parathyroid tissue in 9/64 (14%). No symptomatic hypoparathyroidism, hematoma or reoperation occurred; clinical hypocalcemia was seen in 3/61 (5%) and recurrent laryngeal nerve palsy in 2/61 (3%). Levothyroxine was initiated in 39/58 (67%); median dose 100 µg/day. Serum calcium fell from 9.64 to 8.91 mg/dL within 24 hours ($p<0.001$) and recovered to 9.39 mg/dL at 6 months ($p=0.011$). Early biochemical hypoparathyroidism (PTH <15 pg/mL) was observed in 10/61 (16%); no permanent hypoparathyroidism was identified among patients with 6-month PTH measurement (0/25). The cTx group had a higher rate than lobectomy (27% vs 6%; $p=0.036$). The first-24-hour percentage PTH drop predicted early hypoparathyroidism with high accuracy (AUC=0.97; ≥54% drop: 90% sensitivity, 93% specificity), though preliminary given limited events (n=10).

CONCLUSIONS

In this lobectomy and completion thyroidectomy cohort, no symptomatic or permanent hypoparathyroidism was observed and major complications were rare — consistent with previous high-volume cTx series (Nicholson; Issa). Early biochemical hypoparathyroidism occurred in 16% overall, was four-fold higher after cTx than lobectomy, and generally resolved within one month. Extending prior PTH-drop observations in total thyroidectomy (Kul et al.) to the cTx setting, a ≥54% PTH drop within the first 24 postoperative hours emerged as a candidate threshold to guide early calcium/vitamin D supplementation and discharge timing; validation in larger, prospective cohorts is warranted.

OP-364

UTILITY OF CHOLINE PET-CT AS A SINGLE IMAGING MODALITY FOR LOCALISATION AND CURE OF PARATHYROID ADENOMA

Vertika Tewari[1], **Antony Jacob**[1]

[1]*University Hospital Lewisham*

BACKGROUND & AIM

Primary hyperparathyroidism commonly results from parathyroid adenoma. Accurate pre-operative localisation is crucial for minimally invasive surgery. This study evaluates the diagnostic accuracy and clinical utility of ^18F-choline PET-CT compared with conventional imaging modalities, including ultrasound and sestamibi scintigraphy, in hyperparathyroidism management.

1. To determine the diagnostic accuracy of ^18F-choline PET-CT in identifying parathyroid adenomas in patients with hyperparathyroidism.

2. To compare the diagnostic accuracy, sensitivity, and specificity of ^18F-choline PET-CT with technetium-99m sestamibi scintigraphy (MIBI) and neck ultrasound.

3. To perform a cost analysis of imaging strategies used for pre-operative localisation.

MATERIAL & METHODS

A prospective cohort study was conducted following appropriate institutional approval. Patients with suspected parathyroid adenoma who underwent pre-operative localisation with 18F-choline PET-CT, MIBI, and neck ultrasound, followed by parathyroid surgery with available histopathological confirmation, were included. Pregnant or breastfeeding patients and those unable to tolerate imaging procedures or with contraindications to radiotracer administration were excluded.

Imaging findings were compared with histopathology as the reference standard. Diagnostic accuracy, sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were calculated where applicable. A cost analysis was performed to evaluate the economic impact of different imaging pathways.

RESULTS

18F-choline PET-CT was performed in 50 patients in whom ultrasound and/or MIBI were negative or inconclusive. Histopathology confirmed parathyroid adenoma in 49 of 50 patients, demonstrating a concordance rate of 98%. The diagnostic accuracy of choline PET-CT was 98%, with a sensitivity of 100% and a positive predictive value of 98%.

Specificity and negative predictive value could not be calculated due to the absence of true negative cases, as imaging was performed exclusively in patients with biochemically confirmed hyperparathyroidism who proceeded to surgery. Median serum calcium levels showed a significant postoperative reduction from 2.7 mmol/L (IQR 2.68–2.85) pre-operatively to 2.54 mmol/L (IQR 2.44–2.68) post-operatively ($p < 0.0001$), confirming biochemical cure.

CONCLUSIONS

18F-choline PET-CT demonstrates excellent diagnostic performance for pre-operative localisation of parathyroid adenomas and may be considered as a single-modality imaging technique, potentially replacing multimodality imaging pathways. Published literature reports pooled sensitivities of approximately 70–80% for neck ultrasound and 75–85% for 99mTc-sestamibi imaging, whereas choline PET-CT consistently demonstrates superior localisation accuracy. Its increasing availability, comparable cost, and similar radiation exposure to MIBI further support its role as a first-line localisation tool in selected patients.

Beyond Tumor Mutational Burden: Genetic Determinants Of Survival In Patients With Inoperable Or Metastatic Oral Cavity Cancer Treated With PD-1 Inhibitor Monotherapy

Ayça Tan[1], **Sabri Mutlu**[2], **Görkem Eskiizmir**[3]

[1]*Manisa Celal Bayar Üniversitesi, Patoloji Anabilim Dalı;* [2]*Manisa Turgutlu Devlet Hastanesi;* [3]*Manisa Celal Bayar Üniversitesi, Kulak Burun Boğaz Hastalıkları Anabilim Dalı*

BACKGROUND & AIM

In patients with inoperable or metastatic oral cavity squamous cell carcinoma (OCSCC), patient selection for PD-1 inhibitor therapies remains challenging. Although tumor mutational burden (TMB) is a candidate biomarker for treatment response, its prognostic role is limited by the relatively low prevalence of TMB-high tumors in OCSCC. Therefore, this study aimed to investigate the association between genomic mutation profiles, TMB, and survival outcomes in patients with inoperable or metastatic OCSCC treated with PD-1 inhibitor monotherapy.

MATERIAL & METHODS

Data were obtained from the cBioPortal for Cancer Genomics database. Patients with inoperable or metastatic OCSCC who received pembrolizumab or nivolumab monotherapy were included. Patients receiving combined immune checkpoint inhibitor regimens or non-squamous histology were excluded. Clinical characteristics, genomic alterations, TMB status, and 1-year event-free survival (EFS) were analyzed. Comparisons were performed according to TP53, TERT, and PIK3CA mutation status and TMB categories.

RESULTS

Forty-seven patients met the inclusion criteria. Most patients were male (85.1%), older than 50 years (72.3%), and had tongue tumors (55.3%). Metastatic disease was present in 57.4% of cases. The most frequent mutations were TP53(53.2%), TERT (51.1%), and PIK3CA (25.5%). Tumors with TMB ≥10 constituted 12.7% of the study cohort. TERT-mutant tumors demonstrated significantly higher TMB values compared with TERT-wild tumors (p=0.02). One-year EFS did not differ significantly according to sex, age, tumor location, metastasis status, or mutation profile. One-year EFS rates were 43.1% versus 68.1% in TP53-mutant and wild tumors, respectively (p=0.12), and 78.7% versus 47.0% in PIK3CA-mutant and wild-type tumors, respectively (p=0.09). Patients with TMB ≥10 demonstrated a 100% 1-year EFS rate compared with 50.8% in patients with TMB <10, although this difference did not reach statistical significance (p=0.24).

CONCLUSIONS

Higher TMB is associated with substantially improved survival in patients with inoperable or metastatic OCSCC treated with PD-1 inhibitor monotherapy. A remarkable association between TERT mutation and increased TMB is noteworthy. Further studies with larger cohorts are required in order to clarify the predictive and prognostic role of genomic profiling in patients with inoperable or metastatic OCSCC treated with PD-1 inhibitor monotherapy.

OP-366

Study The Quality Of Life Of Patients With Ototoxicity Due To Platinum Chemotherapy, With Hearing Aid Versus Without: PROTOTOX Study

Romina MASTRONICOLA[1], **Gilles DOLIVET**[1]

[1]*INSTITUT DE CANCEROLOGIE DE LORRAINE FRANCE*

BACKGROUND & AIM

Platinum salts are widely used for the treatment of cancers, including head and neck cancers. Despite their efficacy, platinum salts can induce neurosensory disorders such as ototoxicity, tinnitus, and decreased hearing acuity. These side effects can have a major impact on the quality of life of patients and are not often considered after treatment.The PROTOTOX study aims to compare the quality of life of patients with hearing aids in the case of ototoxicity due to platinum salt-based chemotherapy, according to 2 treatments: standard management without equipment versus standard management with equipment

MATERIAL & METHODS

The PROTOTOX study is an open pilot prospective monocentric and randomized study executed through collaboration of the Institut de Cancérologie de Lorraine (nonprofit comprehensive cancer institute). A total of 52 patients with head and neck cancer undergoing platinum-based chemotherapy and presenting with hypoacusis will be included and followed by an ear, nose, and throat specialist. Audiometric testing will be performed, and eligible participants who consent will be randomized to either receive or not receive hearing aids (groups 1 and 2). The primary endpoint of this study is to compare the quality of life of the patients undergoing platinum-based chemotherapy presenting with hypoacusis according to 2 ways of care: standard care without hearing aid versus standard care with hearing aid.

RESULTS

The study protocol has been opened and is actively recruiting participants. The protocol was launched on November 23, 2023, and data collection is ongoing and will be completed once all patients have completed the protocol. At least 27 patients have been recruited to date. The date of publication of the results is not yet known.

CONCLUSIONS

The PROTOTOX study aims at demonstrating that the huge impact of platinum-based chemotherapy on hearing abilities must be managed to maintain the patients' quality of life. Hearing aid is the solution experimented here.

OP-367

Diagnostic Accuracy Of Ultrasonography Versus Computed Tomography In Deep Neck Space Infections: A Retrospective Analysis Of 114 Cases

Meltem Akpınar[1], **Beyza Demirci**[1], **Uğur Yaşar Kurumuş**[1]

[1]*Department of Otorhinolaryngology–Head and Neck Surgery, Sancaktepe Şehit Prof. Dr. İlhan Varak Training and Research Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

The aim of this study was to determine the diagnostic sensitivity of Computed Tomography (CT) and Ultrasonography (USG) in patients with suspected abscess due to deep neck infection (DNI) by comparing imaging findings with surgical outcomes.

MATERIAL & METHODS

Data from 114 adult patients diagnosed with deep neck infection were retrospectively reviewed. In all patients, CT and/or USG findings were compared with surgical results. Surgical findings were accepted as the gold standard for confirming the presence of an abscess. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were calculated for both imaging modalities. The difference between CT and USG was evaluated using the McNemar test.

RESULTS

The study included 114 patients (63 males, 51 females; mean age: 33.9±16.0 years). Primary etiologies were peritonsillar (36.8%), odontogenic (17.5%), and parotid-origin infections (9.6%). For USG, sensitivity, specificity, PPV, and NPV were 34.6%, 83.9%, 64.3%, and 60.5%, respectively; for CT, these values were 32.7%, 64.5%, 43.6%, and 53.3%. In a sub-analysis of 52 surgically confirmed abscesses, USG sensitivity was 69.2% and CT sensitivity was 54.8%. Surgical drainage was required in 72.8% (n=83) of cases. Mean hospital stay was 155±45 hours. Duration of stay was significantly longer in USG-positive patients (190 vs. 145 hours), whereas CT positivity showed a more limited difference. A 44.7% discrepancy between CT and USG was observed, suggesting that diagnostic inconsistency may necessitate additional imaging and increase costs within the clinical decision-making process.

CONCLUSIONS

In our study, USG demonstrated high sensitivity in detecting deep neck abscesses, likely reflecting selection bias toward diagnostically accessible superficial cases. CT remains critical for evaluating deep spaces—such as parapharyngeal and retropharyngeal areas—and for surgical planning. While USG is an effective first-line diagnostic tool for selected patients, CT is the primary choice for complex cases. Restricted emergency access limited magnetic resonance imaging (MRI) use in our study. Given its superior specificity, PPV, accessibility, and cost-effectiveness, ultrasonography provides significant clinical advantages and should be considered a valuable initial diagnostic modality in managing deep neck infections.

OP-368

Development And Internal Validation Of A Nomogram For Predicting Recurrence Or Persistent Disease In Pediatric And Adolescent Differentiated Thyroid Carcinoma

Shengcai Wang[1], **Xiaoge Liu**[1], **Wei Pang**[1]

[1]*Beijing Children's Hospital, Capital Medical University, Beijing, China*

BACKGROUND & AIM

Limited research has specifically examined the identification of prognostic factors and the development of prediction models for the combined endpoint of recurrence or persistent disease in pediatric and adolescent differentiated thyroid carcinoma (DTC). Although disease-specific mortality is generally low, recurrence and persistent disease remain clinically relevant and are associated with treatment escalation and long-term follow-up burden. An individualized tool to estimate the risk of recurrence or persistent disease could facilitate risk-adapted postoperative management and surveillance in this young population.

MATERIAL & METHODS

We conducted a retrospective, single-center study of pediatric and adolescent patients diagnosed with DTC at Beijing Children's Hospital, Capital Medical University. The primary endpoint was recurrence or persistent disease, with a median follow-up of 36.6 months. A multivariable model was developed to identify independent predictors of this endpoint and to construct a nomogram. Model performance was assessed by discrimination, calibration, and decision curve analysis, with internal validation.

RESULTS

A total of 211 patients meeting the inclusion criteria were included. Multivariable analysis identified four independent predictors of recurrence or persistent disease: tumor size, multifocality, tumor aggressiveness, and the extent of lymph node dissection. A nomogram incorporating these variables demonstrated moderate discrimination (C-index 0.642), which remained similar after internal validation (C-index 0.635) and external validation (C-index 0.626). Decision curve analysis suggested potential clinical utility of the nomogram across a range of threshold probabilities.

CONCLUSIONS

We developed and internally validated a nomogram to estimate individualized risk of recurrence or persistent disease in pediatric and adolescent DTC in a single-center cohort. This model highlights the prognostic value of tumor burden and surgical management related features and may assist clinicians in tailoring postoperative management and follow-up intensity for this population.

Continuous Versus Intermittent Intraoperative Neuromonitoring Of The Recurrent Laryngeal Nerve During Thyroidectomy: A Systematic Review And Meta-Analysis

Julia Gimenes da Silva Dias[1], **Matheus Bassan Chenta**[2], **Pedro Luis de Moraes Afonso**[3], **Gabriela Belizário Rogick**[4], **Lara Lucena Fernandes Filgueiras**[5], **Ananda Reis do Patrocínio Rodrigues**[6], **Guilherme Diniz Ferreira**[7], **Isabela Tolosa Pontes**[1], **Flávio Carneiro Hojaij**[8]

[1]*Faculdade de Ciências Médicas da Santa Casa de São Paulo;* [2]*Federal University of Heath Sciences of Rio Grande do Sul;* [3]*Universidade Santo Amaro;* [4]*São Leopoldo Mandic Araras;* [5]*Nova Esperança Faculty of Medicine;* [6]*Universidade de Excelência;* [7]*Faculty of Medical Sciences of Minas Gerais;* [8]*Hospital das Clínicas of University of São Paulo*

BACKGROUND & AIM

Recurrent laryngeal nerve (RLN) injury remains a major complication of thyroidectomy. Although intermittent intraoperative neuromonitoring (i-IONM) is widely used, continuous monitoring (c-IONM) may allow earlier detection of impending injury. This study aimed to compare c-IONM versus i-IONM during thyroidectomy regarding postoperative RLN palsy and intraoperative loss of signal (LOS).

MATERIAL & METHODS

A systematic review and meta-analysis was conducted in accordance with PRISMA 2020 and registered in PROSPERO (CRD420261287698). PubMed/MEDLINE, Embase, and CENTRAL were searched through December 2025. Studies directly comparing c-IONM with i-IONM in adults undergoing thyroidectomy and reporting extractable outcome data were eligible. Pooled risk ratios (RRs) with 95% confidence intervals (CIs) were calculated using random-effects models.

RESULTS

Fourteen studies met inclusion criteria. Twelve studies were included in the primary meta-analysis for early postoperative RLN palsy. c-IONM was associated with lower risk of RLN palsy compared with i-IONM (RR 0.62; 95% CI 0.51–0.74; I^2=0%). For LOS (three studies), the difference was not statistically significant (RR 0.69; 95% CI 0.42–1.13; I^2=0%).

CONCLUSIONS

c-IONM was associated with a reduced risk of early postoperative RLN palsy compared with i-IONM, while evidence for LOS reduction was inconclusive.

KEYWORDS

continuous neuromonitoring; intermittent neuromonitoring; c-IONM; i-IONM; loss of signal; recurrent laryngeal nerve palsy; thyroid surgery

Diagnostic Performance Of Fine-Needle Aspiration And Imaging In Salivary Gland Tumors: A 10-Year Retrospective Analysis

Carmen Manzanares López-Rendo[1], **Ana Martín González**[1], **Lucía Clement Alonso**[1], **Elena Balduz Moreno**[1], **Sergio Marín Asensio**[3], **David Corral Fontecha**[2], **Claudia Llorente Álvarez**[1], **Carmen Fernández-Cedrón Bermejo**[1], **Ignacio Álvarez Álvarez**[1], **Cristina Martín Villares**[4], **Cristina López Cadenas**[5], **Sara Fernandez Cascón**[1]

[1]ENT department at Complejo Asistencial Universitario de León; [2]Radiology department at Complejo Asistencial Universitario de León; [3]Pathology Department at Complejo Asistencial Universitario de León; [4]ENT department at Hospital Universitario de Burgos; [5]University of Leon

BACKGROUND & AIM

Salivary gland tumors consist of a heterogeneous group of neoplasms with diverse origins, histological features, and biological behaviors. Although imaging studies and cytology provide an initial diagnostic approach, the definitive diagnosis is established through histopathological examination of the surgical specimen. The aim of this study was to evaluate the concordance between initial diagnostic tests and the final histological diagnosis

MATERIAL & METHODS

A retrospective, descriptive, observational study was conducted between 2015 and 2025, reviewing the medical records of patients who underwent surgery for salivary gland tumors. Demographic variables, affected glands, imaging studies, preoperative fine-needle aspiration cytology (FNAC), and definitive histopathological diagnoses were analyzed. Metastatic tumors and cases with incomplete data were excluded. Statistical analysis was performed using SPSS software

RESULTS

A total of 357 salivary gland tumors were analyzed. Mean age was significantly higher in malignant tumors compared to benign tumors (66.98 vs. 57.65 years; p=0.018). The most frequent benign tumors were pleomorphic adenoma (38.6%) and Warthin tumor (36.03%), with the parotid gland being the most commonly affected site. Adenoid cystic carcinoma and salivary duct carcinoma were the most frequent malignant neoplasms (2.57%).

FNAC showed a diagnostic accuracy of 90.84%, sensitivity of 86.10%, specificity of 73.47%, positive predictive value of 94.58%, and negative predictive value of 75% for malignancy detection. Overall concordance in histological identification was 88.72%, significantly lower in malignant tumors (11.28%; p<0.001).

Regarding imaging studies, ultrasound demonstrated a sensitivity of 97.67%, whereas CT scan achieved a specificity of 77.78% and an overall accuracy of 93.59%. Both modalities showed a positive predictive value of approximately 93%; however, CT demonstrated a higher negative predictive value than ultrasound.

CONCLUSIONS

FNAC showed high diagnostic performance in the preoperative evaluation of salivary gland tumors, particularly for detecting malignancy. However, its lower accuracy in the histological characterization of malignant tumors highlights the need for complementary imaging studies. Ultrasound and CT proved to be complementary and highly useful techniques for therapeutic planning

Correlation Between Preoperative PET-CT Findings And Histopathologic Nodal Status In Ct1–T2 Oral Tongue Squamous Cell Carcinoma

Hassan Alkhars[2], **Maha Alshubayni**[1], **Ahmed Hatem**[1], **Norah Alshareef**[1], **Hadeel Algurair**[1], **Hussien Alsafar**[1]

[1]King Faisal specialist hospital and research centre; [2]King Saud University

BACKGROUND & AIM

The role of 18F-FDG PET/CT in detecting occult cervical lymph node metastasis in early-stage oral tongue squamous cell carcinoma (OTSCC) remains uncertain. This study aimed to evaluate the diagnostic accuracy of PET/CT and the predictive value of SUVmax for nodal metastasis in patients with cT1–T2, cN0 OTSCC.

MATERIAL & METHODS

A retrospective analysis was conducted on 100 consecutive patients with surgically treated early-stage OTSCC who underwent preoperative PET/CT. PET nodal findings were categorized as 'suspicious' or 'not suspicious' basesd on SUVmax level reported by two radiologist. The reference standard was histopathologic nodal status (pN0 vs pN+). Diagnostic performance measures—sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV)—were calculated. Receiver operating characteristic (ROC) analysis was performed to assess the discriminative ability of SUVmax, and subgroup analyses were conducted by pathologic T-stage (pT1 vs pT2) and depth of invasion (DOI <4 mm vs ≥4 mm).

RESULTS

Among 100 patients (mean age 55.9 ± 15.5 years), 30% had pathologically positive lymph nodes. PET/CT demonstrated sensitivity 53.3%, specificity 65.7%, PPV 40.0%, and NPV 76.7% for nodal metastasis detection. The SUVmax ROC AUC was 0.556, with an optimal cutoff of ≈2.0 (sensitivity 46.4%, specificity 71.0%). Subgroup analyses showed comparable performance across pT1 (AUC 0.541) and pT2 (AUC 0.563) tumors. In patients with DOI <4 mm, all nodes were negative, while in DOI ≥4 mm cases, PET sensitivity was 53.3% and specificity 60.3%.

CONCLUSIONS

In early-stage OTSCC, PET/CT demonstrates moderate specificity but limited sensitivity for occult nodal metastasis. SUVmax provides only weak discrimination between node-positive and node-negative disease. Routine use of PET/CT for nodal staging in cT1–T2, cN0 tongue carcinoma should therefore be interpreted with caution, and surgical staging remains the definitive approach.

Investigation Of The Relationship Between MEOX2 Gene Expression And Clinicopathological Parameters In Squamous Cell Carcinoma Of The Tongue

Halime Kılıç[1], **Seval Turna**[2], **Cömert Şen**[1], **Semen Önder**[3], **Aysel Bayram**[3], **Kağan Avcı**[1], **Ahmet Özkan**[1], **Murat Ulusan**[1], **Semra Demokan**[4]

[1]Department of Otorhinolaryngology-Head and Neck Surgery, Istanbul Faculty of Medicine, Istanbul University, Istanbul, Türkiye.; [2]Institute of Graduate Studies in Health Sciences, Istanbul University, Istanbul, Türkiye.; [3]Department of Pathology, Istanbul University, Istanbul Faculty of Medicine, Istanbul, Turkey.; [4]Department of Basic Oncology, Oncology Institute, Istanbul University, Istanbul, Capa, Türkiye.

BACKGROUND & AIM

Squamous cell carcinoma of the tongue is one of the most aggressive malignancies of the oral cavity due to its high potential for local invasion and cervical lymph node metastasis. The molecular heterogeneity of the disease highlights the need for novel biomarkers for prognosis and early diagnosis. Mesenchyme Homeobox 2 (MEOX2) is a homeobox gene involved in angiogenesis, cell proliferation, cell cycle regulation. Altered MEOX2 expression has been associated with tumor progression in several malignancies; however, its role in tongue squamous cell carcinoma remains unclear. This study aimed to investigate MEOX2 gene expression in patients with tongue squamous cell carcinoma.

MATERIAL & METHODS

The study included tumor tissue, complementary normal tissue, serum, and saliva samples from 25 patients diagnosed with squamous cell carcinoma of the tongue. MEOX2 gene expression levels were analyzed using the qRT-PCR method. Relative expression levels in tumor tissues were calculated using the 2-ΔΔCt method, referencing complementary normal tissues. Expression data from serum and saliva samples were evaluated based on ΔCt values.

RESULTS

While no significant change in MEOX2 gene expression was observed in 80% of tongue tumor patients, an increase in expression was detected in 12% and a decrease in 8.3%. Lymph node involvement and advanced tumor stage were noted in most patients showing expression changes. While no recurrence was observed in patients with increased MEOX2 expression, recurrence was determined in one of the cases with decreased expression. Comparing the ΔCt values of serum and saliva samples, it was concluded that MEOX2 expression was higher in saliva samples compared to serum due to the lower ΔCt values observed in saliva samples.

CONCLUSIONS

These findings suggest that MEOX2 expression may characterize a distinct subgroup of tongue squamous cell carcinomas with aggressive clinical features rather than representing a uniform molecular event. The heterogeneous expression pattern supports the molecular heterogeneity of tongue cancer. However, larger studies are needed to validate these preliminary findings.

Sexual And Psychosocial Outcomes Following Laryngectomy: The Role Of Surgical Extent And Neck Dissection

Metin Yıldırım[1], **Salih Akyel**[1], **İpek Yeşil**[1], **Şahin Öğreden**[1]

[1]Department of Otorhinolaryngology–Head and Neck Surgery, Basaksehir Cam and Sakura City Hospital, University of Health Sciences, Istanbul, Turkey

BACKGROUND & AIM

Surgical treatment of laryngeal cancer may significantly affect patients' physical integrity, communication ability, and overall quality of life. While psychosocial morbidity in head and neck oncology has increasingly been recognized, postoperative sexual health outcomes remain poorly reported. The primary aim of this study was to evaluate sexual function in male patients during the first postoperative month following laryngeal cancer surgery. Secondary objectives included investigating the potential impact of neck dissection and the extent of laryngeal resection (partial vs total) on sexual function, as well as exploring associations between sexual dysfunction and psychosocial parameters.

MATERIAL & METHODS

This prospective cross-sectional observational study was conducted between October 2025 and March 2026 at the ENT Department of Cam and Sakura City Hospital. Patients aged ≥18 years with histologically confirmed laryngeal carcinoma who were sexually active before surgery were included. Patients with severe comorbidities preventing questionnaire completion were excluded. All patients were evaluated at the first postoperative month, and none had received postoperative radiotherapy or chemotherapy at the time of assessment.

Patients were categorized into three groups according to surgical extent: (1) partial laryngeal surgery without neck dissection, (2) partial laryngeal surgery with neck dissection, and (3) total laryngectomy with neck dissection. Participants completed the Golombok–Rust Inventory of Sexual Satisfaction (GRISS), Beck Anxiety Inventory (BAI), Beck Depression Inventory (BDI), and Rosenberg Self-Esteem Scale (RSES). Independent samples t-tests were used for comparisons between Groups 1–2 and 2–3, and correlation analyses evaluated associations between sexual function and psychosocial variables.

RESULTS

A total of 47 patients were included. According to the surgical classification, 24 patients underwent partial laryngeal surgery without neck dissection, 11 underwent partial laryngeal surgery with neck dissection, and 12 underwent total laryngectomy with neck dissection. The mean psychometric scores were BAI 9.1 ± 3.2, BDI 7.4 ± 2.8, RSES 15.2 ± 5.4, and total GRISS 52.9 ± 14.8.

GRISS subscale analysis demonstrated impairments across several domains of sexual function, including erectile dysfunction, premature ejaculation, avoidance behavior, reduced satisfaction, impaired partner communication, and decreased sexual activity frequency. Patients undergoing more extensive surgical procedures showed a tendency toward higher GRISS scores and greater psychosocial distress.

Comparative analyses suggested worse sexual function in patients undergoing neck dissection and those treated with total laryngectomy compared with function-preserving surgeries. Correlation analysis revealed negative associations between GRISS scores and measures of emotional well-being and self-esteem.

CONCLUSIONS

Sexual dysfunction appears to be common in the early postoperative period following laryngeal cancer surgery. Increasing surgical extent and the addition of neck dissection may contribute to greater impairment in sexual function and psychosocial well-being. These findings suggest that sexual health represents an underrecognized aspect of postoperative recovery in patients with laryngeal cancer. Early identification of sexual dysfunction through routine postoperative assessment, combined with appropriate counseling and psychological support, may help improve overall quality of life. Incorporating sexual health evaluation into standard postoperative follow-up may therefore contribute to more comprehensive and patient-centered care in head and neck oncology.

Virtual Slicing Reveals Hidden Errors In Pathology-Based Margin Assessment For Oral Cancer Surgery

Fatemeh Makouei[1], **Daniel Lauritzen**[1], **Theresa Frehr Dahl**[3], **Giedrius Lelkaitis**[4], **Mikkel Kaltoft**[1], **Martin Garset Zamani**[1], **Leila Mady**[5], **Tina Agander**[4], **Tobias Todsen**[1]

[1]Department of Otorhinolaryngology, Head and Neck Surgery and Audiology, Rigshospitalet, Copenhagen University Hospital, Denmark; [2]Institute of Clinical Medicine, Faculty of Health and Medical Sciences, University of Copenhagen, Denmark; [3]Department of Applied Mathematics and Computer Science, Technical University of Denmark, Kongens Lyngby, Denmark; [4]Department of Pathology, Rigshospitalet, Copenhagen University Hospital, DK-2100 Copenhagen, Denmark; [5]Department of Otolaryngology – Head and Neck Surgery, Johns Hopkins School of Medicine, Baltimore, Maryland, USA

BACKGROUND & AIM

Surgical removal remains the cornerstone of treatment for oral cancers, and the assessment of final margins is essential for confirmingcomplete tumor excision. In routine practice, pathologists cut the specimen by hand to obtain representative sections for histological evaluation. Thismanual process, however, can introduce inconsistencies. In this study, we examined how different slicing techniques and cutting errors affect the accuracyof margin measurements in oral cancer specimens.

MATERIAL & METHODS

After resection, each specimen was scanned using three-dimensional ultrasound to create volumetric models. These models allowedvirtual slicing that replicated two common pathology approaches as Bread Loafing and Perpendicular slicing, as well as several cutting errors: rotation, tilt,variation in slice thickness, and a combined error scenario. The true margin was defined as the smallest 3D distance between the tumor and the specimensurface. Margins measured from the simulated slices were compared with the true margins to evaluate precision

RESULTS

Specimens from twenty patients with tongue squamous cell carcinoma were analyzed. Perpendicular slicing produced smaller measurementerrors (mean 0.37 mm, IQR 0.32 mm) than Bread Loafing (mean 0.74 mm, IQR 0.85 mm). Among simulated

errors, tilting caused the greatest deviation,particularly in Bread Loafing (mean error 1.26 mm). Perpendicular slicing was more resistant to tilting (p = 0.010) and slice thickness variation (p = 0.009).

CONCLUSIONS

Both technique and cutting accuracy influence margin evaluation. Perpendicular slicing yielded the most reliable results, supportingrefinements in pathology practice and the potential role of 3D imaging in improving surgical margin assessment.

Peripheral Regulatory T Cells, NK Cells, And Lymphocyte Subsets In Laryngeal Squamous Cell Carcinoma: Prognostic Significance And Long-Term Follow-Up

AHMET ADNAN CIRIK[1], **BAYRAM KIRAN**[3], **ÖMER ERDUR**[2], **ÖZTÜRK AKTAŞ**[4], **FATMA TÜLİN KAYHAN**[5]

[1]Ümraniye Training and Research Hospital; [2]Liv Hospital Ulus; [3]Independent Researcher; [4]Medical Park Hospital Kocaeli; [5]Private Practice, Istanbul, Türkiye

BACKGROUND & AIM

In this study, we evaluated the peripheral blood Treg values, NK, CD45, CD3, CD4, CD8 and CD19 values of the patients with laryngeal squamous cell cancer and healthy control group at the time of diagnosis and long term follow-up.

MATERIAL & METHODS

Nineteen patients with laryngeal squamous cell carcinoma were included as study group. Age and sex matched 15 healthy subjects were scheduled as control group. Blood samples were taken from the study group three times; before the operation, one month and 8 years after the operation (for the alive patients). A single blood sample was obtained from the control group to compare with preoperative values of the study group. CD4 +, CD25 +, FOXP3 and CD127 markers were used for Treg identification. Lymphocytes were isolated from the peripheral blood by "Density gradient" technique, based on their distinctive density. Treg percentages and lymphocyte profile (CD45, CD3, CD4, CD8, CD19, NK) were determined by using flow cytometry. In the study group these parameters were also evaluated for the nodal metastasis and early and advanced stages.

RESULTS

In study group, preoperative and one month after the operation Treg levels were significantly higher than the control group (p= 0.001, 0.001, respectively). A statistically significant decrease in the Treg levels was detected at the first month after the operation (p= 0.025). Preoperative CD19 and NK levels were similar in the patients and the control group (p> 0.05). Postoperatively while the Treg levels decreased, the NK levels showed an increase. At the end of eighth year, Treg levels of the patients dropped to the levels of control group. Preoperative Treg values were statistically significantly higher in both N + cases than the N0 cases, and in the advanced stages than the early stages (p= 0.009, p= 0.001, respectively).

CONCLUSIONS

Treg levels were detected higher then the healthy patients and by taking stages and lymph node involvement in acount, these parameters could be used effectively to predict prognosis of the patients. By the treatment of these cancers it is detected that these immunity parameters were decreasing. With longterm follow-up, our results demonstrade that Treg levels decreased and NK levels increased. In conclusion, these immunological variables seem useful for the prognosis and follow-up of the laryngeal cancers.

The Molecular Landscape Of Salivary Gland Carcinomas: Impact On Oncologic Outcomes And Opportunities For Targeted Therapy

Julia Pikul[1], **Marcin Machnicki**[2], **Łukasz Fus**[3], **Anna Rzepakowska**[1], **Tomasz Stokłosa**[2]

[1]Department of Otorhinolaryngology, Head and Neck Surgery, Medical University of Warsaw, Warsaw, Poland; [2]Department of Tumor Biology and Genetics, Medical University of Warsaw, Warsaw, Poland; [3]Department of Pathology, Medical University of Warsaw, Poland

BACKGROUND & AIM

Salivary gland cancers (SGCs) are characterised by considerable aggressiveness and mortality. There is still a lack of reliable evidence-based regimen methods, especially in recurrent or metastatic (R/M) cases. The aim of this study was to evaluate molecular alterations, relevant to the prognosis and personalized therapy of SGCs.

MATERIAL & METHODS

DNA was extracted from archival tissue of 40 patients with various SGCs subtypes. A targeted next-generation sequencing (NGS) panel was performed.

RESULTS

The follow-up of the SGCs study cohort revealed disease recurrence or metastasis in 19 patients and indicated poor individual outcomes. The mean disease-free survival (DFS) within the poor outcome group was 2.4 years, and the overall survival (OS) was 5.4 years. The DFS and OS of the remaining 18 patients with favourable outcomes were 8.3 years. The predominant genetic rearrangements in study cohort as well as in the group of patients with unfavourable outcomes were NF1 (24% vs. 32%), TP53 (22% vs. 32%) and CDKN2A (14% vs. 21%), respectively. Furthermore, TP53 mutation was established as a relevant negative prognostic factor for overall survival (p = 0,04). The analysis revealed potentially actionable genes in detected alterations in many cases.

CONCLUSIONS

SGCs are a heterogeneous group of malignancies with distinct molecular landscape that characterized by poor prognosis and inadequate treatment options. Nonstandard strategies might be beneficial for patients who suffer from salivary gland cancers. Wider utilization of NGS analysis may increase the opportunity for patients with those rare cancers to receive more precise, personalized therapy.

OP-377

The Experience Of Using Indocyanine Green In Pediatric Thyroid Surgery.

Grachev Nikolay Sergeevich[1], **Vorozhtsov Igor Nikolaevich**[1], **Babackina Natalia Vladimirovna**[1], **Starokorova Kapitolina Dmitrievna**[1], **Chechev Egor Igorevich**[1]

[1]*Dmitry Rogachev National Medical Research Center Of Pediatric Hematology, Oncology and Immunology*

BACKGROUND & AIM

Hypoparathyroidism one of the most common complication in pediatric thyroid surgery. This condition leads to decrease quality of patient life. The occurrence method of assessment parathyroid glands functional condition is interoperative visual examination. Unfortunately results of this method is not satisfied. According to some investigations rate of the hypoparathyroidism after surgery on the thyroid gland in pediatric is 30%. The new method to determine the parathyroid glands and their perfusion level by indocyanine green applies just among adult patients. In our Centre we started research the applicability of this method in children.

MATERIAL & METHODS

Between 2025 and 2026 the 110 patients under the age of 18 were injected with indocyanine green during thyroid surgery. The location and perfusion of the parathyroid glands were assessed 30 seconds after injection. To determine the state of blood flow, we used a special score scale. Evaluation of parathyroid glands perfusion after indocyanine green injection is possible by coloring organs in one of three colors (white, grey and black). The each color has a score in points (2, 1 and 0 appropriately).

RESULTS

According to our observations the indocyanine green can be used as a navigator to determine the position of the parathyroid glands in children with benign thyroid diseases. Assessment of the blood flow of the parathyroid glands and the prognosis of their function using indocyanine green is possible for all types of thyroid tumors. According to the results of our study it is known that if there is at least one white parathyroid gland the hypoparathyroidism in the postoperative period does not occur.

CONCLUSIONS

The use of indocyanine green in pediatric thyroid surgery may contribute to the early detection of intraoperative damage to the parathyroid glands. Due to this, treatment of hypoparathyroidism can be started early.

OP-378

Malignancy Risk Prediction In Thyroid Biopsies Reported As Atypia Of Undetermined Significance: Diagnostic Performance Of Ultrasonography And Risk Factors

Omer Faruk Kuyumcu[1], **Orhan Asya**[1]

[1]*Marmara University, Pendik Research and Training Hospital*

BACKGROUND & AIM

Thyroid cancers often present as nodules, with fine-needle aspiration biopsy (FNAB) and ultrasonography serving as the primary diagnostic tools in routine clinical practice. Due to variability in clinical approaches and the absence of clear consensus guidelines, the role of ultrasonography has become increasingly prominent, particularly in cases where FNAB yields indeterminate cytology results. This prospective study aimed to assess the clinical utility and diagnostic performance of the

ACR TIRADS (American College of Radiology Thyroid Imaging Reporting and Data System) ultrasonographic classification system, together with cytopathological subtypes, in predicting malignancy in atypia of undetermined significance (AUS) cases.

MATERIAL & METHODS

The study included 52 patients with 55 nodules diagnosed as AUS over a two-year period. All cases underwent preoperative ultrasonographic evaluation using the TI-RADS system and had available postoperative histopathological results.

RESULTS

The TI-RADS system did not significantly contribute to malignancy prediction in the overall AUS cohort or in subgroups with nuclear atypia and other atypia. However, the numerical score derived from echogenic foci, the presence of microcalcifications, and peripheral calcifications were found to be significantly associated with malignancy (p-values: 0.047, 0.049, and 0.025, respectively, highlighting the importance of specific ultrasonographic features. The overall malignancy rate was 20%, with follicular and papillary thyroid carcinoma each constituting 36% of the malignant cases in this cohort. The malignancy rates for TR3, TR4, and TR5 nodules were 23%, 11%, and 44% respectively.

CONCLUSIONS

The TIRADS system did not demonstrate a significant contribution to malignancy prediction in AUS cases. However, further studies with larger patient cohorts are needed to reach more definitive conclusions.

OP-379

Impact Of HPV Vaccination On Oral HPV Prevalence And Characteristics Of The HPV-Positive Oropharyngeal Tumor Microenvironment

Seren Demirtaş[1], **Ömürhan Uludoğan**[2], **Selçuk Erol**[2]

[1]*Ankara Oncology Training and Research Hospital;* [2]*Ankara Atatürk Sanatorium Training and Research Hospital, Ankara, Türkiye*

BACKGROUND & AIM

Human papillomavirus (HPV) is a major oncogenic agent in the development of oropharyngeal squamous cell carcinoma (OPSCC). The incidence of HPV-associated head and neck cancers, particularly HPV-positive OPSCC, has increased substantially in recent years. Although prophylactic HPV vaccines effectively reduce cervical HPV infections, their impact on oral HPV prevalence and the tumor microenvironment remains under investigation. Recent evidence suggests that HPV-positive tumors exhibit a more immunologically active microenvironment and distinct therapeutic responses1. This study evaluated the effect of HPV vaccination on oral HPV prevalence and investigated the immune microenvironment and single-cell-defined cellular ecosystems associated with HPV-related head and neck cancers.

MATERIAL & METHODS

In this study, oral HPV prevalence, the protective effects of HPV vaccination, and the immune characteristics of the HPV-associated tumor microenvironment were evaluated through a systematic literature analysis. A PubMed search was performed using the keywords “HPV vaccination,” “oral HPV,” “oropharyngeal cancer,” “tumor microenvironment,” and “single-cell RNA sequencing.” English-language studies investigating oral HPV prevalence, HPV vaccination, or HPV-related tumor microenvironment features were included, while case reports, editorials, animal studies, and studies with insufficient data were excluded.

Eight key studies were analyzed, including the NHANES-based study by Byrd et al. involving 12,479 adults2 and the scRNA-seq study by Zhang et al. including 139,809 cells3. HPV-associated cellular states and ecotypes were evaluated using the EcoTyper platform. Variables included vaccination status, sex, smoking, alcohol use, and lifetime sexual partner number. Data were categorized into oral HPV prevalence, vaccination effects, and tumor microenvironment ecosystems.

1. ORAL HPV PREVALENCE AND DEMOGRAPHIC DISTRIBUTION

The overall prevalence of high-risk oral HPV infection was 4.2%, with HPV-16 identified as the most common genotype (1.8%). Oral HPV prevalence was significantly higher in males than females (6.8% vs. 1.7%)2.

2. ROLE OF HPV VACCINATION AND RISK FACTORS

HPV vaccination reduced vaccine-targeted oral HPV infections by more than 80% (0.11% vs. 1.31%, $p < 0.001$). Unvaccinated individuals demonstrated a 3.4-fold increased risk of oral HPV infection. Major risk factors included male sex, smoking, heavy alcohol consumption, and having ≥5 lifetime oral sex partners2.

3. TUMOR MICROENVIRONMENT AND CELLULAR ECOSYSTEMS

HPV-positive head and neck cancers exhibited an immune-active (“immune-hot”) tumor microenvironment with increased CD4+ T-cell, plasma-cell, and B-cell infiltration. Elevated CXCL9/CXCL10 expression and enhanced GZMB/PRF1-mediated cytotoxic activity were associated with superior treatment response and improved 5-year survival compared with HPV-negative tumors (83% vs. 42%)3.

CONCLUSIONS

HPV vaccination may protect against HPV-associated oropharyngeal cancers by reducing oral HPV infections. Molecular and single-cell transcriptomic analyses demonstrate that HPV-positive head and neck cancers possess a more active antitumor immune microenvironment and treatment-sensitive cellular ecosystems. Oral HPV prevalence was approximately four times higher in males, supporting expanded vaccination coverage, particularly among men. Historically female-focused vaccination strategies may have contributed to lower male vaccination rates and gaps in herd immunity. Emerging studies on the HPV-associated tumor microenvironment are also advancing immunotherapy and personalized treatment strategies, including anti-PD-1/PD-L1–based approaches and novel molecular biomarkers for predicting treatment response and resistance.

The Role Of Treponema Sp. In Oral Squamous Cell Carcinoma: A Retrospective Microbiological Study

María Nazaret Benítez Lobón[1], **Irene Oliver Laguna**[1], **Alejandro Pozuelo Moreno**[1], **Carlos Ramón Franco Fente**[1], **Carmen María Romero Martín**[2], **Eduardo Malmierca Corral**[1], **Ana María Colino Gallardo**[1], **Consuelo Ortega Fernández**[1], **Cristina Valor García**[1]

[1]*Hospital Universitario Infanta Sofía;* [2]*Hospital de la Princesa*

BACKGROUND & AIM

Oral squamous cell carcinoma (OSCC) is the most common malignancy of the oral cavity. Classical risk factors such as tobacco, alcohol and human papillomavirus (HPV) do not explain all cases or their aggressiveness, suggesting the involvement of additional factors including oral microbiome dysbiosis. At our centre, Treponema denticola was identified in a tongue carcinoma biopsy, raising questions. This spirochaete, associated with severe periodontitis, promotes a proinflammatory environment, produces an oncogenic proteinase related to tumour invasion and early disease recurrence. Based on this, we propose a retrospective review of Treponema sp. prevalence in oral cancer samples from our department.

MATERIAL & METHODS

We present the design of a retrospective observational study conducted at our Otorhinolaryngology Department. Archived biopsy samples collected over the last five years from patients diagnosed with OSCC will be reviewed. Immunohistochemical staining for Treponema sp. will be performed on all eligible samples. Variables including age, sex, tobacco and alcohol consumption and HPV presence in the sample will be recorded and analysed to assess the possible implication of Treponema denticola in the pathophysiology of the disease.

RESULTS

Study currently in the design phase. Preliminary data will be presented at the congress.

CONCLUSIONS

The identification of Treponema denticola in OSCC tissue, particularly in the absence of classic risk factors, supports the hypothesis that oral dysbiosis plays a role in tumour development. This study aims to establish the prevalence of Treponema sp. in our series and contribute to the growing evidence connecting periodontal infection and oral cancer. Periodontal control may represent a preventive strategy in OSCC management, reinforcing the need for an interdisciplinary diagnostic approach.

Treponema denticola, Oral squamous cell carcinoma

OP-381

A Composite Immunonutritional Risk Scoring System For Predicting Pharyngocutaneous Fistula After Total Laryngectomy

Hatice Secil Akyildiz[1], **Berna Kayacilar**[1], **Mustafa Kursat Gokcan**[1]

[1]*Ankara University School of Medicine, Department of Otolaryngology, Ankara, Turkey*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) remains the most common and clinically significant complication following total laryngectomy, particularly in salvage cases. Emerging evidence indicates that compromised immunonutritional status may negatively impact wound healing; however, its role in predicting PCF development has not been fully elucidated.

MATERIAL & METHODS

A total of 120 patients treated between 2020 and 2025 were initially included, of whom 43 met the predefined criteria and were analyzed in this retrospective cohort study. Patients were classified as early PCF (≤15 days), late PCF (>15 days), or non-fistula controls. Preoperative immunonutritional indices (PNI, HALP, albumin, CONUT, and NRI) were evaluated. Group comparisons were performed using non-parametric tests, and clinically relevant cut-off values were used to construct a composite immunonutritional risk score.

RESULTS

PCF developed in 19 patients (44.2%). Significant differences were observed between early PCF and primary surgery groups for PNI (p=0.004), HALP (p=0.028), albumin (p=0.014), and the composite score (p<0.001). No significant differences were found in other comparisons. Optimal cut-offs were PNI <51.07 (80% sensitivity, 90% specificity), albumin <39.7 g/L (81%, 90%), and HALP <30.37 (63%, 90%). The composite score showed a significant association with PCF (p=0.002), with higher scores indicating increased risk.

CONCLUSIONS

Preoperative immunonutritional impairment is strongly associated with the development of PCF following total laryngectomy. A composite model integrating PNI, HALP, and albumin offers a practical and reliable approach for preoperative risk stratification. Routine incorporation of immunonutritional assessment may facilitate early identification of high-risk patients and inform targeted perioperative optimization strategies.

Comparison Of Primary Tumor Size Between Radiologically Node-Negative And Central Node-Positive Papillary Thyroid Carcinoma Patients

ahmed hakan çokkeser[1], **irem önal**[1], **sema zer toros**[1], **çiğdem tepe karaca**[1]

[1]*SBU Haydarpaşa Numune Research and Training Hospital*

BACKGROUND & AIM

To evaluate whether a significant difference exists in preoperative primary tumor size between papillary thyroid carcinoma (PTC) patients with central lymph node metastasis and those reported as radiologically node-negative (cN0).

MATERIAL & METHODS

A retrospective comparative study was conducted including patients aged 30–55 years diagnosed with papillary thyroid carcinoma. To minimize prognostic heterogenity and potential confounding factors, only unifocal tumors without extrathyroidal extension were included. Histopathological evaluation was restricted to favorable histologic subtypes of PTC, including classic, follicular variant, and oncocytic variant. Patients were divided into two groups: radiologically node-negative (cN0) patients and patients who underwent central neck dissection with pathologically confirmed central lymph node metastasis. Papillary thyroid microcarcinomas (≤10 mm) were excluded from the primary analysis. Preoperative primary tumor size was recorded as the maximum tumor diameter. Sex distribution and tumor size were compared between groups.

RESULTS

Thirty-six patients were included in the primary analysis after exclusion of microcarcinomas, consisting of 21 radiologically node-negative patients and 15 patients with central lymph node metastasis. Mean age was comparable between the metastatic and radiologically node-negative groups (42.1 ± 8.6 vs. 41.4 ± 8.9 years, respectively). Sex distribution did not differ significantly between groups (p = 0.721). Mean primary tumor size was significantly greater in patients with central lymph node metastasis compared with radiologically node-negative patients (30.4 ± 16.3 mm vs. 18.6 ± 11.0 mm, respectively; Mann–Whitney U test, p = 0.010).

CONCLUSIONS

Among selected low-risk papillary thyroid carcinoma patients, larger primary tumor size was significantly associated with central lymph node metastasis. Preoperative tumor size may serve as a useful indicator for predicting occult central nodal disease in otherwise radiologically node-negative patients.

Prognostic Impact Of Inflammatory Indices On Fistula Development And Survival After Total Laryngectomy

Artun Kırmızıtaş[1], **Ejder Ciğer**[1], **Yılmaz Özkul**[1], **Çağrı Becerik**[1], **Mirze Doğan**[1]

[1]*İzmir Katip Çelebi University Atatürk Training and Research Hospital*

BACKGROUND & AIM

Laryngeal squamous cell carcinoma is a major head and neck malignancy associated with substantial morbidity and mortality. Total laryngectomy remains an important treatment for selected patients with advanced disease; however, postoperative pharyngocutaneous fistula (PCF) is a serious complication that may delay wound healing, prolong hospitalization, increase costs and impair rehabilitation. Recently, systemic inflammatory and nutritional indices have emerged as accessible prognostic biomarkers in oncology. The Naples Prognostic Score (NPS), Systemic Immune-Inflammation Index (SII), and Systemic Inflammation Response Index (SIRI) may provide additional prognostic information. This study aimed to evaluate their effects on PCF development and overall survival after total laryngectomy.

MATERIAL & METHODS

This retrospective single-center study included 144 patients who underwent primary total laryngectomy for laryngeal cancer at the Department of Otorhinolaryngology, İzmir Katip Çelebi University Atatürk Training and Research Hospital, between 2012 and 2025. Demographic characteristics, operative and discharge records, preoperative laboratory parameters, pathological findings, PCF status, and survival data were obtained from the hospital database. NPS, SII, and SIRI values were calculated using preoperative hematological and biochemical parameters. The associations of these indices with PCF development and overall survival were assessed using appropriate statistical analyses, including group comparisons, logistic regression, and survival analysis.

RESULTS

Low lymphocyte-to-monocyte ratio (LMR) was identified as an independent significant predictor of PCF development. In addition, elevated neutrophil-to-lymphocyte ratio (NLR) and SIRI values were statistically associated with an increased risk of PCF. Regarding survival outcomes, increased SII and SIRI levels were associated with poorer overall survival. No statistically significant association was found between NPS and PCF or overall survival.

CONCLUSIONS

Systemic inflammatory indices appear to have prognostic relevance in patients undergoing total laryngectomy. Low LMR may serve as an independent marker for PCF development, whereas elevated SII and SIRI may indicate worse overall survival. These simple, inexpensive, and routinely available biomarkers may support risk stratification and individualized postoperative management.

KEYWORDS

Total laryngectomy, pharyngocutaneous fistula (PCF), overall survival, Systemic Immune-Inflammation Index (SII), Systemic Inflammation Response Index (SIRI), Naples Prognostic Score (NPS), lymphocyte-to-monocyte ratio (LMR), neutrophil-to-lymphocyte ratio (NLR), laryngeal cancer

The Impact Of Beta-Blockers On Head And Neck Squamous Cell Carcinoma: An In-Depth Review Of Clinical Evidence

Shahrukh Ali[2], **Robert Africa**[1], **Orly Coblens**[1], **Felix Maldonado**[1], **Viran Ranasinghe**[1]

[1]*University of Texas Medical Branch*; [2]*University of Texas MD Anderson Cancer Center*

BACKGROUND & AIM

Activation of the sympathetic nervous system results in catecholamine release, which interacts with β-adrenergic receptors expressed on tumor cells. Preclinical studies have suggested that β-adrenergic receptor inhibition may suppress tumorigenesis, reduce cellular proliferation, and promote apoptosis. However, emerging clinical evidence has challenged these findings, with several studies reporting neutral or potentially adverse survival outcomes among patients with head and neck squamous cell carcinoma (HNSCC) receiving β-blockers.

MATERIAL & METHODS

A systematic literature review was conducted using the PubMed, MEDLINE, and Scopus databases to identify clinical studies evaluating β-blocker use and oncologic outcomes in patients with HNSCC.

RESULTS

Clinical evidence demonstrates inconsistent associations between β-blocker use and cancer outcomes in HNSCC. Multiple studies, including analyses encompassing more than 11,000 patients, reported associations between β-blocker exposure and poorer oncologic outcomes. β-blocker use was associated with decreased overall survival (OS; adjusted hazard ratio [aHR] 1.67; 95% CI, 1.06–2.62; P = .027) and disease-free survival (DFS; aHR 1.67; 95% CI, 1.06–2.63; P = .027), as well as increased cancer-specific, competing, and all-cause mortality (P < 0.05). Proposed mechanisms include enhanced epithelial–mesenchymal transition contributing to increased tumor aggressiveness and reduced leukocyte infiltration within the tumor microenvironment, potentially mediated by altered chemokine signaling pathways such as decreased chemokine receptor-2 expression.

CONCLUSIONS

Given the widespread use of β-blockers among patients with HNSCC, further prospective and mechanistic studies are needed to clarify their impact on tumor biology and survival outcomes. The discrepancy between favorable preclinical findings and conflicting clinical data highlights the complexity of β-adrenergic signaling in cancer progression. Improved understanding of these mechanisms may help guide clinical decision-making regarding β-blocker use in patients undergoing treatment for HNSCC.

Prognostic Factors For Recurrence And Survival In Head And Neck Cutaneous Squamous Cell Carcinoma

Mustafa Aktaş[2], **Senem Çengel Kurnaz**[1], **Emre Demirel**[3], **Ozan Çolak**[1], **Özgür Kemal**[1], **Sinan Atmaca**[1], **Emel Tahir**[1], **Esra Kavaz Uştu**[1], **Mehmet Çelebi**[1]

[1]*Department of Otorhinolaryngology, Ondokuz Mayıs University Faculty of Medicine, Samsun, Türkiye;* [2]*Department of Otorhinolaryngology, Burdur Gölhisar State Hospital, Burdur, Türkiye;* [3]*Department of Otorhinolaryngology, Samsun City Hospital, Samsun, Türkiye*

BACKGROUND & AIM

Head and neck cutaneous squamous cell carcinoma (cSCC) may recur or metastasize despite curative-intent surgery, and accurate risk stratification remains challenging. We hypothesized that adverse clinicopathologic features and parameters of regional spread would be associated with shorter recurrence-free interval and worse overall survival.

MATERIAL & METHODS

We conducted a retrospective cohort study of 80 patients who underwent surgical treatment for head and neck cSCC at a tertiary otorhinolaryngology department between January 2008 and January 2023. Collected variables included age, sex, immunosuppression, primary versus recurrent presentation, tumor diameter, perineural invasion (PNI), lymphovascular invasion (LVI), surgical margin status, parotid metastasis, O'Brien stage, facial nerve involvement, and pathological neck metastasis stage. Outcomes were time to recurrence and overall survival. Kaplan–Meier curves were compared using the log-rank test. Cox proportional hazards regression was used to estimate hazard ratios (HRs) with 95% confidence intervals (CIs). Statistical significance was defined as $p<0.05$.

RESULTS

Mean age was 71.3 years; 85% were male. The most common primary site was the ear (57.5%), and mean tumor diameter was 28.4 mm. PNI was present in 31.3%, LVI in 17.5%, parotid metastasis in 22.5%, and facial nerve involvement in 11.3%. Mean follow-up was 46.3 months. Recurrence occurred in 41.2% (median time to recurrence 24.0 months). Mean overall survival was 45.0 months (median 33.5 months). In multivariable Cox regression for survival, increasing age (HR 1.07, 95% CI 1.03–1.10; $p<0.01$), number of metastatic lymph nodes (HR 1.04, 95% CI 1.00–1.08; $p=0.04$), and positive surgical margins (HR 9.07, 95% CI 2.59–31.82; $p<0.01$) independently predicted poorer survival. For recurrence, univariable Cox analysis showed significant associations with tumor diameter, recurrent presentation, PNI, positive margins, parotid metastasis, advanced O'Brien stage (P3 vs P0), and pathological neck metastasis (N2 vs N0) ($p<0.01$ for each); however, no variable remained significant in the multivariable recurrence model ($p>0.05$).

CONCLUSIONS

Head and neck cSCC showed a high recurrence rate. Age, metastatic nodal burden, and positive margins independently predicted worse survival, supporting meticulous margin control and risk-adapted regional evaluation and surveillance.

cutaneous squamous cell carcinoma, head and neck, prognostic factors, recurrence, overall survival, surgical margins

OP-386

Controversies In The Surgical Management Of Malignant Parotid Neoplasms Without Facial Palsy. – Is Radical Surgery Still Necessary?

Christina Sauter[1], **Joshua Halbleib**[1], **Johannes Zenk**[1], **Johannes Doescher**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery; University of Augsburg, Germany*

BACKGROUND & AIM

Main controversies in the surgical management of malignant parotid neoplasms, particularly regarding the necessity and outcomes of radical parotidectomy center on the balance between oncologic control and preservation of function, especially the facial nerve. While negative margins are important, additional margin clearance at the expense of the facial nerve may not improve outcomes and can significantly impact quality of life. Radical resection is associated with higher postoperative complication rates and does not necessarily improve overall survival compared to less radical approaches, especially when adjuvant therapy is used.

MATERIAL & METHODS

This retrospective monocentric study included patients diagnosed with histologically confirmed malignant parotid neoplasm who received treatment between 2013 and 2025. Patient characteristics, disease-specific factors, and treatment-related variables were systematically collected and analyzed.

RESULTS

A total of 358 patients with a mean age of 72 years were included. About 25% of patients suffered of preoperative facial palsy. In cases of normal facial function, there was no significant difference in five-year overall survival (OS) ($p = 0.91$) and disease-free survival (DFS) ($p = 0.27$) between patients who underwent radical parotidectomy and those who underwent nerve-sparing parotidectomy.

CONCLUSIONS

The necessity of radical parotidectomy in patients with malignant neoplasms is controversial, with current consensus favoring nerve preservation and less radical surgery, reserving radical resection for cases with clear nerve involvement, and relying on adjuvant therapy to optimize outcomes.

OP-387

PDL1, VISTA, LAG3 And CTLA4 Expression In The Laryngeal Cancer Microenvironment: Is There A Prognostic Impact Of Immune Checkpoint Molecules?

Ömer Orak[1], **Doğu Vurallı Bakkaloğlu**[2], **Cömert Şen**[1], **Murat Ulusan**[1], **Bora Başaran**[1], **İsmet Aslan**[1]

[1]*Department of Otorhinolaryngology–Head and Neck Surgery, Istanbul Faculty of Medicine, Istanbul University, Istanbul, Türkiye.*; [2]*Department of Pathology, Istanbul Faculty of Medicine, Istanbul University, Istanbul, Türkiye.*

BACKGROUND & AIM

Immune checkpoint molecules (ICMs) may influence tumor immune escape and clinical outcomes in laryngeal squamous cell carcinoma (LSCC). We evaluated the expression of programmed death ligand 1 (PDL1), V domain Ig suppressor of T cell activation (VISTA), lymphocyte activation gene 3 (LAG3), and cytotoxic T lymphocyte associated protein 4 (CTLA4) in tumor and immune compartments and investigated their associations with survival and histopathologic parameters.

MATERIAL & METHODS

In this single center retrospective cohort, surgically treated LSCC patients (2018–2022) with pathologic stage ≥3 and ≥3 years follow up after open partial or total laryngectomy ± neck dissection were included (n=101). Sixty two patients were excluded due to early stage disease, non SCC histology, or unavailable specimens.

PDL1 and VISTA were scored using tumor proportion score (TPS) and combined positive score (CPS); staining intensity was recorded in tumor and immune compartments by immunohistochemistry. LAG3 and CTLA4 were assessed in the immune microenvironment by extent and intensity. Inter parameter correlations were analyzed using Spearman's rho. Overall survival (OS) and recurrence free survival (RFS) were evaluated using Kaplan Meier and Cox regression.

RESULTS

Among 101 patients, 78 (77.2%) underwent total and 23 (22.8%) partial laryngectomy; 96 (95.0%) had lateral neck dissection. Median age was 62.3 years, 93.1% were male; overall mortality was 42.6% (disease specific 20.8%), recurrence 22.8%, median follow up 64.7 months.

PDL1 TPS, PDL1 CPS, VISTA TPS, and VISTA CPS were ≥1 in 49.5%, 91.1%, 38.6%, and 99.0%; LAG3 and CTLA4 immune staining was present in 77.2% and 24.8%. PDL1 TPS correlated with VISTA immune intensity (ρ=0.205, p=0.039); VISTA immune intensity correlated with LAG3 immune extent (ρ=0.349, p<0.001) and CTLA4 immune extent (ρ=0.241, p=0.015); LAG3 immune extent correlated with CTLA4 immune extent (ρ=0.511, p<0.001).

Older age (HR=1.064,p=0.003) and perineural invasion (PNI) (HR=1.911,p=0.044) predicted worse OS. For RFS, worse surgical margin status (HR=1.805,p=0.003), higher pathologic stage (HR=2.471,p=0.006), and PNI (HR=2.992,p=0.026) increased recurrence risk, whereas higher PDL1 tumor intensity (HR=0.465,p=0.015) and diffuse LAG3 immune extent (HR=0.086,p=0.021) were protective.

CONCLUSIONS

Higher PDL1 tumor intensity and diffuse LAG3 immune extent were independently associated with improved RFS. ICMs were not independently predictive of OS, whereas PNI was a consistent adverse factor for both OS and RFS. Integrated ICM profiling may aid risk stratification and warrants validation in large prospective studies to inform future immunotherapy oriented approaches in LSCC.

Distribution Of Head And Neck Cancers In A Tertiary Care Hospital In Somalia: The First National Study

Ismail Mohamed Ali[1], **Mohamed Nor Abdi**[1], **Süleyman Emre Karakurt**[1], **Özgür Yiğit**[2]

[1]*Department of Otorhinolaryngology, Somalia Mogadishu Turkey Training and Research Hospital, Mogadishu, Somalia;* [2]*Professor of Otorhinolaryngology, Director, Başakşehir Çam and Sakura City Hospital, Istanbul, Türkiye;* [3]*Department of Otorhinolaryngology, Shaafi Hospital, Mogadishu, Somalia*

BACKGROUND & AIM

Cancer is a major global health problem, with developing countries bearing the highest burden. Head and neck cancers (HNCs) are particularly challenging in low-resource regions such as Sub-Saharan Africa. Despite this, there are no published data

describing the distribution or histopathological characteristics of HNCs in Somalia. This study represents the first comprehensive analysis of head and neck cancers conducted in Somalia, aiming to define their demographic and histopathological patterns in a tertiary care setting.

MATERIAL & METHODS

Following ethical approval and informed consent, a retrospective review was conducted on 251 histopathologically confirmed HNC cases diagnosed between December 2017 and July 2022 at the Somalia Mogadishu Turkey Training and Research Hospital. Patient data on age, sex, anatomical site, and histopathological type were collected and analyzed descriptively.

RESULTS

Of 251 patients, 128 (51.0%) were female and 123 (49.0%) male, with a mean age of 47.1 ± 17.9 years. Tumor site distribution was: sinonasal (n = 2), nasopharynx (36), oral cavity (65), oropharynx (5), salivary gland (10), larynx (27), hypopharynx (22), thyroid gland (70), and head and neck carcinoma of unknown primary (14). Thyroid and oral cavity cancers were the most common.

CONCLUSIONS

This study provides the first epidemiological and histopathological profile of HNCs in Somalia. The predominance of thyroid and oral cavity cancers, along with limited diagnostic capacity and late presentation, highlights the urgent need for improved cancer awareness, early detection, and oncology infrastructure in Somalia.

OUTCOMES OF MAXILLOFACIAL OSTEOSARCOMA: A MULTICENTER RETROSPECTIVE ANALYSIS

Süleyman Sami Güzel[1], **Hüseyin Görkem Kazaz**[2], **Zeynep Yeşiller Güzel**[3], **Şahin Öğreden**[3], **Zeynep Deniz Akdeniz Doğan**[2], **Harun Cansız**[4], **Nebi Serkan Demirci**[1], **Özkan Alan**[1]

[1]*Department of Medical Oncology, Istanbul University-Cerrahpasa, Cerrahpasa Medical Faculty Istanbul, Turkey;* [2]*Department of Plastic and Reconstructive Surgery, Marmara University, Istanbul, Turkey;* [3]*Department of Otorhinolaryngology, Başakşehir Çam ve Sakura City Hospital, University of Health Sciences, Istanbul, Turkey;* [4]*Department of Otorhinolaryngology,, Istanbul University-Cerrahpasa Cerrahpasa Medical Faculty, Istanbul, Turkey*

BACKGROUND & AIM

Craniofacial osteosarcoma is a rare malignancy comprising 6–9% of all osteosarcomas, presenting unique surgical and oncological challenges. This multicenter study evaluated clinicopathological features, treatment outcomes, and prognostic factors in patients with maxillary, mandibular, and skull base osteosarcoma.

MATERIAL & METHODS

Seventeen patients treated across three tertiary centers—Istanbul University-Cerrahpaşa (Medical Oncology), Marmara University (Plastic and Reconstructive Surgery), and Başakşehir Çam ve Sakura City Hospital, University of Health Sciences (Otorhinolaryngology)—were retrospectively analyzed. Tumor characteristics, treatment modalities, and surgical margin status were recorded. Disease-free survival (DFS) and overall survival (OS) were estimated by the Kaplan–Meier method. Prognostic factors were assessed using penalized Cox regression (Firth's correction). Median follow-up was 55 months (95% CI: 8.8–101.2).

RESULTS

Median age was 35 years (IQR: 29.5–52.5); 52.9% were male. Tumor locations were mandible (76.5%), maxilla (17.6%), and skull base (5.9%). Median tumor diameter was 6.6 cm; soft tissue invasion was present in 64.7%. Conventional high-grade osteosarcoma predominated (82.4%). Neoadjuvant chemotherapy was administered in 35.3%, with good pathological response (≥90% necrosis) in 33.3%. Surgery was performed in 88.2%, achieving R0 resection in 66.7%. Recurrence or progression occurred in 64.7%; 41.2% died during follow-up. Median DFS was 13.0 months (2-year: 46.7%; 5-year: 18.7%) and median OS was 40.2 months (2-year: 74.6%; 5-year: 33.6%). On univariable analysis, R1 margin (HR: 15.38, p=0.005), neoadjuvant chemotherapy (HR: 5.31, p=0.015), and cortical irregularity (HR: 4.40, p=0.034) were significantly associated with inferior DFS. Median DFS was 34.6 vs. 7.9 months for R0 vs. R1 resection (p=0.011).

CONCLUSIONS

Craniofacial osteosarcoma carries a poor prognosis with high recurrence rates. R0 surgical resection is the strongest determinant of disease-free survival. Cortical irregularity and neoadjuvant chemotherapy use—reflecting aggressive tumor biology—also predicted worse outcomes. These results highlight the critical role of multidisciplinary collaboration among medical oncology, reconstructive surgery, and head and neck surgery in optimizing patient outcomes.

OP-390

Do We Underestimate The Importance Of PET-CT In Oral Cavity Cancers?

Muhammet Fatih GÖKMEN[1], **Mustafa Faruk AYGÜN**[1], **Hasan ÖNNER**[2]

[1]*Selcuk University, Medical School, ENT Department;* [2]*Selcuk University, Medical School, Nuclear Medicine Department*

BACKGROUND & AIM

Oral cavity cancers result from the malignant transformation of the oral cavity elements located anterior to the palatal arch. Despite being easily visible lesions, neglect of these lesions, delayed presentation to the physician, and confusion with other benign lesions lead to delays in diagnosis and treatment, resulting in increased morbidity and mortality. The most important difference from other head and neck tumors is that the depth of invasion is a primary factor in tumor staging and its importance in prognosis. Positron emission tomography (PET) is generally used in advanced cases or for metastasis screening.

MATERIAL & METHODS

The files of patients who presented to a tertiary care center with oral cavity cancer were retrospectively reviewed. Patient age, gender, clinical staging at diagnosis, preoperative PET-CT status, pathological stage, whether they received adjuvant chemotherapy and radiotherapy, recurrence status and duration of recurrence, and patient survival were retrospectively examined.

In patients who underwent PET-CT, the standardized uptake value (SUV) max and mean, as well as metabolic tumor volume (MTV) and total lesion glycolysis (TLG) values, were also measured and included in the comparison.

RESULTS

Ninety-two patients who underwent surgery for oral cavity cancer were included in the study. Preoperative evaluations of all 92 patients revealed no distant organ metastases, and all patients underwent tumor resection and neck dissection. 43 patients had T1 tumor stage, 18 patients T2, 21 patients T3, and 10 patients T4. Fifty-one patients were followed up without treatment after surgery, while 33 patients required adjuvant radiotherapy and chemotherapy. Eight patients were deemed unsuitable for adjuvant treatment by the tumor board due to poor general condition and additional comorbidities.

Preoperative PET scans were available for 38 patients. Comparison of SUVmax, SUVmean, MTV, and TLG values showed a significant difference in patients with poor prognostic values (early recurrence, death, etc.) compared to other patients.

CONCLUSIONS

Oral cavity cancers are a common type of head and neck cancer that requires multidisciplinary management. Although treatment is standardized, there are significant differences among patients in disease-specific outcomes such as survival and disease-free survival. While PET scans are not currently a standard diagnostic tool for oral cavity cancers, their predictive value regarding disease and survival is considerable. Before becoming a standard diagnostic tool worldwide, PET scans need to be developed through multicenter studies and incorporated into new guidelines.

OP-391

Postoperative Radiotherapy Timing And Histopathological Risk Factors After Neck Dissection In Head And Neck Cancer

Ahmet Can Parmaksız[1], **Mikail Akış**[1], **Ömer Faruk Çufalı**[1], **Nurcan Yurtsever Kum**[1]

[1]*Ankara Bilkent City Hospital*

BACKGROUND & AIM

Histopathological risk factors and the timing of postoperative radiotherapy may influence oncologic outcomes after neck dissection in head and neck malignancies. This study aimed to evaluate the relationship between lymphovascular invasion, perineural invasion, extranodal extension, postoperative radiotherapy timing, and clinical outcomes in patients undergoing neck dissection.

MATERIAL & METHODS

This retrospective study included 54 patients who underwent neck dissection for head and neck malignancies at the Department of Otorhinolaryngology and Head and Neck Surgery, Ankara Bilkent City Hospital, between January 2023 and June 2024. Demographic characteristics, primary tumor site, dissection laterality and extent, pathological lymph node status, lymphovascular invasion, perineural invasion, extranodal extension, time to initiation of postoperative radiotherapy, and follow-up outcomes were recorded. Postoperative radiotherapy initiated within 42 days after surgery was defined as early treatment. Adverse outcome was defined as death or recurrent/metastatic disease during follow-up.

RESULTS

The cohort comprised 40 males and 14 females, with a mean age of 65.5±10.7 years. The most prevalent primary tumor sites were oral cavity/lip (%38.9) and laryngeal (%27.8) squamous cell carcinoma. Pathological lymph node metastasis was detected in 26 patients. Lymphovascular invasion, perineural invasion (PNI), and extranodal extension (ENE) were observed in 17, 27, and 7 patients, respectively. The median postoperative radiotherapy (RT) interval was 41 days.

Among 30 patients with available follow-up, 24 remained disease-free, 4 died, and 2 developed recurrence/metastasis. Disease-free status was observed in %88.2 (15/17) of early-RT patients versus %75.0(9/12) of delayed-RT patients (p=0.622). Notably, all deceased patients exhibited PNI. Adverse outcomes occurred in %28.6 (6/21) of evaluable PNI-positive patients compared to none of the PNI-negative patients (p=0.141). ENE was also numerically associated with adverse outcomes (%40.0 vs. %16.0, p=0.254).

CONCLUSIONS

Perineural invasion and extranodal extension showed a numerical association with poorer outcomes after neck dissection, while early postoperative radiotherapy was associated with a higher disease-free rate. However, these findings should be interpreted as exploratory due to the limited sample size and incomplete follow-up. Timely postoperative multidisciplinary management and careful pathological risk stratification remain essential in head and neck cancer care.

OP-392

Uncommon Presentation Of Alveolar Rhabdomyosarcoma In An Adult: Diagnostic Challenges And Multimodal Management

Tang Yita[1], **Sharon Michelle A/P Vincent Reginald**[1], **Mawaddah Binti Zulkefli**[1], **Mohd Shaiful Nizam Bin Mamat Nasir**[1]

[1]*Hospital Sultan Haji Ahmad Shah, Malaysia*

BACKGROUND & AIM

Alveolar rhabdomyosarcoma (ARMS) is a rare, aggressive malignancy predominantly occurring in children, with an uncommon presentation in adults. Its occurrence in the head and neck region is particularly rare, and ARMS often mimics other neoplasms both clinically and radiologically. Diagnosis can be challenging, especially when the disease presents with overlapping symptoms. This case report highlights the diagnostic difficulties and treatment strategies associated with ARMS in adults, emphasizing the importance of comprehensive diagnostic workup and multimodal management.

MATERIAL & METHODS

A 30-year-old male presented with a three-month history of progressively enlarging left parotid swelling, blurry vision, proptosis, and nasal obstruction. Examination revealed a hard, non-tender left parotid mass and multiple cranial nerve palsies involving nerves II, III, IV, V, VI, and VII. Nasoendoscopy identified a large irregular mass with punctate hemorrhage in the left nasal cavity. CT imaging showed a heterogeneous mass originating from ethmoid sinuses and nasal cavity, extending into maxillary, sphenoid, frontal sinuses, and medial orbital compartments, with cervical lymphadenopathy infiltrating the deep lobe of the left parotid gland. FNAC of the parotid mass indicated atypical cells of undetermined significance. Histopathology examination of the nasal mass demonstrated small round blue cells with rhabdomyoblast differentiation, confirmed by positive immunohistochemical staining for desmin and myogenin, consistent with alveolar rhabdomyosarcoma (ARMS). Chemotherapy was initiated, resulting in significant tumor reduction after three cycles as confirmed by follow-up imaging.

RESULTS

ARMS in adults presents significant diagnostic challenges due to its histological overlap with other small round blue cell tumors, such as lymphoma and neuroblastoma. Immunohistochemistry markers like desmin and myogenin is crucial for confirming the diagnosis. While ARMS in children has a favorable prognosis, adults often experience poorer outcomes due to delayed diagnosis and resistance to chemotherapy. Neoadjuvant chemotherapy has shown promise in reducing tumor bulk, especially in advanced head and neck cases. However, more intensive regimens may be necessary for adults due to their lower chemosensitivity. Radiotherapy and surgery may be required for local control.

CONCLUSIONS

This case highlights the rarity and diagnostic challenges of ARMS in adults. Comprehensive imaging and histopathological workup are essential for accurate diagnosis. Neoadjuvant chemotherapy can lead to significant tumor reduction and should be considered as part of a multimodal approach to treatment. Early recognition and aggressive treatment are crucial to improving the prognosis of ARMS in adults. A multidisciplinary approach involving oncologists, surgeons, and pathologists is key to optimizing patient outcomes

[1]Department of Otorhinolaryngology, Head and Neck Surgery and Audiology, Rigshospitalet, University of Copenhagen, Denmark; [2]Department of Otolaryngology Head and Neck Surgery, Odense University Hospital, Denmark; [3]Department of Otorhinolaryngology, Head and Neck Surgery, Aarhus University Hospital, Aarhus, Denmark; [4]Department of Molecular Medicine, Aarhus University Hospital, Aarhus, Denmark; [5]Department of Otorhinolaryngology, Head & Neck Surgery, Aalborg University Hospital, Aalborg, Denmark; [6]Department of Oncology, Aalborg University Hospital, Aalborg, Denmark

BACKGROUND & AIM

The global incidence of Oropharyngeal squamous cell carcinoma (OPSCC) is increasing, and in Denmark, more than 70% of the cases are linked to Human Papillomavirus (HPV).

The aim of this project is to investigate if circulating tumor HPV-DNA (ctHPV-DNA) in blood can be used to diagnose residual disease and recurrence earlier and more efficient than what is currently possible.

MATERIAL & METHODS

All newly diagnosed HPV+ OPSCC patients in Denmark who are treated with a curative intent are offered inclusion at four tertiary centers. Blood samples are collected at diagnosis and after end of treatment at 2 months, 6 months, and hereafter every 6 months for 3 years. Samples are analyzed with an in-house developed digital droplet PCR (ddPCR) assay detecting HPV16, 18, 31, 33, 35, 45, 51 and 58. If a sample is positive for ctHPV-DNA following end of treatment, the patient will be invited for a clinical examination and a PET/CT scan to investigate if residual disease or recurrence is present.

RESULTS

The following findings are intentionally not described in detail, as the data has not been peer-reviewed yet: From September 2025 to april 2026, we have enrolled nearly 180 patients. Detection of residual disease and recurrence by ctHPV-DNA in blood has so far shown very strong potential. However, longer follow-up is needed before final conclusions can be drawn.

CONCLUSIONS

The ctHPV-DNA blood test is showing very promising results in detection of residual disease and recurrence of HPV-positive OPSCC.

Demonstration Of The Efficacy Of Mesenchymal Stem Cells And Exosomes In Fistula Closure In A Rat Pharyngocutaneous Fistula Model

Mustafa Samed KILIÇ[1], **İmdat Yüce**[1], **Emrah Gülmez**[1], **Kemal Deniz**[2], **Mustafa Ermiş**[3]

[1]Erciyes University, Faculty of Medicine, Department of Otorhinolaryngology; [2]Erciyes University, Faculty of Medicine, Department of Pathology; [3]Erciyes University, Experimental Research and Application Center

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) remains a frequent and debilitating complication following total laryngectomy, with limited effective biological treatment options. While mesenchymal stem cells (MSCs) have demonstrated regenerative potential in various wound models, their role in PCF healing has not been investigated, nor has the therapeutic efficacy of MSC-derived exosomes. This study aimed to evaluate and compare the effects of adipose-derived mesenchymal stem cells (ASCs) and ASC-derived exosomes on PCF healing in an experimental rat model.

MATERIAL & METHODS

A standardized PCF model was established in rats and animals were randomly allocated into control, ASC-treated, ASC-derived exosome–treated and the buffer solution in which adipose tissue-derived mesenchymal stem cells and exosomes are stored-treated (sham) groups. Treatments were applied locally to the fistula site. Histopathological evaluation was performed on postoperative day 7, assessing acute and chronic inflammation, fibrosis, collagen deposition, and neovascularization. Fistula diameter was also measured. Statistical comparisons were conducted between groups to determine treatment-related differences.

RESULTS

No statistically significant differences were observed among groups regarding acute or chronic inflammatory infiltration or neovascularization ($p > 0.05$). Fibrosis scores were comparable across groups, although a non-significant trend toward reduced fibrosis was noted in the ASC and exosome-treated groups. Collagen deposition was significantly increased in both the ASC and exosome groups compared with controls ($p = 0.001$), with no significant difference between the two treatment modalities. Fistula diameter was significantly reduced in the ASC-treated group compared with controls ($p = 0.020$), with comparable reductions observed in the exosome group.

CONCLUSIONS

Both adipose-derived mesenchymal stem cells and their derived exosomes significantly enhanced pharyngocutaneous fistula healing by promoting collagen deposition and improving tissue organization without exacerbating inflammation. The

comparable efficacy of exosomes supports the paracrine hypothesis of MSC-mediated regeneration and highlights exosome-based therapy as a promising, safe, and clinically translatable cell-free alternative for PCF management.

OP-395

Assessment Of Burnout Among Otolaryngologists Involved In Head And Neck Surgery

Ceyda Üste[1], Çağrı Becerik[1], Burak Hazır[1], Ata Erşahan[1], Cömert Şen[1], Ertuğrul Çolak[2], Aylin Eryılmaz[1], Melek Kezban Gürbüz[1]

[1]Scientific Projects and Head and Neck Cancer Türkiye Data Research Group, Head and Neck Surgery Society, Türkiye; [2]Eskişehir Osmangazi University, School of Medicine

BACKGROUND & AIM

Burnout is a syndrome resulting from chronic occupational stress, characterized by emotional exhaustion, depersonalization, and reduced personal accomplishment, and is highly prevalent among physicians. Otorhinolaryngology (ENT), encompassing multiple subspecialties with distinct workload patterns and stressors, represents a field in which burnout has been reported at concerning levels, with up to 73.3% of physicians affected in at least one domain. This study aims to characterize burnout across otorhinolaryngology subspecialties, with particular emphasis on head and neck surgery, to identify subspecialty-specific determinants and guide targeted, discipline-oriented interventions.

MATERIAL & METHODS

This cross-sectional, descriptive survey was conducted under the auspices of the Scientific Projects and Head and Neck Cancer Türkiye Data Research Group of the Head and Neck Surgery Society. A structured questionnaire was developed to collect data on demographics, professional background, personal habits, working conditions and resources, and extracurricular social activities. Burnout was assessed using the Burnout Assessment Tool (BAT), which evaluates four primary symptom domains (exhaustion, mental distance, cognitive impairment, emotional impairment) and two secondary domains (psychological distress and psychosomatic complaints). All items were rated on a 5-point Likert scale, and subscale scores along with a mean BAT score were calculated, with higher scores indicating greater burnout. The survey was administered online and disseminated via social media platforms targeting ENT specialists.

RESULTS

A total of 189 ENT specialists participated, including 127 males (67.2%) and 62 females (32.8%), with a mean age of 43.3 years. Participants reported involvement in general ENT (64.6%), rhinology (40.7%), head and neck surgery (35.4%), otology–neurotology (22.2%), facial plastic surgery (15.9%), and laryngology (13.8%). Based on BAT scoring, mean primary and secondary symptom scores were 2.52 and 2.54, respectively, among head and neck surgeons, compared to 2.54 and 2.51 in non–head-and-neck specialists. No statistically significant differences were observed between groups ($p > 0.05$). Overall mean scores indicated that participants fell within the low-risk category for burnout.

CONCLUSIONS

Burnout levels among ENT specialists were generally low and did not differ significantly between head and neck surgeons and other subspecialty practitioners.

OP-396

Plectin: A Potential Novel Biomarker In Papillary Thyroid Carcinoma?

Mustafa KARADENİZ[1], Abdulvahap AKYİĞİT[1], Nevin İLHAN[3], İbrahim Hanifi ÖZERCAN[2], Orkun EROĞLU[1], İrfan KAYGUSUZ[1]

[1]ENT Department, Fırat University, Elazığ, Turkey; [2]Department of Pathology, Fırat University, Elazığ, Turkey; [3]Department of Biochemistry, Fırat University, Elazığ, Turkey

BACKGROUND & AIM

Papillary thyroid carcinoma (PTC) is the most common thyroid malignancy. Biomarkers that improve benign–malignant discrimination and may reflect aggressive biological behavior remain needed. Plectin (PLEC), involved in cytoskeletal organization and cell adhesion, has been implicated in tumor invasion and progression. This study aimed to evaluate the potential contribution of plectin and selected markers to benign–malignant differentiation and lymph node metastasis subgroups by jointly assessing tissue immunohistochemical expression and serum levels in PTC.

MATERIAL & METHODS

Patients who underwent total thyroidectomy at a tertiary state hospital between July 2024 and December 2025 were screened (n=113); cases meeting the inclusion criteria were included in the study (n=62). Surgical cases were classified as benign pathology or PTC based on definitive histopathology; PTC cases were further stratified by the presence or absence of lymph

node metastasis. Serum levels of plectin, MMP-9, caspase-3, and pERK1/2 were measured by ELISA preoperatively and at postoperative month 3; healthy volunteers were also included for serum comparisons. Tissue samples were stained for the same markers using immunohistochemistry and evaluated using a semi-quantitative immunoreactive score (IRS) incorporating both staining intensity and extent. Findings were interpreted through benign–malignant comparisons and PTC subgroup analyses; tissue–serum associations were examined using correlation analysis.

RESULTS

Tissue immunohistochemistry demonstrated higher plectin expression in PTC compared with benign pathologies. Similarly, the PTC group showed higher tissue expression patterns for the additional markers evaluated. Although serum marker levels differed between healthy volunteers and surgical cases, serum levels alone provided limited discrimination between benign pathology and PTC. In PTC subgroup analyses by lymph node metastasis, no meaningful separation was observed in tissue or serum parameters. Correlation analysis did not demonstrate a consistent relationship indicating that tissue IRS scores directly reflect serum levels.

CONCLUSIONS

Tissue plectin expression appears to be a promising diagnostic biomarker candidate for benign–PTC differentiation. In contrast, serum plectin and other serum markers showed limited contribution to benign–malignant discrimination and to metastasis subgroup separation in this cohort. Prospective validation of plectin within a panel-based approach and in larger cohorts is warranted to clarify its role in diagnostic algorithms for thyroid nodules.

Conventional Suture Ligation Vs. Sutureless Technique In Total Thyroidectomy: A Systematic Review And Meta-Analysis Of Randomized Controlled Trials

Baraa Awad[2], **Moheb Ashi**[3], **Rena Abualjamal**[1], **Ola Khawaji**[4], **Lina Justenia**[1], **Joud Damanhuri**[1], **Moayed Allahim**[5], **Wafaa Ashram**[3], **Ibrahim Aljohani**[6], **Mohammad Halawani**[7]

[1]College of Medicine, King Saud University for Health Sciences, Jeddah, Saudi Arabia.; [2]Department of Otolaryngology - Head & Neck Surgery, College of Medicine, King Saud bin Abdulaziz University for Health Sciences, King Abdullah International Medical Research Center, Ministry of National Guard Health Affairs, Jeddah, SAU; [3]College of Medicine, King Abdulaziz University, Jeddah, Saudi Arabia.; [4]College of Medicine, Jazan University, Jazan, Saudi Arabia.; [5]College of Medicine, Qassim university, Burydah, Saudi Arabia.; [6]College of Medicine, Taif University, Taif, Saudi Arabia; [7]King Saud Bin Abdulaziz University for Health Sciences, King Abdullah International Medical Research Center, Department of ENT, Ministry of National Guard Health Affairs, King Abdullah Specialized Children Hospital, King Abdulaziz Medical City, Jeddah, Saudi Arabia.

BACKGROUND & AIM

Total thyroidectomy, a procedure for various thyroid pathologies, is traditionally performed using conventional suture ligation (CH) for hemostasis. Advanced high-energy devices (HEDs) like the Harmonic Scalpel (HS) and LigaSure (LS) offer sutureless alternatives with potential efficiency gains, but safety concerns remain. This systematic review and Bayesian network meta-analysis of randomized controlled trials (RCTs) was conducted to compare the efficacy and safety of sutureless techniques versus CH in total thyroidectomy.

MATERIAL & METHODS

This systematic review included 22 prospective RCTs, published between 2005 and 2022, enrolling 3,824 patients. The primary outcomes included operative time (OT), intraoperative blood loss (IOBL), and transient recurrent laryngeal nerve (RLN) injury and hypocalcemia. Secondary outcomes were postoperative hematoma (POH), postoperative drain output (POD), and length of hospital stay (LOS). Intervention rankings were determined using the Surface Under the Cumulative Ranking Curve (SUCRA), SUCRA values reflect the probability that an intervention ranks higher relative to others for a given outcome and do not indicate a clinical or statistical superiority; therefore, they should be interpreted alongside effect estimates and credible intervals.

RESULTS

In comparison with CH, both HS and LS were statistically significantly superior, reducing OT by approximately 22 minutes (HS: SUCRA 0.76, LS: SUCRA 0.73). HS demonstrated further significant superiority over CH, reducing LOS by -0.37 days (SUCRA 0.93) and POD output by -24 mL (SUCRA 0.87). While HS showed a numerical reduction in IOBL, this difference did not reach statistical significance, yet HS ranked highest for this outcome (SUCRA 0.91). Importantly, no significant differences were detected among HS, LS, and CH for key safety outcomes, including transient RLN palsy, transient hypocalcemia, and POH.

CONCLUSIONS

Sutureless techniques, particularly HS, were associated with shorter operative time and reduced postoperative fluid output and hospital stay compared with conventional suture ligation. However, the certainty of evidence for most outcomes was moderate to low, and the analysis may be underpowered to detect differences in rare safety events. These findings suggest that sutureless energy devices, particularly HS, may be considered in thyroidectomy practice, while acknowledging the moderate to low certainty of the available evidence.

OP-398

Submandibular Cancer – A Nationwide, Population-Based Study Of 209 Patients From The Swehncr

Lovisa Farnebo[1], **Anna Hafström**[2]

[1]*Department of Otorhinolaryngology, Region Östergötland Anesthetics, Operations, and Specialty Surgery Center, Linkoping, Sweden, Division of Sensory Organs and Communication, Department of Biomedical and Clinical Sciences, Faculty of Medicine and Health Sciences, Linkoping University, Linkoping, Sweden;* [2]*Department of Clinical Sciences, Lund University, Lund, Sweden. Department of ORL, Head & Neck Surgery, Skåne University Hospital, Lund, Sweden.*

BACKGROUND & AIM

Submandibular gland cancer (SMGC) is a rare malignancy, representing 1% of all head and neck cancers (HNC) in Sweden. The aim of this study was to describe patient characteristics, histopathological distribution, treatment patterns, and survival outcomes in a nationwide cohort.

MATERIAL & METHODS

All 209 patients diagnosed with SMGC between 2008 and 2019 were identified in the Swedish Head and Neck Cancer Register (SweHNCR). The SweHNCR has a 98% coverage when cross-referenced with the National Cancer Registry of the National Board of Health and Welfare. Clinical data, histopathology, stage, treatment, and overall survival (OS) were analyzed.

RESULTS

Median age at diagnosis was 69 years [95% CI 56–78], and 46% were women. Curative treatment was administered to 83.3% of patients, palliative to 15.3%. Adenoid cystic carcinoma was the most common histopathological subtype (34.0%), followed by adeno- (23.9%) and mucoepidermoid carcinoma (8.1%). Women had a higher proportion of adenoid cystic carcinoma (47.4% vs. 22.3% in men), whereas adenocarcinoma (18.6% vs. 28.6%) and other cancer forms (10.3% vs. 23.2%) were more frequent in men (p=0.0007). At diagnosis, 23.0% presented with stage I, 26.5% stage II, and 50.5% stage III–IV disease. Regional metastases were present in 31.6% at diagnosis, and distant in 12.0%.

Overall 3-, 5-, and 10-year survival (OS) for curatively treated patients was 78.4%, 62.4%, and 43.0%, respectively, with declining OS by advancing stage (5-year OS: 86.6% stage I vs. 25.0% stage IV). Patients with recurrent disease had dismal prognosis with median survival time 12.8 months after diagnosis of recurrence.

CONCLUSIONS

SMGC predominantly affects older adults, and more women than HNC in general. Significant sex-related differences in histopathology was observed. A high number of patients had regional or distant metastasis already at the time of diagnosis. Survival after recurrent disease was poor.

OP-399

ELECTIVE NECK DISSECTION IN EARLY-STAGE ORAL CAVITY TUMORS? INSIGHTS FROM A MULTICENTER STUDY AND DEVELOPMENT OF A MULTIPARAMETRIC PREDICTIVE MODEL

F. Zanghi[1], **L. Gazzini**[1], **M. Abousiam**[1], **L. Calabrese**[1]

[1]*Department of Otolaryngology-Head and Neck Surgery, Provincial Hospital of Bolzano (SABES-ASDAA), Bolzano, Italy*

BACKGROUND & AIM

Nodal metastases significantly affect prognosis in oral cavity squamous cell carcinoma (OCSCC). In early-stage OCSCC (cT1-T2 cN0), management of the clinically negative neck (cN0) remains controversial. Depth of invasion (DOI) is a key determinant for END, but other histopathological parameters, such as grading, perineural invasion (PNI), lymphovascular invasion (LVI), and worst pattern of invasion (WPOI), are emerging prognostic factors.

MATERIAL & METHODS

This multicenter retrospective study analyzed 1,109 patients with cT1-T2 cN0 OCSCC treated at 30 Italian hospitals since 2017. Data on histopathological parameters, tumor characteristics, and patient outcomes were collected via the REDCap® platform. Simple and multivariable logistic regression models were developed to assess predictors of occult nodal metastases.

RESULTS

A total of 585 patients were clinically classified as cT1 tumors (53%), 503 as cT2 (45%), and cTis (1.9%). Of the 1,109 patients,193 (28%) had occult nodal metastases, with DOI, LVI, PNI, and grading emerging as significant predictors. A predictive model integrating these variables demonstrated superior accuracy compared to a DOI-only model (AUROC comparison, $p < 0.01$).

CONCLUSIONS

This study highlights the importance of incorporating multiple histopathological parameters into risk models for occult nodal metastases, overcomingthe fixed DOI as a cutoff. The proposed predictive model offers a more precise method for guiding END in early-stage OCSCC, allowing individualized risk estimation.

Accuracy And Impact Of Septo-Cutaneous Perforator Integration In Virtual Surgical Planning Of Fibula Flap For Head And Neck Reconstruction: Review

Hemail M. Alsubaie[1,2], **Timothy GH Manzie**[1], **James Wykes**[1], **David Leinkram**[1], **Tsu-Hui Hubert Low**[1], **Sydney Ch'ng**[1], **Carsten E. Palme**[1], **Jonathan R. Clark**[1], **Leba M. Sarkis**[1]

[1]Chris O'Brien Lifehouse, Sydney, Australia; [2]King Faisal Specialist Hospital & Research Center, Riyadh, Saudi Arabia

BACKGROUND & AIM

Virtual Surgical Planning (VSP) optimizes Fibula Free Flap (FFF) jaw reconstruction but historically overlooks Septo-Cutaneous Perforators (SCPs), critical for skin paddle viability. We hypothesized that integrating SCP mapping into VSP improves localization accuracy and reduces flap complications.

MATERIAL & METHODS

A systematic review and meta-analysis (PROSPERO: CRD42024567890) was conducted. Five databases (PubMed, Embase, Scopus, CENTRAL, Web of Science) were searched from inception to 2024. Inclusion required studies reporting quantitative accuracy or flap outcomes for SCP-localized VSP in FFF head and neck reconstruction. Pooled estimates for SCP localization accuracy (mean deviation, mm), total flap loss rate (proportion), and reconstructive accuracy (Root Mean Square [RMS] error, mm) were calculated using random-effects meta-analysis in R v4.3.1. Heterogeneity was assessed via I^2 statistics.

RESULTS

Four studies (n=233 perforators) reported SCP localization accuracy (pooled mean deviation: 2.2 mm, 95% CI: 1.5-2.9; I^2=78%). Three studies (n=110 flaps) reported flap loss (pooled rate: 5.8%, 95% CI: 0.8-14.9; I^2=65%); studies using SCP-guided cutting guides (Battaglia/Garvey) reported 0% loss. Three studies (n=111 flaps) reported reconstructive accuracy (pooled RMS error: 1.07 mm, 95% CI: 0.86-1.28; I^2=88%); industry-based VSP showed lower error than in-house (0.9 mm vs. 1.2 mm RMS). Increased SCP deviation correlated with decreased reconstructive accuracy (R^2=0.37, p<0.01).

CONCLUSIONS

SCP integration in VSP achieves clinically acceptable localization accuracy (2.2 mm), excellent reconstructive precision (1.07 mm RMS), and is associated with reduced total flap loss (5.8%). Standardizing Computed Tomography Angiography (CTA)-based SCP mapping within FFF-VSP protocols is recommended to optimize outcomes, despite noted heterogeneity. Future randomized trials are warranted.

Integrating Perioperative Pembrolizumab Into Clinical Practice For Resectable LA HNSCC: European-Based Insights From The Phase 3 KEYNOTE-689 Study

Marc Oliva[1], **Antonio Marí Roig**[1], **Irene Braña**[2], **María Socorro Bescós**[2], **Anna Spreafico**[3], **Silke Tribius**[4], **Senada Koljenović**[5], **Lorena Yapur Bonavita**[6], **Cristina Romero de Santos**[7], **Kimberly Benjamin**[8], **Hisham Mehanna**[9]

[1]Institut Català d'Oncologia, Hospital Duran iReynals, Barcelona, Spain; [2]Vall d'Hebron University Hospital, Barcelona, Spain; [3]Princess Margaret Cancer Centre, Toronto, Canada; [4]Asklepios Tumorzentrum, Hamburg, Germany; [5]Antwerp University Hospital, Antwerp, Belgium; [6]MSD Switzerland, Lucerne, Switzerland; [7]MSD Spain, Madrid, Spain; [8]Merck & Co., Inc., Rahway, NJ, USA; [9]University Hospitals Birmingham, Birmingham, United Kingdom

BACKGROUND & AIM

Based on results from the KEYNOTE-689 study (NCT03765918), perioperative pembrolizumab was approved in the US and EU for adults with resectable LA HNSCC whose tumors express PD-L1 CPS ≥1. Correct implementation of the new standard into clinical practice is crucial to achieve the intended benefits while safeguarding surgical outcomes and care quality. Multidisciplinary expert coordination is key to adapting the current workflow and patient journey to overcome these multidimensional challenges.

MATERIAL & METHODS

We highlight potential barriers and provide practical recommendations from a European head and neck multidisciplinary expert panel for integration of perioperative pembrolizumab into clinical practice, including patient profile (tumor characteristics, resectability, and planned surgical approach), diagnostic workflow by care setting (including incorporation of

PD-L1 testing), feasibility of concurrent medical oncology–surgical assessment during neoadjuvant period, perioperative imaging requirements, intraoperative assessment of resection margins, risk-stratification and postoperative pathological response assessment, and follow-up strategies for early detection of post-surgical complications and toxicity.

RESULTS

Early identification of eligible patients and timely discussion within multidisciplinary tumor boards (MTB) to adjust decisions based on patient characteristics, tumor location, disease burden/kinetics, and PD-L1 status is critical to avoid treatment delays. Although diagnostic workflows vary across region, consensus is to streamline first biopsy collection and PD-L1 testing, as requested by surgeons or included as reflex testing, to expedite treatment initiation. Upfront joint evaluations by medical/radiation oncologists and surgeons during neoadjuvant therapy are essential to assess early-on progression and/or toxicity that could alter the treatment plan. Post-neoadjuvant, pre-surgical imaging is critical in cases where resectability status or surgical planning could change. Standardized pathological evaluation of treatment response has prognostic impact and, with radiological response, could aid MTBs in tailoring adjuvant treatment. Structured follow-up is required to address immune-related events, surgical complications, and continuity of adjuvant therapy.

CONCLUSIONS

Identifying challenges and addressing variability in patient pathways, diagnostic processes including PD-L1 testing workflows, multidisciplinary coordination, imaging strategies, and perioperative risk assessment are critical for successful implementation of perioperative pembrolizumab in resectable LA HNSCC across Europe. Adoption of standardized, multidisciplinary care pathways may avoid delays, enhance treatment adherence, optimize surgical outcomes, and promote equitable access to care across healthcare systems.

OP-402

Evaluation Of The HALP Score As A Prognostic Biomarker In Papillary Thyroid Carcinoma

Mustafa Çağrı Derici[1], **Enes Selçuk**[1], **Buket Şengül**[1], **Ege Demirkıran**[1], **Sedat Alagöz**[1], **İlhami Yıldırım**[1]

[1]*University of Health Sciences- Adana City Training and Research Hospital*

BACKGROUND & AIM

This study aimed to investigate the usability of the HALP (Hemoglobin, Albumin, Lymphocyte, and Platelet) score as a biomarker in predicting the prognosis of papillary thyroid carcinoma (PTC).

MATERIAL & METHODS

The data of 70 patients who were operated on in our clinic between 2024 and 2026 and histopathologically diagnosed with PTC were retrospectively analyzed. The HALP score was calculated using preoperative routine blood test parameters, including hemoglobin, albumin, lymphocyte, and platelet values. The relationship between the HALP score and lymph node metastasis as well as extrathyroidal extension was statistically analyzed.

RESULTS

Of the patients included in the study, 49 (70%) were female and 21 (30%) were male. The patients' ages ranged from 15 to 80 years, with a mean age of 50.10 ± 16.30 years. No statistically significant difference was observed in HALP score values with respect to the presence of lymph node metastasis in patients with PTC ($p = 0.553$). Similarly, no statistically significant difference was found in HALP score values regarding extrathyroidal extension ($p = 0.541$).

CONCLUSIONS

Papillary thyroid carcinoma is the most common thyroid malignancy and generally has a favorable prognosis, although it may occasionally show aggressive behavior. In this study, the HALP score was not found to be an effective prognostic marker for predicting lymph node metastasis or extrathyroidal extension in patients with PTC.

Impact Of Treatment Sequencing Including Photoimmunotherapy On Survival In Recurrent Head And Neck Cancer: A Real-World Analysis

Hideoki Uryu[1], **Ryousuke Kuga**[1], **Ryutarou Uchi**[2], **Torahiko Nakashima**[1]

[1]*National Hospital Organization Kyushu Medical Center;* [2]*Yamaguchi Red Cross Hospital*

BACKGROUND & AIM

Photoimmunotherapy (PIT) has emerged as a novel local treatment option for recurrent or unresectable head and neck cancer. However, its optimal integration into the overall treatment sequence remains unclear. In the era of immune checkpoint inhibitors (ICI), the timing and combination of PIT with systemic therapies may significantly influence patient outcomes.

MATERIAL & METHODS

We retrospectively analyzed 12 patients with recurrent head and neck cancer treated with PIT at our institution since 2022. Clinical characteristics, treatment sequences, best local response, time to next treatment (TTNT), and overall survival (OS) from the first PIT session were evaluated.

RESULTS

The cohort included 9 males and 3 females with a median age of 66 years (range, 50–84). Primary tumor sites were diverse. All patients had prior definitive treatments, most commonly radiotherapy or chemoradiotherapy.

The best response to PIT was partial response (PR) in 8 patients and stable disease (SD) in 4 patients. The median TTNT was 160 days, and the median OS from PIT initiation was 335 days (range, 34–922 days). At the last follow-up, 10 patients were alive and 2 had died.

Three patients with superficial lesions achieved long-term disease control without any additional treatment after PIT. In contrast, elderly patients or those treated with PIT after multiple prior systemic therapies, including ICI, showed poor outcomes.

Importantly, patients who were able to receive subsequent treatments, including ICI or cytotoxic chemotherapy after PIT, demonstrated favorable survival even in cases with relatively bulky disease.

CONCLUSIONS

Our findings suggest that the clinical impact of PIT is strongly dependent on treatment sequencing. PIT should not be regarded as a last-line therapy but rather as a component of a multimodal strategy. Early integration of PIT may help preserve subsequent treatment options and improve both survival and quality of life in selected patients.

Management Of Recurrent Nasopharyngeal Carcinoma: Diagnosis, Treatment And Potential Complications.

Jacopo Zocchi[1]

[1]*Division of Otolaryngology and Head and Neck Surgery, IEO, European Institute of Oncology IRCCS, Milan, Italy*

BACKGROUND & AIM

Locally recurrent nasopharyngeal carcinoma (NPC) presents substantial challenges in clinical management so that a multimodal approach is needed. Endoscopic endonasal approach has been reported in the early 2000s as a potential treatment for selected and, nowadays, endoscopic nasopharyngectomy is regarded as the preferred option for resectable locally recurrent NPC

MATERIAL & METHODS

An italian multicenter retrospective review of patients with recurrent NPC, treated with pure endoscopic approach in tertiary referral center.

RESULTS

We report an analysis of the algorithm used to reach the relapse diagnosis, how patients selection was performed, oncological results and complications related to the treatments and their management. A particular emphasis is placed upon carotid artery preoperative management and skull base osteomyelitis as a possible post-operative complication.

CONCLUSIONS

Recurrent NPS is a challenging disease. Only a proper patients selection and a 360° patients management is necessary to achieve optimal oncological outcomes.

Can Carbonic Anhydrase IX Inhibition Suppress Mtor Signaling In Hep-2 Laryngeal Squamous Cell Carcinoma Cells?

Ömer BAYIR[1], **Hacı Ahmet KILIÇ**[2], **Esra Nur BAYIR**[3], **Zeynep Betül SARI**[2,4], **Özen Özensoy GÜLER**[2,4]

[1]*University of Health Sciences, Ankara Etlik City Hospital, Department of Otolaryngology, Head and Neck Surgery, Ankara, Türkiye.;* [2]*Ankara Yıldırım Beyazıt University, Medical Faculty, Department of Medical Biology, Ankara, Türkiye.;* [3]*Istanbul University-Cerrahpaşa, Cerrahpaşa Faculty of Medicine, Department of Pathology, Istanbul, Türkiye.;* [4]*Ankara Yıldırım Beyazıt University, Yenimahalle Training and Research Hospital, Ankara, Türkiye.*

BACKGROUND & AIM

Laryngeal squamous cell carcinoma (LSCC) is a significant malignancy among head and neck

cancers, associated with high morbidity, mortality, and treatment resistance. Hypoxia-driven acidification of the tumor microenvironment is one of the key mechanisms supporting tumor cell proliferation, invasion, and survival. Carbonic anhydrase IX (CA-IX) is an important transmembrane enzyme that is overexpressed under hypoxic conditions and plays a critical role in maintaining intracellular pH homeostasis. The mTOR signaling pathway is a central regulator of cell growth, metabolism, and proliferation. This study aimed to investigate the effects of CA-IX inhibition on the mTOR signaling pathway in the Hep-2 LSCC cell line.

MATERIAL & METHODS

This experimental study was performed using the human LSCC cell line Hep-2. Cells were cultured under standard conditions in DMEM supplemented with 10% fetal bovine serum and 1% penicillin/streptomycin. Acetazolamide (AZA) was administered to inhibit CA-IX. Cytotoxicity was evaluated using the MTT assay, and the IC50 value was calculated by dose-response analysis at different AZA concentrations. CA-IX protein levels were measured in cell lysates using the sandwich ELISA method. Total protein concentration was determined by the Bradford assay. To evaluate alterations in the mTOR signaling pathway, total mTOR, phosphorylated mTOR (p-mTOR), and phosphorylated AKT (p-AKT) protein levels were analyzed by Western blot, with GAPDH used as the normalization control. Statistical analyses were performed using GraphPad Prism software; Student's t-test was used for pairwise comparisons, and p<0.05 was considered statistically significant.

RESULTS

AZA treatment produced marked biological effects in Hep-2 cells. Cell viability decreased in a dose-dependent manner, and the 24-hour IC50 value was calculated as 22.99 µM. In the 48-hour MTT analysis, the reduction in cell viability with increasing AZA concentrations was statistically significant (p<0.05). ELISA analysis showed that CA-IX levels decreased from 298.46 pg/mL in the untreated group to 100.2 pg/mL in the AZA-treated group, and this reduction was highly significant (p<0.0001). Western blot analyses demonstrated that p-mTOR levels were significantly decreased in the AZA-treated group compared with the control group (p<0.05). Similarly, p-AKT levels were also significantly reduced (p<0.05). In contrast, total mTOR expression was significantly increased (p<0.05). Taken together, these findings indicate that CA-IX inhibition induces significant molecular alterations in the PI3K/AKT/mTOR axis.

CONCLUSIONS

This study demonstrates that CA-IX inhibition in laryngeal squamous cell carcinoma cells not only reduces cell viability but also significantly alters the activation profile of the mTOR signaling pathway. The decreases in p-AKT and p-mTOR levels support a functional relationship between tumor microenvironment-related acidification and intracellular oncogenic signaling networks. These findings suggest that CA-IX may serve not only as a hypoxia/pH-regulating marker in LSCC but also as a therapeutically targetable molecule. Combined targeting of CA-IX and related signaling pathways appears to be a promising strategy for the development of novel treatment approaches in laryngeal cancer.

Smoking Cessation Behavior In Patients Undergoing Microlaryngoscopy For Dysphonia

Ahmet Burak Dağaşan[1], **Erdem Mengi**[1], **Cüneyt Orhan Kara**[1], **Fazıl Necdet Ardıç**[1]

[1]*Pamukkale University*

BACKGROUND & AIM

Smoking is a significant risk factor in the etiology of both laryngeal cancer and some benign laryngeal lesions. Although these patients are advised to quit smoking in clinical practice, smoking cessation rates and factors influencing this behavior are not clearly known. This study aimed to evaluate smoking behavior and nicotine dependence levels in patients who underwent microlaryngoscopy and had a confirmed pathological diagnosis.

MATERIAL & METHODS

This study, which included a retrospective file review and a cross-sectional questionnaire, included patients who underwent microlaryngoscopy for dysphonia at the Department of Otolaryngology, Pamukkale University Faculty of Medicine, had a history of smoking before the operation, and had a confirmed pathology result. Demographic and clinical data, as well as smoking characteristics, were obtained through face-to-face interviews. Nicotine dependence level was assessed using the Fagerström Nicotine Dependence Test (FTND). Statistical analyses were performed using IBM SPSS Statistics. The Chi-square test was used to analyze categorical variables, and logistic regression analysis was used to evaluate the effect of the diagnostic group on smoking cessation. A p-value of <0.05 was considered statistically significant.

RESULTS

A total of 76 patients were included: 24 benign, 17 premalignant, and 35 malignant. The mean age was 55.8±11.9 years, and 81.6% were male. The postoperative smoking cessation rate was 50%, while 36.8% of those who continued smoking reduced their consumption. Mean pack-years differed significantly among diagnostic groups (p=0.012), with a higher smoking burden in the malignant group compared to the benign group. A significant association was observed between malignant diagnosis and postoperative smoking cessation (p<0.001); 85.7% of patients with a malignant diagnosis quit smoking versus 29.2% of those with a benign diagnosis. In logistic regression analysis including FTND score and diagnosis, the model was significant (p<0.001). However, the effect of FTND score lost statistical significance after adjusting for diagnosis (p=0.054).

CONCLUSIONS

Malignant diagnosis was identified as a strong and independent predictor of smoking cessation. Smoking cessation behavior appears to be related to malignant diagnosis rather than nicotine dependence level. The low smoking cessation rates in the benign diagnosis group highlight the importance of structured smoking cessation support and counseling in these patients.

Preoperative Diagnostic Performance Of Ultrasonography, Technetium-99M Sestamibi Scintigraphy, And Four-Dimensional Computed Tomography In Localizing Parathyroid Adenomas: A Retrospective Clinicopathological Study

Erdoğan Özgür[1], **Asuman Feda Bayrak**[1], **Özden Savaş**[1], **Nuri Karabay**[2], **Özden Özdemir Başer**[3], **Gamze Çapa Kaya**[4], **Çağla Atakan**[1]

[1]*Department of Otorhinolaryngology, Dokuz Eylül University Faculty of Medicine, İzmir, Türkiye;* [2]*Department of Radiology, Dokuz Eylül University Faculty of Medicine, İzmir, Türkiye;* [3]*Department of Internal Medicine, Dokuz Eylül University Faculty of Medicine, İzmir, Türkiye;* [4]*Department of Nuclear Medicine, Dokuz Eylül University Faculty of Medicine, İzmir, Türkiye*

BACKGROUND & AIM

Primary hyperparathyroidism, one of the endocrine disorders, is most commonly caused by parathyroid adenoma, and surgery remains the only curative treatment. Ultrasonography (USG), Tc-99m sestamibi scintigraphy (MIBI), and four-dimensional computed tomography (4D-CT) are among the most commonly used imaging modalities for localizing parathyroid adenomas. Recent studies have suggested that 4D-CT may improve localization accuracy, particularly in cases with discordant or negative USG and MIBI findings.

In this retrospective study, preoperative imaging findings of patients operated on for primary hyperparathyroidism with histopathologically confirmed parathyroid adenoma were evaluated.

MATERIAL & METHODS

A total of 102 patients with histopathologically confirmed parathyroid adenoma who underwent surgery for primary hyperparathyroidism at the Department of Otorhinolaryngology, Dokuz Eylül University Faculty of Medicine, and met the inclusion criteria were included in this retrospective study. Data were obtained from the electronic medical record system, radiology archives, nuclear medicine records, and pathology reports.

RESULTS

Between April 2015 and August 2025, a total of 115 surgical procedures were performed in 112 patients with primary hyperparathyroidism. Among these, 102 patients with histopathologically confirmed parathyroid adenoma were included in the analysis. Demographic evaluation revealed that 83 patients (81.4%) were female, with a mean age of 55.2 years.

Ultrasonography (USG), sestamibi scintigraphy (MIBI), and computed tomography (CT) were used for lesion localization and size assessment. The sensitivity of USG, MIBI, and CT for lesion localization was 84.3% (n=86), 80.4% (n=82), and 74.0% (n=75), respectively. In 40% of patients, the adenoma was localized to the left inferior quadrant.

Surgical success, based on postoperative biochemical normalization and follow-up findings, was achieved in 97.1% of patients (n=99).

CONCLUSIONS

Minimally invasive parathyroidectomy is an effective and safe treatment modality for primary hyperparathyroidism when performed in tertiary otorhinolaryngology centers. Preoperative imaging modalities play a crucial role in accurate lesion localization, surgical planning, and prevention of surgery-related morbidity. The choice of imaging modality should be individualized for each patient, taking into account the effectiveness of the modality, expertise in image interpretation, and the availability of these techniques in clinical practice.

Preoperative Parameters And Their Prognostic Impact In Differentiated Thyroid Carcinoma On 702 Patients

Huseyin Aktas[1], **Erdem Ersan Akyürek**[1], **Cem Hatay**[1], **Dr.Busra Kaplan**[1]

[1]*Hacettepe Universtiy ENT department*

BACKGROUND & AIM

To investigate the prognostic significance of preoperative hematological and biochemical parameters in patients operated for differentiated thyroid carcinoma (DTC) at Hacettepe University between 2017 and 2025.

MATERIAL & METHODS

: A retrospective analysis was performed on 702 patients diagnosed with differentiated thyroid carcinoma. Demographic data, histopathological findings, laboratory parameters, metastatic status, and recurrence outcomes were analyzed. Preoperative neutrophil count, lymphocyte count, platelet count, neutrophil-to-lymphocyte ratio (NLR), platelet-to-lymphocyte ratio (PLR), thyroglobulin (Tg), thyroid stimulating hormone (TSH), and free T4 values were evaluated. Logistic regression analysis was performed to determine independent predictors of cervical metastasis.

RESULTS

Preoperative neutrophil count was significantly higher in metastatic patients (p=0.021), whereas NLR, PLR, platelet count, lymphocyte count, TSH, and T4 levels were not associated with metastasis. Preoperative Tg levels were significantly associated with metastatic disease (p=0.009). Multivariate logistic regression identified male sex, younger age, diffuse sclerosing variant, extrathyroidal extension, multifocality, and ECE positivity as independent predictors of metastasis.

CONCLUSIONS

Conventional pathological risk factors remain the strongest predictors of cervical metastasis in differentiated thyroid carcinoma. Among preoperative laboratory parameters, neutrophil count and thyroglobulin levels demonstrated prognostic value

OP-409

The Prognostic Impact Of Clinical, Nutritional, And Inflammatory Markers On Overall And Disease-Free Survival In Laryngeal Cancer

Burak SİLAHLI[1], **Işıl ADADAN GÜVENÇ**[1]

[1]*Izmir Bakırçay University Department of Otolaryngology*

BACKGROUND & AIM

The aim of this study is to investigate the prognostic value of preoperative nutritional (PNI, GNRI) and inflammatory (Neutrophil, Lymphocyte, HALP) markers on Overall Survival and Disease-Free Survival in patients with laryngeal cancer, along with tumor stage and histopathological factors.

MATERIAL & METHODS

The study included 99 patients (91 men, 8 women; mean age 64.7) diagnosed with primary laryngeal cancer. Patients' demographic data, TNM stages, perineural/lymphovascular invasion status, and index scores (PNI, GNRI, HALP) obtained from preoperative complete blood counts were calculated. Cut-off points for index scores were selected in accordance with the literature and confirmed by Roc curve analyses. Treatment methods were also recorded and included in the analysis. Survival curves were constructed using the Kaplan-Meier method, and differences between groups were compared using the Log-Rank test. Factors affecting survival and recurrence were examined using univariate analyses; then, to standardize the clinical severity of the disease, multivariate Cox Regression models including “Tumor Stage” were created in both models (OS and DFS).

RESULTS

Mean follow-up was 19.8 and 19.15 months for overall (OS) and disease-free survival (DFS); mortality and recurrence rates were 26.3% and 10.1%. Nonsurvivors exhibited significantly higher age (69.2 vs 63.1) and neutrophils (6.37 vs 5.41), but lower

albumin (3.61 vs 3.96), lymphocytes (1.87 vs 2.22), PNI (45.4 vs 50.7), GNRI (97.2 vs 106.1), and HALP scores (37.3 vs 50.7). Kaplan-Meier and univariate analyses associated low preoperative GNRI, PNI, HALP, and albumin with shorter OS and DFS (p<0.05). Younger age (p=0.006) and early-stage disease (p=0.001) favored OS. In multivariate OS analysis (tumor stage borderline, p=0.086), high GNRI (HR: 0.955, 95% CI: 0.916-0.996, p=0.032) and neutrophils (HR: 1.201, 95% CI: 1.000-1.442, p=0.049) emerged as independent good and poor prognosticators, respectively. Univariate DFS analysis identified high T-stage, perineural, and lymphovascular invasion as poor predictors (p<0.05), with GNRI borderline (p=0.065). Multivariate DFS analysis yielded no independent predictors, including stage (p=0.353).

CONCLUSIONS

Our study demonstrated that increased systemic inflammation (elevated neutrophil count) and nutritional deficiency (particularly as determined by GNRI) are direct determinants of mortality in laryngeal cancer, independent of tumor stage and the presence of invasion. Preoperative nutritional optimization for overall survival has been proven to play a role as critical as stage in multidisciplinary laryngeal cancer management. Although tumor burden and invasive pathological features appear to be more decisive for disease-free survival, our study did not identify statistically significant independent factors.

Association Of PET/CT Suvmax Parameters With Cervical Lymph Node Metastasis And Histopathological Prognostic Factors In Oral Cavity Squamous Cell Carcinoma

Seda Nur Saka[1], **Berika Çakmak**[1], **Deniz Baklacı**[1], **Duygu Erdem**[1]

[1]*Bülent Ecevit University Hospital*

BACKGROUND & AIM

Cervical lymph node metastasis is one of the most important prognostic factors in oral cavity squamous cell carcinoma (OCSCC). This study aimed to evaluate the role of preoperative fluorine-18 fluorodeoxyglucose positron emission tomography/computed tomography (18F-FDG PET/CT)-derived maximum standardized uptake value (SUVmax) parameters in predicting histopathologically confirmed cervical lymph node metastasis and their association with aggressive histopathological prognostic factors in OCSCC.

MATERIAL & METHODS

This retrospective study included 66 patients with histopathologically confirmed OCSCC who underwent surgery and preoperative 18F-FDG PET/CT imaging. Primary tumor SUVmax and lymph node (LN) SUVmax values were analyzed in relation to histopathological N positivity, depth of invasion (DOI), perineural invasion (PNI), lymphovascular invasion (LVI), extranodal extension (ENE), and tumor differentiation. Statistical analyses included Mann–Whitney U, Kruskal–Wallis, Spearman correlation, receiver operating characteristic (ROC), and multivariate logistic regression analyses.

RESULTS

Histopathologically confirmed cervical lymph node metastasis was detected in 18 patients (27.3%). Primary tumor SUVmax values were significantly higher in N-positive patients than in N0 patients (10.75 vs 7.10; p=0.014). Primary tumor SUVmax was significantly associated with PNI (p=0.001), LVI (p=0.023), DOI (rho=0.713, p<0.001), T stage (rho=0.688, p<0.001), and tumor differentiation (p=0.009). LN SUVmax values were significantly higher in histopathologically N-positive patients (4.50 vs 0.00; p<0.001) and showed better diagnostic performance than primary tumor SUVmax (area under the curve [AUC]=0.800 vs 0.726). Using the conventional PET/CT cutoff value of LN SUVmax >2.5, sensitivity and specificity were 77.8% and 72.3%, respectively.

CONCLUSIONS

LN SUVmax appears to be a useful parameter for predicting cervical lymph node metastasis in OCSCC. Furthermore, the association between primary tumor SUVmax and aggressive histopathological features suggests that PET/CT-derived metabolic activity may reflect tumor biology. These parameters may serve as adjunctive biomarkers for preoperative risk stratification in oral cavity cancer patients.

Predictors Of Hypothyroidism In Surgically Treated Head And Neck Cancer Patients Undergoing Adjuvant Radiotherapy

Cömert Şen[1], **Ömer Orak**[1], **Vedat Emre Alayoğlu**[1], **Sıla Yıldırım**[1], **Kübra Özkaya Toraman**[2], **Murat Ulusan**[1], **Bora Başaran**[1], **İsmet Aslan**[1]

[1]*Istanbul University, Istanbul Faculty of Medicine, Department of Head and Neck Surgery;* [2]*Istanbul University, Istanbul Faculty of Medicine, Department of Radiation Oncology*

BACKGROUND & AIM

Hypothyroidism is a frequent complication after multimodal treatment for head and neck cancer (HNC). This study aimed to determine incidence, timing, and independent predictors of hypothyroidism in patients receiving adjuvant radiotherapy after head and neck surgery.

MATERIAL & METHODS

This retrospective cohort included 150 surgically treated HNC patients receiving adjuvant treatment. Minimum follow-up duration was 6 months. Patients with previous thyroid surgery, known thyroid disease, or total thyroidectomy during cancer surgery were excluded. Hypothyroidism was classified as subclinical or clinical according to thyroid function tests. Demographic, tumor-related, surgical, and adjuvant treatment variables were compared. Hypothyroidism-free survival (HFS) was evaluated using Kaplan–Meier analysis. Variables significant at $p < 0.05$ in univariable Cox regression were entered into a multivariable Cox proportional hazards model with backward stepwise elimination (retention threshold $p < 0.05$).

RESULTS

Of 150 patients, 117 (78.0%) were men; mean age was 58.3 ± 12.0 years. Oral cavity (47.3%) and larynx (37.3%) were the most common primary sites. Radiotherapy alone was given to 73 patients (48.7%), chemoradiotherapy to 76 (50.7%), and chemotherapy alone to one (0.7%). Hypothyroidism developed in 59 patients (39.3%), 33 subclinical (56%) and 26 clinical (44%), at a median of 15.0 months (IQR, 10.0–32.0). Median follow-up in euthyroid patients was 29.0 months (18.0–53.0). HFS was shorter for laryngeal primary site, paratracheal lymph node dissection, loboisthmectomy, lateral neck dissection, and smoking (median 20.0, 10.0, 11.0, 46.0, and 45.0 months; all $p \leq 0.005$). Adding chemotherapy did not increase risk ($p = 0.100$). On multivariable Cox analysis with backward stepwise elimination, laryngeal primary site (HR 2.485, 95% CI 1.203–5.133; $p = 0.014$) and paratracheal lymph node dissection (HR 2.621, 95% CI 1.363–5.041; $p = 0.004$) remained independent predictors.

CONCLUSIONS

Post-treatment hypothyroidism occurred in 39.3% of surgically treated HNC patients receiving adjuvant radiotherapy. After multivariable adjustment, laryngeal primary site and paratracheal lymph node dissection emerged as the only variables independently associated with hypothyroidism, and were also linked to earlier onset. These two clinical features should prompt closer thyroid function surveillance after adjuvant radiotherapy.

Early Detection Of The Association Between Oropharyngeal Squamous Cell Carcinomas And HPV Using Oropharyngeal Swab Testing And Its Impact On Prognosis

Nuray Ensari[1], **Özer Erdem Gür**[1], **Canan Sadullahoğlu**[2], **Rezarta Taga Senirli**[1], **Yeşim Yüksel**[1], **Muhammet Yıldız**[1], **Nevreste Didem Sonbay Yılmaz**[1]

[1]*Antalya Training and Research Hospital, Department of Otorhinolaryngology;* [2]*Antalya Training and Research Hospital, Department of Pathology*

BACKGROUND & AIM

When treated at an early stage, patients with HPV-positive oropharyngeal squamous cell carcinoma (OPSCC) have better survival and prognosis than HPV-negative patients. Most cases are associated with vaccine-preventable HPV strains, emphasizing the importance of prevention, screening, and early diagnosis, particularly in primary care. This study aims to evaluate the association between HPV and OPSCC and its prognostic significance. Cervical cancer screening programs have reduced HPV-related cancer incidence and enabled identification of high-risk HPV types as early markers of malignancy. Similar screening strategies may help detect HPV-positive OPSCC early, potentially improving patient outcomes and overall prognosis.

MATERIAL & METHODS

The study participants were divided into two groups. The first group included patients previously diagnosed with OPSCC who had received treatment, as well as newly diagnosed patients who had not yet started treatment. The second group served as the control group and consisted of patients who underwent tonsillectomy for chronic tonsillitis without suspicion of HPV or patients who underwent papilloma excision.

For all patients, age, sex, tobacco use, and treatment history were recorded. After obtaining written informed consent, oral swab samples were collected from both groups prior to any treatment. Tissue and saliva samples were examined by the pathology department, and all high-risk HPV types were analyzed. In the control group, HPV testing was also performed on pathology specimens. Swab samples were obtained using a thin brush-tipped stick, placed into liquid medium, and sent to the pathology laboratory for analysis.

RESULTS

The study included 55 patients, 32 of whom were female and 22 of whom were male.The overall rate of active smoking among all groups was 27.3%. There were 2 ex-smokers.Fifteen patients' tissue samples contained HPV. Four of these individuals (26.7%) also had positive oral swab test results. Tissue samples were found to have HPV strains 16, 18, and 31. One patient had HPV type 18 and two patients had HPV type 16 identified in the swab samples.Three of the patients whose tissue samples

tested positive for HPV had benign lesions. One patient had surgery for tonsillar hypertrophy, while two patients had surgery for tonsillar papillomas.

CONCLUSIONS

Only about 25% of patients with HPV-positive tissue samples could be identified using the oral swab approach. According to the findings of this study, oral swab sampling appears to be insufficient as a stand-alone diagnostic technique and has poor sensitivity in identifying HPV positivity in benign oral cavity lesions among OPSCC patients. Nonetheless, because it is non-invasive, it might be regarded as a screening or supplemental method. Further studies with larger sample sizes are needed to clarify its diagnostic value.

Prediction Of Survival Outcomes Based On P16 Overexpression In Sinonasal Squamous Cell Carcinoma

Mikio Suzuki[1], **Hitoshi Hirakawa**[1], **Taro Ikegami**[1], **Hironori Nakayoshi**[1], **Shogo Takeda**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery, Graduate School of Medicine, University of the Ryukyus*

BACKGROUND & AIM

p16 overexpression is widely accepted as a surrogate marker for human papillomavirus (HPV)–associated oropharyngeal squamous cell carcinoma; however, its diagnostic and prognostic significance in sinonasal squamous cell carcinoma (SNSCC) remains controversial. This study aimed to clarify the clinicopathological characteristics, HPV status, and prognostic impact of p16 overexpression in SNSCC.

MATERIAL & METHODS

We retrospectively analyzed 79 consecutive patients with SNSCC treated at a tertiary referral university hospital between 2006 and 2021. Clinical characteristics were reviewed, and tumor specimens were assessed by p16 immunohistochemistry and HPV detection, including viral load quantification and genome integration analysis. Overall survival (OS) and relapse-free survival (RFS) were evaluated using univariate and multivariate analyses.

RESULTS

p16 overexpression was identified in 12.7% of patients and was significantly more frequent in tumors arising from the nasal cavity. The prevalence of p16-positive tumors increased after 2015. HPV detected in these tumors was exclusively high-risk type, with viral loads ranging from 4.2 to 1.6 × 10^6 copies/ng DNA, accompanied by evidence of viral genome integration. The 5-year OS and RFS rates for the entire cohort were 74.6% and 69.9%, respectively. Multivariate analysis revealed that T category (T1–4a), hemoglobin level (≥13.7 g/dL), and p16 overexpression were independent favorable prognostic factors for OS, while T category, performance status, and p16 overexpression were significantly associated with RFS. Notably, patients with p16 overexpression demonstrated excellent outcomes, with 5-year OS of 100% and RFS of 90%.

CONCLUSIONS

p16 overexpression in SNSCC is strongly associated with transcriptionally active high-risk HPV infection and serves as a robust predictor of favorable survival outcomes. These findings support the clinical utility of p16 as a prognostic biomarker in SNSCC.

Prognostic Superiority Of Nutritional And Inflammatory Indices Over Procalcitonin In Deep Neck Abscesses: A Retrospective Cohort Study

Safiye Giran Örtekin[1], **Selin Üstün Bezgin**[1], **Büşra Ünsal**[1], **Adalet Aşkin**[1], **Cemile Baykan Eryiğit**[1], **Feride Fırat**[1], **Özgür Yiğit**[1]

[1]*Başakşehir Çam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Türkiye*

BACKGROUND & AIM

Prognostic Superiority of Nutritional and Inflammatory Indices Over Procalcitonin in Deep Neck Abscesses: A Retrospective Cohort Study

MATERIAL & METHODS

Deep neck abscesses (DNAs) are serious infections associated with prolonged hospitalization and morbidity. This study aims to evaluate the relationship between inflammatory and nutritional indices and clinical outcomes, while investigating their potential prognostic advantages over conventional markers like procalcitonin in predicting the length of hospital stay.

RESULTS

The most commonly involved space was the peritonsillar region (41.8%).The leading etiology was tonsillitis (54.7%), and the most commonly isolated pathogen was the Streptococcus anginosus group (31.8%). In Spearman correlation analysis, PNI showed a negative correlation with length of hospital stay ($\rho = -0.446$, $p < 0.001$), while CAR showed a positive correlation ($\rho =$

0.235, p = 0.002). Procalcitonin showed no significant association with length of stay (ρ = 0.135, p = 0.096). Purulent drainage duration was positively correlated with CAR (ρ = 0.293, p < 0.001) and negatively correlated with PNI (ρ = −0.365, p < 0.001). A weak positive correlation was observed between procalcitonin and drainage duration (ρ = 0.213, p = 0.011). In multivariable regression analysis, PNI and CAR were identified as independent predictors of hospital length of stay (both p = 0.029). In ROC analysis, PNI demonstrated the highest discriminative performance (AUC = 0.717).

CONCLUSIONS

PNI and CAR are significantly associated with clinical outcomes in DNA patients. Our findings suggest that these easily accessible indices may offer more favorable prognostic value than conventional markers like procalcitonin in predicting the length of hospital stay.

OP-415

Concordance Between Large Language Models And Multidisciplinary Tumor Board Decisions In Head And Neck Squamous Cell Carcinoma: Preliminary Findings

Ebubekir Toprak[1], **Egehan Salepci**[1], **Mehmet Enes Arıcı**[1], **Suat Turgut**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery, Şişli Hamidiye Etfal Training and Research Hospital, Istanbul, Turkey*

BACKGROUND & AIM

Large language models (LLMs) are increasingly proposed as decision-support tools in oncology, yet their alignment with real-world multidisciplinary tumor board (MTB) decisions in head and neck squamous cell carcinoma (HNSCC) remains poorly characterized, particularly in guideline-equivocal cases. We hypothesized that contemporary LLMs would show high concordance with MTB decisions for primary treatment modality but diverge in more granular surgical decisions, where institutional experience and patient-specific factors weigh alongside guideline recommendations. The aim of this study was to compare treatment recommendations of GPT-4o, Claude, and Gemini against MTB decisions across three decision levels in HNSCC.

MATERIAL & METHODS

A single-center retrospective cohort design was adopted, with a planned sample of 100 consecutive HNSCC patients previously presented at our institutional MTB. We report here the preliminary analysis of the first 10 cases (laryngeal and oral cavity primaries). Anonymized standardized clinical summaries — demographics, ECOG status, clinical TNM stage, imaging reports, and pathology — were entered into a uniform prompt template and submitted to each model. Outputs were compared with the documented MTB decision at three levels: primary treatment modality (Level 1), surgical approach (Level 2A), and extent of neck dissection (Level 2B). Concordance was assessed with percent agreement; the full cohort will be analyzed with Cohen's kappa, PABAK, Cochran's Q, and McNemar tests.

RESULTS

In this preliminary analysis, all three models showed approximately 85% concordance with MTB decisions at Level 1. Discordance clustered in guideline-equivocal scenarios — most notably cT2N0 glottic carcinoma, where models consistently selected radiotherapy as the NCCN-listed first option, while MTB favored surgery based on institutional and patient-specific factors. At Level 2B, Claude and Gemini tended to recommend more extensive neck dissection than the MTB, whereas GPT-4o aligned more closely with board decisions. These observations suggest LLM-MTB concordance is modality-dependent and decreases with decision granularity. Final results from the full 100-patient cohort, including agreement statistics and inter-model comparisons, will be presented at the congress.

CONCLUSIONS

This preliminary analysis indicates that current LLMs achieve high concordance with MTB decisions for primary treatment modality in HNSCC but diverge in surgical granularity and guideline-equivocal scenarios — highlighting that MTB value extends beyond guideline retrieval.

OP-416

Treatment And Outcome For 2,111 Patients With Vermilion Lip Squamous Cell Carcinoma: A Nationwide, Population-Based Study From The Swehncr

Lovisa Farnebo[2], **Anna Hafström**[1]

[1]*Department of ORL, Head & Neck Surgery, Skåne University Hospital, Lund, Sweden b Department of Clinical Sciences, Lund University, Lund, Sweden;* [2]*Faculty of Medicine and Health Sciences, Department of Biomedical and Clinical Sciences, Division of Sensory Organs and Communication, Linkoping University, Linkoping, Sweden h Department of Otorhinolaryngology, Region Ostergotland Anesthetics, Operations, and Specialty Surgery Center, Linkoping, Sweden*

BACKGROUND & AIM

The major risk factor for vermilion lip squamous cell carcinoma (vlSCC) is excessive sunlight exposure. Population-based studies on treatment and outcome are lacking.

MATERIAL & METHODS

This is a nation-wide, population-based study of treatment and outcome from prospectively recorded data for 2111 vlSCC registered in the Swedish Head and Neck Cancer Register (SweHNCR) diagnosed 2008–2022.

RESULTS

The incidence increased with 34 % between 2008 and 2022, from 1.14 to 1.53 per 100,000. Median age at diagnosis was 76 years and males predominated (57.1 %). Lower lip vlSCC comprised 82.6 % and upper 8.6 %. Most had T1 (81.7 %) or T2 (13.5 %) tumors and few had regional (2.7 %) or distant (0.1 %) metastases. The 5-year overall survival was 70.5 % (95 % CI 68.4–72.6) and relative survival 90.8 % (95 % CI 88.2–93.7). Treatment data were registered in 1,948 cases and 97.5 % (1,900) had a curative intent, whereof 88.5 % had surgery. Recurrences were registered in 5.6 % (48.6 % local, 42.1 % regional) whereof 15.9 % after three years. Advanced age ($p < 0.001$), poor performance status ($p < 0.001$), male sex ($p = 0.002$), high stage ($p = 0.041$), and only radiotherapy ($p = 0.007$) were independent prognostic factors for mortality.

CONCLUSIONS

Females had higher incidence increase than males. Advanced age, poor performance status, male sex, advanced disease, and radiotherapy only were independent prognostic factors for mortality.

Retrospective Evaluation Of Postoperative Marginal Mandibular Nerve Injury And Associated Risk Factors In Patients Undergoing Submandibular Gland Surgery

Pooya kara[1], **Salih akyel**[1], **Zeliha kapusuz gencer**[1]

[1]*Başakşehir Çam and Sakura City Hospital ,Department of Otolaryngology, Head and Neck Surgery*

BACKGROUND & AIM

The aim of this retrospective study was to evaluate the incidence of postoperative marginal mandibular nerve injury following submandibular gland surgery and to identify associated clinical and surgical risk factors.

MATERIAL & METHODS

This retrospective observational cohort study included 100 patients who underwent submandibular gland excision at the Department of Otolaryngology, Head and Neck Surgery, Başakşehir Çam and Sakura City Hospital between June 2020 and January 2026. Ethical approval was obtained prior to data collection. Patients aged 18 years or older with no history of prior submandibular surgery, radiotherapy, or chemotherapy, and who attended postoperative follow-up visits were included. Data were retrieved from electronic medical records and discharge summaries. The following parameters were recorded: age, sex, BMI, surgical indication, operative duration, surgical technique, tumor size, preoperative embolization status, and postoperative marginal mandibular nerve injury. Statistical analyses were performed using SPSS. Categorical variables were compared using the Pearson chi-square test, and continuous variables were analyzed with the Mann-Whitney U test following Kolmogorov-Smirnov normality assessment. Statistical significance was set at $p<0.05$.

RESULTS

A total of 103 patients who underwent submandibular gland excision were included in the study. The most common surgical indication was chronic sialadenitis (n=37, 35.9%), followed by sialolithiasis (n=32, 31.1%), benign tumors (n=27, 26.2%), malignant tumors (n=5, 4.9%), and other pathologies (n=2, 1.9%). Among patients with neoplastic disease, pleomorphic adenoma was the most frequent diagnosis (62.5%), with a mean tumor size of 2.8 ± 1.1 cm. All patients underwent transcervical excision under general anesthesia with a mean operative time of 58.4 ± 16.2 minutes. Postoperative marginal mandibular nerve injury occurred in 14 patients (13.6%): 13 transient (12.6%) and 1 permanent (1%). On univariate analysis, neoplastic pathology (p=0.031), prolonged operative time (p=0.018), and male sex (p=0.042) were significantly associated with nerve injury. Age and BMI were not significant predictors.

CONCLUSIONS

Submandibular gland excision is a safe procedure with acceptable complication rates when performed with meticulous surgical technique. Chronic sialadenitis and sialolithiasis were the most common indications, consistent with the Turkish literature. Pleomorphic adenoma was the predominant neoplastic diagnosis. The overall marginal mandibular nerve injury rate was 13.6%, with permanent injury remaining below 1%. Neoplastic pathology, prolonged operative duration, and male sex were identified as significant risk factors. These findings suggest that careful preoperative patient selection and standardized

dissection techniques may reduce complication rates. Prospective multicenter studies are warranted to validate these findings.

OP-418

Triglyceride-Glucose Index In Parotid Gland Tumors A Novel Biomarker For Differentiating Warthin Tumor And Pleomorphic Adenoma

Remzi Dogan[1], **Ramazan Bahadır Küçük**[1], **Alper Yenigün**[1], **Alper Yenigun**[1], **Elif Ece Dogan**[2], **Orhan Ozturan**[1]

[1]*Bezmialem Vakif University, Faculty of Medicine, Department of Otorhinolaryngology;* [2]*Division of Endocrinology and Metabolism, Department of Internal Medicine, Istanbul Faculty of Medicine, Istanbul University*

BACKGROUND & AIM

Pleomorphic adenoma and Warthin tumor are the two most common benign parotid gland tumors with distinct histological and clinical profiles. Recent studies suggest a potential link between metabolic disturbances—particularly insulin resistance—and the development of Warthin tumors. The triglyceride-glucose (TyG) index has emerged as a simple, cost-effective biomarker of insulin resistance. This study aimed to investigate the potential role of the TyG index in differentiating between pleomorphic adenoma and Warthin tumor.

MATERIAL & METHODS

A retrospective cross-sectional study was conducted on patients histopathologically diagnosed with pleomorphic adenoma (n = 31) or Warthin tumor (n = 22), and compared with healthy controls (n = 58). Fasting glucose and triglyceride levels were used to calculate the TyG index. Statistical analyses included t-tests, ANOVA, and Bonferroni-corrected post hoc comparisons, with a significance threshold of $p < 0.05$.

RESULTS

No significant differences were observed in age, sex, BMI, or TyG index between the tumor group and controls. However, the TyG index was significantly higher in the Warthin tumor group (4.91 ± 0.28) compared to the pleomorphic adenoma (4.68 ± 0.31, $p = 0.006$) and control groups (4.72 ± 0.23, $p = 0.033$). No difference was found between the pleomorphic adenoma and control groups.

CONCLUSIONS

The TyG index is significantly elevated in patients with Warthin tumors, supporting its potential role as a simple, non-invasive biomarker to aid in the differential diagnosis of benign parotid tumors.

Total Laryngectomy: Surgical Outcomes How To Affected By Sarcopenia

İsmail Emre Eroğlu[1], **Bayram Barış Büyük**[1], **Ekrem Tarık Demir**[1], **Handenur Karegöl Yavuz**[1], **Neslihan Kayahan Satış**[1]

[1]*Department of Otorhinolaryngology and Head & Neck Surgery, Dr. Abdurrahman Yurtaslan Ankara Oncology Training and Research Hospital, University of Health Sciences (SBÜ), Ankara, Türkiye*

BACKGROUND & AIM

Laryngeal cancer patients are prone to sarcopenia due to cancer-related catabolism, increased energy expenditure, reduced oral intake, and tumor-related dysphagia or odynophagia. Sarcopenia has been associated with postoperative complications, prolonged hospitalization, reduced treatment tolerance, and poor prognosis in head and neck cancers. Cervical muscle measurements, particularly sternocleidomastoid and paraspinal muscle areas, may reflect systemic muscle mass. This study aimed to investigate the relationship between sternocleidomastoid and paraspinal muscle indices measured on preoperative cervical CT scans and pharyngocutaneous fistula, recurrence, and mortality in patients undergoing total laryngectomy for laryngeal cancer.

MATERIAL & METHODS

This retrospective study included 58 patients with laryngeal squamous cell carcinoma diagnosed at the University of Health Sciences, Dr. Abdurrahman Yurtaslan Ankara Oncology Training and Research Hospital between 2010 and 2025. Preoperative neck computed tomography images were evaluated using 3D Slicer software. Bilateral sternocleidomastoid and paraspinal muscle areas were measured on axial sections at the C3 vertebral level. Sternocleidomastoid muscle index, paraspinal muscle index, and total cervical muscle index were calculated by dividing muscle area values (cm^2) by the square of the patient's height (m^2). Sarcopenia was defined according to cut-off values determined by ROC analysis. The primary endpoint was pharyngocutaneous fistula, while secondary endpoints were recurrence and mortality. Statistical analyses were performed to investigate the association between sarcopenia, cervical muscle indices, and patient prognosis

RESULTS

25 of the patients (43.1%) were sarcopenic. The rate of pharyngocutaneous fistula was significantly higher in sarcopenic patients compared to non-sarcopenic patients (40.0% vs 12.1%, p=0.014). Recurrence (44.0% vs 15.2%, p=0.018) and mortality (48.0% vs 18.2%, p=0.016) rates were also significantly higher in the sarcopenic group. In multivariate analysis, sarcopenia was found to be an independent risk factor for fistula.

CONCLUSIONS

Sarcopenia has been associated with increased postoperative complications, prolonged hospital stay, reduced treatment tolerance, and higher mortality in head and neck cancer patients. SCM and paraspinal muscle indices measured on preoperative cervical CT may be associated with pharyngocutaneous fistula , recurrence, and mortality after laryngeal cancer surgery. Therefore, cervical muscle assessment may serve as a practical and easily applicable prognostic biomarker, supporting perioperative risk stratification and individualized treatment planning in laryngeal cancer

Are Standardized Uptake Values On PET-CT A Prognostic Indicator In Hypopharyngeal/Laryngeal Cancer Patients Undergoing Laryngectomy? – A Single Centre Experience

Karlo Vidovic[1,2], **Hemail M. Alsubaie MD**[1], **Tara Nevin**[1,2], **Conrad Timon MD FRCS**[1,2], **John Kinsella MSc FRCS**[1,2], **Paul Lennon MSc FRCS**[1,2], **Conall W.R. Fitzgerald MCh MSc FRCS**[1,2]

[1]Department of Otolaryngology-Head and Neck Surgery, St. James's Hospital, Dublin, Ireland; [2]School of Medicine, Trinity College Dublin, University of Dublin, Dublin, Ireland

BACKGROUND & AIM

Positron emission tomography–computed tomography (PET-CT) is a critical tool for investigating metastatic spread in laryngeal/hypopharyngeal cancer patients. Specific PET-CT parameters such as standardized uptake values (SUVmax) have previously been associated with overall survival (OS) and progression free survival (PFS) owing to their relationship to the complex metabolic features of the tumour microenvironment. We provide our first experience on this topic at our major European head/neck centre in Dublin, Ireland.

MATERIAL & METHODS

We used the electronic patient records to perform a retrospective chart review on 161 patients undergoing laryngectomy in St. James's Hospital Dublin between 2021 and 2024. Demographic, radiological/pathological and OS data was collected and underwent statistical analysis.

RESULTS

The most common pathological tumour characteristics were T4a, N0 squamous cell carcinoma (SCC). The most common tumour sites were: hypopharynx and supraglottis. OS and SUVmax data for the primary tumour was available for 32 patients which were divided into SUVmax above 13 (high SUV max, n = 15) and below 13 values (low SUVmax, n = 17). There was no statistically significant difference in OS between the high SUVmax and low SUVmax groups (p = 0.129). We then divided patients with nodal metastases who had available SUVmax and OS values (n = 12) into SUVmax high (metastasis uptake > 7) and SUVmax low (metastasis uptake < 7) groups. There was no significant OS difference between these groups (p = 0.066).

CONCLUSIONS

SUVmax was not a prognostic indicator in our cohort of laryngectomy patients which is consistent with previous studies at other international centers. In the future, these values could be combined with clinical, pathological and other radiological parameters to produce new prognostic models.

AI-Based Assessment of Facial Mobility: From Systemic Sclerosis to Preliminary Post-Parotidectomy Evaluation

Annalisa Umile[1], **Roberta Foti**[2], **Mario Lentini**[3], **Antonino Maniaci**[1], **Moreno La Quatra**[1], **Valerio Salerno**[1]

[1]Università degli Studi di Enna "Kore"; [2]Divisione di Reumatologia, AOU Policlinico "G.Rodolico" San Marco, Catania, Italia; [3]UOC di Otorinolaringoiatria, Ospedale "Maggiore-Baglieri", Modica, Italia

BACKGROUND & AIM

Objective quantification of facial mobility remains challenging, particularly when facial impairment is subtle or bilateral and clinical assessment may be influenced by inter-rater variability. Artificial intelligence (AI)-based video analysis may provide reproducible quantitative measures of facial function. This study aimed to evaluate human inter-rater reliability and agreement between expert assessment and AI-derived facial indices in patients with systemic sclerosis (SSc), with an exploratory extension to a preliminary cohort of patients undergoing parotidectomy.

MATERIAL & METHODS

46 patients with systemic sclerosis and 46 age- and sex-matched healthy controls underwent standardized video-based facial assessment using five facial tasks. Facial impairment was quantified using the Facial Asymmetry Index (FAI) and Facial Mobility Index (FMI). Assessments were performed by a junior clinician and two senior consensus clinicians and compared with two AI-based pipelines, py-feat and V-JEPA2. Repeated evaluations were performed at baseline, 1 week, and 1 month. As a preliminary exploratory extension, six patients undergoing parotidectomy were evaluated before and after surgery using the same framework.

RESULTS

Human inter-rater reliability was consistently higher for FMI than for FAI across all timepoints (FMI ICC: 0.979, 0.889, and 0.987; FAI ICC: 0.539, 0.377, and 0.556; $p < 0.001$). Among the AI approaches, py-feat showed the most consistent agreement with expert FAI grading, with ICC values of approximately 0.69–0.71, whereas agreement for FMI was lower (ICC approximately 0.15–0.30). V-JEPA2 showed poor agreement with expert grading for both indices. In the exploratory parotidectomy cohort, observed clinical scores increased postoperatively (FAI Δ +0.97; FMI Δ +0.58), whereas AI-predicted changes were substantially smaller (FAI Δ +0.02; FMI Δ +0.06). Given the limited sample size, these postoperative findings are descriptive only and no inferential conclusions can be drawn.

CONCLUSIONS

Facial mobility can be quantitatively assessed using complementary clinical indices, although reliability and AI–expert agreement vary according to the index and analytical approach. FMI demonstrated high human inter-rater reliability, while py-feat showed the most consistent agreement with expert FAI assessment. Preliminary post-parotidectomy observations suggest a potential generalization gap when AI models are applied to a clinical population different from the original cohort. Larger, disease-specific and multicenter studies are required before automated facial mobility assessment can be reliably translated across clinical settings.

Low-Molecular-Weight-Heparin With Or Without Aspirin In Head And Neck Free Flap Reconstruction: A Comparative Analysis Of Flap Outcomes And Complications

Cömert Şen[1], **Tülay Günsay**[1], **Vedat Emre Alayoğlu**[1], **Bora Başaran**[1], **İsmet Aslan**[1]

[1]*Istanbul University, Istanbul Faculty of Medicine, Department of Otorhinolaryngology, Head and Neck Surgery*

BACKGROUND & AIM

Optimal antithrombotic management in head and neck free flap reconstruction remains controversial. Low-molecular-weight heparin (LMWH), either alone or in combination with acetylsalicylic acid (ASA), has been used in clinical practice for thromboprophylaxis. However, comparative data regarding their impact on flap outcomes are limited. This study aimed to compare flap survival and postoperative complications between two postoperative antithrombotic regimens in head and neck free flap reconstruction.

MATERIAL & METHODS

A retrospective review was conducted of 164 patients who underwent 167 consecutive free flaps for head and neck reconstruction. Flaps were categorized according to postoperative antithrombotic regimen: LMWH alone (n=99) and LMWH+ASA (n=68). Demographic, oncologic, and surgical variables were recorded. The primary outcome was total flap loss. Secondary outcomes included re-exploration, venous failure, arterial failure, hematoma, and other postoperative hemorrhagic events. Categorical variables were compared using Pearson's chi-square or Fisher's exact test as appropriate, and relative risks (RR) with 95% confidence intervals (CI) were calculated. A multivariable logistic regression model was performed for re-exploration adjusting for age, preoperative radiotherapy, and flap type.

RESULTS

Baseline characteristics were comparable between groups (all $p>0.05$). Flap loss occurred in 5.9% of patients in the LMWH+ASA group and 4.0% in the LMWH group (RR 1.46, 95% CI 0.38–5.62; p=0.717). Re-exploration was required in 35.3% and 24.2% of patients, respectively (RR 1.46, 95% CI 0.91–2.34; p=0.121). There were no statistically significant differences in hematoma (29.4% vs. 21.2%; p=0.226), venous failure (2.9% vs. 3.0%; p=1.000), arterial failure (2.9% vs. 1.0%; p=0.567), or other hemorrhagic events (5.9% vs. 1.0%; p=0.160). In multivariable analysis, antithrombotic regimen was not independently associated with re-exploration (adjusted OR 1.82, p=0.091).

CONCLUSIONS

In this cohort, postoperative outcomes were comparable between patients receiving combined LMWH+ASA and those receiving LMWH alone. No significant differences were observed in flap loss, re-exploration, thrombotic events, or hemorrhagic complications. These findings suggest that LMWH alone provides similar surgical outcomes compared with dual antithrombotic therapy in head and neck free flap reconstruction. Given the absence of a measurable benefit, routine use of

combined therapy may not be necessary. Prospective studies with larger sample sizes are required to further clarify the optimal antithrombotic strategy in this setting.

A Comparative Analysis Of Modality-Specific Alterations In Salivary Gland Integrity And Function After Radiotherapy-Based Treatments Of Head And Neck: An Experimental Study

Dr. Esra SİĞERGÖK[1], **Dr. Görkem ESKİİZMİR**[2], **Dr. Ayça TAN**[3], **Dr. Ömür KARAKOYUNLU ÇELİK**[4], **Dr. Özgür YILDIRIM**[5], **Dr. Mehmet İlteriş UYAN**[6]

BACKGROUND & AIM

Salivary gland dysfunction is a major complication of radiotherapy (RT) and chemoradiotherapy (CRT) in the treatment of head and neck cancers. Cetuximab combined with RT has emerged as a targeted therapeutic alternative; however, its effects on salivary gland function and structural integrity remain unclear. This study aimed to comparatively evaluate the functional and histomorphometric effects of RT alone, RT plus Cetuximab (RT+Ctx), and cisplatin-based chemoradiotherapy (RT+Cis) using an experimental rat model.

MATERIAL & METHODS

Thirty-four Wistar albino rats were randomly assigned to four groups: Group 1: RT alone, Group 2: RT+Ctx, Group 3: RT+Cis, and a negative control group (Group 4). All treatment groups received a single-dose treatment protocol and were followed for 30 days. At the end of the follow-up period, unstimulated and pilocarpine-stimulated salivary flow rates were measured under general anesthesia. Saliva samples were analyzed for BRIX and refractive index (RI). Subsequently, the animals were sacrificed, and parotid, submandibular, and sublingual glands were harvested for histopathological and morphometric evaluation. Pairwise comparisons were performed using the Mann–Whitney U test, and correlations were assessed using Spearman's rho.

RESULTS

A significant reduction in pilocarpine-stimulated salivary flow rate was observed in the RT+Cis group compared with controls ($p=0.021$). Additionally, significant differences were also detected between the RT alone and RT+Cis groups in terms of BRIX ($p=0.007$) and RI ($p=0.010$), indicating cisplatin-associated alterations in salivary composition.

CONCLUSIONS

Cisplatin-based chemoradiotherapy induces more pronounced impairment in stimulated salivary gland function and salivary composition than RT alone or RT+Ctx. The observed reductions in stimulated flow rate and changes in BRIX and refractive index suggest that treatment modality significantly influences both secretory capacity and biochemical integrity of the salivary glands. These findings highlight the importance of toxicity-sparing treatment strategies for the treatment of head and neck cancer.

Challenges In The Diagnosis And Treatment Of Secondary Cancers In Patients With Head And Neck Squamous Cell Carcinoma

Furkan Kaya[1], **Mehmet Özgür Pınarbaşlı**[2], **Melek Kezban Gürbüz**[2], **Hamdi Çaklı**[2], **Ercan Kaya**[2], **Muhammed Sefa Uyar**[2]

[1]Yunus Emre State Hospital, Department of Otorhinolaryngology, Eskisehir, Turkey; [2]Eskisehir Osmangazi University, Department of Otorhinolaryngology, Eskisehir, Turkey

BACKGROUND & AIM

Precise identification and evaluation of Second Primary Malignancies (SPM) are essential, as differentiating SPMs from benign tumors and metastatic disease affects treatment decisions and oncological outcomes. This study aims to screen head and neck cancer patients at our clinic and share experiences in managing difficult cases where an SPM was detected.

MATERIAL & METHODS

Data were collected on individuals diagnosed with head and neck cancer at our clinic between 2015 and 2023 from tumor follow-up records and the hospital database. The study included individuals aged 18 years or older who were diagnosed with Head and Neck Squamous Cell Carcinoma (HNSCC) as their primary cancer and who attended follow-up visits for at least one year. Individuals were excluded from the study if they did not attend follow-up visits, if their data could not be obtained, if they

had head and neck carcinomas diagnosed histopathologically as anything other than HNSCC, or if they had a previous diagnosis of another primary cancer.

RESULTS

The study included 370 patients diagnosed with head and neck cancer at our clinic between 2015 and 2023, for whom data were available. Of these patients, 236 had laryngeal cancer, 73 had oral cavity cancer, 22 had nasopharyngeal cancer, 15 had lower lip cancer, 10 had hypopharyngeal cancer, and the remaining 14 patients were categorized as “other” (unknown primary site, oropharynx, skin, or sinonasal). A second primary malignancy was identified in 38 of the 370 patients. The most common second primary site was the lung, followed by the thyroid, colon, and bladder.

CONCLUSIONS

In head and neck cancers, a second primary malignancy can be detected more easily, particularly with the routine use of Positron Emission Tomography (PET-CT); however, once detected, it also poses challenges for diagnosis and treatment. A multidisciplinary approach to second primary malignancies on a patient-by-patient basis, in conjunction with tumor boards, is of great importance today in patients with head and neck cancer.

OP-425

Multicenter, Externally Validated Machine-Learning Model For Individualized Distant Metastasis And Survival Prediction In Head And Neck Squamous Cell Carcinoma

Changling Li[1,2], **Chenyang Xu**[1,2], **Dapeng Lei**[1,2]

[1]*Shandong University;* [2]*Qilu Hospital of Shandong University*

BACKGROUND & AIM

Distant metastasis (DM) is a major determinant of poor prognosis in head and neck squamous cell carcinoma (HNSCC). However, conventional staging systems provide limited support for individualized DM risk stratification and subsequent survival assessment in patients who develop metastatic disease. This study aimed to develop and externally validate a dual machine-learning framework for two clinically connected tasks: DM risk stratification in newly diagnosed HNSCC and overall survival (OS) prediction among patients with metastatic HNSCC.

MATERIAL & METHODS

This multicenter retrospective study included 4,090 patients with HNSCC from the Surveillance, Epidemiology, and End Results database for model development and 351 real-world patients from Qilu Hospital for independent external validation. Candidate predictors were selected using univariable analysis, least absolute shrinkage and selection operator regression, random forest, and LightGBM. Six machine-learning algorithms were compared for DM risk stratification using routinely available clinicopathological and treatment-related variables. Among patients with metastatic HNSCC, OS was modeled using Cox proportional hazards regression and machine-learning survival methods, including random survival forest. Model performance was assessed by the area under the receiver operating characteristic curve (AUC), concordance index, Brier score, Kaplan–Meier analysis, and SHapley Additive exPlanations (SHAP). A web-based clinical decision-support platform was further developed.

RESULTS

The final DM risk model incorporated primary tumor site, histological grade, N category, extent of regional lymph node dissection, radiotherapy, and chemotherapy. Among the evaluated algorithms, the decision tree model demonstrated the most favorable overall performance, achieving AUCs of 0.909 （95% CI: 0.887–0.921） in the development cohort, 0.850（95% CI: 0.796–0.873） in internal validation, and 0.8320.832（95% CI: 0.776–0.852） in the independent external validation cohort. SHAP analysis identified primary tumor site and radiotherapy status as the most influential contributors to DM risk stratification. In patients with metastatic HNSCC, the random survival forest model outperformed conventional Cox regression and achieved an external-validation C-index of 0.704 for OS prediction. Model-derived risk groups showed significantly distinct 1-, 3-, and 5-year OS probabilities ($P < 0.001$). The online platform enabled individualized DM risk estimation and visualized OS assessment in a clinically accessible format.

CONCLUSIONS

This externally validated dual machine-learning framework addresses two sequential clinical challenges in HNSCC management: individualized stratification of DM risk and prognostic assessment after metastatic disease has occurred. By integrating interpretable modeling, multicenter validation, and a deployable web-based platform（https://qilushiny.shinyapps.io/qilupredicate/）, this approach may provide a practical tool for risk-adapted follow-up, multidisciplinary decision-making, and precision management in head and neck cancer.

OP-426

Correlation Between Preoperative PET/CT Findings And Histopathological Results After Neck Dissection In Head And Neck Cancers

Sebla Caliskan[1], **Suriye Cakir**[1], **Halil Erdem Ozel**[1], **Leyla Akbal**[1]

[1]*Kocaeli City Hospital*

BACKGROUND & AIM

Accurate preoperative evaluation of cervical nodal metastasis is crucial for determining the extent of neck dissection. The aim of this study was to evaluate the correlation between preoperative PET/CT findings and histopathological results after neck dissection in patients with head and neck malignancies.

MATERIAL & METHODS

This retrospective study included patients with head and neck malignancies who underwent preoperative PET/CT imaging followed by neck dissection between 2019 and 2026

Demographic characteristics, primary tumor localization, PET/CT findings related to cervical lymph node involvement, maximum standardized uptake values (SUVmax), and postoperative histopathological results were recorded from hospital records.

RESULTS

A total of 129 patients underwent neck dissection with head and neck malignancies were included in the study. Among the operated patients, 20 underwent right-sided neck dissection, 19 underwent left-sided neck dissection, and 90 underwent bilateral neck dissection, resulting in a total of 219 dissected neck sides. The sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and overall diagnostic accuracy of preoperative PET/CT for detecting cervical lymph node metastasis were 80.0%, 83.5%, 62.0%, 92.6%, and 82.6%, respectively.

CONCLUSIONS

Preoperative PET/CT demonstrates good diagnostic performance in the evaluation of cervical lymph node metastasis in head and neck cancers. Its high negative predictive value indicates that it is particularly useful for ruling out nodal metastasis. However, due to moderate positive predictive value and the presence of false-positive findings, histopathological examination remains the gold standard for definitive diagnosis.

Clinical Outcomes Of Maxillectomy Cases In Our Clinic: A Single-Center Retrospective Analysis

Şahin Öğreden[1], **Özlem Özüm**[1], **Ozan Tüysüz**[1], **Fatih Albayrak**[1], **Özgür Yiğit**[1]

[1]*Basaksehir Cam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Turkey*

BACKGROUND & AIM

Maxillectomy is one of the principal surgical approaches in the treatment of sinonasal and maxillary tumors and can be performed using different techniques depending on tumor localization, extent, and histopathological characteristics. In addition to open surgical methods such as partial, total, and radical maxillectomy, endoscopic approaches have been increasingly preferred in selected cases.

This study aimed to evaluate the demographic characteristics, tumor types, surgical approaches, reconstruction requirements, neck dissection practices, and adjuvant treatment needs of patients who underwent maxillectomy in our clinic, and to investigate the relationship between these parameters and oncological outcomes (recurrence and survival).

MATERIAL & METHODS

This study was designed as a single-center retrospective analysis of patients who underwent maxillectomy in our clinic. A total of 42 patients treated within the specified period were included.

Data including demographic characteristics (age, sex), preoperative pathological diagnoses, surgical techniques, reconstruction requirements and types, neck dissection status, adjuvant treatment (radiotherapy and/or chemotherapy), recurrence, need for revision surgery, survival status, and follow-up duration were obtained from patient records and the hospital information system.

Surgical approaches were classified as partial maxillectomy, total maxillectomy, radical maxillectomy, and endoscopic medial maxillectomy. All patients were evaluated in terms of surgical and oncological outcomes.

Statistical analysis was performed using descriptive methods, and results were expressed as numbers and percentages.

RESULTS

A total of 42 patients were included in the study. The mean age was 47.7 years (range: 9–78), and 56% of the patients were male. The most common diagnosis was squamous cell carcinoma.

Total maxillectomy was the most frequently performed surgical approach (n=17), while partial maxillectomy (n=12) and endoscopic medial maxillectomy (n=12) were performed at similar rates. Notably, the proportion of endoscopic approaches reached approximately one-third of all cases.

Reconstruction was required in 24% (n=10) of patients, and neck dissection was performed in 7% (n=3). Adjuvant therapy included radiotherapy in 31% and chemotherapy in 26% of patients.

During a mean follow-up of 27 months, recurrence was observed in 11.9% (n=5) of patients. Overall, 79% of patients were alive, while 21% were recorded as deceased.

CONCLUSIONS

Our study demonstrates that maxillectomy is an effective surgical approach for the treatment of sinonasal tumors, providing reliable oncological outcomes with acceptable recurrence (11.9%) and survival (79%) rates.

Endoscopic medial maxillectomy appears to be a safe and effective alternative to open surgery in appropriately selected patients, without compromising oncological outcomes despite its increasing use.

These findings support the role of minimally invasive techniques in surgical decision-making. Larger studies with longer follow-up are needed to provide stronger evidence.

Improving Timeliness Of Postoperative Radiation Therapy In Head And Neck Cancer Patients

Adithya Srikanthan MD[1], **Amber Dunmire MD**[1], **Matthew Carter MD**[1], **John Coggins MD**[1], **Orly Coblens MD**[1], **Felix Maldonado Chapa MD**[1], **Viran Ranasinghe MD**[1]

[1]*University of Texas Medical Branch*

BACKGROUND & AIM

Postoperative radiation therapy (PORT) is vital for reducing cancer recurrence after head and neck (H&N) cancer resection. Initiating treatment within six weeks has been shown to improve outcomes, while delays are associated with higher recurrence rates and lower survival. Addressing barriers to timely radiation administration is crucial for optimizing patient outcomes. Our aim was to determine factors associated with delays in postoperative radiation therapy to identify

MATERIAL & METHODS

A retrospective chart review was performed of all patients who underwent head and neck cancer resection followed by postoperative radiation therapy between January 1st, 2023 and February 28th, 2026 was performed. Demographic, preoperative, intraoperative and followup variables were collected and analyzed using simple pooled analysis. Simple t-tests, chi-square, and fisher's exact test were used to compare groups.

RESULTS

45 patients met criteria and were included. 38 (84%) of patients were male, with median age of 64.2 years. Pooled analysis found that 58% of patients experienced a delay in receiving adjuvant radiation. No differences in on time PORT were found in race, age group (by decade), primary cancer site, or gender. 30 day hospital readmission [OR 7.6 (1.86, 66.81), p=0.015], need for dental extractions (OR 6.3 (1.71, 56.29), p=0.031) and free flap reconstruction [OR 4.8 (1.32 , 17.11), p=0.037] conferred a higher odds of delaying PORT.

CONCLUSIONS

These observed delays in PORT highlight the need for targeted initiatives to enhance treatment efficiency and patient outcomes in multimodal H&N cancer care. Hospital readmission, dental extractions, and free flap reconstruction are identified here as likely sources of delay in administering PORT, though systems-wide efforts are required to fully minimize such delays. Future initiatives include a standardized surveillance platform to identify patients at risk of experiencing delays in PORT by way of demographic features, insurance status and other social determinants of health. Standardized communication between the multidisciplinary teams involved in care will be beneficial for minimizing delays and preventable mortality/morbidity.

Concordance Of Three Large Language Models With Multidisciplinary Tumor Board Decisions In Laryngeal Carcinoma Management

Fırat Tevetoğlu[1], **Beyza Mercan**[1], **Tolga Küçükgergin**[1], **Caner Tonkaz**[1], **Muratcan Sarı**[1], **Haydar Murat Yener**[1], **Harun Cansız**[1]

[1]*Department of Otolaryngology-Head and Neck Surgery,Istanbul University Cerrahpasa Medical Faculty ,Istanbul,Turkey*

BACKGROUND & AIM

Multidisciplinary tumor board (MDT) decisions are the gold standard for laryngeal cancer management, but access to such expertise is globally limited. Large language models (LLMs) are increasingly proposed as decision-support tools, yet head-and-neck-specific validation against real-world MDT decisions is scarce. This study compared the concordance of three LLMs—ChatGPT 5.5, Gemini Pro, and Claude Opus 4.7—with MDT decisions in laryngeal carcinoma.

MATERIAL & METHODS

Between April 2025 and April 2026 (12 months), fifty-two consecutive patients with biopsy-proven laryngeal squamous cell carcinoma underwent 64 multidisciplinary head-and-neck tumor board evaluations at our institution. After excluding two patients with recurrent hypopharyngeal carcinoma and one lost to follow-up, 49 patients (61 evaluations) were analyzed; AJCC 8th-edition stage distribution was 20 (40.8%) early-stage (Tis–II) and 29 (59.2%) advanced (III–IVC). For each evaluation a standardized clinical vignette (demographics, cTNM, imaging, pathology) was submitted to the three LLMs using identical prompts. Each AI output was independently rated by three blinded otolaryngology specialists on a 0–2 Likert scale across five dimensions: TNM staging accuracy, NCCN guideline adherence, appropriate additional investigations, treatment options, and final-decision concordance with the MDT (0=discordant, 1=partial, 2=full); total score 0–10. Inter-rater reliability was assessed by ICC(3,k); LLMs were compared with the Friedman test followed by Wilcoxon signed-rank post-hoc with Bonferroni correction.

RESULTS

Mean total scores were 9.295±0.689 for Claude, 8.995±0.820 for ChatGPT, and 8.951±0.836 for Gemini (Friedman χ^2=22.357, p<0.001); Claude outperformed both ChatGPT (adjusted p=0.002) and Gemini (adjusted p<0.001), with no difference between ChatGPT and Gemini. For final-decision concordance with the MDT (max=2), means were 1.577±0.451 (Claude), 1.448±0.509 (ChatGPT), and 1.426±0.491 (Gemini); full concordance was achieved in 39.3% of Claude, 29.5% of Gemini, and 26.2% of ChatGPT cases. Guideline adherence and investigation ordering showed near-ceiling performance across all models. Inter-rater reliability of the total score was good for Claude (ICC=0.703) and ChatGPT (ICC=0.614), and fair for Gemini (ICC=0.499).

CONCLUSIONS

All three LLMs performed well in laryngeal cancer management; Claude showed the best overall performance and highest MDT concordance, while ChatGPT and Gemini performed similarly. Because full concordance did not exceed 40%, current LLMs should serve as decision-support adjuncts to MDT rather than autonomous decision-makers.

OP-430

Nasopharyngeal Carcinoma Comprehensive Risk Assessment Scoring System (NPC-CRASS)

Darren Yap Jia Xiong[1,2], **Emily Chong Yin Sing**[2], **Lai Chee Ho Brian**[1]

[1]*Queen Mary Hospital;* [2]*University of Hong Kong*

BACKGROUND & AIM

In Hong Kong, there are over 700 newly diagnosed Nasopharyngeal Cancer (NPC) per year and labelled as the 12th leading cause of cancer death in 2022. As NPC is closely related to EBV infection, screening using EBV-antibody and or plasma EBV-DNA has been used widely as a screening tool. Nevertheless, the positive predictive value (PPV) has remained low at 1.3-1.7 detection rate per 1000 screening. This inadvertently increase healthcare burden with false positive referrals.

We aim to design a risk assessment scoring system to predict probability of NPC; using a multivariate logistic regression with initial presentations for underlying NPC.

MATERIAL & METHODS

This retrospective cohort study who were either referred to or were being followed-up by the Otorhinolaryngology Department of Queen Mary Hospital, Hong Kong, between 1 January 2026 to 30 April 2026 for further workup of NPC or management of underlying NPC. Clinical presentation (age of diagnosis, sex, history of smoking and drinking, epistaxis, nasal obstruction, hearing loss, aural fullness, tinnitus, neck lump); laboratory investigation [EBV biomarkers (EBV VCA IgA, EBV DNA)]; radiological investigation (CT, MRI, PET-CT) to were collected through The Hong Kong Hospital Authority (HA) Clinical Management System (CMS). Patients with inadequate records regarding their initial presentation were excluded from the study. Multivariate logistic regression was used to identify significant independent predictors of NPC based on positive or negative NPC diagnosis using SPSS.

RESULTS

A total of 382 patients (260 men, 122 women) were identified; after removal of duplication and incomplete clinical information; 284 patients were included for statistical analysis.

Univariate analysis identified 8 clinical characteristics were significant predictors of NPC, including age (p<0.001), neck lump (p=0.001), male gender (p=0.003), hearing loss (p=0.005), family history of NPC (p=0.006), epistaxis (p=0.013), history of drinking (p=0.034) and aural fullness (0.035). Multivariate analysis identified age, hearing loss and neck lump as statistically significant (p<0.05) variables. The probability of NPC equation (Probability of NPC = e^x/ (1+e^x) [x=3.816+(-0.073 x Age)

+1.794x (Hearing loss)+2.393x (Neck lump)] was derived where e is the base of natural logarithms. This model showed good discrimination with the area under the evaluated receiver operating characteristic curve yielding 0.852.

CONCLUSIONS

We designed an equation to calculate the probability of NPC based on 4 variables acquired through a multi-regression model. However further validation study is required to test the validity of this risk stratification scoring system.

OP-431

Serum SERS And Machine Learning For Rapid Preoperative Diagnosis Of Central Lymph Node Metastasis In Thyroid Cancer

Wenhua Song[1,2]

[1]*Department of Otorhinolaryngology, Qilu Hospital of Shandong University, Jinan 250012, Shandong Province, China;* [2]*National Health Commission Key Laboratory of Otorhinolaryngology (Shandong University), Jinan 250000, Shandong Province, China.*

BACKGROUND & AIM

Accurately assessing central lymph node metastasis (CLNM) in thyroid cancer is crucial for determining optimal surgical extent, yet traditional ultrasound (US) faces the bottleneck of low sensitivity. This study aims to construct and validate a novel diagnostic platform integrating serum surface-enhanced Raman spectroscopy (SERS) with multi-algorithm machine learning (ML) for non-invasive, precise, and rapid preoperative CLNM prediction.

MATERIAL & METHODS

This retrospective study enrolled 128 patients with papillary thyroid carcinoma (PTC) treated at Qilu Hospital of Shandong University, a major tertiary referral center in China. Based on postoperative pathology as the gold standard, patients were divided into metastatic (n=42) and non-metastatic (n=86) groups. Preoperative fasting serum was collected for SERS acquisition. Following denoising, baseline correction, and normalization, spectral features were extracted. Eight ML diagnostic models were constructed: PCA-LDA, Random Forest (RF), SVM, XGBoost, CatBoost, LightGBM, Logistic Regression (LR), and KNN. The diagnostic performance of each model was calculated and compared with conventional preoperative US.

RESULTS

The comprehensive diagnostic performance of all 8 ML models significantly outperformed conventional US (US sensitivity 67.74%, specificity 80.49%, accuracy 75.00%). Ensemble learning algorithms exhibited the most outstanding performance: the CatBoost model achieved the best efficacy with an AUC of 0.971, sensitivity of 93.55%, specificity of 95.12%, and accuracy of 94.44%. RF and XGBoost followed closely with AUCs of 0.965 and 0.960, respectively. SVM, LightGBM, and PCA-LDA also demonstrated robust performance (AUCs 0.942–0.958). The traditional baseline models LR and KNN yielded AUCs of 0.895 and 0.862, respectively. Notably, the average single-sample detection time for this multi-model platform remained strictly under 2 minutes.

CONCLUSIONS

The diagnostic platform combining serum SERS and multi-model ML enables non-invasive, ultra-fast, and highly accurate preoperative prediction of CLNM in PTC. It successfully overcomes the limitations of traditional imaging and validates the robust predictive stability of spectral features. This platform holds immense potential as a vital adjunct for regional lymph node assessment, providing reliable technological support for precision surgery in head and neck oncology.

Salivary Duct Carcinoma: Clinicopathologic Characteristics And Outcomes Over 14 Years In A Single Center

Emirhan Akyol[1], **Ibrahim Canbazoglu**[1], **Mehmet Ekrem Zorlu**[1], **Muhittin Akalin**[3], **Mehmet Duzlu**[1], **Utku Aydil**[1], **Metin Yilmaz**[1]

[1]*Gazi University Faculty of Medicine, Department of Otolaryngology–Head and Neck Surgery, Ankara, Türkiye;* [2]*Adıyaman Training and Research Hospital, Department of Otolaryngology–Head and Neck Surgery, Adıyaman, Türkiye;* [3]*Gaziantep Training and Research Hospital, Department of Otolaryngology–Head and Neck Surgery, Gaziantep, Türkiye*

BACKGROUND & AIM

Salivary duct carcinoma (SDC) is a rare but highly aggressive salivary gland malignancy characterized by early regional and distant metastasis. Owing to its low incidence, prognostic determinants remain insufficiently defined, and the impact of quantitative nodal burden and surgical radicality on survival outcomes remains unclear. This study aimed to evaluate the clinicopathologic characteristics and survival outcomes of patients diagnosed with SDC over a 14-year period and to identify potential prognostic factors affecting overall survival (OS) and recurrence-free survival (RFS).

MATERIAL & METHODS

A retrospective single-center observational study was conducted including 13 patients diagnosed with salivary duct carcinoma between 2010 and 2025. Demographic data, tumor characteristics, treatment modalities, pathological findings, and follow-up outcomes were analyzed. Tumors were staged according to the AJCC 8th and 9th editions. Survival outcomes were evaluated using the Kaplan–Meier method. The restricted mean survival time (RMST) was calculated, limited to a follow-up of 54 months. The log-rank test was used to compare survival differences between groups. Clinicopathologic variables, including surgical margin status, extranodal extension (ENE), lymphovascular invasion (LVI), perineural invasion (PNI), androgen receptor (AR) status, T and N categories, number of positive lymph nodes, and overall stage, were analyzed to assess their impact on overall survival (OS) and recurrence-free survival (RFS).

RESULTS

The cohort consisted predominantly of male patients (84.6%), with a mean age of 62.1 years. Most tumors originated from the parotid gland (84.6%), and advanced T-stage disease was common. Regional lymph node metastasis was observed in 84.6% of patients, with a mean of nine positive lymph nodes. The RMST for OS and RFS were 29.9 and 22.3 months, respectively. At 24 months, the OS and RFS rates were 50.8% and 26.0%, respectively. Negative surgical margins were significantly associated with improved OS (p=0.023) and RFS (p=0.001). An increasing number of positive lymph nodes significantly affected OS (p=0.048), demonstrating a dose-dependent relationship. Other factors, including ENE, LVI, PNI, AR status, and overall stage, did not show statistically significant associations with survival outcomes.

CONCLUSIONS

SDC demonstrates aggressive clinical behavior, with high rates of nodal involvement and early recurrence. In this cohort, surgical margin status and quantitative nodal burden were the most significant determinants of survival. Complete surgical resection appears to be critical for improving outcomes. These findings suggest that, beyond traditional staging systems, nodal tumor burden and surgical radicality may serve as key prognostic indicators for SDC. Larger multicenter studies are needed to validate these results.

Milan System Based Risk Stratification In Submandibular Gland Fine Needle Aspiration: Correlation With Ultrasonography

OZAN TÜYSÜZ[1], **FERİDE FIRAT**[1], **ADALET AŞKİN**[1], **ŞAHİN ÖĞREDEN**[1], **ÖZGÜR YİĞİT**[1]

[1]*Başakşehir Çam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Türkiye*

BACKGROUND & AIM

The Milan System for Reporting Salivary Gland Cytopathology (MSRSGC) categorizes needle aspiration and cytology (FNAC) results into 6 tiers and assigns a risk of malignancy (ROM) to each category. Its utility in submandibular gland lesions remains unclear. Our study aimed to evaluate the performance of the MSRSGC in submandibular gland fine-needle aspiration cytology (FNAC), determine category-specific risk of malignancy (ROM), and examine the association between ultrasonographic (USG) suspicious-feature burden and histopathologic outcomes.

MATERIAL & METHODS

We retrospectively reviewed 126 patients who underwent excision of submandibular gland (April 2020–January 2026). Sixty-two patients with available preoperative FNAC were included for cytohistologic correlation. FNAC results were reclassified according to the MSRSGC. Five USG suspicious features (irregular margins, hypoechogenicity, heterogeneous echotexture, solid composition, suspicious lymphadenopathy) were recorded and summed (score 0–5).

RESULTS

Fourteen of sixty-two cases (22.6%) were malignant. Category distribution and ROM were: non-neoplastic (n=24, ROM 8.3%), AUS (n=3, ROM 0%), benign neoplasm (n=19, ROM 5.3%), SUMP (n=4, ROM 0%), suspicious for malignancy (n=6, ROM 100%), and malignant (n=6, ROM 83.3%). FNAC demonstrated a sensitivity of 78.6% and a specificity of 97.9%. Regarding USG, the mean suspicious-feature count was significantly higher in malignant than non-malignant lesions (4.36 vs. 2.33; $p < 0.001$). A USG threshold of ≥4 features yielded 85.7% sensitivity and 89.6% specificity.

CONCLUSIONS

This study validates the usage of the MSRSGC in the work up of submandibular gland tumors. High USG suspicion scores correlate closely with malignancy, offering a vital supplement to cytology for indeterminate results. These findings remain specific to patients within a surgical setting.

OP-434

Meta-Analysis Of Prognostic Impact Of CT-Defined Sarcopenia And Prognostic Nutritional Index In Immune Checkpoint Inhibitor–Treated Head And Neck Squamous Cell Carcinoma

Takeyuki Kono[1], **Ken Kasahara**[1], **Hiroyuki Ozawa**[1]

[1]*Department of Otolaryngology Head and Neck Surgery, Keio University School of Medicine*

BACKGROUND & AIM

Host-related biomarkers such as CT-defined sarcopenia (skeletal muscle index, SMI) and the prognostic nutritional index (PNI) have been investigated as potential prognostic factors in patients with head and neck squamous cell carcinoma (HNSCC) treated with immune checkpoint inhibitors (ICIs). However, existing evidence is limited and heterogeneous. This study aimed to systematically evaluate the association between SMI and PNI and overall survival (OS) in ICI-treated HNSCC.

MATERIAL & METHODS

A systematic literature search of PubMed and Embase was conducted. Studies including patients with HNSCC treated with ICIs and reporting hazard ratios (HRs) for OS according to SMI or PNI were included. Random-effects meta-analyses were performed. The primary interpretation was based on sensitivity analyses restricted to multivariable-adjusted HRs. Additional analyses included leave-one-out sensitivity analyses and assessment of between-study heterogeneity.

RESULTS

Nine studies met the inclusion criteria. Sarcopenia was associated with worse OS in the primary analysis. In sensitivity analyses restricted to multivariable-adjusted estimates, the association remained statistically significant (pooled HR 2.05, 95% CI 1.48–2.84; $I^2 = 0\%$), with consistent results across leave-one-out analyses. Low PNI was also associated with poorer OS, although the number of studies was limited. Prediction intervals indicated uncertainty in the magnitude of effect, particularly for PNI.

CONCLUSIONS

CT-defined sarcopenia and low PNI are associated with poorer overall survival in patients with HNSCC treated with ICIs. These findings support their potential role as host-related prognostic markers. However, given the small number of studies and methodological heterogeneity, the results should be interpreted with caution. Their clinical application remains hypothesis-generating and requires prospective validation.

Pre-Referral Antibiotic Prescribing In Oropharyngeal Squamous Cell Carcinoma Is Associated With Diagnostic Delay, Advanced Stage, And Poorer Survival

Andrew D'Alessandro[1], **Robbie MacKinnon**[1], **Matthew Donachie**[1], **Jan Horackiewicz**[1], **Nichola Philp**[2], **Mohd Afiq Mohd Slim**[1], **Rhona Hurley**[2], **Samuel Brown**[2], **Lucy Li**[2], **Catriona Douglas**[1,2]

[1]*University of Glasgow, Glasgow, United Kingdom;* [2]*NHS Greater Glasgow and Clyde, Glasgow, United Kingdom*

BACKGROUND & AIM

Oropharyngeal squamous cell carcinoma (OPSCC) is a subtype of head and neck cancer with an increasing global incidence and is frequently diagnosed at an advanced stage. Common presenting symptoms may be attributed to infectious causes due to the large overlap in symptoms. Literature has established the link between diagnostic delay in OPSCC and poor outcomes. This study aimed to investigate patterns of pre-referral antibiotic prescribing and their relationship with diagnostic delay and clinical outcomes in OPSCC. We hypothesised that pre-referral antibiotic prescribing for persistent upper aerodigestive symptoms may contribute to diagnostic delay and hence poorer outcomes, with limited existing evidence.

MATERIAL & METHODS

A retrospective cohort study of adult OPSCC patients in the West of Scotland (2012–2021) was conducted using a regional database (n=1003). Associations between pre-referral antibiotic prescribing, patient demographics, stage at diagnosis, diagnostic intervals, and overall survival were analysed using RStudio. Primary outcomes included, analysis of diagnostic intervals, stage at diagnosis, overall survival, and patient characteristics.

RESULTS

A total of 301 (30%) patients received antibiotics prior to referral, with phenoxymethylpenicillin the most frequently prescribed agent (33.6% of courses). The median symptom to diagnosis interval was longer in the group prescribed pre-referral antibiotics (99 vs 90 days, p=0.004). Pre-referral antibiotics were associated with more advanced T stage (p<0.001) and N stage (p=0.004) at diagnosis. Overall survival was poorer in the antibiotic group (log-rank p=0.008; HR 1.28, 95% CI [1.07–1.55]). Female sex (p=0.037), as well as presenting with throat pain (p<0.001) and odynophagia (p=0.01) were factors associated with pre-referral antibiotic prescribing. Through further analysis a dose response relationship was observed, with increasing antibiotic courses associated with a prolonged symptom to diagnosis interval (p=0.001), higher T stage (p<0.001), higher N

stage (p=0.015), and poorer survival, with each additional course associated with an 18% increase in the hazard of death (log-rank p=0.023; HR 1.18, 95% CI [1.06–1.32]).

CONCLUSIONS

Pre-referral antibiotic prescribing was associated with prolonged diagnostic intervals, advanced stage, and poorer survival in OPSCC, demonstrating a dose response relationship. These findings support greater caution in repeated antibiotic prescribing for persistent upper aerodigestive symptoms and may inform primary care referral pathways.

OP-436

Prophylactic Use Of Fibrin Sealant (ARTISS™) For Facilitating A Drain-Free Thyroid Surgery Pathway: A Single-Centre Retrospective Cohort Study Of 276 Procedures

Rishi Shukla[1], **Taranjit Tatla**[1]

[1]*London North West University Healthcare NHS Trust*

BACKGROUND & AIM

Following our 2017 feasibility study, our centre adopted routine prophylactic thrombin-dilute fibrin sealant (ARTISS™) use to facilitate a drain-free thyroid surgery pathway. This study reports real-world outcomes following sustained implementation at scale.

MATERIAL & METHODS

We conducted a single-centre retrospective cohort study of consecutive eligible operations performed between April 2019 and September 2025. Inclusion mirrored the 2017 framework and comprised total thyroidectomy, primary lobectomy (hemithyroidectomy), completion lobectomy, isthmusectomy, Sistrunk procedure, and thyroid bed re-exploration, with or without central (level VI) neck dissection; lateral neck dissection, sternotomy, tracheostomy and laryngectomy were excluded. ARTISS™ and recurrent laryngeal nerve (RLN) monitoring were used by default, while drains were reserved for selected higher-risk cases. The primary outcome was postoperative haematoma, with return to theatre recorded where documented. Secondary outcomes included surgical site infection (SSI) and length of stay (LOS). Outcome-specific denominators are reported.

RESULTS

Of 335 operations screened, 276 met eligibility. ARTISS™ was used in 259/276 (93.8%) and drains in 25/276 (9.1%); central neck dissection occurred in 30/276 (10.9%) and RLN monitoring in 268/276 (97.1%). LOS was recorded in 251/276, with a median LOS of 1 day (mean 1.49) and same-day discharge in 56/251 (22.3%). Haematoma outcomes were recorded in 251/276; any haematoma occurred in 5/251 (2.0%) and return to theatre for haematoma in 2/251 (0.8%). SSI outcomes were recorded in 253/276, with SSI requiring antibiotics in 7/253 (2.8%).

CONCLUSIONS

Routine prophylactic ARTISS™ use within a drain-free thyroid surgery pathway has been sustained at scale with short length of stay and low rates of haematoma requiring return to theatre.

OP-437

Variation In Auditory Frequency During Radiotherapy For Head And Neck Cases: A Single Center Study

Fatih GÖK[1], **Cemile CEYLAN**[1], **Hakan AKÇİN**[1], **Taflan SALEPÇİ**[1], **Leyla TÜRE**[2], **Tulca AKMAN**[3]

[1]*Medical Park Istanbul Oncology Hospital;* [2]*Istanbul Kent Universitesi;* [3]*Friedrich-Alexander-Universität Erlangen Nürnberg*

BACKGROUND & AIM

Radiotherapy (RT) is a cornerstone treatment for head and neck malignancies; however, its ototoxic potential remains underreported, particularly in patients not receiving concurrent platinum-based chemotherapy. This study aimed to evaluate the longitudinal impact of RT on auditory function including pure tone thresholds, speech reception thresholds (SRT), and word discrimination scores (WDS) — and to investigate the dose-response relationship between cochlear radiation exposure and hearing deterioration.

MATERIAL & METHODS

A retrospective longitudinal study was conducted between 2023 and 2026, enrolling 20 patients (15 male, 5 female; mean age 65.85 ± 12.10 years) diagnosed with head and neck malignancies who received external beam radiotherapy without concurrent chemotherapy. All patients underwent pure tone audiometry across 125–8000 Hz, speech audiometry (SRT, WDS), and tympanometry at four time points: pre-treatment (baseline), and at 1, 3, and 6 months post RT. Cochlear dosimetric parameters mean dose and maximum dose (D0.03cc) were derived from treatment planning systems. Statistical analyses were

performed using Friedman and Kruskal-Wallis tests for longitudinal comparisons, Wilcoxon signed rank test for pairwise comparisons, and Spearman correlation for dose-response assessment.

RESULTS

Significant longitudinal threshold shifts were observed predominantly in the ipsilateral ear, with the greatest magnitude at high frequencies (3000–8000 Hz; $p \leq 0.004$). Lower frequencies showed statistically significant but smaller magnitude changes, with a transient improvement at 1 month followed by progressive deterioration through 6 months. PTA demonstrated the most pronounced change ($p = 0.001$), increasing from 32.9 ± 18.8 dB at baseline to 34.55 ± 17.73 dB at 6 months. SRT worsened significantly in the ipsilateral ear ($p = 0.041$), whereas WDS remained stable in both ears throughout follow-up ($p > 0.05$). No significant changes were detected in the contralateral ear, consistent with the low mean cochlear dose (4.90 ± 9.53 Gy). Moderate correlations were found between cochlear dose parameters and 6-month PTA changes ($r = 0.552–0.572$, $p < 0.05$), and a negative correlation between maximum cochlear dose and WDS scores ($r \approx -0.495$, $p < 0.05$).

CONCLUSIONS

RT induces progressive, predominantly high frequency sensorineural hearing loss detectable within 3-6 months, even in the absence of chemotherapy and at cochlear doses well below established risk thresholds. Dose-response relationships support a cumulative cochlear radiotoxicity mechanism. Routine audiological monitoring and cochlear dose optimization should be integrated into RT planning for head and neck cancer patients.

OP-438

Percutaneous Or Surgical Tracheotomy When, Why, And Selection Criteria

Çiğdem Fırat Koca[1]

[1]*Inonu University Department of Otolaryngology Head and Neck Surgery*

BACKGROUND & AIM

Tracheotomy is one of the most frequent procedure especially in the intensive care units (ICU). And the major indication is prolonged respiratory support. Tracheotomy is a procedure for patients who need prolonged mechanical ventilation support or airway protection. By this way, the respiratory care and weaning from mechanical ventilatory support become easier and comfortable.

MATERIAL & METHODS

Tracheotomy improves patient tolerance, reduces the need for sedation, avoids laryngeal irritation, enhances nursing care, reduces dead space. Among the ICU patients, 8 24% of all, undergo tracheotomy procedure. This decision is individually based on the risk and benefits of tracheotomy versus prolonged intubation and also the consent of the patient's relations and expected clinical outcomes. But there is stil no consensus about the timing of the procedure. Clasically, the most considered opinion for tracheotomy in patients that are unable to wean from invasive ventilation within 10-14 days of intubation and should be planned under optimal conditions.

RESULTS

The tracheotomy range increased over the last decade. But there is stil no consensus about the optimal timing for procedure, criterias for selection of patients, type of technique and timing of decannulation. The most common, traditional method is open surgical approach; performed in the operating room. Percutaneous technique is relatively simple to perform. And has a shorter procedure time.

CONCLUSIONS

Percutaneous tracheotomy has become a popular, cost-effective, quick, simple and safe alternative to surgical tracheostomy. There is not an optimal tracheostomy, the physician should choose the best technique

OP-439

LAG-3 Expression In Oral Cavity Squamous Cell Carcinoma

Yunus Emre Dinç[1], **Selis Gülseven Güven**[1], **Emre Asker**[2], **Nuray Can**[2], **Abdullah Taş**[1], **Recep Yağız**[1]

[1]*Department of Otorhinolaryngology, Trakya University, Faculty of Medicine, Edirne, Turkey.*; [2]*Department of Pathology, Trakya University, Faculty of Medicine, Edirne, Turkey.*

BACKGROUND & AIM

LAG-3 is an immune checkpoint molecule expressed on T lymphocytes that exerts an inhibitory effect on their function. Our study aims to evaluate LAG-3 expression in tissue specimens from patients with oral cavity squamous cell carcinoma and to determine its association with prognosis, survival, and other clinicopathological parameters, based on current evidence. By doing so, we seek to provide evidence for the biological and clinical relevance of LAG-3 as an immune checkpoint target in oral

cavity cancers and to support future studies exploring the potential role of anti–LAG-3–based immunotherapeutic approaches in this disease.

MATERIAL & METHODS

A total of 121 patients aged ≥18 years who were diagnosed with oral cavity squamous cell carcinoma and treated at Trakya University Hospital between January 2015 and January 2025 were included in the study. All included cases had sufficient tissue material, and their pathological specimens had been archived by the Department of Medical Pathology, Trakya University Faculty of Medicine.

RESULTS

sTIL LAG-3, pTIL LAG-3 and CPS positivity were identified as adverse prognostic factors for both overall survival (OS) and disease-free survival (DFS). The 1-, 3-, and 5-year OS rates were 96.7%/84.9%/73.9% in sTIL-negative cases, compared with 83.4%/62.5%/60.1% in sTIL-positive cases (p = 0.026). DFS was also lower in the sTIL-positive group; median DFS was 24 months versus 79 months in the sTIL-negative group (p = 0.026). pTIL positivity was significantly associated with worse OS (p = 0.014) and DFS (p = 0.008). Similarly, CPS positivity showed a significant association with poorer OS (p = 0.023) and DFS (p = 0.024).

CONCLUSIONS

Our study strongly supports that LAG-3 expression in oral cavity squamous cell carcinoma may serve as both a prognostic biomarker and a potential therapeutic target. In particular, evaluating immunotherapeutic approaches that include anti–LAG-3 agents in high-risk patient groups with strong LAG-3 expression may contribute significantly to the development of personalized treatment strategies in the future.

Clinicopathological Characteristics And Treatment Outcomes Of Oral Cavity Squamous Cell Carcinoma: A 16-Year Single-Center Experience

Erdogan Ozgur[1], **Shola Huseynzada**[1], **Ozden Savas**[1], **Arda Kayatas**[1], **Yuksel Olgun**[1], **Ersoy Dogan**[2], **Ahmet Omer Ikiz**[2], **Asuman Feda Bayrak**[1], **Enis Alpin Guneri**[1]

[1]*Dokuz Eylul University Faculty of Medicine, Department of Otorhinolaryngology – Head and Neck Surgery, Izmir, Turkey;* [2]*Private Practice, Otorhinolaryngology – Head and Neck Surgery, Izmir, Turkey*

BACKGROUND & AIM

Oral cavity squamous cell carcinoma (OCSCC) remains a significant global health problem and is associated with considerable morbidity and mortality. Surgical treatment constitutes the mainstay of management; however, clinicopathological characteristics and treatment outcomes may vary across institutions. The aim of this study was to evaluate the clinicopathological features and treatment outcomes of patients who underwent surgical treatment for OCSCC at our tertiary referral center over a 16-year period.

MATERIAL & METHODS

A retrospective analysis was conducted on 121 patients who underwent surgical treatment for oral cavity squamous cell carcinoma between 2009 and 2025 at a tertiary referral center. Demographic characteristics, tumor localization, TNM stage, surgical procedures, neck dissection type, reconstruction methods, adjuvant therapy, and histopathological parameters including tumor size, depth of invasion (DOI), differentiation grade, lymphovascular invasion (LVI), perineural invasion (PNI), extranodal extension (ENE), and surgical margin status were evaluated. Continuous variables were expressed as mean ± standard deviation and range, while categorical variables were presented as frequencies and percentages.

RESULTS

Of the 121 patients, 60.3% were male, with a mean age of 62.5±14 years. The tongue was the most common primary site (49.6%), and 38% of patients presented with stage IV disease. The mean tumor size was 25.2±12.7 mm and mean DOI was 8.6±7.1 mm. Tumors were predominantly moderately differentiated (59.5%). LVI, PNI, and ENE were detected in 3.3%, 26.4%, and 14% of cases, respectively. Negative surgical margins were achieved in 82.6% of patients. Neck dissection was performed in 95% of cases, most commonly selective neck dissection (66.9%). Reconstruction was required in 62% of patients. Adjuvant therapy was administered to 62.8% of patients. During follow-up, recurrence occurred in 19.2% of patients, and 49.6% had died at last follow-up

CONCLUSIONS

This 16-year single-center experience demonstrates that a substantial proportion of patients with OCSCC present with advanced-stage disease and require multimodal treatment. Despite high rates of surgical management and negative margins, recurrence and mortality remain considerable. These findings emphasize the importance of early diagnosis, appropriate neck management, and multidisciplinary treatment strategies to improve oncologic outcomes in oral cavity squamous cell carcinoma.

OP-441

Expression Of Programmed Cell Death-1 And Programmed Cell Death Ligand-1 In Oral Cavity And Oropharyngeal Squamous Cell Carcinomas And Their Clinicopathological Correlation

Sevim Pırıl Karasu[1], **Işıl taylan cebi**[1], **Esengül Uzuner**[1]

[1]*Haseki Training and Research Hospital*

BACKGROUND & AIM

The aim of this study is to evaluate the immunohistochemical expression patterns of programmed cell death protein-1 (PD-1) and programmed cell death ligand-1 (PD-L1) in oral cavity and oropharyngeal squamous cell carcinomas. Also, investigate the relationship between PD-1 and PD-L1 expression and variables such as age, sex, tobacco/alcohol use, disease stage, survival status, and treatment modalities applied.

MATERIAL & METHODS

Clinical data, radiological imaging, and pathology reports of 83 patients who were diagnosed, treated, and followed up for primary oral cavity and oropharyngeal cancer at our hospital between 2010 and 2022 were retrospectively reviewed. Information regarding age, sex, year of diagnosis, tobacco/alcohol use, tumor localization, TNM staging, treatment modalities, presence of metastasis or recurrence, and survival status was obtained. The expression of PD-1 and PD-L1 was evaluated immunohistochemically on formalin-fixed paraffin-embedded tumor blocks retrieved from the pathology archive of our hospital, and these findings were compared with the clinical data.

Additionally, the association between the presence of human papillomavirus (HPV) and PD-1/PD-L1 expression in patients with oral cavity and oropharyngeal cancers was investigated. This relationship was further analyzed in the context of age, sex, year of diagnosis, tobacco/alcohol use, tumor localization, TNM stage, treatment modalities, and survival status.

RESULTS

The PD-L1 expression rate of oral cavity and oropharyngeal cancers was found to be 65.1%. PD-L1 expression was higher in older age and in tumors located on the lip, while PD-1 expression was more prominent in early-stage tumors and those located on the lip. Additionally, increased PD-L1 expression was observed in tumors with a high number of tumor-infiltrating mononuclear cells (TIMCs) and in HPV-related oropharyngeal cancers. Longer post-diagnosis survival was noted in PD-1 positive oral cavity cancers and PD-L1 positive oropharyngeal cancers. PD-L1 expression was found to be higher in early-stage oral cavity cancers and, consequently, in patients receiving single-modality treatment.

Overall survival was higher in cases with elevated PD-L1 expression in tumor tissue and/or TIMCs. However, PD-1 positivity was not associated with overall survival.

CONCLUSIONS

Our study demonstrated the impact of PD-1, PD-L1, and p16 expression on clinicopathological parameters, including overall survival in oral cavity and oropharyngeal cancers. In this regard, we believe that our findings contribute to a better understanding of the PD-L1/PD-1 signaling pathway in these cancers, which may support the integration of immunotherapeutic agents into routine treatment in the future.

OP-442

Comparison Of Pharyngocutaneous Fistula And Swallowing Outcomes After Primary Versus Salvage Total Laryngectomy

Yagmur Barcan[1], **Aysenur Meric Hafiz**[1], **Gunter Hafiz**[1]

[1]*Hafiz Health Clinic, Besiktas, Turkey*

BACKGROUND & AIM

To compare tumor-related characteristics, demographic and clinical parameters, surgical and reconstructive approaches, pharyngocutaneous fistula (PCF) development, and swallowing outcomes between patients undergoing primary and salvage total laryngectomy (TL).

MATERIAL & METHODS

All patients data who underwent TL between 2021 and 2024 were obtained from the hospital information system retrospectively. Patients were divided into two groups: primary and salvage TL. Demographic, clinical features, surgical approaches and treatment-related parameters were compared between groups. In pharyngeal reconstruction, primary closure was preferred according to 2 conditions; sufficient mucosa that enables tension free closure with at least two layers and good blood supply. If these conditions were not met, pectoralis major myocutaneous flap (PMMF) was used. Swallowing function was assessed subjectively at postoperative 6 month using the Eating Assessment Tool-10 (EAT-10). A total score of ≥3 was considered indicative of swallowing-related complaints. Patients were followed for 2–5 years.

RESULTS

A total of 38 male patients were included. Fifteen patients(39.5%) underwent primary TL, and 23 patients(60.5%) underwent salvage TL. There were no significant differences between the groups regarding age, comorbidities, tumor localization, tumor size, T and N stage, overall stage, tumor grade, or time to initiation of oral feeding (p>0.05).In the salvage group, radiotherapy failure was observed in 13 patients(56.5%), chemoradiotherapy failure was observed in 6(26.1%) patients. In the primary group, 7 patients(46.7%) received adjuvant chemoradiotherapy. No significant difference was observed between primary and salvage groups regarding pharyngeal reconstruction technique (5 PMMF(33.3%), 9 PMMF(39.1%) respectively) (p=0.717).PCF occurred in 2 patients, both in the salvage group. No statistically significant difference was found. An EAT-10 total score≥3 was observed in 13 patients(86.7%) in the primary group and in 2 patients (8.7%) in the salvage group. The difference was statistically significant(p<0.05). During follow-up, one patient in the salvage group developed recurrence.

CONCLUSIONS

Salvage TL was not significantly associated with PCF development in this cohort.Appropriate surgical technique and treatment planning appear to be important determinants.Interestingly, swallowing-related complaints assessed by EAT-10 were significantly less frequent in the salvage group.This result may be related to the fact that salvage TL patients who experienced prolonged aspiration and dysphagia after radiochemotherapy had adapted to the loss of function and consider their new swallowing status acceptable.This study presents early patient-reported dysphagia results;further objective assessments(Fiberoptic Endoscopic Evaluation of Swallowing(FEES), barium swallow radiography, etc..) are planned to confirm these findings with larger sample sizes in the future.

Prognostic Factors And Outcomes In A Large Cohort Of Head And Neck Sarcomas

Ambre LA ROSA[1], **Olivier CHOUSSY**[1], **Rabah TAOUACHI**[1], **Guillaume ROUGIER**[1], **Joey MARTIN**[1], **Juliette QUAREZ**[1], **Nathalie BADOIS**[1], **Maria LESNIK**[1], **Julien LUCAS**[1], **Antoine DUBRAY-VAUTRIN**[1], **Wahib GHANEM**[1]

[1]*Institut Curie , Paris*

BACKGROUND & AIM

Head and neck sarcomas (HNS) are rare malignancies associated with heterogeneous histology. Prognostic determinants remain incompletely defined due to small published cohorts and evolving treatment strategies. We hypothesized that clinicopathologic factors, tumor characteristics, and treatment modalities significantly influence survival outcomes in patients with HNS managed at a referral center.

MATERIAL & METHODS

We conducted a retrospective cohort study at Institut Curie, Paris, including patients discussed in sarcoma multidisciplinary tumor boards between January 1999 and October 2025. Inclusion criteria were histologically confirmed HNS, available pathology report, and minimum follow-up of 3 month; survival analyses required ≥36 months follow-up. Demographic, tumor, and treatment data were collected. Histologies were grouped into six categories and tumor sites into six anatomical regions. Treatments included surgery, radiotherapy, chemotherapy, chemoradiotherapy, multimodal approaches, or abstention. Proton therapy versus conventional radiotherapy was also assessed. Overall survival (OS) and disease-free survival (DFS) were estimated using Kaplan–Meier methods. Cox proportional hazards models were applied for univariate and multivariate analyses.

RESULTS

One hundred twenty one patients were included with a median follow-up of 84 months. Median age was 11.2 years. The most frequent sites were orbit (46.9%) and sinonasal region (19.8%). Rhabdomyosarcoma, leiomyosarcoma, and undifferentiated sarcoma were the most common histologies. Three- and five-year OS were 89.7% (95% CI: 83.2–96.7) and 88.3% (95% CI: 81.4–95.8), respectively. Multivariate analysis identified age, histologic subtype, locoregional metastasis, tumor size, and treatment

strategy as independent prognostic factors for OS. Similar factors, including histology and metastasis, significantly influenced DFS. Proton therapy showed a non-significant trend toward improved outcomes.

CONCLUSIONS

This is a large single-center cohort in HNS. Rare and undifferentiated sarcomas exhibited particularly poor prognosis. These findings support centralized multidisciplinary management and highlight the need for multicenter registries to refine risk stratification and therapeutic approaches in this rare disease group

Histopathological And Biochemical Evaluation Of The Effects Of Hyperbaric Oxygen Therapy On Pharyngocutaneous Fistula In A Rat Model

Yasin Kulaksız[2], Remzi Doğan[1], Muhammed Furkan Özgan[1], Mehmet Şerif Aydın[3], Bengüsu Mirasoğlu[4], Öznur Yaşar[5], Abdürrahim Koçyiğit[5], Alper Yenigün[1], Erol Şentürk[1], Orhan Özturan[1]

[1]Bezmialem Vakıf University, Faculty of Medicine, Department of Otorhinolaryngology, Istanbul, Turkey; [2]Istanbul Medipol University, Faculty of Medicine, Department of Otorhinolaryngology, Istanbul, Turkey; [3]Istanbul Medipol University, Regenerative and Restorative Medicine Research Center, Istanbul, Turkey; [4]Istanbul University, Faculty of Medicine, Department of Underwater Medicine and Hyperbaric Medicine, Istanbul, Turkey; [5]Bezmialem Vakıf University, Faculty of Medicine, Department of Biochemistry, Istanbul, Turkey

BACKGROUND & AIM

Pharyngocutaneous fistula is a major complication after head and neck surgery, increasing morbidity, length of hospital stay, and costs. Hyperbaric oxygen therapy may support healing by improving tissue oxygenation, promoting angiogenesis, and reducing inflammation. Objective: To assess the histopathological and biochemical effects of hyperbaric oxygen therapy on experimentally induced pharyngocutaneous fistula in rats.

MATERIAL & METHODS

Twenty female Sprague Dawley rats were randomized into two groups. After surgical pharyngotomy, Group 1 received 100% oxygen at 2.4 atmospheres absolute pressure for 80 minutes twice daily for 7 days; Group 2 served as controls. Macroscopic wound appearance, histopathological scores (inflammatory cell infiltration, neovascularization, fibroblast proliferation, collagen deposition), and oxidative stress parameters (total oxidant status, total antioxidant status, thiol/disulfide balance, and glutathione peroxidase activity) were evaluated.

RESULTS

Wounds were mostly erythematous in the hyperbaric oxygen therapy group, whereas all controls had purulent discharge. Histopathological scores did not differ significantly; however, the treated group showed organized granulation tissue, reduced inflammatory infiltration, and partial epithelialization. Biochemical analyses showed lower total oxidant status and oxidative stress index and higher total antioxidant status and thiol levels in the treated group ($p = 0.001$).

CONCLUSIONS

Hyperbaric oxygen therapy improved oxidative stress parameters and supported wound healing in this experimental model. Although histopathological differences were not significant over the short study period, the findings suggest that hyperbaric oxygen therapy may be a useful adjunct in pharyngocutaneous fistula management; larger and longer-term studies are warranted.

OP-445

Investigation Of The Relationship Between T Stage And The Decision For Neck Dissection In Lip Cancers

Sadiye Doğan Başara[1], Hakkı Caner İnan[1], Betül Ağırgöl[1], Melih Alpay[1], Veyis Şener[1], Veysel Akif Savaş[1]

[1]Bursa High Specialty Training and Research Hospital, University of Health Sciences

BACKGROUND & AIM

This study aims to investigate neck dissection strategies based on T stage in lip cancers and to evaluate the feasibility of a close follow-up option for early-stage patients.

MATERIAL & METHODS

A total of 33 patients who underwent surgery for lip cancer between 2022 and 2026 were retrospectively evaluated. The gender distribution, tumor localization, TNM staging, neck dissection (ND) status, and postoperative follow-up data of the patients were analyzed.

RESULTS

Of the patients, 26 were male (78.8%) and 7 were female (21.2%). Tumors were located on the lower lip in 28 cases (84.8%) and on the upper lip in 5 cases (15.2%). Early-stage disease was identified in 25 patients (75.8%), while 8 patients (24.2%) had advanced-stage disease. Sixteen patients had T1 tumors, and 10 had T2 tumors. Prophylactic neck dissection was performed on 10 patients with no clinically suspected nodal metastasis. Within this group, 3 were at the T1 stage and 2 were at the T2 stage. Therapeutic neck dissection was performed on 7 patients with clinically suspected nodal metastasis, and nodal metastasis was detected in 3 of these patients. Metastatic lymph nodes were detected in 2 out of 7 patients with T3 tumors. Neck dissection was performed on all patients with advanced-stage disease (n=8) and on 8 patients (33.3%) with early-stage disease.

CONCLUSIONS

Over a mean follow-up period of 20 months, no recurrence was observed in 28 patients (84.8%). One patient with early-stage disease underwent neck dissection due to cervical recurrence during the postoperative follow-up period. In our series, the marked predominance of lip cancer in males and on the lower lip is consistent with the literature. For T1-T2 cancers, close observation without prophylactic neck dissection may be considered as a viable option. However, particularly for T3-T4 patients, neck dissection should be performed even in clinically N-negative cases.

OP-446

Ethanol Sclerosant Therapy For Benign Cystic Thyroid Lesions: Insights From An 8-Year Retrospective Analysis

Niamh Gibson[1], **Alexandra Nelson**[1], **Dhrith Jayanth**[2], **Kruthrhan Rajendran**[2], **John Hunter**[1], **Edward Chisholm**[1]

[1]*Musgrove Park Hospital, Taunton;* [2]*University of Bristol Medical School*

BACKGROUND & AIM

Benign thyroid nodules are common; present in up to 67% of the general population with around a quarter having a predominantly cystic component. (1) Around 5% of patients may experience compressive symptoms or cosmetic concerns that requires intervention. Fine needle aspiration (FNA) is often used for symptomatic relief; however, this is associated with a recurrence rate of up to 59%. (1) Ultrasound guided ethanol sclerotherapy is a non-surgical alternative for the treatment of benign cystic thyroid nodules.

MATERIAL & METHODS

Patients who had had recurrence of benign thyroid cysts after FNA drainage who requested further intervention were offered ethanol sclerotherapy at Musgrove Park Hospital in place of hemithyroidectomy between April 2017 and March 2025. Under ultrasound guidance U2 cysts were drained to near complete dryness, with the needle still in the cavity 2-3ml of dehydrated ethanol was installed.

RESULTS

Thirty-nine patients were identified (79% female, age range 14-87 years).Mean cyst diameter was 4.1cm and aspirate volumes ranged from 1-230mls. One patient (3%) had a unilateral vocal cord palsy following ethanol sclerotherapy which resolved within 24hrs.

Overall, 77% (30/39) achieved a subjective decrease in cystic volume/ compressive symptoms to the extent they did not want any further intervention.

In 31% (9/39) the cyst refilled to the extent the patient wanted further follow-up or intervention. This consisted of surveillance (33%), repeat ethanol sclerotherapy (25%), surgery (25%), radiofrequency ablation (8%) and repeat FNA (8%).

CONCLUSIONS

Ethanol sclerotherapy is a safe and effective minimally invasive treatment for benign cystic thyroid nodules which have refilled after initial drainage. Recurrence rate is lower than FNA drainage alone and avoids operative intervention and its associated costs and risks in more than 75% of cases.

Transaxillary Gas-Insufflation Approach For Single-Port Robotic Thyroidectomy (TAGA-SP): A Two-Step Streamlined Technique

Jungirl Seok[1], **Jeon Seong**[1], **Seo Young Kim**[1], **Pilkeun Jang**[1], **Eun-Jae Chung**[1], **Chang Hwan Ryu**[2], **Junsun Ryu**[2], **Yuh-Seog Jung**[2]

[1]*Department of Otorhinolaryngology-Head and Neck Surgery, Seoul National University Hospital, Seoul National University College of Medicine, Seoul, South Korea;* [2]*Department of Otorhinolaryngology-Head and Neck Surgery, National Cancer Center, Goyang, South Korea*

BACKGROUND & AIM

Robot-assisted transaxillary thyroidectomy has evolved to improve cosmetic outcomes and reduce morbidity. The Gas-insufflation One-Step TransAxillary approach introduced but had limited assist ports for suction or bleeding control. Building on our prior experience with the TAGA (TransAxillary Gas-insufflation Approach) using the da Vinci Xi system, which proved feasible and safe for workspace creation, we refined this method for the single-port (SP) platform. We developed a two-step technique, TAGA-SP, combining an initial endoscopic phase with SP robotic dissection. This study evaluated surgical outcomes, complications, and the learning curve of operative time reduction in our initial TAGA-SP series.

MATERIAL & METHODS

In the TAGA-SP technique, the procedure begins with a conventional endoscopic gas-insufflation transaxillary approach to create the flap and establish the working space. After adequate visualization of the thyroid field, one of the three initial ports is closed, while the remaining supportive port is maintained to allow suction and assistance during robotic dissection. The da Vinci SP system (Intuitive Surgical, USA) is then introduced through the main port for thyroid lobectomy. Operative variables—including total surgical time, console time, and perioperative complications—were retrospectively analyzed in the initial patient series.

RESULTS

All procedures were successfully completed without conversion to open surgery. The mean operative time decreased with experience. No major complications, including permanent recurrent laryngeal nerve injury or postoperative hematoma, were observed. One patient experienced transient vocal cord paresis that recovered spontaneously.

CONCLUSIONS

The TAGA-SP technique represents a refined two-step adaptation of the transaxillary gas-insufflation approach for use with a single-port robotic platform. By incorporating an initial endoscopic phase and maintaining an assist port for suction and bleeding control, this method enhances intraoperative safety and procedural flexibility without compromising minimal invasiveness. Our initial experience demonstrates that TAGA-SP technique may serve as a practical and safe entry platform for surgeons transitioning from conventional endoscopic or open thyroidectomy to robotic surgery, providing a gradual and controlled learning pathway toward proficiency in robotic thyroidectomy.

OP-448

Functional And Oncologic Outcomes After Transoral Laser And Robotic Surgery For Oropharyngeal Carcinoma

Gizelle Francis[1], **Colin Mackay**[1], **Jonathan Trites**[1], **Martin Cortsen**[2], **S. Mark Taylor**[1], **Matthew Rigby**[1]

[1]*Division of Otolaryngology - Head and Neck Surgery, Department of Surgery, Dalhousie University;* [2]*AdventHealth Medical Group Otolaryngology and Head and Neck Surgery at Daytona Beach*

BACKGROUND & AIM

Transoral laser microsurgery (TLM) and transoral robotic surgery (TORS) have emerged as minimally invasive techniques for the management of oropharyngeal carcinoma (OPC), aiming to optimize oncologic control while preserving function. The goal of this study is to compare oncologic and functional outcomes of TLM and TORS.

MATERIAL & METHODS

A retrospective chart review was conducted on 296 patients with OPC who underwent TLM or TORS at a single centre academic teaching hospital between 2015 and 2024. Demographics and surgical outcomes were compared among the treatment modalities using Fisher's exact test for categorical variables and t-tests for continuous variables. Two-year overall survival (OS), disease-specific survival (DSS), and disease-free survival (DFS) were calculated using Kaplan-Meier survival curves. Functional outcomes were measured using proxy variables such as gastric tube placement (G tube), bleeding, and need for tracheostomy.

RESULTS

The mean patient age was 61.1 years and 78.7% were male. Tracheostomy ($p=0.037$) and overall bleeding rates ($p< 0.001$) were significantly higher in TORS group, while there was no significant difference in G tubes. There were no statistically significant differences in OS ($p=0.7$), DSS ($p=0.54$), DFS ($p=0.84$) between modalities.

CONCLUSIONS

Both TLM and TORS demonstrated excellent oncologic outcomes, with 2-year OS, DSS, and DFS exceeding 90% and comparable between groups. G tube placement rates were comparable between groups. Postoperative bleeding and tracheostomy rates were significantly higher in the TORS group. These findings reinforce that both TLM and TORS are effective minimally invasive approaches for OPC; however, in our study TORS was associated with higher rates of post-operative complications.

Analysis Of Surgical Treatment Strategies And Prognostic Factors In Pediatric Head And Neck Rhabdomyosarcoma: A Single-Center Retrospective Cohort Study Of 162 Cases

Ge Zhang[1,2], **Shengcai Wang**[1,2], **Fengda Ren**[1,2]

[1]*National Center for Children's Health, Beijing 100045, China;* [2]*Department of Otorhinolaryngology Head and Neck Surgery, Beijing Children's Hospital, Capital Medical University, Beijing 100045, China*

BACKGROUND & AIM

To explore surgical intervention strategies in the comprehensive treatment of pediatric head and neck rhabdomyosarcoma (HNRMS). This study aims to compare survival outcomes between upfront direct surgery and delayed surgery after neoadjuvant chemotherapy, and identify independent prognostic risk factors, thereby providing robust evidence for individualized clinical surgical decision-making.

MATERIAL & METHODS

We retrospectively analyzed 162 pediatric HNRMS patients undergoing primary tumor resection between September 2013 and March 2025. Patients were assigned to upfront direct surgery (n=78) and delayed surgery after neoadjuvant chemotherapy (n=84) groups. Overall survival (OS) and event-free survival (EFS) served as primary and secondary endpoints, evaluated using the Kaplan-Meier method and Log-rank test. Cox proportional hazards models were utilized to identify independent prognostic factors and construct a prognostic nomogram, with predictive efficacy assessed by the area under the receiver operating characteristic curve (AUC). Inverse probability of treatment weighting (IPTW) was applied to adjust for baseline indication bias and determine the true prognostic value of surgical timing.

RESULTS

The median follow-up was 24.7 months. The 3-year OS and EFS rates were 80.1% and 53.3%. Significant baseline indication bias existed; the delayed surgery group exhibited higher proportions of aggressive features (tumor >5 cm, parameningeal origin, meningeal invasion, and metastases) (P<0.05). Multivariate analysis revealed no radiotherapy, IRS stage III/IV, meningeal invasion (HR=5.75, P=0.005), and N1 stage (HR=4.63, P=0.018) as independent adverse factors for OS. The constructed nomogram yielded AUCs of 75.11% and 75.81% for predicting 3-year and 5-year OS. After IPTW adjustment, OS showed no significant difference between delayed and upfront surgery groups (weighted HR=0.630, 95%CI: 0.241–1.643, P=0.344). EFS differences were similarly non-significant (P=0.696).

CONCLUSIONS

No radiotherapy, meningeal invasion, regional lymph node metastasis, and IRS stage III/IV are independent adverse prognostic factors for pediatric HNRMS. The constructed nomogram demonstrates excellent individualized predictive efficacy. After rigorously adjusting for baseline indication bias via IPTW, upfront direct surgery and delayed surgery after neoadjuvant chemotherapy yielded comparable survival benefits. Individualized surgical strategies must be carefully formulated by integrating tumor anatomical features with comprehensive multidisciplinary evaluations.

Single-Center Clinical Experience In Laryngeal Squamous Cell Carcinoma: Treatment Patterns, Recurrence Dynamics, And Patient Survival

Serra Tanışman[1], **Sema Zer Toros**[1], **Çiğdem Tepe Karaca**[1]

[1]*Otorhinolaryngology – Head and Neck Surgery, Haydarpaşa Training and Research Hospital*

BACKGROUND & AIM

Optimal management of laryngeal squamous cell carcinoma (LSCC) remains influenced by tumor stage, organ preservation strategies, and institutional experience. Recurrence and patient survival are key determinants of long-term prognosis. We present a single-center clinical experience evaluating treatment patterns, recurrence dynamics, and patient survival in LSCC.

MATERIAL & METHODS

Between 2015 and 2026, 280 patients diagnosed with LSCC were retrospectively reviewed at a tertiary referral center. Fifty-seven patients were excluded due to insufficient follow-up or incomplete data, leaving 223 patients for analysis. Clinical stage was available in 209 cases. Patients were stratified according to initial treatment strategy as primary surgical treatment or definitive chemoradiotherapy (CRT). Recurrence timing, patient survival, and clinical–pathological stage correlation were evaluated retrospectively.

RESULTS

Primary surgical treatment was performed in 135 patients (60.5%), while 88 patients (39.5%) received definitive CRT; 11 of these later required salvage laryngectomy. Surgical procedures included cordectomy (n=38), partial laryngectomy (n=47), and total laryngectomy (n=50); 17 cordectomies were open and 21 were performed via a transoral approach.

The overall recurrence rate was 12% (27/223), with a median time to recurrence of 11 months. Recurrence occurred in 5.2% of patients treated with primary surgery and 22.7% of those treated with definitive CRT. Within advanced-stage (III–IV) disease, recurrence remained higher in patients managed with definitive CRT compared to those treated surgically (15.1% vs 6.7%).

Median follow-up was 26 months, and median overall survival (OS) was 30 months. Overall mortality was 31% (71/223), and recurrence was associated with markedly higher mortality (63% vs 27%).

CONCLUSIONS

Recurrence represents a critical prognostic event in LSCC and is strongly associated with increased mortality, particularly when occurring within the first year. These findings underscore the importance of closer follow-up during the first year after treatment. Early detection and early recognition of recurrence may contribute to improved outcomes. Careful patient selection and tailored treatment strategies remain essential to optimize survival and long-term prognosis.

OP-451

Comparison Of Subjective And Objective Outcomes Following Ablation Therapy For Thyroid Nodule

Jin-Yi, Lin[1], **Chun-Wei Huang**[1]

[1]*Department of Otolaryngology–Head and Neck Surgery, China Medical University Hospital, Taiwan*

BACKGROUND & AIM

Thyroid nodules are common clinical conditions. Compared to traditional surgery, ablation therapy is minimally invasive with fewer complications, but post-treatment reduction and clinical outcomes vary. This study investigated the predictors of volume reduction rate (VRR) after ablation and analyzed the correlation between objective and subjective clinical improvements.

MATERIAL & METHODS

Patients with benign thyroid nodules undergoing ablation were enrolled. Preoperative ultrasound features (size, number, echogenicity, composition, calcification, margin, and vascularity), self-reported symptoms, and cosmetic scores were collected. Volume and clinical scores were tracked at 1, 3, and 6 months postoperatively to calculate VRR. Statistical analyses included t-tests, ANOVA, and multivariate linear stepwise regression.

RESULTS

In 46 patients, mean nodule volume decreased from 9.87 mL preoperatively to 4.95, 2.95, and 1.83 mL at 1, 3, and 6 months, yielding VRRs of 47.5%, 69.6%, and 80.2%, respectively. Age, laterality, and margin did not significantly affect 6-month VRR. However, composition, echogenicity, vascularity, and calcification showed significant differences ($P<0.05$). Multivariate regression identified solid component <25% and anechoic status as significant VRR predictors ($P<0.05$). Symptom scores decreased from 5.8 to 4.1, 2.8, and 1.8, and cosmetic scores decreased from 2.9 to 2.1, 1.8, and 1.4 at 1, 3, and 6 months, respectively, showing significant improvements from month 1 ($P<0.05$). At 6 months, symptom and cosmetic improvements significantly correlated with preoperative severity and VRR ($P<0.05$).

CONCLUSIONS

Ablation therapy significantly reduces thyroid nodule volume and improves symptoms and cosmetic appearance, with notable efficacy within 1 month. Preoperative nodule composition and echogenicity are key predictors of VRR, highlighting the clinical value of pre-treatment imaging findings in predicting prognosis.

OP-452

Clinicopathological Evaluation And Surgical Outcomes Of Parotidectomy: A Six-Year Retrospective Study

INARA BASHIROVA[1], **ŞEVVAL GÜNAY**[1], **DENİZ BAKLACI**[1]

[1]*Department of Otolaryngology and Head and Neck Surgery, Zonguldak Bülent Ecevit University Hospital*

BACKGROUND & AIM

Approximately 80% of salivary tumors originate in the parotid gland and are predominantly benign. Pleomorphic adenoma and Warthin's tumor are the most frequent benign lesions; mucoepidermoid carcinoma is the most common malignancy. Surgery, aiming for mass excision and facial nerve preservation, remains the gold standard for primary tumors and head/neck metastases. However, large contemporary series from our country are limited. This study retrospectively evaluates the demographic, clinical, and histopathological features of patients undergoing parotidectomy for primary or metastatic lesions in our clinic over six years, sharing our surgical approaches and complication rates to contribute to clinical experience.

MATERIAL & METHODS

This retrospective clinical study was conducted by reviewing records of patients who underwent surgical procedures in the parotid region at the Otolaryngology and Head and Neck Surgery Department of Zonguldak Bülent Ecevit University Hospital

between January 2020 and April 2026. The study adhered to the Declaration of Helsinki principles, and institutional ethics committee approval was obtained. We included patients operated on for benign and malignant primary parotid masses, sialolithiasis, and diagnostic or therapeutic parotidectomies performed for suspected occult metastasis or direct tumor invasion from head and neck malignancies. Patients with incomplete hospital records or lacking regular follow-up were excluded. Overall, 200 patients meeting inclusion criteria constituted the study sample. Of these, 152 were treated for primary parotid pathologies, while 48 underwent parotidectomy due to secondary metastasis or invasion. Patient demographics, surgical indications, techniques, histopathological diagnoses, and postoperative complications were analyzed retrospectively

RESULTS

Of 200 patients (112 men, 88 women; mean age: 60.5), 152 (76%) had primary parotid masses and 48 (24%) had suspected head and neck metastases. Pleomorphic adenoma (43.3%) and Warthin tumor (37.0%) were the most common primary benign pathologies, followed by myoepithelioma and basal cell adenoma. Superficial parotidectomy was the most frequent surgery (60.5%), followed by total (19%) and subtotal (12.5%) parotidectomy; extracapsular dissection was never performed. A modified Blair incision was utilized in 94.1% of cases. Postoperative complications included seroma (6.5%) and fully resolving transient facial palsy (6.5%). Permanent paralysis (3.0%) occurred solely due to mandatory oncological nerve sacrifice. Frey syndrome (1.5%) and wound infections (1.0%) were rare. Among the 48 metastatic cases, cutaneous squamous cell carcinoma (79.2%) and malignant melanoma (16.7%) were most frequent, with primary lesions predominantly originating from preauricular and malar regions

CONCLUSIONS

This study shares our clinical experience by presenting the histopathological distribution, surgical approaches, and complication rates of a large parotidectomy series. Benign pathologies predominated, and superficial parotidectomy was the most frequent procedure. Our low permanent facial paralysis rates highlight how routine neuromonitoring and surgical expertise prevent iatrogenic morbidity. Furthermore, findings underscore the parotid gland's vital role as a "sentinel" drainage station for malar and preauricular squamous cell carcinomas. To address rising aesthetic demands, we increasingly utilize minimally invasive face-lift and tragal V incisions, providing a contemporary reference for oncological, functional, and aesthetic parotid surgery management

OP-453

Pharyngeal Mucosal Margin Vessel Counts And Predictive Value Of Risk Factors For Pharyngocutaneous Fistula After Total Laryngectomy

Ozan Tuysuz[1], **Ayca Ilgın Altaner Asaroglu**[1], **Sahin Ogreden**[1], **Nilsen Erdogan**[1], **Rabia Dogukan**[1], **Ozgur Yigit**[1]

[1]*Basaksehir Cam ve Sakura Sehir Hastanesi*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) is the most frequent and a major complication following total laryngectomy; increasing short and long term morbidity, and is the most common cause of wound related death for the postsurgical head and neck cancer. Dysregulation of angiogenesis is closely related to impaired wound healing, tissue hypoxia and tumor progression. This study aims to evaluate the prognostic significance of vessel counts from pharyngeal mucosal margins of total laryngectomy surgical materials along with the other related predictive factors for pharyngocutaneous fistula, with the review of current literature.

MATERIAL & METHODS

This preliminary study conducted on a retrospetive analysis of the patients in single tertiary institution undergoing total laryngectomy between 2020-2025. Comparisons has made of pharyngocutaneous margin vessel counts from the surgical histopathologic archive based on the groups between who developed and did not develop pharyngocutaneous fistula; also evaluated the factors may affect PCF occurrence, related to the patient, the disease, and the received treatment. These factors were clinical stage, tumor extension, flap reconstruction, tobacco use, received radiotherapy/cemotherapy, postoperative inflammatory markers, serum protein levels, postoperative anemia. Mean margin vessel counts evaluated from 10x field from histopathological archive from base of the tongue, left and right hypopharyngeal margins and aryepiglottic folds

RESULTS

The cohort conducted of 41 patiens (34 males, 7 females) and divided into two groups with (n=22) and without (n=19) fistula. The mean vascular proliferation value (MVPV) was significantly higher in patients who developed fistula (50.9 vs 35.8, $p < 0.001$). In the ROC analysis, MVPV demonstrated high discriminatory performance in predicting fistula development (AUC: 0.903). According to the logistic regression analysis, every 10-unit increase in MVPV increases the probability of PCF by approximately 10 times. In the multivariable logistic regression analysis adjusted for pectoralis flap reconstruction, MVPV remained independently associated with the development of fistula. MVPV levels did not show a significant difference according to tumor location. Serum albumin levels, total protein levels, hematocrit levels found to be significantly lower, sedimentation was significantly higher in the PCF group.

CONCLUSIONS

Early identification of patients at high risk can help to reduce the incidence of PCF. Therefore margin vessel counts can be a significant predictive biomarker in total laryngectomy enabling risk assesment and guiding postoperative care accordingly. Further investigations with larger cohorts incorperating histopathological evaluation of locoregional wound healing in residual tissues may provide critical insights and eluciate the causative mechanisms of the disease.

Head And Neck Paragangliomas : An Overview From Diagnosis To Treatment.

Lamali Lina Celia[1], **Hireche Lina**[1], **Megherbi Ouziane**[1], **Medkour Samira**[1], **Hachemi Mohamed**[1], **Oukaour Lylia**[2], **Habouchi Amine**[2], **Hasbellaoui Mokhtar**[1]

[1]*ENT head and neck surgery department , Lamine Debaghine hospital, University of Health Sciences;* [2]*Imaging and interventional radiology department, Lamine Debaghine hospital, University of Health Sciences*

BACKGROUND & AIM

Paragangliomas (PGLs) are a group of neuroendocrine tumors that arise in the parasympathetic or sympathetic ganglia. Head and neck PGLs (HNPGLs) comprise 65% to 70% of all PGLs and account for 0.6% of all head and neck cancers. The majority of HNPGLs are benign, and commonly originates from the carotid body, jugular bulb, and vagal body. The aim of our study is to highlight the clinical and radiological diversity of paragangliomas of the head and neck, as well as the best therapeutic decision in each case according to the different management possibilities.

MATERIAL & METHODS

This is a descriptive analysis of a series of 27 patients with paraganglioma of the head and neck, diagnosed and treated over a 5-year period (2020-2025). This series excludes all other types of tumors of the temporal bone and cervical region. All patients underwent clinical and paraclinical examinations in our department.

RESULTS

The average age is 49 with a sex ratio of 0,28 .

The localisation was mainly tympanic (n= 13), tympanojugular (n= 6), carotid (n= 5) and vagal (n= 3). All tumors were solitary with two familial cases and no secreting or malign paraganglioma.

For glomus tympanicum and tympanojugular, the symptomatology is dominated by unilateral pulsatile tinnitus. However, cervical tumors are pauci-symptomatic. 78% of the cases present a pulsatile mass.

The HRCT scan supplemented by an MRI confirms the diagnosis of paraganglioma and specifies its origin.

Surgery was performed in all cases with glomus tympanicum (100%), 1 case of glomus tympanojugular (16%), 4 cases of carotid paraganglioma (80%) and 2 cases of vagal paraganglioma (66%) .A radiotherapy was performed in 22% of cases (with significant intracranial extension, advanced age, high comorbidities or insufficient contralateral vascular supplementation).

No tumor recurrence in patients treated surgically with a follow-up ranging from 6 months to 5 years.

CONCLUSIONS

Paragangliomas are rare vascular tumors and multiple forms are described in the head and neck region. Clinical manifestations are variable and sometimes nonspecific, delaying diagnosis and management. Imaging remains the preferred examination to guide diagnosis. Management is not standardized and depends on the patient's age, tumor location, and treatment morbidity.

EVALUATION OF THYROID GLAND INVASION IN ADVANCED LARYNGEAL SQUAMOUS CELL CARCINOMA

Muhammed Sefa UYAR[1], **Hamit İPEK**[1], **Hamdi ÇAKLI**[1], **Mehmet Özgür PINARBAŞLI**[1], **Melek Kezban GÜRBÜZ**[1]

[1]*Eskişehir Osmangazi University Faculty of Medicine, Department of Otolaryngology–Head and Neck Surgery, Eskişehir, Turkey*

BACKGROUND & AIM

Total laryngectomy is considered the gold standard treatment in advanced laryngeal cancer and in cases of recurrence following organ-preserving therapies. Depending on the patterns of tumor spread, the addition of ipsilateral thyroidectomy to total laryngectomy is also recommended. However, the relatively low incidence of thyroid gland invasion (1–30%) and the risk of significant morbidities such as hypothyroidism and hypoparathyroidism following thyroidectomy make its necessity controversial.

This study aimed to identify predictors of thyroid gland invasion in patients with advanced laryngeal squamous cell carcinoma (LSCC) and to evaluate the necessity of thyroidectomy.

MATERIAL & METHODS

Patients diagnosed with advanced LSCC who underwent total laryngectomy with concurrent thyroidectomy between 2006 and 2024 were retrospectively analyzed. Patients with a history of preoperative chemotherapy or radiotherapy were excluded.

Preoperative laryngoscopic findings, radiologic imaging (CT/MRI), and histopathologic reports of 85 patients were evaluated. Statistical analysis was performed using IBM SPSS for Windows version 21.0. Chi-square tests were used for comparison of categorical variables, and a p-value <0.05 was considered statistically significant.

RESULTS

Thyroid gland invasion was detected in 9 (10.6%) out of 85 patients histopathologically.

On histopathological evaluation, full-thickness thyroid cartilage invasion (p=0.027) and extralaryngeal spread (p=0.004) were significantly associated with thyroid gland invasion. Subglottic extension (>1 cm) was found to be borderline significant (p=0.052). On radiological evaluation, thyroid cartilage destruction (p=0.045), cricoid cartilage destruction (p=0.001), subglottic extension (p=0.047), and extralaryngeal spread (p=0.006) were significantly associated with thyroid gland invasion.

There was no significant association was found between thyroid gland invasion and age, sex, tumor location, stage and lymph node involvement.

CONCLUSIONS

In our study, the rate of thyroid gland invasion was consistent with rates reported in the literature. Additionally, thyroid cartilage destruction, extralaryngeal spread, and subglottic extension were found to be associated with thyroid gland invasion and to increase this risk, in line with previous reports.

These findings suggest that ipsilateral thyroidectomy should not be performed routinely during total laryngectomy, but rather selectively in patients with thyroid cartilage destruction, extralaryngeal spread, and subglottic extension.

Risk Of Thyroid Carcinoma In Patients Treated Surgically With Assumed Benign Cytology In Riyadh, Saudi Arabia

Manar Alzahrani[1], **Lama Aldosari**[1], **Abdullah Alkhaldi**[1], **Mohammed Alessa**[1]

[1]*King Abdulaziz Medical City*

BACKGROUND & AIM

This study aimed to report the rate of thyroid malignancy in benign fine-needle aspirations (Bethesda II) at King Abdulaziz Medical City and evaluate the factors that affect false-negative outcomes of FNA.

MATERIAL & METHODS

All patients referred for thyroidectomy from 2009 to 2019 were reviewed (n = 1968). Only patients with a benign FNA, corresponding to the Bethesda II, were included (n = 384). Information on age, gender, body mass index (BMI), serum thyroid-stimulating hormone, type of surgery and histopathological outcomes were retrieved.

RESULTS

Of the sample (n = 384) with an initial benign FNA, 63 patients had a malignancy on postoperative pathological examination, yielding an overall false-negative rate of 16.4%. The most frequently reported histopathological type was papillary thyroid microcarcinomas (n = 52). For the false-negative group, the mean age was 43.8 years (range 21-70 years) with an 84.1% female predominance. The surgical choice for 74% (n = 46) of cases was total thyroidectomy. Age, gender, thyroid function and BMI did not affect the false-negative rate of benign FNA (p > 0.05).

CONCLUSIONS

This study found a higher risk of malignancy compared to the literature related to benign FNA. The risk of malignancy should be considered, even with benign FNA.

KEYWORDS

benign cytology; fine-needle aspiration; malignancy; thyroid carcinoma.

Is P16 Enough? The Prognostic Role Of HPV In Head And Neck Cancer Of Unknown Primary

Rusana Bark[1], **Evelina Jörtsö**[2], **Anders Näsman**[3,4], **Tina Dalianis**[1,3], **Linda Marklund**[5,1,2]

[1]*Medical Unit Head Neck Lung and Skin Cancer, Department of Head and Neck Surgery, Stockholm, Sweden, Karolinska University Hospital, Stockholm, Sweden;* [2]*Division of ENT Diseases, Department of Clinical Science, Intervention and Technology, Karolinska Institutet, Stockholm, Sweden;* [3]*Department of Oncology-Pathology, Karolinska Institutet, Stockholm, Sweden;* [4]*Dept of Clinical Pathology and Cytology, Karolinska University Hospital, Stockholm, Sweden;* [5]*Department of Surgical Sciences, Section of Otolaryngology and Head and Neck Surgery, Uppsala University, Uppsala, Sweden*

BACKGROUND & AIM

Head and neck cancer of unknown primary (HNCUP) typically presents as cervical lymph node metastasis without identification of the primary tumor despite comprehensive evaluation. Many cases are HPV-positive and associated with favorable prognosis, suggesting an oropharyngeal origin. In the 8th TNM edition, HNCUP is classified by HPV or p16 status, although concordance between these markers is imperfect. HPV/p16 discordance, as reported in oropharyngeal cancer, may affect treatment stratification. This study evaluated the prevalence and prognostic significance of HPV/p16 discordance in HNCUP in a high HPV-prevalence region.

MATERIAL & METHODS

This study included 141 patients diagnosed with HNCUP at Karolinska University Hospital between 2000 and 2024. For cases diagnosed from 2014 to 2024, HPV and p16 were determined using fine needle aspiration cytology (FNAC) from neck metastases or retrieved form medical records. For cases diagnosed from 2000 to 2013, relevant data were obtained from a previous study. P16 expression was assessed using immunohistochemistry, while HPV DNA status was evaluated via PCR. Survival analysis, both overall and disease-free, included 137 patients in the 2-year survival analysis and 124 in the 5-year survival analysis.

RESULTS

Of the 141 patients, 128 had both HPV and p16 status and were analyzed for discordance. Among these, 71/128 (55.4%) were HPV DNA+ and 57/128 (44.5%) were HPV DNA-. Concordance in both HPV DNA and p16 positivity (HPV DNA+/p16+) was seen in 53/71 (74.6%) whereas 18/71 (25.4%) were HPV DNA+/p16-. Patients with HPV+ HNCUP, regardless of p16 status, had a better overall survival.

CONCLUSIONS

In this cohort of patients with HNCUP from a high HPV-prevalence region, HPV/p16 discordance was observed in a substantial proportion of cases, with one quarter of HPV DNA–positive tumors lacking p16 overexpression. Despite this discordance, HPV positivity—irrespective of p16 status—was associated with improved overall survival. These findings suggest that HPV DNA status may carry important prognostic information beyond p16 expression alone. The results parallel observations in oropharyngeal cancer and highlight the potential clinical relevance of combined HPV and p16 assessment in HNCUP.

OP-458

Endoscopic Surgical Anatomy Of The Parapharyngeal Space Via The Transparotid Approach: A Cadaveric Morphometric Study

Hatice Secil Akyildiz[1,2], **Mehmet Yilmaz**[3], **Mustafa Kursat Gokcan**[1], **Eray Tuccar**[3]

[1]*Ankara University Faculty of Medicine, Department of Otolaryngology;* [2]*Ankara University Institute of Health Sciences, Clinical Anatomy;* [3]*Ankara University Faculty of Medicine, Department of Anatomy*

BACKGROUND & AIM

The parapharyngeal space (PPS) is a deep anatomical region with complex neurovascular relationships, posing significant challenges for surgical access. Among various approaches, the transparotid route provides a natural lateral corridor, particularly for prestyloid lesions. However, detailed endoscopic anatomical data and morphometric relationships relevant to this approach remain limited. To define the endoscopic surgical anatomy of the PPS via the transparotid approach and to quantitatively evaluate the spatial relationships of critical neurovascular structures, with particular emphasis on surgical safety corridors.

MATERIAL & METHODS

This descriptive and analytical cadaveric study was conducted on five formalin-fixed adult human cadaver heads, yielding a total of ten dissection fields (bilateral). A standardized transparotid approach was performed using both conventional and endoscopic techniques (0° and 30° optics). Morphometric measurements were obtained using digital calipers, focusing on distances between the styloid process and adjacent neurovascular structures, as well as superficial–deep anatomical correlations. Dissections were documented and analyzed to assess surgical planes and transition zones between prestyloid and poststyloid compartments.

RESULTS

A total of 10 parapharyngeal dissections were analyzed. The prestyloid compartment consistently provided a reliable surgical corridor. Quantitative assessment demonstrated a stable anatomical relationship between the styloid process and the facial nerve (4.75 ± 1.7 mm), supporting its role as a dependable landmark. In contrast, the distance between the styloid process and the internal carotid artery showed marked variability (18.35 ± 9.6 mm), whereas its relationship with the internal jugular vein remained relatively constant (12.6 ± 1.8 mm). The hypoglossal nerve exhibited the greatest positional variability (29.8 ± 9.1 mm), limiting its utility as a surgical reference. No statistically significant side-to-side differences were identified ($p > 0.05$), although minor asymmetrical trends were observed, particularly in facial nerve depth and vascular relationships. Overall, these

findings distinguish stable from variable anatomical structures within the parapharyngeal space, with important implications for surgical orientation and risk mitigation.

CONCLUSIONS

The transparotid approach offers reliable access to the parapharyngeal space, with the prestyloid compartment serving as a safe and consistent entry corridor. The styloid process is a dependable landmark for early identification of the facial nerve, whereas the internal carotid artery and hypoglossal nerve demonstrate significant variability. Recognition of these patterns is essential for optimizing surgical orientation and minimizing neurovascular risk.

OP-459

Predictive Value Of Continuous Intraoperative Neuromonitoring (CIONM) In Thyroid Surgery: A Study Of 166 Patients And 326 Nerves At Risk

Omar Alshdaifat[1], **Osama Hamarneh**[1]

[1]*Abdali Hospital, Amman, Jordan*

BACKGROUND & AIM

Continuous intraoperative neuromonitoring (CIONM) provides real-time functional assessment of the recurrent laryngeal nerve (RLN). This study evaluates the incidence, etiology, and predictive accuracy of CIONM signal loss, specifically focusing on its role as a clinical decision-making tool.

MATERIAL & METHODS

A Prospective analysis was conducted on 166 patients undergoing thyroidectomy (total and hemi), involving 326 nerves at risk (NAR). Standardized CIONM protocols were employed via vagal stimulation. Loss of signal (LOS) events were categorized by surgical cause and correlated with postoperative laryngoscopy results.

RESULTS

- Incidence of LOS: A loss of continuous signal occurred in 46 NAR (14.1%). Combined loss of both continuous and intermittent signals was observed in 5 NAR (1.5%).
- Etiology of Nerve Stress: Traction was the predominant cause of LOS (n=31), followed by thermal injury (n=11), cutting (n=2), crushing (n=1), and laceration (n=1).
- Clinical Outcomes: Postoperative laryngoscopy confirmed 37 cases of temporary vocal cord palsy and 3 cases of permanent palsy.
- Statistical Performance:

. Ten patients (False Positives) showed intraoperative LOS but normal postoperative function, while four patients (False Negatives) experienced palsy despite a stable signal.

· Sensitivity: 90.0%

· Specificity: 96.5%

· Positive Predictive Value (PPV): 78.3%

· Negative Predictive Value (NPV): 98.6%

CONCLUSIONS

CIONM serves as a highly reliable "early warning system," particularly for identifying traction, which remains the most frequent and reversible cause of nerve stress. The high Negative Predictive Value (98.6%) provides surgeons with excellent confidence to proceed with bilateral surgery. Conversely, the 78.3% PPV demonstrates that while signal loss does not always result in permanent injury, it serves as a critical trigger for intraoperative corrective maneuvers. Ultimately, the high sensitivity of CIONM justifies the practice of "staged thyroidectomy" in the event of unilateral LOS to prevent the devastating complication of bilateral vocal cord paralysis.

BACKGROUND & AIM

The aim of this study was to examine the thyroid glands of the offspring of maternal rats exposed to 3.5 GHz radiofrequency radiation (RFR) during the prenatal period, at postnatal months 18 and 24.

MATERIAL & METHODS

In this study, Wistar Hannover rats were obtained from an ethically approved experimental protocol (no. 2022-02) under the Ethics Committee of Bağcılar Training and Research Hospital.

The dams were exposed to 3.5 GHz RFR only during pregnancy. The offspring were not exposed to any radiation until postnatal months 18 and 24. The 18-month group consisted of a total of 15 female rats (8 control, 7 RFR-exposed), and the 24-month group consisted of a total of 15 male rats (7 control, 8 RFR-exposed). All animals were sacrificed under ketamine anesthesia, and thyroid tissues were evaluated histopathologically, morphologically, and immunohistochemically.

RESULTS

A significant increase in total score and colloid parameters was observed between the 18- and 24-month experimental groups ($p = 0.010$; $p = 0.008$). Immunohistochemical analysis of thyroid tissues in the 18-month group showed that prenatal exposure to 3.5 GHz RFR increased Ki-67 ($p = 0.002$), Caspase-3 ($p = 0.018$), and LC3B levels ($p > 0.05$). Data from the 24-month group indicated that prenatal RFR exposure increased Ki-67 ($p = 0.002$) and Caspase-3 ($p = 0.018$) while decreasing LC3B. IL-1β and NF-κB were not affected by the radiation ($p > 0.05$).

Morphological measurements revealed that RFR did not alter peripheral and central follicle diameters ($p > 0.05$) but significantly decreased peripheral epithelial height ($p = 0.016$).

CONCLUSIONS

Prenatal exposure to 3.5 GHz RFR induced selective morphological and cellular alterations in thyroid tissue at postnatal months 18 and 24.

Ultrasonographic Measurement Of Minimum Tumor–Fascia Distance For Differentiating Deep And Superficial Parotid Tumors

Ozan Tüysüz[1], **Merve Demir Aksoy**[1], **Mehmet Kadıoğlu**[1], **Ali Dablan**[1], **Şahin Öğreden**[1], **Özgür Yiğit**[1]

[1]*Basaksehir Cam and Sakura City Hospital*

BACKGROUND & AIM

This prospective study was designed to evaluate whether the minimum tumor–parotideomasseteric fascia distance (MTFD), measured by ultrasonography, can reliably predict the preoperative localization of parotid tumors as superficial or deep lobe and assist in surgical decision-making. Accurate preoperative identification of tumor localization is essential for appropriate surgical planning and risk assessment. Based on our review of the existing literature, this study represents the first prospective investigation addressing the diagnostic role of MTFD in this context.

MATERIAL & METHODS

Between September 2024 and January 2026, 52 patients who underwent surgical treatment for parotid gland tumors at the Department of Otolaryngology, Basakşehir Cam and Sakura City Hospital were prospectively included. In all patients, the minimum tumor–parotideomasseteric fascia distance (MTFD) was measured and recorded during preoperative ultrasonographic examinations. All measurements were independently performed by two experienced radiologists who were blinded . Tumor localization was classified intraoperatively as superficial or deep lobe according to the relationship between the tumor and the facial nerve and was accepted as the reference standard. To account for operator-dependent variability inherent to ultrasonography, simulated measurement error was incorporated into MTFD values. The diagnostic performance of MTFD for predicting deep lobe localization was assessed using receiver operating characteristic (ROC) analysis. The area under the curve (AUC) was calculated, and the optimal cutoff value was determined using the Youden index. Statistical significance was defined as $p < 0.05$.

RESULTS

Based on surgical findings, tumor localization was classified as superficial lobe in 41 patients (78.9%) and deep lobe in 11 patients (21.1%).Superficial lobe tumors showed lower MTFD values than deep lobe tumors.. Tumors were located in the left parotid gland in 28 patients (53.8%) and in the right parotid gland in 24 patients (46.2%). The study cohort consisted of 17 female (32.6%) and 35 male patients (67.4%). Histopathological examination revealed pleomorphic adenoma in 20 cases, Warthin tumor in 24 cases, non-diagnostic findings in 3 cases, and neoplasms of uncertain malignant potential (SUMP) in 5 cases. After adjustment for measurement variability, ROC analysis demonstrated excellent diagnostic performance of MTFD for predicting deep lobe localization, with an AUC of 0.985 (95% CI: 0.941–1.000). At a cutoff value of 2.6 mm, sensitivity was 85% and specificity was 98%. Secondary analysis demonstrated significantly higher MTFD values with increasing surgical extent ($p = 0.0019$).

CONCLUSIONS

Ultrasonographically measured MTFD demonstrates good diagnostic performance in predicting lobar localization of parotid tumors and may provide meaningful support for preoperative surgical planning. However, the limited sample size and the relatively small number of deep lobe tumors restrict the generalizability of these findings. Larger, multicenter prospective studies are required to further validate the diagnostic and clinical utility of MTFD.

OP-462

Intratumoral And Peritumoral CT Radiomics For Predicting PD-L1 Expression And Pathological Complete Response To Neoadjuvant Chemoimmunotherapy In Hypopharyngeal Carcinoma

Xu Chenyang[1], **Song Wenhua**[1], **Li Changling**[1], **Yu Zhenbin**[1], **Yan Jiaxuan**[1], **Lei Dapeng**[1]

[1]*Department of Otorhinolaryngology, Qilu Hospital of Shandong University, National Health Commission Key Laboratory of Otorhinolaryngology (Shandong University), Jinan 250012, China*

BACKGROUND & AIM

To construct a radiomics model based on contrast-enhanced computed tomography (CT) of intratumoral and peritumoral regions of hypopharyngeal carcinoma for noninvasive preoperative prediction of programmed death-ligand 1 (PD-L1) expression status, evaluate its predictive value for pathological complete response (pCR) after neoadjuvant chemoimmunotherapy, and provide an objective basis for individualized treatment decision-making.

MATERIAL & METHODS

364 patients with hypopharyngeal carcinoma who underwent preoperative cervical contrast-enhanced CT and neoadjuvant chemoimmunotherapy from three domestic medical centers were retrospectively enrolled. The intratumoral region of the primary lesion and peritumoral regions with 1–5 mm circumferential expansion were delineated slice by slice, and radiomic features were extracted. The optimal features were screened through analysis of variance and least absolute shrinkage and selection operator (LASSO) regression, and multiple machine learning models including random forest, extreme gradient boosting (XGBoost), and support vector machine (SVM) were constructed to establish a classification model with PD-L1 expression status as the endpoint. The receiver operating characteristic (ROC) curve, calibration curve, and decision curve analysis (DCA) were used to evaluate the discrimination, calibration, and clinical net benefit of the model. The concordance index (C-index), net reclassification improvement (NRI), and integrated discrimination improvement (IDI) were applied to further assess the predictive efficacy of the model for pCR events.

RESULTS

The positive rates of PD-L1 in the training cohort, internal validation cohort, and external validation cohort were 58.5%, 56.6%, and 55.1%, respectively, with an overall pCR rate of 36%. The combined feature model of intratumoral + 2 mm peritumoral region showed the optimal predictive efficacy, with the area under the ROC curve (AUC) of 0.812, 0.785, and 0.769 in the training cohort, internal validation cohort, and external validation cohort, respectively. The calibration curve indicated good consistency and DCA revealed that the model achieved clinical net benefit within a wide range of threshold probabilities. The results of C-index, NRI and IDI demonstrated that the radiomics model significantly improved the prediction accuracy of pCR, which was superior to the model with clinical factors alone. SHAP analysis showed that peritumoral textural heterogeneity, intratumoral attenuation gradient, and marginal morphological features were the key features driving PD-L1 prediction.

CONCLUSIONS

The CT radiomics model based on the combination of intratumoral and peritumoral regions can noninvasively and accurately predict PD-L1 expression status in hypopharyngeal carcinoma, and effectively evaluate the probability of pCR after neoadjuvant chemoimmunotherapy, which provides a noninvasive imaging stratification tool for precision immunotherapy of locally advanced hypopharyngeal carcinoma.

OP-463

Diagnostic Accuracy Of The Milan Classification System For Salivary Gland Cytology: A Retrospective Validation In A Middle Eastern Tertiary Center

MOHAMMED ALESSA[1]

[1]*KING SAUD UNIVERSITY;* [2]*MINISTRY OF NATIONAL GUARD HEALTH AFFAIRS*

BACKGROUND & AIM

The Milan System for Reporting Salivary Gland Cytopathology (MSRSGC) was introduced to standardize cytological diagnosis and provide risk of malignancy (ROM) estimates. While validation studies from Western and Asian populations have confirmed its clinical value, data from the Middle East remain scarce.

Objective: To validate the diagnostic accuracy of the Milan System in a Middle Eastern tertiary care population, calculate ROM values, assess demographic and clinical predictors of malignancy, and analyze recurrence and survival outcomes

MATERIAL & METHODS

We conducted a retrospective diagnostic accuracy study of 144 patients with salivary gland tumors who underwent fine-needle aspiration (FNA) followed by surgical excision (2014–2023). FNA results were classified using the Milan System and compared with final histopathology. Diagnostic performance metrics, including sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and overall accuracy with 95% confidence intervals (CIs), were calculated. Logistic regression was used to evaluate predictors of malignancy. Recurrence-free survival was analyzed with the Kaplan–Meier method

RESULTS

Of 144 patients, 138 had complete cytology and histopathology data. ROM values were 0% for category I, 11.8% for category II, 14.3% for AUS, 5.9% for SUMP, and 87.0% for malignant. Overall sensitivity was 71.4% (95% CI: 52.9–84.7), specificity 97.3% (95% CI: 92.4–99.1), PPV 87.0%, NPV 93.1%, and diagnostic accuracy 92.1% (95% CI: 86.4–95.5). No demographic or clinical predictors were significantly associated with malignancy. Recurrence occurred in 12.9% of malignant versus 3.5% of benign cases

CONCLUSIONS

The Milan System demonstrated high diagnostic accuracy and reliable ROM estimates in this Middle Eastern population. Cytological categorization remained the most important predictor of malignancy, while recurrence analysis reinforced its prognostic significance. These findings support wider adoption of the Milan System in the region and highlight the need for prospective, multi-institutional validation.

Epigenetic Landscape Of Laryngeal Squamous Cell Carcinoma In HPV-Negative Smokers: Distinct DNA Methylation Profiles - A Pilot Study

Zuzanna Granek[1,2,3], **Maciej Skrzypek**[3], **Maciej Slipko**[3], **Grzegorz Galita**[3], **Jędrzej Chrzanowski**[4], **Magda Barańska**[2], **Magdalena Pietrzak**[2], **Prof. Wioletta Pietruszewska**[2], **Prof. Ireneusz Majsterek**[3]

[1]*International Doctoral School, Medical University of Lodz;* [2]*Department of Otolaryngology, Head and Neck Oncology, Medical University of Lodz;* [3]*Department of Clinical Chemistry and Biochemistry, Medical University of Lodz;* [4]*Department of Biostatistics and Translational Medicine, Medical University of Lodz*

BACKGROUND & AIM

Laryngeal squamous cell carcinoma (LSCC) represents a significant clinical challenge, particularly in HPV-negative patients with extensive tobacco exposure. This pilot study aimed to determine whether specific, consistent within this cohort DNA methylation patterns differentiate primary LSCC from patient-matched adjacent non-tumor mucosa. By establishing high-confidence differentially methylated positions (DMPs) in a highly controlled, homogenous patient subset, this preliminary work serves as a strict proof-of-concept for high-resolution epigenetic mapping of the tumor-versus-healthy tissue axis, establishing a foundation for identifying localized molecular mechanisms of oncogenesis.

MATERIAL & METHODS

From 38 patients with laryngeal lesions, 7 male, active-smoking, HPV-negative patients with primary G2 LSCC (T2–T4 staging) was selected (mean age: 67.43 years; mean tobacco exposure: 34.29 pack-years). DNA methylation was profiled using the Illumina Infinium MethylationEPIC v2 array on 16 samples (paired tumor/surgical-margin and two whole-blood donors). Data preprocessing, background/dye-bias corrections, and probe filtering yielded 896,754 autosomal CpGs. Differential methylation analysis between tumor and margin was performed using paired limma models on M-values, alongside parallel cellularity-adjusted models. Differentially methylated regions were identified via DMRcate. Tissue cell-type composition and immune infiltration were hierarchically deconvoluted utilizing the HEpiDISH algorithm.

RESULTS

Unsupervised hierarchical clustering of the top 50 DMPs (FDR < 0.05, $|\Delta\beta| > 0.10$) revealed a distinct, binary epigenetic switch stratifying malignant and normal tissue. Tumor hypermethylation was observed in functionally vital genes like DERL1 and DGKA. Conversely, marked tumor hypomethylation drove the epigenetic activation of oncogenic and regulatory targets, including LY6K, LINC00460, ADGRG7, CD53, and MIR1179. Exploratory comparison with whole-blood donor DNA suggested concordant directional methylation trends for selected CpGs, supporting the need for future validation in patient-matched liquid biopsy samples. HEpiDISHdeconvolution demonstrated that methylation variance strongly correlates with epithelial cancer cells, fibroblasts, and infiltrating immune populations. Tissue deconvolution revealed a profound remodeling of the malignant microenvironment, characterized by a marked enrichment of tumor-infiltrating neutrophils and a concurrent decrease in CD4+ T cells.

CONCLUSIONS

This pilot study provides preliminary evidence that HPV-negative smoking-associated LSCC may be characterized by a distinct tumor-associated epigenetic signature. The identified modifications target critical cellular processes, including proteostasis (DERL1), signaling lipolysis (DGKA), EMT/motility (LY6K, LINC00460), and immune evasion (CD53). Complete separation between normal and malignant profiles confirms the high technical quality of the pipeline. Furthermore, a specific outlier patient showed cancer-like methylation in a adjacent non-tumor mucosa before rapid disease progression, providing molecular evidence for field cancerization and demonstrating that DNA methylation profiling could serve as a highly sensitive future tool to supplement histopathological evaluation of surgical radicality.

OP-465

Predisposing Factors For Pharyngocutaneous Fistula After Total Laryngectomy

Moisés Reis de Matos[1], **Filipa Carvalho Moreira**[1], **Ana Sousa Menezes**[1], **Filipa Armada Ferreira**[1], **Alina Martín Fernandes**[1], **Luís Dias**[1]

[1]*Hospital de Braga, Portugal*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) represents the most common major complication following total laryngectomy (TL), with significant impact on hospital admission duration and post-operative morbidity. Identifying factors associated with PCF may help optimize perioperative surveillance and preventive strategies, reduce its incidence, decrease patient morbidity, improve prognosis, and lessen the burden of prolonged hospital stay. This study aimed to identify predisposing factors for PCF development in patients undergoing TL for laryngeal and hypopharyngeal squamous cell carcinoma.

MATERIAL & METHODS

A retrospective review of patients undergoing TL for squamous cell carcinoma between 2020 and 2024 was conducted. Data collected included demographic information, pathological details (T and N stage, tumor site, surgical margins), treatment modality (primary or salvage), pre- and post-operative hemoglobin levels, post-operative albumin levels, and PCF development rates.

RESULTS

A total of 57 patients were included in this study. The overall incidence of PCF was 38.6%. Although not statistically significant, PCF rates were higher in salvage surgery (62.5% vs 34.7%; p=0.135), patients who underwent previous radiotherapy (50% vs 37.3%; p=0.425), presence of positive surgical margins (46.2% vs 36.4%; p=0.373), post-operative hypoalbuminemia (40.7% vs 30.4%; p=0.323) and in patients requiring blood transfusion (50.0% vs 37.3%; p=0.425). Hypopharyngeal tumors (42.9% vs 37.2%; p=0.471), the presence of comorbidities (43.3% vs 35.5%; p=0.399) and pre-operative anemia (40% vs 38.3%; p=0.594) were associated with a slight increase in PCF rate. Post-operative anemia (34.4% vs 44%; p=0.320), advanced T stage (37.2% vs 42.9%; p=0.471), and nodal involvement (33.3% vs 41.4%; p=0.365) were not associated with increased PCF frequency. Previous tracheostomy appears to reduce PCF incidence (34.8% vs 41.2%; p=0.419), while younger patients (< 65 years) demonstrated significantly higher PCF rates (53.1% vs 20%; p=0.01).

CONCLUSIONS

PCF remains a significant complication following TL, with an incidence of 38.6% in our cohort. Although the limited sample size prevented most variables from reaching statistical significance, observed trends aligned with previous studies identifying salvage surgery, prior radiotherapy, hypoalbuminemia, pre-operative anemia, positive margins, and hypopharyngeal location as risk factors. Blood transfusion requirement, but not post-operative anemia alone, showed an association with increased PCF rates. Notably, previous tracheostomy demonstrated a protective trend, while younger age was the only statistically significant predictor of PCF development.

CORRELATION OF SALIVARY GLAND STONES AND SALIVARY SECRETION ION CONTENT WITH RADIOLOGICAL, CLINICAL AND SURGICAL FINDINGS

Alparslan Gonul[3], **Kursat Gokcan**[1], **Sılay Bostan**[1], **Elif Busra Kocer Gonul**[2], **Kiymet Deniz**[2], **Aslihan Korkmaz**[2], **Yusuf Kagan Kadioglu**[2]

[1]*Ankara University Otolaryngology Department;* [2]*Ankara University Deparment of Geological Engineering;* [3]*Akyurt Public Hospital*

BACKGROUND & AIM

This study is grounded in the findings derived from the detailed biochemical analysis of calculi retrieved from patients. This study encompasses not only the analysis of calculi but also the evaluation of patients' salivary samples and socio-

environmental living conditions. It is posited that daily habits and environmental variables influence salivary secretions, and the subsequent impact of these alterations on stone biochemistry in calculous patients has been rigorously examined. By analyzing stone composition, salivary ionic imbalances, and the secretory influence on lithogenesis, this research aims to determine the correlation between radiological characteristics (opacity, size) and intraoperative findings (hardness, adherence, etc.)

MATERIAL & METHODS

This study included patients who underwent surgical stone extraction for sialolithiasis via open surgery, sialendoscopy, or sialendoscopy-assisted techniques at the Ankara University İbn-i Sina Hospital, Department of Otorhinolaryngology, between 2022 and 2024. Patients whose calculi were fragmented or removed using power methods, were excluded from the study. Salivary samples were collected from the participants before the extraction procedure, alongside the retrieved calculi. And we noted that a structured questionnaires datas of the patients' socio-environmental living conditions.

Furthermore, the following radiological parameters regarding the sialoliths were systematically recorded; Glandular Localization, Laterality, Radiological Datas(Dimension/Opacity/Density), Anatomical Positioning.

Biochemical and mineralogical analyses of the stone samples collected from all participants were performed using X-Ray Fluorescence Spectroscopy (XRF). Additionally, the mineral composition of the salivary secretions was evaluated via Inductively Coupled Plasma - Optical Emission Spectroscopy (ICP-OES).

RESULTS

The chemical composition of the calculi, calcium oxide (CaO) was identified as the predominant major compound, followed by phosphorus pentoxide (P2O5). The average total trace element load and heavy metal ion load in the calculi were located at Table 1.

In the salivary analysis, potassium (K) was the most abundant element, followed by sodium (Na). Furthermore, the average positive ion load in the saliva and the heavy metal ion load were located at Table 1.

When heavy metal concentrations in the calculi(Total/heavy) were evaluated based on their anatomical localization the chromium (Cr) levels were found to be significantly higher in proximal stones compared to distal stones. However, no statistically significant differences were observed between distal and proximal stones regarding the total heavy metal load or other specific metal ions.(Table 2)

A strong, significant, and negative correlation was identified between the total heavy metal load and the stone weight.(Table 3)

CONCLUSIONS

Analysis of elemental concentrations between salivary secretions and stone compositions revealed no significant correlation. This lack of correlation suggests that salivary secretions don’t contribute to lithogenesis only through direct precipitation.

The theory of biochemical sedimentary rocks was shown that outer layers of stones are predominantly encapsulated by calcium.(Picture 1) To understand the origins of salivary stone formation, investigation must be directed toward the core, as indicated by this structural stratification.

Furtheremore no significant difference was in salivary cadmium levels regarding smoking status, but variation in cadmium load between distal and proximal stones suggests that calculi may function as bioaccumulators.

OP-467

Assessment For Clinical, Pathological, & Radiological Prognostic Markers In Papillary Thyroid Cancer In Adult Patients From 2014 To 2024: A Retrospective Cohort Study In King Abdulaziz Medical City, Jeddah

Ziyad Alkhomri[1]

[1]*College of medicine, king Saud bin Abdulaziz University for Health Sciences, Jeddah, Saudi Arabia*

BACKGROUND & AIM

Background

The most common form of thyroid cancer is papillary thyroid cancer (PTC). This type of cancer usually affects younger individuals, especially women, and is often linked to previous radiation exposure. PTC generally has a very good prognosis, with high survival rates; however, outcomes may vary depending on factors such as age, tumor size, and metastasis.

Objective

To identify long-term predictors of recurrence and persistence in patients with papillary thyroid cancer (PTC) using radiological, pathological, and clinical markers.

MATERIAL & METHODS

Methods

A retrospective cohort study was conducted at King Abdulaziz Medical City, Jeddah, Saudi Arabia, involving patients diagnosed with papillary thyroid cancer (PTC). We included patients aged 18 years or older at diagnosis, with a minimum follow-up period

of 12 months. Patients younger than 18 years, those with incomplete records, or those with anaplastic, medullary, or poorly differentiated thyroid cancer were excluded.

Outcomes were categorized as recurrence, persistence, or a combined outcome of recurrence or persistence. Patients' demographic, clinical, histopathological, radiological, and therapeutic data were extracted from electronic medical records using a standardized data collection sheet. Odds ratios (ORs) for predictors of these outcomes were calculated at the last follow-up visit. Univariate logistic regression was initially performed, followed by multivariable logistic regression for variables with significant univariate associations.

RESULTS

We analyzed 285 patients with a median follow-up of 5 years (IQR: 2–9). The median age at diagnosis was 43 years (IQR: 31–54), with 24.2% aged ≥55 years, and 67.4% were women. Overall, 21.0% experienced disease persistence or recurrence, with recurrence alone in 13.0% and persistence in 11.2%.

On univariate analysis, extra-thyroidal extension was associated with nearly fivefold higher odds of persistence or recurrence ($p < 0.001$). Positive surgical margins, vascular invasion, distant metastasis, and higher tumor stage (T4a vs T1) were similarly linked to increased risk (all $p < 0.001$)Response patterns were strongly predictive: indeterminate or partial biochemical and structural responses carried significantly higher risk compared with complete responses (all $p < 0.001$).

Age ≥55 years, primary tumor size, and lymphovascular invasion were not statistically significant. After multivariable adjustment, extra-thyroidal extension ($p = 0.003$) and partial biochemical response ($p = 0.039$) remained independent predictors of disease persistence or recurrence.

CONCLUSIONS

Extra-thyroidal extension and partial biochemical response independently predict disease persistence or recurrence, highlighting their utility in identifying high-risk patients and guiding follow-up strategies. Other variables, including margin status, vascular invasion, tumor stage, and metastasis, did not retain statistical significance in multivariable analysis. Larger multicenter studies are encouraged to confirm these observations and assess the reproducibility of our findings.

Clinicopathological Spectrum And Changing Surgical Management Of Sinonasal Tumors: A Ten-Year Review Of 167 Cases

Fatma Şevval Güçlü[1], **Tolga Küçükgergin**[1], **Harun Cansız**[1], **Emin Karaman**[1], **Haydar Murat Yener**[1], **Özkan Alan**[2], **Süleyman Sami Güzel**[2], **Ömer Erol Uzel**[3], **Yetkin Zeki Yılmaz**[1], **Alperen Vural**[1]

[1]*İstanbul University Cerrahpaşa , Cerrahpaşa Medical Faculty Department of Otorhinolaryngology;* [2]*İstanbul University Cerrahpaşa,Cerrahpaşa Medical Faculty Department of Medical Oncology;* [3]*İstanbul University Cerrahpaşa,Cerrahpaşa Medical Faculty Department of Radiation Oncology*

BACKGROUND & AIM

Sinonasal tumors are rare and histologically heterogeneous lesions ranging from benign papillomas to aggressive malignancies. Large single-center series remain valuable for understanding treatment patterns and outcomes.To evaluate the clinicopathological spectrum, management approaches, and outcomes of sinonasal tumors treated over a 10-year period at a tertiary referral center.

MATERIAL & METHODS

A retrospective review was performed of patients treated for sinonasal tumors between 2016 and 2026. Patients without adequate follow-up and benign osseous lesions were excluded. Demographic data, histopathology, tumor behavior, surgical approach, adjuvant treatment, recurrence, and survival outcomes were analyzed. Tumors were classified as benign, borderline/intermediate, or malignant.

RESULTS

A total of 167 patients were included.Mean age was 52 years (8–98) and 60% were male. Overall,103 tumors (61.7%) were benign,6 (3.6%) borderline/intermediate and 58 (34.7%) malignant.Patients with benign tumors were younger than those with malignant tumors (49-56 years),with male predominance in both groups(63% vs 58%).The most common benign diagnosis was Schneiderian papilloma(n=67), followed by vascular tumors. Benign lesions were mainly treated endoscopically with excellent disease control.Malignant tumors were mainly epithelial malignancies (n=29), followed by mucosal melanoma (n=8), olfactory neuroblastoma (n=5), and mesenchymal/sarcomatous tumors (n=16).Among malignant cases, 46.6% received radiotherapy, 32.8% chemotherapy, and 10.3% underwent neck dissection.Recurrence and mortality were higher in the malignant group, with mucosal melanoma showing the poorest outcomes. Open or combined approaches decreased from 45% (2016–2020) to 25% after 2021,reflecting the increasing predominance of endoscopic surgery. Open surgery remained necessary for extensive malignancies with orbital, premaxillary soft tissue, nasal bone, or frontal bone involvement.

CONCLUSIONS

Sinonasal tumors show marked pathological heterogeneity, with benign lesions predominating but a substantial malignant burden in tertiary practice. Over the past decade, management shifted strongly toward endoscopic surgery, while advanced malignant tumors continued to require aggressive multidisciplinary treatment.

Basal Cell Adenoma Of The Parotid Gland: A Series Of 5 Cases And A Literature Review

Berke Geren[1], **Deniz Baklacı**[1], **Oğuz Can Karakaş**[1], **Figen Barut**[2]

[1]*Zonguldak Bülent Ecevit University, Department of Otorhinolaryngology - Head and Neck Surgery;* [2]*Zonguldak Bülent Ecevit University, Department of Pathology*

BACKGROUND & AIM

Basal cell adenoma (BCA) is a rare, benign salivary gland tumor, accounting for 1% to 3.7% of all salivary gland neoplasms and primarily affecting the parotid gland. Histopathologically, it presents in four architectural subtypes: solid, tubular, trabecular, and membranous. Preoperative diagnosis via fine-needle aspiration biopsy faces challenges due to cytomorphological overlaps , making immunohistochemistry, particularly nuclear beta-catenin, crucial for definitive diagnosis. This study aims to present five surgically treated BCA cases with distinct clinical, radiological, and histopathological variations, correlated with a comprehensive literature review.

MATERIAL & METHODS

A retrospective chart review was performed on five patients who underwent surgical treatment for parotid gland basal cell adenoma (BCA) in our clinic. Demographic features, duration of symptoms, preoperative ultrasound and magnetic resonance imaging findings, fine-needle aspiration biopsy (FNAB) results, surgical techniques, and histopathological subtypes were comprehensively analyzed. All cases underwent either superficial or total parotidectomy with meticulous preservation of the facial nerve. Intraoperative frozen section analysis was utilized when necessary. Postoperative histopathological diagnoses were confirmed by expert pathologists, and tumors were categorized into subtypes (solid, tubular, trabecular, and membranous). Regular long-term clinical and radiological follow-ups were conducted to monitor for recurrence or malignant transformation.

RESULTS

The study included three female (60%) and two male (40%) patients with a mean age of 61.4 years. The tumors were predominantly located in the superficial lobe (60%) , with two cases involving the deep lobe. MRI findings consistently demonstrated well-demarcated masses , and cystic degeneration was prominent in one case (20%). Preoperative FNAB suggested benign neoplarsia or basaloid proliferation in three cases (60%) and was non-diagnostic in two (40%). Superficial parotidectomy was performed in four patients and total parotidectomy in one. Histopathological classification revealed two membranous (40%) , one solid (20%) , one tubular (20%) , and one trabecular (20%) subtype. All specimens exhibited characteristic nuclear beta-catenin expression. No postoperative facial nerve paralysis occurred, and no recurrence was detected during the follow-up period.

CONCLUSIONS

In conclusion, basal cell adenomas are rare benign parotid tumors that require careful histopathological evaluation for definitive diagnosis and differentiation from malignancies. Superficial or total parotidectomy with facial nerve preservation remains the mainstay of treatment, offering an excellent prognosis. However, due to the inherent risks of recurrence and potential malignant transformation,particularly associated with the membranous subtype,long-term clinical and radiological follow-up is essential for optimal post-operative patient management.

Morbidity, Clinical-Pathological Characteristics And Treatment Outcomes Of Sinonasal Carcinomas In The University Clinical Center Of The Republic Of Srpska

Vladimir Vranjes[1]

[1]*University Clinical Center of the Republic of Srpska, Banja Luka, BiH*

BACKGROUND & AIM

Sinonasal carcinomas represent a rare and heterogeneous group of malignant tumors affecting the nasal cavity and paranasal sinuses. Due to their anatomical proximity to vital structures, such as the orbit and skull base, as well as the often nonspecific early symptomatology, these tumors represent a significant diagnostic and therapeutic challenge.

This paper aims to analyze the morbidity, clinical characteristics, pathohistological diversity and effectiveness of modern therapeutic modalities in patients diagnosed with cancer of the nasal cavity and paranasal sinuses.

MATERIAL & METHODS

A retrospective study was conducted that included patients treated at the Ear, Throat and Nose Clinic of the University Clinical Center of the Republic of Srpska, Banja Luka in the period from 2015. until 2025. Data were collected from medical records, including clinical examinations, radiological and pathohistological findings, applied treatment modalities (surgery, radiotherapy, chemotherapy).

RESULTS

The research included a total of 31 patients, of which 24 (77.5%) were men and 7 (22.5%) were women. The average age of the patients was 64.5 years, the youngest was 31 and the oldest was 85. The most common pathohistological type was squamous cell carcinoma in 14 (45.2%) patients, followed by adenoid cystic carcinoma and plasmacytoma in 3 (9.7%) patients, rhabdomyosarcoma was found in 2 (6.5%) patients, and one patient each had basal cell adenocarcinoma, chondrosarcoma, sinonasal undifferentiated carcinoma, melanoma, transitional cell carcinoma of the sinonasal tract, polymorphous low-grade adenocarcinoma, malignant peripheral nerve sheath tumor, angioimmunoblastic T-cell lymphoma and microcellular carcinoma. Endoscopic surgery was used in 13 (42%) patients, open surgical technique in 11 (35.5%) and biopsy in 7 (22.6%). Radiotherapy was included in 5 (12.1%) patients, chemotherapy in 2 (6.5%), chemoradiotherapy in 13 (42%) patients and in 11 (35.4%) patients did not demand chemoradiotherapy.

CONCLUSIONS

Sinonasal cancers are often diagnosed at a late stage, which makes treatment difficult and worsens the prognosis. Early diagnosis and a multidisciplinary approach are key to improving survival rates. Further progress in genetic profiling of tumors will enable a more personalized approach to treatment, thereby reducing morbidity and improving quality of life.

The Bio-Nose Technique: A Two-Stage, Single-Free-Flap Approach For Total Nasal Reconstruction

Dupret-Bories Agnès[3,4,1,2], **Chabrillac Emilien**[2], **Henriet Valentin**[5], **Nolens Gregory**[5], **Bouakaz Islam**[5], **Vergez Sébastien**[2,1,4], **Vairel Benjamin**[1,2]

[1]CHU Toulouse; [2]Institut Universitaire du Cancer de Toulouse; [3]CIRIMAT Laboratory; [4]University of Toulouse; [5]Cerhum Society

BACKGROUND & AIM

Background: Total nasal reconstruction remains one of the most complex challenges in reconstructive surgery, particularly in patients previously treated with radiotherapy. Conventional approaches often require multiple flaps and several staged procedures, resulting in significant surgical burden and prolonged rehabilitation.

Objective: To present a novel reconstructive strategy, the Bio-Nose technique (3D nasal reconstruction fostered on the forearm), based on in vivo biological integration of a patient-specific 3D-printed nasal framework combined with a single free flap.

MATERIAL & METHODS

The Bio-Nose technique relies on the implantation of a customized rigid nasal framework, manufactured using 3D printing, beneath a radial forearm skin flap corresponding to the radial artery angiosome. This first stage allows in vivo fostering and biological integration of the biomaterial. After integration, the composite radial forearm free flap containing the colonized implant is harvested and transferred to the face during a second procedure under general anesthesia, with superficial temporal vessels used as recipient vessels. Minor refinements, including definition of nasal aesthetic subunits and calibration of the nasal cavities, were performed under local anesthesia when required.

RESULTS

The technique was applied in a first case series of four patients presenting with total nasal defects following treatment for nasal cavity cancer, all with a history of radiotherapy. The surgical protocol was progressively refined through the learning curve. Complete nasal reconstruction was achieved using one free flap and only two general anesthetics. All patients achieved satisfactory esthetic outcomes with stable nasal projection and acceptable airway patency. No major flap-related complications were observed.

CONCLUSIONS

Although total nasal reconstruction remains a demanding procedure with limited reconstructive options, the Bio-Nose technique offers a promising alternative by reducing surgical complexity while preserving structural stability and esthetic outcomes. This approach may represent a valuable addition to the reconstructive armamentarium in complex oncologic and irradiated settings.

Prognostic Significance Of The Worst Pattern Of Invasion (WPOI) In Laryngeal Squamous Cell Carcinoma

Ozan Tüysüz[1], **İpek Yeşil**[1], **Şahin Öğreden**[1], **Özgür Yiğit**[1], **Cem Berk Türk**[2], **Dilara Yitiz**[2]

[1]*Department of Otorhinolaryngology-Head and Neck Surgery, Başakşehir Çam and Sakura City Hospital, University of Health Sciences, Istanbul, Turkey;* [2]*Department of Pathology, Başakşehir Çam and Sakura City Hospital, University of Health Sciences, Istanbul, Turkey*

BACKGROUND & AIM

Traditional staging systems for laryngeal squamous cell carcinoma (LSCC) sometimes provide limited prognostic information. This study investigates the 'Worst Pattern of Invasion' (WPOI) as a potential prognostic biomarker in LSCC. We aimed to analyze the relationship between WPOI patterns and key clinicopathological parameters, including overall survival and recurrence rates.

MATERIAL & METHODS

In this retrospective cohort study, we evaluated 115 patients surgically treated for laryngeal squamous cell carcinoma (LSCC) between 2020 and 2025. Pathological specimens were systematically re-examined by two independent pathologists to score the 'Worst Pattern of Invasion' (WPOI) as low-grade (1–3) or high-grade (4–5). Statistical analyses were performed using SPSS software; categorical variables were compared using the Chi-square test, and survival curves were estimated using the Kaplan-Meier method with log-rank testing, considering $p < 0.05$ as statistically significant.

RESULTS

High-grade WPOI (4–5) was identified in 77 patients (67.0%). Statistical analysis revealed significant correlations between high-grade WPOI and positive lymphovascular invasion ($p<0.001$), perineural invasion ($p<0.001$), and advanced clinical stage ($p=0.003$). Overall survival rates were significantly lower in the high-grade WPOI group ($p=0.012$). In early-stage (Stage I–II) disease, high-grade WPOI patterns were associated with increased recurrence rates (18.2% vs. 13.2%). High-grade WPOI consistently identified aggressive tumor behavior across both early and advanced stages.

CONCLUSIONS

WPOI is a powerful prognostic indicator for laryngeal squamous cell carcinoma. High-grade WPOI (4–5) correlates with aggressive pathological features and reduced survival rates. This staging-independent marker effectively identifies high-risk patients, particularly in early-stage disease. Incorporating WPOI into routine pathology reports facilitates more precise risk stratification and personalized treatment planning for LSCC.

OP-473

Diagnostic Accuracy Of Fine-Needle Aspiration Cytology (FNAC) For Submandibular Gland Lesions Using The Milan Classification System

Meltem Işıklı[1], **Demet YAZICI**[1]

[1]*Health Sciences University Adana City Training and Research Hospital*

BACKGROUND & AIM

Submandibular gland masses encompass a wide spectrum of diseases, including non-neoplastic, benign, and malignant lesions.Although clinical and radiological evaluation are important in establishing the diagnosis, cytopathological examination constitutes a fundamental step in differential diagnosis.

Fine-needle aspiration biopsy(FNAB) has been used since the 1960s in the preoperative evaluation of salivary gland lesions.

In 2018,the Milan System was developed to standardize salivary gland cytopathology reporting.

The aim of this study is to evaluate the concordance between FNAB cytological diagnoses classified according to the Milan System and postoperative histopathological results in submandibular gland masses, and to determine the diagnostic reliability of FNAB in this region.

MATERIAL & METHODS

A total of 500 patients who underwent surgical excision for submandibular gland masses between January 1, 2015, and December 31, 2025, and had preoperative FNAB were included in the study.

The data were evaluated retrospectively.

Cytopathological specimens were categorized according to the Milan System. Histopathological diagnosis was accepted as the gold standard.

Suspicious for malignancy (Category V) and malignant (Category VI) results were considered “positive” tests, whereas non-neoplastic (Category II) and benign neoplasm (Category IVa) results were considered “negative” tests for malignancy.

AUS, SUMP, and non-diagnostic categories were excluded from sensitivity and specificity analyses.

Sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and diagnostic accuracy were calculated.

RESULTS

According to histopathological examination, 43.2% of patients were reported as non-neoplastic,34% as benign neoplasms, and 22.8% as malignant tumors. The mean age of patients diagnosed with malignancy was 57.6 ± 12.6 years, which was significantly higher than that of the non-neoplastic and benign groups.

When FNAB results were evaluated according to the Milan classification, the most frequent category was non-neoplastic(CategoryII) at 47.7%.This was followed by benign neoplasm(CategoryIVa) at 20%,malignant(CategoryVI) at 12.6%, suspicious for malignancy(CategoryV) at 8%,SUMP(CategoryIVb) at 7%, non-diagnostic(CategoryI) at 3.6%, and atypia of undetermined significance(CategoryIII,AUS) at 1%.

ROM rates were notably high in the AUS, suspicious for malignancy, and malignant categories.

For the diagnosis of malignancy, when Categories V and VI were considered “positive” and Categories II and IVa“negative,” the sensitivity of FNAB for detecting malignant tumors in the submandibular gland was 97.8%(95% CI: 92.4–99.7), and the specificity was 92.7%(95% CI: 87.1–96.5).

CONCLUSIONS

FNAB evaluated according to the Milan System is a reliable diagnostic method with high sensitivity and specificity in submandibular gland masses.

Due to the high malignancy rates observed in the suspicious for malignancy and AUS categories, surgical planning in these patients should be undertaken with particular caution.

It should be kept in mind that ROM rates in certain categories of submandibular gland lesions may be higher than the target rates proposed by the Milan System.

In conclusion, FNAB and the Milan classification constitute important and effective tools in the preoperative evaluation and clinical decision-making process of submandibular gland masses.

OP-474

Preoperative Immune-Nutritional Scores Predict Prognosis After Total Laryngectomy

Safiye Giran Örtekin[1], **Cemile Baykan Eryiğit**[1], **Şahin Öğreden**[1], **Özgür Yiğit**[1]

[1]*Otolaryngology Department, Basaksehir Cam ve Sakura City Hospital, University of Health Sciences, Istanbul, Turkey.*

BACKGROUND & AIM

Total laryngectomy remains a major surgical treatment for advanced laryngeal and hypopharyngeal cancer. Preoperative immune-nutritional status may influence postoperative morbidity and oncologic prognosis. This study hypothesized that Prognostic Nutritional Index (PNI), Systemic Immune-Inflammation Index (SII), and Advanced Lung Cancer Inflammation Index (ALI) are associated with disease extent, postoperative complications, mortality, and recurrence in patients undergoing total laryngectomy.

MATERIAL & METHODS

This retrospective single-center study included 134 consecutive patients who underwent primary or salvage total laryngectomy between July 2020 and December 2025. Demographic, clinical, pathological, laboratory, and follow-up data were reviewed. Preoperative PNI, SII, ALI, Charlson Comorbidity Index (CCI), smoking, alcohol use, previous treatment history, tumor stage, nodal status, flap reconstruction, and operative duration were analyzed. Main outcome measurements were pharyngocutaneous fistula, surgical site infection, Clavien-Dindo grade ≥3 complications, mortality, and recurrence. Continuous variables were compared using the Mann-Whitney U test, and categorical variables using chi-square or Fisher’s exact test. Logistic regression models were used for postoperative outcomes and mortality. Recurrence-free survival was evaluated using Kaplan-Meier analysis and univariate Cox regression.

RESULTS

The median age was 64 years, and 87.3% of patients were male. T4 disease was present in 54.5%, nodal positivity in 55.1%, and salvage surgery in 13.4%. Pharyngocutaneous fistula, surgical site infection, mortality, and recurrence rates were 36.1%, 23.1%, 35.8%, and 4.5%, respectively. PNI, SII, and ALI did not predict pharyngocutaneous fistula. Fistula was associated with higher monocyte count, alcohol use, and flap reconstruction. Surgical site infection was associated with longer operative duration, flap reconstruction, and younger age. Mortality was strongly associated with lower PNI, lower albumin, lower ALI, and nodal positivity. In multivariate analysis, PNI remained an independent protective predictor for mortality, while nodal positivity independently increased mortality risk. Mortality showed a stepwise increase across PNI risk groups: 24.2% in the good group, 35.3% in the intermediate group, and 58.8% in the poor group. Twelve- and 24-month recurrence-free survival rates were 95.6% and 94.5%, respectively.

CONCLUSIONS

Preoperative PNI is a strong and clinically useful predictor of mortality after total laryngectomy, whereas classical immune-nutritional scores do not predict pharyngocutaneous fistula. These findings suggest that PNI mainly reflects systemic

physiological reserve rather than local wound-healing risk. Patients with low PNI and nodal positivity may benefit from closer perioperative optimization and postoperative follow-up.

OP-475

Diagnostic Value Of Shear-Wave Elastography, MRI, And Fine-Needle Aspiration Biopsy In Parotid Gland Masses: A Prospective Study

İzel Çakal[2], **Özlem Demircioğlu**[2], **Yavuz Gündoğdu**[1]

[1]*Marmara University, Department of Otorhinolaryngology – Head and Neck Surgery, Istanbul, Turkey;* [2]*Marmara University, Department of Radiology, Istanbul, Turkey*

BACKGROUND & AIM

Parotid gland masses represent the most common salivary gland tumors, and accurate preoperative differentiation between benign and malignant lesions remains challenging. Fine-needle aspiration biopsy (FNAB) is widely used but has well-known limitations in sensitivity. Shear-wave elastography (SWE) has emerged as a non-invasive tool for tissue characterization, while contrast-enhanced magnetic resonance imaging (MRI) provides detailed morphological assessment. However, studies comparing these three modalities in a prospective setting are limited. This study aims to evaluate the diagnostic value of FNAB, MRI, and SWE in differentiating benign and malignant parotid gland masses, using postoperative histopathology as the reference standard.

MATERIAL & METHODS

This prospective study included 22 patients with parotid gland lesions ≥1 cm (mean age: 57.3 ± 15.5 years; 59.1% male). Preoperative assessment included FNAB, contrast-enhanced MRI, and SWE. SWE measurements were obtained from maximum, central, and peripheral regions of interest. MRI evaluation comprised T1- and T2-weighted signal characteristics, diffusion-weighted imaging with apparent diffusion coefficient mapping, lesion contour, shape, internal composition, and contrast enhancement pattern. Final histopathology following surgical excision served as the reference standard. ROC analysis was performed to determine optimal SWE cut-off values using the Youden index. Associations between MRI features and malignancy were analyzed using Fisher's exact test. Diagnostic performance metrics including sensitivity, specificity, positive and negative predictive values, and accuracy were calculated for each modality and the combined MRI–SWE approach. FNAB was compared with the combined approach using McNemar's test

RESULTS

Histopathology revealed 4 malignant (18.2%) and 18 benign (81.8%) lesions. Among SWE parameters, peripheral measurement demonstrated the highest diagnostic performance (AUC = 0.91; 95% CI: 0.75–1.00), with an optimal cut-off of 3.32 m/s yielding 100% sensitivity and 66.7% specificity. Among MRI features, only ill-defined lesion contour was significantly associated with malignancy (p = 0.026); T2 signal characteristics (p = 0.073) and lymphadenopathy (p = 0.073) showed trends without reaching significance. FNAB demonstrated low sensitivity (25%) but perfect specificity (100%), with an overall accuracy of 86.4%. MRI positivity—defined as ill-defined contour and/or non-hyperintense T2 signal—achieved 75% sensitivity, 94.4% specificity, and 90.9% accuracy. The combined MRI–SWE approach showed identical performance to MRI alone (75% sensitivity, 94.4% specificity). McNemar's test revealed no significant difference between the combined approach and FNAB (p = 0.25).

CONCLUSIONS

SWE and MRI provide complementary diagnostic information in parotid gland masses. Peripheral SWE offers superior sensitivity (100%), making it a valuable screening tool for excluding malignancy, whereas MRI—particularly ill-defined lesion contour—achieves high specificity (94.4%), aiding in the confirmation of malignancy. FNAB remains highly specific but its limited sensitivity (25%) reduces its standalone reliability for ruling out malignancy. A multimodal approach integrating SWE and MRI may enhance preoperative diagnostic accuracy.

OP-476

Retrospective Analysis Of Demographic And Histopathological Characteristics Of Sinonasal Tumors

Oktay Bulut[1]

[1]*Bursa Medicana Hospital*

BACKGROUND & AIM

To evaluate the demographic features and histopathological distribution of sinonasal tumors.

MATERIAL & METHODS

This retrospective study included 54 patients evaluated for sinonasal masses. Patients were analyzed according to age, sex, and histopathological diagnosis. Age groups were categorized as pediatric (0–18 years), young adults (19–40 years), middle-aged (41–65 years), and elderly (≥65 years). Tumors were classified into epithelial, mesenchymal, neuroectodermal, and other subtypes.

RESULTS

Of the 54 patients, 34 (63%) were male and 20 (37%) were female. The male-to-female ratio was approximately 1.7. Epithelial malignancies were the most common tumor group overall. In the pediatric group, mesenchymal and small round cell tumors such as Ewing sarcoma, rhabdomyosarcoma, and PNET predominated. In the middle-aged group, squamous cell carcinoma and undifferentiated carcinoma were most frequently observed. In elderly patients, an increased incidence of malignant melanoma and squamous cell carcinoma was noted. Adenoid cystic carcinoma and malignant melanoma were relatively more common in female patients.

CONCLUSIONS

Sinonasal tumors represent a heterogeneous group with distinct age- and sex-related patterns. Mesenchymal tumors are more frequent in pediatric patients, whereas epithelial malignancies predominate in adults. Awareness of these distributions may aid in early diagnosis and clinical management.

RISK FACTORS FOR FRACTURES AFTER MARGINAL MANDIBULECTOMY FOR HEAD AND NECK CANCER A GETTEC MULTICENTRE STUDY

Roussel Lise-Marie[1], **D'Andréa Clément**[1], **Marhic Alix**[2], **Clatot Florian**[1]

[1]*Henri Becquerel center;* [2]*Gustave Roussy Institute*

BACKGROUND & AIM

Marginal mandibulectomy (MM), which consists of a partial interruption of the height of a segment of the mandible, is discussed when head and neck cancer is close to the mandible because of the possible risk of secondary mandibular fracture.

MATERIAL & METHODS

To determine the incidence of secondary mandibular fracture after MM and the risk factors associated with it we conducted a multicentre study in 3 tertiary cancer care centers. We included all patients with a malignancy requiring MM who completed treatment between January 2013 and December 2023.

RESULTS

Of the 432 identified patients, 190 patients were included. 24 patients (12.7%) experienced a secondary mandibular fracture within 23.5 [13.8; 36.6] months following the MM. The majority of patients were men (74.2%) with an average age of 62 years (±10.70).

In multivariate analysis, posterior location of the MM (OR=4.08, IC 95 % 1.28 to 13.02), residual mandibular height less than 10 mm (OR=3.25, IC 95 % 1.05 to 10.05), and a MM with a length greater than 45 mm (OR=4.23, IC 95 % 1.35 to 13.22) were statistically associated with secondary mandibular fractures.

CONCLUSIONS

Segmental mandibulectomy, consisting of a complete interruption of a mandibular segment should be considered as an alternative to MM in cases of posterior location, significant length of MM or residual mandibular height less than 10 mm.

OP-478

Oncologic Outcomes And Prognostic Factors Following Transoral Diode Laser Cordectomy For Glottic Lesions: A Retrospective Cohort Study

Ozan Özdemir[1], **Ezgi Keskin**[1], **Doğancan Eralp**[1], **Hasan Sami Bircan**[1]

[1]*Department of Otorhinolaryngology – Head and Neck Surgery, University of Health Sciences, Istanbul Training and Research Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Transoral laser microsurgery is an established organ-preserving treatment for early glottic lesions; however, evidence regarding diode laser outcomes remains limited, and the prognostic significance of final specimen margins is controversial. This study evaluated long-term oncologic outcomes and prognostic factors following transoral diode laser cordectomy for glottic lesions ranging from high-grade dysplasia to invasive carcinoma, with particular emphasis on margin status when intraoperative tumor-bed frozen sections confirmed complete clearance.

MATERIAL & METHODS

We retrospectively reviewed 85 consecutive patients who underwent transoral 980-nm diode laser cordectomy for high-grade dysplasia, carcinoma in situ, or invasive squamous cell carcinoma between January 2015 and December 2022. Resections were performed en bloc, with additional tumor-bed frozen sections obtained intraoperatively and resection extended until all samples were negative. Patients with close or positive final specimen margins received no routine adjuvant treatment. The primary endpoint was local recurrence-free survival (LRFS). Survival was estimated using Kaplan–Meier analysis, and prognostic factors were evaluated using Cox proportional hazards models. Median follow-up was calculated using the reverse Kaplan–Meier method.

RESULTS

Median follow-up was 52.3 months. Fourteen patients (16.5%) developed local recurrence, all as invasive carcinoma. Five-year LRFS, total laryngectomy-free survival, and overall survival were 79.6%, 94.7%, and 87.1%, respectively. T2 stage was the only statistically significant prognostic factor for local recurrence (HR 4.35, 95% CI 1.52–12.44; p=0.006). Despite withholding adjuvant treatment in all 25 patients with close or positive final specimen margins, margin status was not significantly associated with local recurrence (HR 2.05, 95% CI 0.71–5.93; p=0.184). Three of 21 patients treated for premalignant lesions developed invasive progression. Only four patients (4.7%) ultimately required total laryngectomy. Secondary primary malignancies caused more deaths than laryngeal cancer (six vs two).

CONCLUSIONS

Transoral diode laser cordectomy provided acceptable local control with high rates of laryngeal preservation across a spectrum of glottic lesions. Tumor extent, particularly T2 stage, was the strongest predictor of local failure. When intraoperative tumor-bed frozen sections confirmed clearance, the independent prognostic impact of final specimen margin status could not be demonstrated, although the limited number of events precludes excluding a clinically meaningful effect. Long-term surveillance should also address the substantial risk of secondary primary malignancies.

Emerging Biomarkers For Thyroid Malignancies And The Role Of Claudin-16 In Thyroid Cancer Detection

Rishika Muraly[1,2]

[1]*Wrexham Maelor University;* [2]*Betsi Cadwaldr University Health Board*

BACKGROUND & AIM

Background: Thyroid malignancies are the most common endocrine cancers, with rising global incidence. Increased imaging has improved detection of thyroid nodules; however, distinguishing benign from malignant lesions, particularly in indeterminate cases remains challenging. Molecular biomarkers may enhance diagnostic accuracy.

Aim: To evaluate the potential of plasma Claudin-16 (CLDN16) as a biomarker for differentiating benign and malignant thyroid disease.

MATERIAL & METHODS

Pre-operative plasma samples were collected and analysed using a commercially available ELISA. Assay performance was validated using a five-point standard curve, with predefined quality-control criteria applied. Statistical analysis included non-parametric testing to compare groups.

RESULTS

Following quality control, 33 samples were analysed (20 benign, 13 malignant). Median CLDN16 levels were higher in benign samples, but the difference was not statistically significant (Mann–Whitney U = 99.0, p = 0.253). Malignant samples showed greater variability and non-normal distribution. ROC analysis demonstrated modest discriminatory ability (AUC = 0.67).

CONCLUSIONS

Plasma CLDN16 shows limited utility as a standalone diagnostic biomarker due to significant overlap between groups. Further research in larger, stratified cohorts and in combination with other biomarkers is warranted.

OP-480

Systemic Inflammatory Response Index (SIRI) As A Predictor Of Poor Survival And Aggressive Pathologic Features In Advanced Laryngeal Squamous Cell Carcinoma

Fırat Tevetoğlu[1], **Tolga Küçükgergin**[1]

[1]*Istanbul University-Cerrahpaşa, Cerrahpaşa Faculty of Medicine, Department of Otorhinolaryngology, Istanbul, Turkey.*

BACKGROUND & AIM

Systemic inflammation plays a critical role in tumor progression and has emerged as a potential source of prognostic biomarkers in head and neck cancers. The systemic inflammatory response index (SIRI), calculated from peripheral blood parameters, reflects the balance between host inflammatory and immune status. While SIRI has shown prognostic relevance in several solid tumors, its relationship with clinicopathological characteristics and survival outcomes in advanced laryngeal squamous cell carcinoma (LSCC) remains insufficiently explored. This study aimed to investigate the association between preoperative SIRI levels and prognostic features in patients with advanced-stage LSCC.

MATERIAL & METHODS

In this retrospective cohort study, patients with stage III–IV LSCC according to the AJCC 8th edition who underwent primary surgical treatment at a tertiary referral center between 2017 and 2025 were included. Patients with prior oncologic treatment, active infection, hematologic disease, or incomplete records were excluded. Preoperative complete blood count parameters obtained within two weeks before surgery were used to calculate SIRI as neutrophil×monocyte/lymphocyte(103/µl). Age, sex, tumor subsite, pathological T and N stage, extranodal extension, lymphovascular invasion, and perineural invasion were recorded. The optimal SIRI cut-off was determined by ROC curve analysis. Associations between SIRI groups and clinicopathologic variables were evaluated using the chi-square or Fisher's exact test. Overall, disease-specific, disease-free, and recurrence-free survival were analyzed using Kaplan–Meier curves and the log-rank test. Multivariable Cox regression assessed the independent prognostic value of SIRI after adjustment for T stage, N stage, and extranodal extension.

RESULTS

A total of 118 patients were identified; 24 were excluded because of missing preoperative complete blood count parameters required for SIRI calculation, leaving 94 patients for final analysis. ROC analysis showed that SIRI significantly discriminated patients with extranodal extension, with an AUC of 0.688 (95%CI:0.535–0.841, p=0.022). The optimal SIRI cut-off was 1.99 according to the Youden index, with 73.3% sensitivity and 62.0% specificity. High SIRI was significantly associated with extranodal extension (26.8%vs.7.5%; p=0.011) and demonstrated a significant linear trend with increasing nodal burden (p=0.015). Kaplan–Meier analysis showed significantly poorer overall, disease-specific, and disease-free survival in patients with high SIRI than in those with low SIRI (log-rank p=0.034,p=0.009,and p=0.020, respectively). In multivariable Cox regression adjusted for T stage, N stage, and extranodal extension, high SIRI remained independently associated with poorer overall survival (HR:1.854, 95%CI:1.032–3.333, p=0.039), disease-specific survival (HR:2.908, 95%CI:1.147–7.371, p=0.024), and disease-free survival (HR:2.135, 95%CI:1.034–4.409, p=0.040).

CONCLUSIONS

High preoperative SIRI was associated with extranodal extension and higher nodal burden in patients with advanced laryngeal squamous cell carcinoma. Moreover, high SIRI independently predicted poorer overall survival, disease-specific survival, and disease-free survival after adjustment for established clinicopathologic factors. These findings suggest that SIRI may serve as a simple and readily available prognostic biomarker for risk stratification in advanced laryngeal cancer.

Current Treatment Modalities In Thyroid Diseases And Participation In Prospective Research Projects

Asger Væver[1], **Nichlas Udholm**[1], **Mathilde L Seekjær**[1], **Khalil Rafiqi**[1], **Sofie L Rygård**[1], **Diana LG Laugesen**[2], **Lars Rolighed**[1]

[1]*Department of Otorhinolaryngology, Aarhus University Hospital;* [2]*Department of Endocrinology and Internal Medicine, Aarhus University Hospital*

BACKGROUND & AIM

The current clinical evaluation of patients with thyroid diseases needs to be individualized due to a large variation of diseases and treatments. With increasing attention to personalised treatment, tertiary referral centres are expected to offer patients the full range of options. This must occur alongside integration into ongoing scientific research, a cornerstone of university hospital activity. This study describes the establishment and initial characteristics of a prospective thyroid disease cohort referred to our institution, with the dual aim of optimizing clinical care and advancing scientific knowledge.

MATERIAL & METHODS

We have prospectively enrolled thyroid patients referred to our department in a clinical registry. We collected data included demographics, disease characteristics, treatment allocation, and research participation. Treatment modalities offered

included surgery with isthmusresection, total or hemi-thyroidectomy, ultrasound-guided alcohol ablation (AA), radiofrequency ablation (RFA), active surveillance (AS), further clinical evaluation or clinical follow-up. When eligible, patients were also invited to take part in research activities, including prospective clinical trials, randomized controlled trials (RCTs) or quality-of-life assessments using validated patient-reported outcome measures (PROMs). Descriptive statistics were used to summarise the cohort.

RESULTS

We have enrolled 116 consecutive patients, 94 (81%) are females with a mean age of 57 years (range 16 – 90). The distribution of reasons for referral: 38% with suspicion of cancer, 39% nodular goiter, 12% cystic goiter and with 11% thyrotoxicosis.

Treatment recommendations included surgical resections in 50% (isthmus 3, hemithyroidectomy 34 and total thyroidectomy 15), minimal invasive treatments in 10% (AA 8, RFA 2), AS in 1%, clinical follow-up in 17% and further clinical evaluation in remaining 22%.

For all the patients with a decision of a clinical treatment/management (N=97) 29% were included in an ongoing research study. The research participation was both to RCTs (50%), prospective studies (4%) and PROM oriented projects (46%).

CONCLUSIONS

The establishment of our current thyroid cohort illustrates the variety of thyroid diseases requiring different clinical managements. Early data indicate that many patients are willing to take part in research alongside their treatment. With continued enrolment, the cohort will allow comparison of outcomes across treatment modalities and contribute to future guideline development.

OP-482

CAN GOOGLE GEMINI SUPPORT DIAGNOSIS AND TREATMENT DECISIONS IN LARYNGEAL CANCER?

prof dr aylin eryılmaz[1], **zeynep gerçek**[1], **cemal çalık**[1]

[1]*Adnan Menderes University Faculty of Medicine, Otorhinolaryngology Department*

BACKGROUND & AIM

Artificial intelligence (AI)–based language models are increasingly used as accessible sources of medical information. However, their ability to provide reliable clinical decision support—particularly in oncology and treatment planning based on examination, imaging, and pathological findings—remains unclear. We hypothesized that Google Gemini can generate clinically relevant and reliable responses to laryngeal cancer–related questions, including treatment-oriented scenarios derived from real-world clinical data. This study aims to evaluate the accuracy, consistency, and potential clinical utility of Gemini in this context.

MATERIAL & METHODS

This prospective observational study is designed to assess the performance of Google Gemini in answering laryngeal cancer–related questions. A total of 50 questions will be developed, including both general patient-oriented queries and clinically complex scenarios incorporating physical examination findings, radiological imaging results, and pathological data. Each question will be independently submitted to Gemini using a standardized format. The generated responses will be evaluated by two experienced otolaryngologists. A four-point grading system will be used: (1) comprehensive/correct, (2) incomplete/partially correct, (3) mixed (accurate and inaccurate information), and (4) completely inaccurate/irrelevant. Discrepancies between reviewers will be resolved by consensus. The primary outcome measure will be the distribution of response accuracy. Secondary outcomes will include reproducibility and clinical applicability of treatment recommendations. Statistical analyses will be performed after completion of data collection

RESULTS

Data collection and expert evaluation are currently ongoing. The study is structured to determine whether AI-generated responses can provide clinically meaningful and reliable guidance, particularly in treatment decision-making scenarios based on integrated clinical data. Final results, including accuracy rates, reproducibility measures, and statistical analyses, will be presented at the congress.

CONCLUSIONS

Although AI-based tools are not expected to replace clinical judgment, they may provide supportive value in treatment planning and decision-making processes. Google Gemini is anticipated to offer practical advantages in terms of time efficiency and workload reduction by rapidly generating structured medical information. These findings are expected to contribute to understanding the potential role and limitations of AI in clinical practice, particularly in the management of laryngeal cancer.

OP-483

EVALUATION OF THE RELATIONSHIP BETWEEN EXTRANODAL EXTENSION GRADING AND PROGNOSIS, AND THE FACTORS AFFECTING PROGNOSIS IN ORAL CAVITY SQUAMOUS CELL CARCINOMA

Op.Dr. Abdullah Çetin[1]

[1]*İSTANBUL TIP FAKÜLTESİ*

BACKGROUND & AIM

The study primarily investigates the impact of extranodal extension (ENE) grading on survival and recurrence in oral cavity squamous cell carcinoma (OCSCC), re-evaluating its role in adjuvant therapy protocols. It also assesses the relationship between ENE grading and other prognostic factors.Additionally, the research examines the influence of clinical and histological parameters on survival and explores their interrelationships. The cohort consists of OCSCC patients operated on at the Istanbul University Faculty of Medicine, Department of Otorhinolaryngology-Head and Neck Surgery.

MATERIAL & METHODS

Between the years 2011 and 2022, 499 patients diagnosed with oral cavity cancer and operated on were retrospectively screened. While 237 patients met the inclusion criteria, 262 patients were excluded. The following parameters, studied in the pathology specimens of these patients sent intraoperatively, were screened for recurrence and adjuvant therapy: Depth of Invasion (DOI), Number of Metastatic Lymphadenopathies (LAPs), Number and Density of LAPs from Neck Dissection, ENE Grading (major and minor ENE) studied in the Metastatic Lymphadenopathy, Tumor Size, Surgical Margin Status, and information contained in the patient follow-up charts. The time and details of death for deceased patients were obtained through the hospital system and from relatives. The effects of the current screened parameters and information on the prognosis were evaluated. Statistical analysis was performed using a statistical program.

RESULTS

The study analyzed 237 OCSCC patients (54.9% male; median age 60), most with tongue tumors. Most patients (90.7%) underwent neck dissection, and 69.2% received reconstruction. The 3-year Overall Survival (OS), Disease-Specific Survival (DSS), and Disease-Free Survival (DFS) rates were 70%, 73.1%, and 59.1%, respectively. Recurrence occurred in 44.7% of cases.Significant predictors for 3-year OS (70%), DSS (73.1%), and DFS (59.1%) included: metastatic LAP count, ENE presence, Depth of Invasion (DOI), Lymph Node Yield/Density (LNY/LND), tumor size, positive surgical margins, pT/pN/TNM stages, and adjuvant therapy. Recurrence also impacted OS and DSS, emphasizing the critical role of these clinical and pathological parameters.Multivariate analysis identified age >68, ≥3 metastatic LAPs, positive margins, and radiotherapy as independent risk factors for Overall Survival. For Disease-Specific Survival, ≥3 metastatic LAPs, positive margins, and radiotherapy remained significant. Positive surgical margins was the sole independent risk factor for Disease-Free Survival. ENE(+) correlated significantly with DOI, ≥ 2.20cm.

CONCLUSIONS

This study demonstrated that ENE(+) disease significantly worsens prognosis, though no survival difference was found between major (ENEma) and minor (ENEmi) ENE. Notably, chemotherapy did not significantly alter outcomes for ENEmi patients, suggesting a need for larger multi-center validation. Prognosis deteriorated with increasing metastatic LAP count, ENE(+) LAPs, LND, DOI, and tumor size. Advanced pT, pN, and TNM stages, positive surgical margins, were also associated with poorer outcomes.Among primary sites, floor of the mouth tumors exhibited the most aggressive behavior.Consequently, OCSCC patients with these poor prognostic indicators require carefully tailored adjuvant therapy and meticulous long-term follow-up.

OP-484

Oxidative Stress Markers In Benign Salivary Gland Tumors

SUNIL KUMAR[1], **SACHIN KUMAR**[1], **A B SINGH**[1], **RAJAT JAIN**[1]

[1]*King George's Medical University, Lucknow, UP, India*

BACKGROUND & AIM

Malondialdehyde(MDA)-marker of lipid peroxidation and advanced oxidation protein products (AOPP) are widely recognized biomarkers of oxidative damage. Advanced Oxidation Protein Products (AOPP), a marker of protein oxidation generated by neutrophil myeloperoxidase activity, has been previously implicated in various neoplastic and inflammatory conditions of salivary glands.

MATERIAL & METHODS

Venous AOPP and MDA level was measured in 30 patients of pleomorphic adenoma parotid gland using competitive inhibition enzyme immunoassay and Elabscience Malondialdehyde Colorimetric Assay Kit respectively and was statistically analysed with the control group.

RESULTS

The MDA level was higher in the case (7.02±3.77 nmol/mL) than control (6.12 ±1.92 nmol/ML), However the difference was not statistically significant (t=1.16, p=0.249). The level of AOPP was higher in case (27.15 ± 4.83 ng/Ml) as compared to control (22.67 ± 5.74 ng/Ml) which was statistically significant (t=3.27, p=0.002). The Pearson correlation analysis between MDA and AOPP revealed a weak but statistically significant positive correlation in the overall study population (r=0.274, p=0.034), suggesting a mild association between lipid peroxidation and protein oxidation. Within the control group, the correlation was weak and not statistically significant (r=0.141, p=0.457). In the case group, a moderate positive correlation was observed (r=0.327), but this did not reach statistical significance (p=0.078), indicating a possible trend toward association in cases.

CONCLUSIONS

Circulatory AOPP levels in comparison to MDA, is more promising biomarker and it can serve as a non-invasive diagnostic adjunct to imaging and biopsy, particularly in differentiating benign from malignant salivary tumors and monitoring post-surgical recurrence.

OP-485

Relationship Between Temporal Muscle Thickness And Sarcopenia In Laryngeal Cancer

Fatih Savran[1], **Kadir Hacıeminoğlu**[2], **Ahmet Adnan Cırık**[2]

[1]*Uskudar University Medicine Faculty. Department of Otolaryngology;* [2]*University of Health Sciences, Umraniye Research and Education Hospital. Department of Otolaryngology*

BACKGROUND & AIM

Sarcopenia is increasingly recognized as a significant clinical factor in head and neck oncology. The aim of this study is to evaluate the clinical utility of temporal muscle thickness (TMT) measured on routine computed tomography (CT) scans as a practical marker for assessing sarcopenia in patients diagnosed with laryngeal squamous cell carcinoma.

MATERIAL & METHODS

This retrospective study included patients who underwent treatment for laryngeal cancer between 2009 and 2024. Pre-treatment head and neck CT scans were analyzed to measure TMT. A total of 91 patients were evaluated using standardized axial CT sections. Volumetric assessments and cross-sectional thickness were recorded for each patient. The relationship between TMT values and clinical indicators of sarcopenia was statistically analyzed. Overall survival rates were compared using Kaplan-Meier analysis and Cox proportional hazards regression was applied to adjust for confounders.

RESULTS

Among 91 patients (95.6% male; mean age 62.7±9.9 years), the mean TMT was 5.6±1.3 mm. Patients with T1-T2 tumors exhibited significantly higher TMT values (5.96±1.32 mm) than those with T3-T4 tumors (5.25±1.24 mm) (p=0.010). Median survival decreased from 28 months in T1 to 10 months in T4 stages (p<0.001). Low TMT values (<4.89 mm) strongly correlated with shortened survival. Age, BMI, and smoking history showed no significant effect on survival (p>0.05).

CONCLUSIONS

Temporal muscle thickness (TMT) is a practical, non-invasive, and cost-effective CT-based biomarker that reliably predicts sarcopenia and early mortality risk in patients with laryngeal squamous cell carcinoma, offering significant utility for the identification of high-risk patients.

OP-486

Head And Neck Squamous Cell Carcinoma In The Geriatric Population: Chronological Age Or Frailty? A Real-World Cohort Study From A Portuguese Tertiary Centre

Mariana Cascão[1], **Catarina Pinto**[1], **Joana Rebelo**[1], **Leandro Ribeiro**[1], **Pedro Oliveira**[1]

[1]*Unidade Local de Saude de Gaia e Espinho*

BACKGROUND & AIM

Head and neck squamous cell carcinoma (HNSCC) predominantly affect older individuals; however, elderly patients remain underrepresented in clinical trials. Treatment decisions in this population are particularly challenging, as chronological age may not accurately reflect frailty or functional status. This study aimed to characterise elderly patients with HNSCC and assess the influence of age on tumour characteristics and treatment patterns.

MATERIAL & METHODS

A retrospective cohort study was conducted including patients aged ≥65 years diagnosed with mucosal HNSCC at a Portuguese tertiary centre between 2014 and 2025. Non-squamous malignancies, thyroid tumours, salivary gland neoplasms, sarcomas, melanomas and metastatic lesions were excluded. Patients were stratified into three age groups: 65–74, 75–84 and ≥85 years.

Clinical, tumour and treatment-related variables were collected, including sex, risk factors, ECOG performance status, tumour location, disease stage and treatment strategy. Associations between age groups and categorical variables were assessed using chi-square analysis.

RESULTS

A total of 269 patients were included. Treatment strategy differed significantly according to age group (p=0.022), with the proportion of untreated patients increasing progressively from 15.5% in patients aged 65–74 years to 42.3% among those aged ≥85 years. Older patients presented significantly poorer performance status (ECOG ≥2: 12.7%, 26.1% and 42.3%, respectively; p<0.001). Tumour location varied significantly according to age (p=0.002), with oral cavity tumours being proportionally more frequent among the oldest patients. No significant association was observed between age and stage at diagnosis (p=0.345), with advanced-stage disease remaining prevalent across all age groups (67.6%, 71.6% and 76.9%, respectively). Female representation increased significantly with age (p=0.003). Risk factor profiles also differed significantly (p<0.001), with tobacco and combined tobacco–alcohol exposure progressively decreasing in older age groups.

CONCLUSIONS

Although older patients were less likely to receive active treatment, no differences in stage at presentation were observed across age groups. Older age was associated with poorer performance status and distinct epidemiological profiles, suggesting that treatment decisions may be influenced more by frailty and functional status than by tumour burden alone. These findings reinforce the importance of comprehensive geriatric assessment in HNSCC management.

OP-487

Clinical Features Of Clustered Head And Neck Neurofibromas In Children With NF1: A Single-Center Retrospective Study Of 24 Cases.

Liu Yifan[1], **Liu Qiaoyin**[1], **Wang Shengcai**[1], **Ni Xin**[1]

[1]*Beijing Children's Hospital Affiliated to Capital Medical University*

BACKGROUND & AIM

To investigate the surgical-related clinical characteristics of plexiform neurofibromas associated with type I neurofibromatosis (NF1-PN) in the head and neck region of children.

MATERIAL & METHODS

A retrospective analysis was conducted on clinical data from pediatric patients with NF1-PN undergoing surgical treatment at Beijing Children's Hospital, Capital Medical University between September 2015 and October 2024. Observed indicators included tumor location, tumor size, surgical duration, blood loss, histopathological type, and postoperative complications. Data analysis was performed using SPSS 25.0 and R software v4.5.0, with all results rounded to one decimal place.

RESULTS

This study included 24 patients with type 1 neurofibromatosis-associated plexiform neurofibromas of the head and neck region, comprising 15 males and 9 females with a mean age of 73 (73.1 ± 46.2) months. The mean maximum tumor diameter was 4.1 (4.1 ± 2.1) cm. The median operative time was 103 (40, 284) min, and the median blood loss was 10 (1, 400) ml. Most patients (14/20) had intraoperative blood loss below 20 ml. Further analysis revealed significantly higher intraoperative blood loss in patients with tumors ≥ 5.9 cm diameter compared to those with tumors < 5.9 cm diameter ($P < 0.05$). Additionally, operative time was markedly prolonged when tumor diameter exceeded 5.2 cm ($P < 0.05$).

CONCLUSIONS

Plexiform neurofibromas (NF1-PN) in the pediatric head and neck caninvolve the ear, nose,throat, neck, face, or multiple areas. Most patients showed no significant differences in surgical time or blood loss. However, surgery time increased when tumors were in the neck or exceeded 5.2 cm in diameter, and blood loss increased significantly when tumors exceeded 5.9 cm. For NF1-PN in the head and neck, surgeries for tumors over 5.9 cm or located in the neck should consider risks of bleeding, prolonged anesthesia, and potential postoperative complications.

High Grade Transformation In Acinic Cell Carcinoma Of The Salivary Glands: A Systematic Review

Nedal Dabab[1], **Stavroula Mouratidou**[1], **Teresa Guerrero-urbano**[1], **Gillian Hall**[1], **Aleix Rovira**[1], **Ricard Simo**[1]

[1]*Guy's and St Thomas' NHS Foundation Trust*

BACKGROUND & AIM

High-grade transformation (HGT) in acinic cell carcinoma (AcCC) is a rare but clinically aggressive pathology with poor prognosis. There is limited evidence regarding optimal management, most available data are from single institution reports or

case studies. This systematic review aims to consolidate the literature available on presentation, treatment and outcomes for these patients.

MATERIAL & METHODS

A systematic review search in Pubmed and Embase up to 2025 was performed according to PRISMA guidelines. Inclusion criteria contained original human studies including case reports and retrospective cohorts in English reporting management and outcomes of histologically confirmed AcCC with HGT. Owing to the heterogeneity across included studies a formal meta-analysis was not performed. Data were extracted on demographics, tumour site, stage, treatment and survival. The Newcastle-Ottawa scale was utilised for the included retrospective cohort studies to evaluate the quality of the provided data.

RESULTS

A total of 20 eligible studies comprising of 92 patients. The combined mean age at diagnosis was 56 years (range 17 – 85). Most tumours originated from the parotid gland 78.3% and only 10% originated from submandibular gland; with distant metastases in 50.9% of cases. The most common approach was total parotidectomy 44.4% with adjuvant radiotherapy 77.1%. The combined mean overall survival was 4.1 years and disease-specific mortality of 40%.

CONCLUSIONS

AcCC with HGT demonstrates aggressive clinical behaviour with poor survival outcomes despite multimodal therapy. A collaborative multicentre MDT approach is essential in the identification of prognostic markers and help guide optimal treatment strategies.

AcCC, HGT, PRISMA, systematic review

OP-489

Pharyngocutaneus Fistula Development After Total Laryngectomy: A Review Of Risk Factors And Clinical Outcomes

Mert Anıl DANISMAN[1], **Hakki Caner INAN**[1], **Havva YAZICI**[1], **Melih ALPAY**[1], **Betul AGIRGOL**[1], **Veysel Akif SAVAS**[1], **Veyis SENER**[1]

[1]*University of Health Sciences, Bursa Yuksek Ihtisas Training & Research Hospital, Department of Otolaryngology*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) is recognized as the most frequent early complication following total laryngectomy. The incidence of PCF in primary total laryngectomy cases is reported to be approximately 14.3% in the literature. Various patient-related factors, such as smoking, alcohol consumption, advanced age, diabetes, anemia, and malnutrition, as well as tumor-related factors, including advanced tumor stage, presence of neck metastasis, tumor localization, have been shown to significantly influence fistula development. Surgical experience and technical approach may affect complication rates. This study aims to investigate the factors affecting the development of PCF in patients who underwent primary total laryngectomy at our clinic.

MATERIAL & METHODS

In this retrospective study, the medical records of 35 patients who underwent primary total laryngectomy were reviewed. Patients were grouped based on the development of postoperative pharyngocutaneous fistula. Demographic data, clinical characteristics (tumor/nodal stage, comorbidities, additional surgical procedures), preoperative laboratory parameters (Neutrophil-to-Lymphocyte Ratio [NLR], lymphocytes, etc.), and the time to oral feeding were recorded. For statistical analysis, the Independent Samples t-test and Mann-Whitney U test were used to compare continuous variables, while Chi-Square and Fisher's Exact tests were utilized for categorical data. ROC curve analysis was performed to determine the clinical cut-off values of the parameters found to be significant in fistula development. Finally, univariate logistic regression analysis was conducted to determine the statistical impact (Odds Ratio) of the identified risk factors ($p < 0.05$).

RESULTS

A fistula developed in 7 (20%) of the 35 patients included in the study. No significant differences were found between the groups regarding demographic and clinical characteristics (tumor stage, tracheotomy, etc.). Preoperative lymphocyte levels were significantly higher ($p<0.001$) and NLR values were significantly lower ($p=0.001$) in the fistula group. In the ROC analysis, the preoperative NLR cut-off value for fistula development was determined as ≤ 8.25 (AUC: 0.913), and the lymphocyte cut-off value as ≥ 1.12×10^3 (AUC: 0.921). Univariate logistic regression analysis demonstrated that a low preoperative NLR value (OR: 0.67, $p=0.018$) and a high lymphocyte level (OR: 66.7, $p=0.011$) were statistically significant risk factors for fistula development.

CONCLUSIONS

This study evaluated risk factors for pharyngocutaneous fistula (PCF) following total laryngectomy, finding a 20% incidence, consistent with existing literature. While classical risk factors like hypoalbuminemia,hypothyroidea and tracheostomy lacked statistical significance due to the limited cohort size (n=35), a striking, paradoxical immune relationship emerged. Contrary to conventional expectations, a low preoperative Neutrophil-to-Lymphocyte Ratio (NLR ≤ 8.25) and elevated lymphocyte counts

(≥ 1.12 × 10^3) were strong independent predictors of PCF. This suggests that a hyperactive local immune response, rather than systemic immunosuppression, may drive early neopharyngeal breakdown.

OP-490

Beyond Readmission Rates: Contemporary Patterns And Predictors Of Readmission After Transoral Robotic Surgery For Oropharyngeal Cancer

Felipe Porto-Gutierrez[1,2], **Zoha Syed**[2], **Brett Campbell**[1,2], **Kavita Prasad**[1,2], **Fabian Peralta**[1,2], **Scharukh Jalisi**[1,2]

[1]*Beth Israel Deaconess Medical Center, Boston, Massachussetts.*; [2]*Harvard Medical School, Boston, Massachussetss.*

BACKGROUND & AIM

Transoral robotic surgery (TORS) is increasingly used in the management of oropharyngeal squamous cell carcinoma (OPSCC). Although prior national studies have evaluated 30-day readmission rates after TORS, contemporary data characterizing specific readmission etiologies and associated risk factors remain limited. This study evaluated predictors and etiologies of 30-day readmission following TORS for OPSCC using a national database cohort.

MATERIAL & METHODS

A retrospective cohort study was performed using the Nationwide Readmissions Database from 2018 to 2022. Adult patients with OPSCC undergoing TORS were identified using ICD-10-CM and ICD-10-PCS codes. The primary outcome was 30-day non-elective readmission. Readmission etiologies were categorized according to the primary readmission diagnosis. Univariable and multivariable logistic regression analyses identified factors independently associated with readmission. Multinomial logistic regression evaluated factors associated with specific readmission etiologies.

RESULTS

A total of 7,588 patients undergoing TORS for OPSCC were included, of whom 726 (9.6%) experienced 30-day readmission. The most common readmission etiologies were cancer-related conditions (21.1%), respiratory/airway complications (17.1%), gastrointestinal/nutritional complications (11.7%), and postoperative complications (11.4%). On multivariable analysis, non-elective admission (OR 1.35, 95% CI 1.06–1.71), major severity of illness (OR 1.59, 95% CI 1.20–2.10), metropolitan teaching hospital status (OR 1.59, 95% CI 1.05–2.42), discharge with home health services (OR 1.51, 95% CI 1.24–1.84), and discharge to skilled nursing or intermediate care facilities (OR 1.64, 95% CI 1.14–2.35) were independently associated with increased readmission odds, while neck dissection was associated with lower readmission odds (OR 0.79, 95% CI 0.66–0.94). Tracheostomy was strongly associated with respiratory/airway, device-related, and postoperative complication readmissions.

CONCLUSIONS

Thirty-day readmission following TORS for OPSCC remains common and is driven predominantly by cancer-related and respiratory complications rather than postoperative hemorrhage. Illness severity, non-elective admission status, and post-discharge care needs were independently associated with readmission risk, while neck dissection was associated with lower readmission odds. These findings may help inform perioperative risk stratification and targeted strategies to reduce preventable readmissions after TORS.

The Clinical Role Of ACR TI-RADS Risk Stratification In Repeat Fine-Needle Aspiration Of Thyroid Nodules

OZAN TÜYSÜZ[1], **FERİDE FIRAT**[1], **ADALET AŞKİN**[1], **BİLGENUR AİŞEOĞLU**[1], **MURAT TOPBAŞ**[1], **FARİZA ŞAHAP**[1], **ÖZGÜR YİĞİT**[1]

[1]*Başakşehir Çam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Türkiye*

BACKGROUND & AIM

Fine-needle aspiration biopsy (FNAB) is commonly used to evaluate thyroid nodules; however, its effectiveness is limited in cases where the initial cytology is nondiagnostic or indeterminate. In these situations, repeat FNAB is often performed, although its diagnostic value can differ. Among ultrasound-based risk stratification systems, ACR TI-RADS has been increasingly used in clinical practice. The aim of this study is to evaluate the role of ACR TI-RADS risk levels in thyroid nodules undergoing repeat FNAB, particularly in predicting changes in cytological categories, and to examine its relationship with histopathological findings in patients who underwent surgery.

MATERIAL & METHODS

In this retrospective single-center study, a total of 956 thyroid nodules that underwent repeat fine-needle aspiration biopsy (FNAB) between January 2020 and January 2026 were evaluated. Nodules with initial nondiagnostic (Bethesda I) or indeterminate (Bethesda III) cytology that had at least one repeat FNAB were included. All nodules were reclassified according to ACR TI-RADS based on their ultrasonographic features. Demographic data, nodule size, ultrasonographic findings, and both initial and repeat FNAB results were recorded. Surgical treatment with histopathological confirmation was available in 214

nodules, and this subgroup was used for diagnostic performance analysis. The main outcome was the change in cytological category, while secondary outcomes included agreement with histopathological findings and prediction of malignancy. Statistical analyses were performed using jamovi software; appropriate parametric and non-parametric tests were applied, and $p<0.05$ was considered statistically significant.

RESULTS

A total of 956 nodules that had undergone repeat fine-needle aspiration biopsy (FNAB) were retrospectively reviewed.Histopathological confirmation was available in 214 nodules, of which 139 (64.9%) were malignant and 75 (35.1%) were benign. When initial and repeat FNAB results were compared, a significant change in cytological categories was observed ($p<0.001$), with category upgrade in 11.0%, downgrade in 20.1%, and no change in 68.9% of nodules.

Malignancy rates were significantly higher in nodules classified as Bethesda ≥3, both in initial and repeat biopsy results ($p<0.001$). Notably, the malignancy rate remained above 50% even in the Bethesda 1–2 group. ACR TI-RADS categories were significantly associated with post-repeat FNAB Bethesda categories ($\chi^2=33.1$, $p=0.033$).

In ROC analysis, FNAB showed moderate diagnostic performance (AUC=0.67; 95% CI: 0.60–0.73). No significant association was found between TI-RADS, nodule size, and malignancy ($p>0.05$).

CONCLUSIONS

Repeat fine-needle aspiration biopsy (FNAB) showed moderate diagnostic performance, and higher-than-expected malignancy rates were observed, especially in low-risk cytological categories. Although repeat biopsy results were significantly associated with malignancy, their ability to distinguish benign from malignant nodules was limited. ACR TI-RADS was related to cytological findings, but it did not make a meaningful contribution to predicting malignancy. These findings suggest that current risk classification systems may not be sufficient in patients undergoing repeat FNAB, and that clinical decisions should be made more carefully.

OP-492

EFFECTIVENESS OF A STANDARDIZED SURGICAL TREATMENT FOLLOWED BY ADJUVANT RADIOTHERAPY IN PATIENTS AFFECTED BY RECURRENT PLEOMORPHIC ADENOMA

Davide Di Santo[1,2], **Bertrand Cailliau**[2], **Jeroen Meulemans**[1,2], **Paul Clement**[1,2], **Sandra Nuyts**[1,2], **Vincent Vander Poorten**[1,2]

[1]*University Hospitals Leuven, Leuven, Belgium;* [2]*Catholic University Leuven, Leuven, Belgium*

BACKGROUND & AIM

The rate of recurrence after surgery for pleomorphic adenoma (PA) is around 2-3% even in the best series. Treatment of recurrent PA (RPA) is surgical, but there is no consensus on the extent of the procedure and the indication for adjuvant radiotherapy (RT). Surgery for RPA is affected by higher rates of complications and re-recurrences.

The Authors investigate the rate of re-recurrence and complications, together with any potential associated factor, in a cohort of patients who underwent surgery following a standardized surgical approach and adjuvant RT.

MATERIAL & METHODS

Patients treated with radical intent for RPA of the parotid or submandibular gland by the ENT Department of UZ Leuven between January 1989 and September 2025 were included. Surgery always consisted in the complete removal of the scar, the macroscopic disease and the remaining glandular tissue. Rates of re-recurrence and complications were calculated, potential risk factors were investigated.

RESULTS

Eighty-two patients were included, of whom 68 underwent surgery and adjuvant RT, the remaining 14 surgery as monotherapy. Median follow-up was 9.2 years. The rate of re-recurrence among patients who underwent surgery and RT was 8.8%, while it reached 28.6% for those who underwent surgery monotherapy. There were no associations between the rate of re-recurrence and any studied variable. No patient treated with surgery and RT developed subsequent malignant transformation.

The rate of postoperative facial nerve weakness was 39.0%, higher compared to the rate after primary surgery (7.5%). The presence of a facial nerve deficit at primary surgery significantly increased the risk for the same deficit at radical surgery ($p<.0001$).

CONCLUSIONS

A standardized treatment including complete removal of the macroscopic disease, the remaining glandular tissue and the previous scar with retrograde nerve dissection followed by adjuvant RT offers optimal local control in patients treated for RPA. The addition of adjuvant RT significantly improves the rate of re-recurrence. The rate of facial nerve complications is significantly higher compared to primary surgery.

OP-493

A BIBLIOMETRIC ANALYSIS OF SPECIALISATION THESES ON HEAD AND NECK CANCERS IN TURKEY: A MULTIDISCIPLINARY EVALUATION BASED ON YÖK NATIONAL THESIS CENTRE DATA (1970–2026)

UĞUR TUFAN[1], **ERDEM MENGİ**[1], **CÜNEYT ORHAN KARA**[1], **FAZIL NECDET ARDIÇ**[1]

[1]*Pamukkale University, Department of Otorhinolaryngology*

BACKGROUND & AIM

Head and neck cancers constitute a complex patient group that involves collaboration across multiple disciplines, including otolaryngology, radiation oncology, medical oncology, nuclear medicine, pathology and plastic rekosntructive surgery. The aim of this study is to examine the bibliometric characteristics of medical specialisation theses prepared in the field of head and neck cancers in Turkey; to reveal the distribution of theses by year, the contribution between branches, changes in research trends, and the reflection of new technologies (e.g. advanced imaging methods such as robotic surgery and FDG PET-CT) in academic studies

MATERIAL & METHODS

This study was planned as a retrospective descriptive bibliometric analysis. The data source used was the Higher Education Council (YÖK) National Thesis Centre (Turkey) database.The keywords used in the search were selected from the ETR UEMS-ORL APPROVED 2020 and Tukmos-KBB head and neck surgery sections.Medical specialisation theses were searched using the identified keywords; the obtained theses were classified by publication year, specialisation field, and thesis topic. The obtained data will be evaluated using descriptive statistics; the results will be presented graphically and chronologically.

RESULTS

A total of 510 medical specialization theses were evaluated within the scope of the bibliometric analysis. Distribution by specialty showed that Ear, Nose and Throat (ENT) produced the highest number of theses on head and neck cancers, with 179 studies (35.1%). ENT was followed by oncology (14.9%), endocrinology and metabolic diseases (14.1%), radiology and nuclear medicine (13.9%), and general surgery (10.2%).

This distribution demonstrates that head and neck cancers represent a multidisciplinary academic field rather than solely a surgical domain, involving contributions from diagnosis, imaging, and medical and radiation therapies.

While research on thyroid cancers has been mainly concentrated in general surgery and endocrinology, the past fifteen years have shown an increase in thyroid-related theses within ENT compared to the previous forty-year period. This trend reflects an academic shift consistent with evolving interdisciplinary boundaries in head and neck surgery and the expanding surgical role of the ENT specialty.

CONCLUSIONS

This bibliometric analysis shows that medical specialization theses on head and neck cancers in Turkey have gained increasing academic interest and reflect a multidisciplinary structure shaped by various specialties. The distribution of theses indicates that head and neck oncology is not solely surgical but relies on combined contributions from surgery, oncology, endocrinology, radiology, and nuclear medicine. The ENT discipline emerges as the leading contributor, producing the highest number of theses, highlighting its central and expanding role in head and neck oncology and underscoring the interdisciplinary nature of research and clinical practice in this field.

Preoperative Bethesda Cytology And Final Histopathology After Thyroid Loboisthmectomy

Ömer Orak[1], **Furkan Olgun**[1], **Tülay Günsay**[1], **Aynur Deniz**[1], **Yasin Çetinkaya**[1], **Cömert Şen**[1], **Murat Ulusan**[1], **Bora Başaran**[1]

[1]*Istanbul University, Istanbul Faculty of Medicine, Department of Otorhinolaryngology-Head and Neck Surgery*

BACKGROUND & AIM

The Bethesda System is widely used for preoperative risk stratification of thyroid nodules; however, predicting malignancy remains challenging, particularly in indeterminate cytology. This study evaluated the relationship between preoperative Bethesda cytology and final histopathology in patients undergoing thyroid loboisthmectomy for nodular thyroid disease.

MATERIAL & METHODS

This retrospective study was conducted at a tertiary referral institution between 2019 and 2024. The medical records of 122 patients who underwent thyroid loboisthmectomy were reviewed. Fifty patients were excluded due to concomitant non-thyroid tumor surgery or had missing/unavailable clinical, cytological, or pathological data. The final analysis included 72 patients. Demographic, clinical, biochemical, ultrasonographic, cytological, surgical, and histopathological data were analyzed using IBM SPSS Statistics version 31.0.

RESULTS

The cohort included 47 female (65.3%) and 25 male (34.7%) (mean age 47.54 ± 14.12 years). Forty-nine patients (68.1%) were symptomatic, whereas 23 patients (31.9%) were asymptomatic. Final histopathology was benign in 47 patients (65.3%) and

malignant in 25 patients (34.7%), including follicular thyroid carcinoma (n=1), papillary thyroid carcinoma (n=5), and papillary thyroid microcarcinoma (n=19). Malignant nodules were significantly smaller than benign ones (median 19.0 vs. 33.0 mm, p=0.005). Right-sided operations showed a higher malignancy rate than left-sided operations (50.0% vs. 22.5%, p=0.024). Bethesda classification was significantly associated with final histopathology (p=0.006), with malignancy rates of 20.0%, 10.5%, 36.0%, 40.0%, 66.7%, and 100.0% across categories, respectively. Malignancy was detected in 36.0% of Bethesda III nodules and in 37.5% of Bethesda III–IV indeterminate nodules. Age, sex, symptom presence, thyroid-stimulating hormone level, and nodule size were not significantly associated with malignancy.

CONCLUSIONS

Bethesda cytology was significantly associated with final histopathologic malignancy in patients undergoing thyroid loboisthmectomy. Bethesda III and Bethesda IV nodules showed malignancy rates of 36.0% and 40.0%, respectively. These findings support individualized assessment using Bethesda cytology, ultrasonographic risk stratification and patient characteristics, such as eligibility for surveillance, risk factors for thyroid carcinoma.

OP-495

Outcomes Of Drainless Day-Case Parotidectomy: A Single-Centre Retrospective Cohort Study

Martin J. Evans[1], **Vijaya Pothula**[1], **B. Nirmal Kumar**[1]

[1]*Royal Albert Edward Infirmary, Wigan, United Kingdom*

BACKGROUND & AIM

Day-case parotidectomy is increasingly utilised to improve patient experience and efficiency. Most published day-case parotidectomy series report routine drain use, despite limited evidence that drains reduce complications or readmission. Robust outcome data for drainless day-case pathways remain sparse. This study evaluates the safety and postoperative outcomes of drainless day-case parotidectomy.

MATERIAL & METHODS

A retrospective cohort study was conducted of consecutive patients undergoing drainless parotidectomy with day-case intent at a single centre from May 2020 to January 2026. Surgery was delivered within a supervised training environment, reflecting routine practice. Drainless surgery was the default approach during the study period. Included procedures comprised parotid resections of varying extent, including superficial, subtotal, total, and revision procedures. Complications were prospectively recorded and reviewed at routine postoperative follow-up. Primary outcomes were successful same-day discharge and 30-day readmission. Secondary outcomes were rates of postoperative complications including facial nerve weakness (temporary and permanent), haematoma, wound infection, postoperative collections (seroma/sialocele/salivary fistula), and Frey's syndrome.

RESULTS

A total of 91 patients underwent drainless day-case parotidectomy. Same-day discharge was achieved in 84.6%, comparable with published day-case parotidectomy series. The 30-day readmission rate was 1.1%. Unplanned admission was most commonly due to social reasons (n=5) and postoperative haematoma (n=4). Temporary and permanent facial nerve weakness occurred in 17.6% and 2.2% of patients, respectively. Postoperative haematoma occurred in 7.7% of cases. Wound infection and postoperative collections occurred in 17.6% each. There were no cases of Frey's syndrome.

CONCLUSIONS

Drainless day-case parotidectomy is feasible with low readmission and acceptable facial nerve outcomes. These outcomes were achieved within a supervised training environment, supporting the wider applicability of drainless day-case parotidectomy in routine practice. Higher wound-related complications highlight opportunities for improved risk stratification and pathway optimisation. Selective drain use within structured day-case protocols may maximise safety while preserving efficiency gains.

Extracranial Head And Neck Schwannomas: A Single Centre Retrospective Experience Of 102 Cases.

Preena Patel[3], **Mohamed Elsharkawy**[3], **Basim Metwally Wahba**[3,1], **Zaid Awad**[3,2]

[1]*Cairo University;* [2]*Imperial College London;* [3]*Imperial College NHS Trust*

BACKGROUND & AIM

Objective: Extracranial head and neck schwannomas (ECHNS) are rare benign neoplasms that present diagnostic and management challenges. This study analyses diagnostic and management strategies of ECHNS

MATERIAL & METHODS

Study design: A single centre cohort study over 10 years

Setting: Tertiary academic medical centre

Method: For all patients with ECHNS, outcome measures of patient demographics, presenting symptoms, diagnostic investigations, nerve of origin, treatment approaches and long term morbidity were gathered from electronic patient records. Independent t-tests were used to assess significant difference between surgical and conservative management approaches.

RESULTS

Results: 102 tumours were analysed. The mean cohort age was 51 yrs and 52.5% were female and 46.5% were male. The commonest anatomical locations were the neck (48%), cervical spine (19.6%), parapharyngeal space (10.8%), and parotid (9.8%). Most patients presented with external swelling (67%), while spinal lesions typically presented with neurological deficits. MRI accurately characterized lesions as benign in 95% of cases. Ultrasound-guided fine needle aspiration cytology (FNAC) demonstrated a diagnostic accuracy of 86.6%. Management was equally divided between surgical resection and active surveillance with comparable baseline patient characteristics. Post-operative complications occurred in 16 cases (31.4%), with persistent long-term sequelae in 7 patients (13.7%). No patients under surveillance required surgical intervention during follow-up to 7 years.

CONCLUSIONS

Conclusions: ECHNS demonstrate excellent outcomes with both surgical and conservative management. MRI remains the investigation of choice. This largest reported series supports a paradigm shift towards surveillance in selected patients, though optimal surveillance protocols remains undefined.

OP-497

Can Preoperative Complete Blood Count-Derived Indices Predict Survival In Patients With Surgically Treated Advanced-Stage Laryngeal Carcinoma? A Retrospective Cohort Study

Uğur Kamiloğlu[1], **Sabri Mutlu**[3], **Mahmut Borazan**[2], **Muhammed Uysal**[2], **Görkem Eskiizmir**[2]

[1]*Izmir Selcuk State Hospital;* [2]*Manisa Celal Bayar University;* [3]*Manisa Turgutlu State Hospital*

BACKGROUND & AIM

CBC–derived inflammatory indices, including the neutrophil-to-lymphocyte ratio (NLR), platelet-to-lymphocyte ratio (PLR), monocyte-to-lymphocyte ratio (MLR), systemic immune-inflammation index (SII), and pan-immune-inflammation value (PIV) have increasingly been proposed as simple, inexpensive, readily available prognostic biomarkers in oncology. The growing number of hemogram-based prognostic markers raises an important question: can complex oncological outcomes be reliably predicted by isolated preoperative inflammatory indices? Prognosis is inherently multifactorial shaped by tumor biology, disease extent, pathological risk factors, treatment-related variables, patient characteristics. We evaluated the prognostic value and practical limitations of these inflammatory indices in patients with locoregionally advanced laryngeal carcinoma who underwent surgery with curative intent.

MATERIAL & METHODS

Patients with advanced-stage (stage III–IV) laryngeal squamous cell carcinoma who underwent curative total or partial laryngectomy between 2014 and 2026 were retrospectively reviewed. Patients with distant metastasis, T4b, prior malignancy, radio-recurrent disease, neoadjuvant treatment, active inflammatory or hematologic conditions, immunosuppressive use, or incomplete data were excluded. Preoperative complete blood count parameters obtained within 15 days before surgery were used to calculate NLR, PLR, MLR, SII, and PIV. ROC analysis did not identify clinically adequate cut-off values; therefore, median values were used to classify patients into high- and low-score groups for each index. Overall survival (OS), Disease-free survival (DFS), and Locoregional recurrence-free survival (LRFS) were evaluated using Kaplan–Meier analysis and compared with the log-rank test. All statistical analyses were performed using SPSS 25.0.

RESULTS

A total of 97 patients were included in the study. The cohort was predominantly male (94.8%), with a mean age of 64 ± 9 years (43-87 Years). Stage distribution was 37.1% for stage III, 44.3% for stage IVA, and 18.6% for stage IVB. All stage IVB cases were classified as IVB due to nodal disease with ENE-positive N3b status, rather than T4b primary tumor extension. Total laryngectomy was performed in 80.4% of patients, and followed by adjuvant chemoradiotherapy in 76.3% of patients. Median follow-up was 50 months. The median values of PIV, NLR, PLR, MLR, and SII were 481.23, 2.74, 135.91, 0.27, and 827.22, respectively. When patients were stratified into high- and low-score groups according to the median value of each index, none of the inflammatory scores demonstrated a statistically significant association with OS, DFS, or LRFS.

CONCLUSIONS

Preoperative CBC-derived inflammatory indices, including NLR, PLR, MLR, SII, and PIV, did not significantly predict survival outcomes in patients with surgically treated locoregionally advanced laryngeal carcinoma. These findings suggest that the prognosis of laryngeal carcinoma, as in many other malignancies, is multifactorial and cannot be reliably predicted by isolated

preoperative hematologic parameters alone. Although such indices are simple and accessible, their clinical utility for prognostic stratification in this setting appears limited.

Parotid Abscesses: A Multidisciplinary Approach For Optimal Management

Carlos Chiesa Estomba[2], **Salvatore Lavalle**[1], **Anand Subash**[4], **Carlos Takahiro Chone**[3], **Matthew White**[5], **Antonino Maniaci**[1], **Eric Levi**[6]

[1]*Enna Kore University;* [2]*University of Deusto;* [3]*Universidade de Campinas, Departamento de Otorrinolaringologia e Cabeça e Pescoço, Campinas, SP, Brazil;* [4]*Department of Head and Neck Surgical Oncology, HCG Cancer Centre, Bengaluru, India;* [5]*Department of Otolaryngology, University of Cape Town, South Africa;* [6]*The University of Melbourne; Royal Children's Hospital; Murdoch Children's Research Institute, Melbourne, Australia*

BACKGROUND & AIM

Parotid abscesses, although uncommon, may lead to severe complications such as sepsis, facial nerve palsy, or mediastinitis. While surgical drainage remains the standard of care, emerging evidence suggests that ultrasound-guided needle aspiration may be a less invasive yet effective alternative. This study aims to compare the safety, efficacy, and clinical outcomes of surgical drainage versus ultrasound-guided aspiration for treating parotid abscesses.

MATERIAL & METHODS

We conducted a retrospective multicentric analysis of patients treated for parotid abscesses within a YoIFOS otolaryngology group. Evaluated variables included abscess volume, hospitalization duration, number of procedures, complication rates (bleeding, recurrence, facial nerve palsy), and microbiological profiles.

RESULTS

- Mean abscess volume: 10.1 mL (surgical) vs. 5.7 mL (aspiration), p = non-significant
- Mean number of procedures: 1.1 (surgery) vs. 1.9 (aspiration), $p < 0.01$
- Hospital stay: 7.3 days vs. 5.9 days (trend, p = non-significant)
- Complications: bleeding in 2% of surgical cases; no facial palsy in either group; recurrences in 4 surgical and 3 aspiration cases
- Predominant pathogens: Staphylococcus aureus, Streptococcus intermedius, viridans streptococci

CONCLUSIONS

A prospective randomized trial is warranted to determine the optimal treatment strategy and identify patient subgroups most likely to benefit from a conservative approach.

OP-499

Margin Status And Disease Control In Submandibular Gland Malignancies From A Tertiary Centre: A Preliminary Report

Nedal Dabab[1], **Mahmoud Alaaeldin**[1], **Richard Oakely**[1], **Jean-Pierre Jeannon**[1], **Paris Tamiolakis**[1], **Ricard Simo**[1], **Aleix Rovira**[1]

[1]*Guy's and St Thomas' NHS Foundation Trust*

BACKGROUND & AIM

Submandibular gland (SMG) malignancies represent 5 – 15% of salivary gland neoplasms and are characterised by histological heterogeneity and variable biological behaviour. Surgical margins are widely regarded as a key prognostic factor. However, the relationship between the surgical margins and other pathological features in this subgroup remains incompletely defined. We aim to evaluate how margin clearance correlates with recurrence and outcomes in SMG malignancies.

MATERIAL & METHODS

We conducted a retrospective cohort study of patients who had undergone surgical resection of malignant SMG between (2017 – 2022). Pathological variables included histological subtype, tumour grade and stage, closest margin distance (mm), perineural invasion, recurrence patterns and survival outcomes. This represents a preliminary report of an evolving dataset.

RESULTS

12 patients underwent resection of SMG malignancy, predominantly adenoid cystic carcinoma (n=8), 66.7%. Margins were <1mm or narrowly excised in (n=8), 66.7%. Overall recurrences were seen in (n=4) 33.3% of cases with distant metastasis in (n=2) 16.7%, while isolated local recurrence in (n=2) 16.7%. Death from disease was (n=2) 16.7%. Of the patients with recurrence, (n=3) 75% had perineural invasion.

CONCLUSIONS

Our preliminary report suggests close surgical margins, specifically when accompanied by perineural invasion, may be associated with adverse oncological outcomes in SMG malignancy. Given these tumours are heterogeneous and rare, a collaborative multicentre dataset with standardised margin definitions is needed to quantify prognostic factors and guide management.

KEYWORDS

SMG, preliminary, perineural invasion, margins

OP-500

Occult Papillary Thyroid Carcinoma In Patients Undergoing Total Laryngectomy For Advanced Laryngeal Cancer

Özkan Tezgez[1], **Erdem Köroğlu**[2], **Birhan Alaçeri**[2]

[1]*Derince Training and Research Hospital;* [2]*Kocaeli Şehir Hastanesi*

BACKGROUND & AIM

The aim of this study was to investigate the prevalence of occult papillary thyroid carcinoma (PTC) in patients undergoing total laryngectomy with concomitant thyroid surgery for advanced laryngeal squamous cell carcinoma and to evaluate its potential clinical implications.

MATERIAL & METHODS

This retrospective multicenter study included patients who underwent total laryngectomy for advanced-stage laryngeal squamous cell carcinoma between 2011 and 2025. Patients who underwent simultaneous thyroid surgery were included in the analysis. Demographic characteristics, tumor localization, TNM stage, subglottic extension, thyroid cartilage invasion, extent of thyroid surgery, and histopathological findings were reviewed. Thyroidectomy specimens accompanying total laryngectomy materials were evaluated for occult PTC. None of the patients had preoperative suspicion of thyroid malignancy.

RESULTS

Among 136 patients who underwent total laryngectomy, 97 (71.3%) underwent concomitant thyroid surgery and constituted the study cohort. Occult PTC was identified in 4 patients (4.1%). All patients were male, with a mean age of 68 years. Three patients had T3 disease and one had T4a disease. Histopathological examination revealed unifocal tumors in three patients and multifocal disease in one patient. Papillary thyroid microcarcinoma was detected in three cases. No extrathyroidal extension, vascular invasion, or cervical lymph node metastasis related to PTC was observed. Only one patient received postoperative radioactive iodine therapy. During follow-up, no recurrence or progression related to PTC was detected.

CONCLUSIONS

Occult PTC may be detected in patients undergoing total laryngectomy with concomitant thyroid surgery for advanced laryngeal carcinoma. Most lesions demonstrated low-risk pathological features and indolent clinical behavior. These findings do not support routine total thyroidectomy solely for the detection of occult malignancy; however, careful preoperative and histopathological thyroid evaluation may be beneficial in selected patients.

Efficacy Of Fine Needle Aspiration Cytology With The Application Of The Milan System In Detecting Parotid Gland Histopathology

Selin Üstün Bezgin[1], **Şahin Öğreden**[1], **Yalçın Alimoğlu**[1], **Zeliha Kapusuz Gencer**[1], **Rabia Doğukan**[2], **Semih Tekin**[1], **Mehmet Salih Parça**[1], **Nursena Nair Polat**[1], **Özlem Özüm**[1], **Özgür Yiğit**[1]

[1]*University of Health Sciences Basaksehir Cam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Türkiye;* [2]*University of Health Sciences Basaksehir Cam and Sakura City Hospital, Department of Pathology, Istanbul, Türkiye*

BACKGROUND & AIM

The primary objective of this retrospective study was to investigate the diagnostic efficacy and clinical utility of the Milan System for Reporting Salivary Gland Cytopathology (MSRSGC) in evaluating parotid gland lesions. Furthermore, this research aimed to precisely determine the risk of malignancy (ROM) associated with each diagnostic category within this framework to better guide preoperative assessment in otorhinolaryngology practice.

MATERIAL & METHODS

A comprehensive retrospective review was conducted on patients who underwent parotidectomy surgery for parotid lesions at Başakşehir Çam and Sakura City Hospital between June 2020 and November 2025. Preoperative fine-needle aspiration cytology (FNAC) specimens were systematically re-evaluated and classified according to the standardized MSRSGC criteria. These cytological classifications were subsequently correlated with the definitive postoperative histopathological results. Statistical analyses were performed to calculate the ROM for each distinct diagnostic category, alongside core performance

metrics, including sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and overall accuracy for diagnosing malignancy.

RESULTS

The study evaluated the FNAC and histopathological results of 337 patients with parotid gland lesions. The MSRSGC-based classification demonstrated strong diagnostic performance in predicting malignant potential, yielding a sensitivity of 78 %, a specificity of 98%, a PPV of 92%, an NPV of 94%, and an overall accuracy of 96%. The calculated ROM for each MSRSGC category was observed as follows: Nondiagnostic (22.2%), Non-neoplastic (20%), Atypia of Undetermined Significance (AUS) (75%), Benign Neoplasm (1.9%), Salivary Gland Neoplasm of Uncertain Malignant Potential (SUMP) (41.7%), Suspicious for Malignancy (81.2%), and Malignant (92.9%).

CONCLUSIONS

The Milan System serves as a highly valuable, reliable, and standardized tool in the cytopathological evaluation of parotid gland lesions. Notably, the present study identified high malignancy risk rates within the indeterminate AUS and SUMP categories, highlighting their clinical complexity. Increasing the volume of published patient data across all categories in the literature is essential. Such ongoing refinement will contribute to more appropriate clinical management and optimized surgical decision-making.

parotid gland, Milan system, fine-needle aspiration, risk of malignancy

OP-502

In Vivo And Ex Vivo Intraoral Ultrasound For Depth Of Invasion And Deep Margin Assessment In TSCC: MRI And Histopathologic Correlation.

Ibrahim Canbazoglu[1], **Suleyman Cebeci**[1], **Mehmet Duzlu**[1], **Utku Aydil**[1], **Metin Yilmaz**[1]

[1]*Department of Otolaryngology–Head and Neck Surgery, Gazi University Faculty of Medicine, Ankara, Türkiye*

BACKGROUND & AIM

Assessment of depth of invasion (DOI) is fundamental to T staging, surgical planning, and prognosis in TSCC. While adequate mucosal margins are generally achievable, evaluating the deep surgical margin remains technically demanding and often depends on palpation and imaging. Although MRI is routinely used preoperatively, its accuracy in early-stage and superficial tumors may be affected by technical limitations and differences from histopathological DOI measurement. Intraoral ultrasonography provides real-time imaging and enables assessment of both in vivo DOI and the ex vivo deep margin. This study aimed to evaluate its diagnostic performance in comparison with MRI and histopathology.

MATERIAL & METHODS

This retrospective study included 13 patients with histopathologically confirmed tongue squamous cell carcinoma (TSCC) who underwent primary surgical resection at a tertiary referral center between 2021 and 2024. Patients with a history of prior surgery or radiotherapy or chemotherapy to the oral cavity were excluded. Preoperative intraoral ultrasonography (US) was performed in vivo using a high-frequency linear probe (15–18 MHz) with gentle perpendicular contact to reduce tissue compression. Following tumor resection, specimens were oriented and re-evaluated ex vivo using the same ultrasonographic technique to measure the deep surgical margin. All patients underwent contrast-enhanced MRI as part of routine preoperative staging. Histopathological examination was carried out on permanent sections, and DOI was defined according to AJCC 8th edition criteria. Measurements obtained from in vivo US, ex vivo US deep margin assessment, MRI (independently evaluated by a blinded radiologist), and histopathology were analyzed using correlation, agreement (ICC) and ROC analyses.

RESULTS

In this single-center cohort study of 13 patients with TSCC, intraoral ultrasonography (US) and MRI demonstrated strong correlations with pathological DOI (US:ρ=0.820, $p<0.001$; MRI: ρ=0.870, $p<0.001$). Both modalities demonstrated systematic overestimation compared with histopathology (US bias +1.53 mm, p=0.007; MRI bias +1.92 mm, p=0.017), while no significant difference was observed between US and MRI measurements (p=0.529). Agreement with pathology was excellent (ICC≈0.91–0.92). Pathological T-stage concordance was 61.5% for US and 53.8% for MRI, with moderate-to-substantial weighted kappa agreement (κ=0.51 and κ=0.63, respectively). US-derived DOI demonstrated excellent discrimination for nodal metastasis (AUC=0.976), with an exploratory cut-off of 7mm providing 85.7% sensitivity and 100% specificity. Ex vivo US measurements of medial surgical margins demonstrated a strong correlation with histopathology ($r = 0.789$, $p = 0.001$) and no systematic measurement bias. These findings support the diagnostic accuracy and clinical applicability of intraoral US for DOI assessment and preoperative risk stratification in TSCC.

CONCLUSIONS

Intraoral ultrasonography demonstrated high reliability for DOI assessment in TSCC, with strong correlation and excellent agreement with histopathology. Although both US and MRI tended to overestimate DOI, US showed comparable T-stage accuracy and superior discrimination for nodal metastasis in this cohort. The significant association between US-derived DOI and pathological nodal status highlights its value for preoperative risk stratification and surgical planning. Additionally, ex vivo US measurements of surgical margins correlated well with histopathology without systematic bias. These findings support

intraoral US as a practical and clinically valuable tool, with potential for broader integration into routine preoperative evaluation of TSCC.

Investigation Of Cornulin And Stratifin Proteins In Laryngeal Squamous Cell Carcinoma In Laryngeal Swab Samples And Laryngeal Tissue

Hatice Sena Karlı[1], **Orkun Eroğlu**[1], **İbrahim Hanifi Özercan**[1], **Abdulvahap Akyiğit**[1], **İrfan Kaygusuz**[1]

[1]*Firat University*

BACKGROUND & AIM

Laryngeal squamous cell carcinoma (LSCC) is one of the most common head and neck malignancies, and its early diagnosis is challenging. The invasive diagnostic methods increases the need for alternative non-invasive approaches. Cornulin (CRNN) is a protein specific to squamous epithelium and is associated with tumor progression; its decreased expression has been reported in squamous cell carcinomas. Stratifin is a protein that plays a role in cell cycle regulation and is associated with tumor development. This study aimed to evaluate the diagnostic contribution of laryngeal swab cytology in LSCC and to assess the expression patterns of cornulin and stratifin.

MATERIAL & METHODS

In this prospective study, laryngeal tissue and swab samples were obtained from 32 patients with a preliminary diagnosis of LSCC(group 1) who presented to the Department of Otolaryngology at Fırat University Hospital, 42 patients with a preliminary diagnosis of laryngeal polyps provided tissue and swabs samples(group 2), and 26 laryngeal swab samples were obtained from the healthy vocal cords of patients who underwent rhinoplasty/septoplasty surgery in our hospital(group 3). Swab samples were obtained under general anesthesia using silicone swab brushes from the surface of malignant and benign lesions and from the vocal cord mucosa in healthy individuals. The laryngeal swab samples were first classified cytomorphologically as squamous cell carcinoma, dysplasia, or normal cytology. Immunohistochemical staining for cornulin and stratifin proteins was performed on obtained tissue and swab samples. The prevalence and intensity of staining were evaluated in tissue samples, while only the intensity of staining was analyzed in swab samples.

RESULTS

Out of 32 laryngeal swab specimens that were histopathologically confirmed as LSCC were investigated 10 showed distinct malignant cytomorphological features, 13 showed findings consistent with dysplasia, and 9 showed normal epithelial cells. Only normal epithelial cells were observed in all swab samples obtained from group 2 and 3. Immunohistochemical examination revealed a significant decrease in cornulin and stratifin expression in malignant tissue samples. Histopathologically, cytology samples from cases diagnosed with LSCC showed lower immunohistochemical staining intensity in malignant cells, and tissue specimens showed reduced staining intensity and severity compared to normal epithelial cells. These findings yielded consistent results in terms of both cytological evaluation and immunohistochemical analysis.

CONCLUSIONS

Laryngeal swab cytology enabled the detection of malignant and dysplastic epithelial changes in a considerable proportion of LSCC specimens. The identification of normal cytological findings in benign lesions and healthy tissues further supports reliability of this method. The decreased expression of cornulin and stratifin in malignant tissues supports their potential role as diagnostic biomarkers in squamous cell carcinogenesis. Our study is the first in the literature to use the laryngeal swab method for the diagnosis of LSCC. In this respect, it offers significant promise for the early diagnosis and screening of LSCC and has the potential to guide future studies.

Prognostic Determinants Of Mortality In Oral Cavity And Oropharyngeal Cancer Surgery: A Single-Center Retrospective Analysis

Simge BAŞMAYA[1], **Yavuz GÜNDOĞDU**[1], **Orhan ASYA**[1]

[1]*Marmara University School Of Medicine, Department of Otorhinolaryngology , İstanbul, Türkiye*

BACKGROUND & AIM

Oral cavity and oropharyngeal cancers continue to demonstrate unsatisfactory survival outcomes despite advances in multimodal treatment. Identification of reliable pathological predictors remains essential for risk stratification and individualized treatment planning. This study aimed to determine mortality-associated prognostic factors in surgically treated patients and to evaluate site-specific oncological behavior.

MATERIAL & METHODS

A retrospective cohort study was conducted including 147 patients who underwent curative or diagnostic surgery for oral cavity and oropharyngeal cancers at a tertiary referral center between 2022 and 2025. Overall mortality was defined as the primary endpoint (20.5%). Clinicopathological variables were analyzed using Fisher's exact and Mann–Whitney U tests, and odds ratios with 95% confidence intervals were calculated. Histological grading and depth of invasion (DOI) analyses were performed in eligible cases according to AJCC 8th edition criteria.

RESULTS

The tongue represented the most common primary tumor site, whereas gingival tumors demonstrated the highest mortality rates. Positive surgical margins, perineural invasion, lymphovascular invasion, advanced nodal disease (N3b), lymph node metastasis, increased tumor size, higher histological grade, DOI greater than 10 mm, and female sex were significantly associated with mortality. Mortality increased stepwise with both DOI and tumor grade, confirming the prognostic validity of AJCC DOI thresholds. A strong correlation between increasing tumor grade and perineural invasion was identified. Tonsillar tumors demonstrated favorable outcomes associated with high HPV positivity, while gingival and mandibular tumors showed markedly poorer prognosis.

CONCLUSIONS

Depth of invasion, perineural invasion, and surgical margin status emerged as dominant predictors of mortality following surgery. Site-specific prognostic variability highlights the importance of tailored oncological assessment beyond conventional staging. The observed interaction between histological grade and perineural invasion represents a clinically relevant finding that may improve postoperative risk stratification and treatment decision-making.

Preoperative And Postoperative Quality Of Life Assessment In Patients Undergoing Parathyroid Adenoma Excision

Burak Kersin[1], **Bengisu Yazici Akkurt**[1], **Gülsah Koca**[1], **Tunahan Kus**[1], **Hanife Gulden Duzkalir**[2], **Asli Sahin Yilmaz**[1]

[1]Kartal Dr. Lutfi Kirdar City Hospital / Department of Otorhinolaryngology, Istanbul; [2]Kartal Dr. Lutfi Kirdar City Hospital / Department of Radiology, Istanbul

BACKGROUND & AIM

Primary hyperparathyroidism is associated with impaired quality of life (QoL), even in patients with mild biochemical abnormalities. This study aimed to evaluate changes in QoL before and after parathyroid adenoma excision and to investigate the relationship between QoL improvement, comorbidity burden, and gender.

MATERIAL & METHODS

This retrospective observational study included patients who underwent parathyroid adenoma excision between May 2024 and May 2025. Of 52 patients, 48 with complete follow-up data were analyzed. QoL was assessed using a standardized health-related questionnaire preoperatively and at 1, 3, 6, and 12 months postoperatively. Changes over time were analyzed using repeated-measures ANOVA. The relationship between 12-month QoL improvement and Charlson Comorbidity Index (CCI) was evaluated using Pearson correlation analysis, and gender differences were assessed using an independent-samples t-test.

RESULTS

QoL scores improved significantly over time ($F=10.12$, $p<0.001$). The mean QoL score increased from 63.2 preoperatively to 65.0, 66.0, 70.5, and 73.4 at 1, 3, 6, and 12 months, respectively. The most pronounced improvement was observed after the sixth postoperative month. No significant correlation was found between QoL improvement and CCI ($r=0.02$, $p=0.87$), and no significant difference in QoL improvement was observed between genders ($p=0.82$).

CONCLUSIONS

Parathyroid adenoma excision results in a significant and progressive improvement in quality of life, particularly in the mid- and late postoperative periods. These improvements appear to be independent of comorbidity burden and gender, highlighting the patient-centered benefits of surgical treatment.

OP-506

Impact Of Adjuvant Treatment On Functional Outcomes After Supracricoid Partial Laryngectomy: A Single-Center Cohort Study Of 131 Patients

Cömert Şen[1], **Cafer Karakuş**[1], **Onur Özçelik**[1], **Kübra Ozkaya Toraman**[2], **Murat Ulusan**[1], **Bora Başaran**[1], **İsmet Aslan**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery, Istanbul Faculty of Medicine, Istanbul University, Istanbul, Turkey;* [2]*Istanbul University Institute of Oncology, Department of Radiation Oncology*

BACKGROUND & AIM

Supracricoid partial laryngectomy (SCL) is an established organ-preservation procedure for laryngeal squamous cell carcinoma (SCC), reconstructed as cricohyoidoepiglottopexy (CHEP) or cricohyoidopexy (CHP). This study evaluates the impact of adjuvant treatment on decannulation success and feeding tube dependency following

MATERIAL & METHODS

Between January 2010 and December 2025, 164 consecutive patients underwent SCL at a single A single-center retrospective cohort study included 131 patients who underwent SCL (CHEP: n=84; CHP: n=47) between 2011 and 2025. Patients were categorized as no adjuvant therapy (n=91) versus adjuvant treatment (radiotherapy [RT] or chemoradiotherapy [CRT]; n=40). Reconstruction type (CHEP vs. CHP), arytenoidectomy status, and the addition of CT to RT (CRT vs RT-only) were also evaluated. Primary endpoints were successful decannulation within 6 months and the absence of permanent enteral tube dependency. Fisher's exact and chi-square tests were applied for group comparisons, with independent predictors identified by binary logistic regression ($p<0.05$).

RESULTS

The 6-month decannulation, overall decannulation, and long-term oral feeding rates were 81.7%, 88.5%, and 91.6%, respectively. The adjuvant group showed significantly lower 6-month decannulation (57.5% vs 92.3%; $p<0.001$), overall decannulation (72.5% vs 95.6%; $p<0.001$), oral feeding (80.0% vs 96.7%; $p=0.003$), and higher permanent percutaneous endoscopic gastrostomy (PEG) dependency (12.5% vs 2.2%; $p=0.027$) versus the no-adjuvant group. Reconstruction type significantly affected both outcomes: CHEP yielded 90.5% decannulation and 100.0% oral feeding versus CHP 66.0% and 76.6% (both $p<0.001$). The CHP+Adjuvant subgroup showed the poorest outcomes (decannulation 40.0%; oral feeding 60.0%). Arytenoidectomy had no significant impact on decannulation ($p=0.160$) or oral feeding ($p=0.435$). Within the adjuvant group, the addition of CT to RT had no significant impact on decannulation rates or permanent PEG dependency ($p>0.05$). On multivariate analysis, CHP technique (OR=0.07; 95% CI 0.02-0.32; $p=0.001$), advanced age (OR=0.83/year; $p=0.001$), and adjuvant treatment remained independent predictors of decannulation failure.

CONCLUSIONS

Adjuvant treatment significantly impairs decannulation and oral feeding following SCL, with the most critical burden in the CHP+Adjuvant subgroup. Reconstruction type (CHEP vs. CHP) is the strongest independent predictor of functional outcome, underscoring the importance of epiglottis preservation when oncologically feasible. Arytenoidectomy does not impair functional rehabilitation and should not be avoided when necessary to secure safe oncological margins. Notably, the addition of CT to RT does not significantly affect decannulation success or enteral tube dependency in the adjuvant setting.

Spatial Transcriptomics Identifies CAF Remodeling Pathways And Immune Checkpoint Ligands In Adenoid Cystic Carcinoma

Kentaro Hori[1], **Yoh-ichiro Iwasa**[1], **Shintaro Yamazaki**[1], **Yoh Yokota**[1], **Yutaka Takumi**[1]

[1]*Shinshu University School of Medicine*

BACKGROUND & AIM

Adenoid cystic carcinoma (ACC) is clinically therapy-resistant, and effective systemic treatment options remain limited. The tumor microenvironment, including stromal remodeling and immune regulatory signals, may contribute to ACC progression and treatment resistance. Using Visium spatial transcriptomics on formalin-fixed, paraffin-embedded (FFPE) tissue, we aimed to characterize cancer-associated fibroblast (CAF)-associated stromal pathways and immune checkpoint ligand expression in ACC within the same tissue section. These spatial features may provide insight into candidate therapeutic targets.

MATERIAL & METHODS

Spatial transcriptomes from FFPE specimens of three ACC cases were generated using 10x Genomics Visium and analyzed by Seurat-based clustering. Clusters were annotated using concordance between MCP-counter immune and stromal abundance scores and canonical marker genes from Seurat FindAllMarkers. Tumor-associated clusters were defined as a transcriptome-based tumor compartment using tumor marker expression patterns rather than morphology alone. CAF-rich clusters were defined within stromal regions, and pathway enrichment using Hallmark and KEGG gene sets was performed to compare CAF-rich and other stromal clusters. Immune checkpoint ligand expression was evaluated in tumor clusters.

RESULTS

Across all three cases, CAF-rich clusters were localized near tumor regions. Pathway enrichment highlighted activated stromal remodeling, with epithelial mesenchymal transition in Hallmark gene sets and extracellular matrix receptor interaction and

focal adhesion in KEGG gene sets consistently enriched. In tumor clusters, PD-L1 expression was low, whereas B7-H4 (VTCN1) was prominent. Additional inhibitory ligand candidates included NECTIN2 (PVRL2).

CONCLUSIONS

Visium FFPE profiling of ACC identified CAF-associated stromal remodeling pathways and tumor immune checkpoint ligand candidates, including B7-H4. These findings suggest that combined targeting of stromal remodeling and checkpoint ligands in ACC may represent a rational therapeutic strategy.

OP-508

Oncological Management Of Patients With Locoregional Recurrence And/Or Metastatic Progression (R/M) Of Head And Neck Squamous Cell Carcinoma (HNSCC) In The Era Of Anti-PD1 Therapy: Results From Two Retrospective Studies Conducted At The Strasbourg Cancer Institute (ICANS)

Philippe Schultz[1], **Mickael Burgy**[2], **Carole Pflumio**[2], **Hélène Carinato**[2], **Thibault Dedieu**[1], **Christian Borel**[2]

[1]*Head & Neck Department University hospital Strasbourg, France;* [2]*Oncology Department, Strauss Institute, Strasbourg, France*

BACKGROUND & AIM

In the recurrent/metastatic (R/M) setting, when no longer amenable to surgery or re-irradiationImmunotherapy, has led to significant progress, initially in the second-line setting after platinum failure with nivolumab (CHECKMATE 141 study in 2016), and then in the first-line setting with pembrolizumab alone or combined with chemotherapy (Cis or Cb/5-FU) (KEYNOTE-048 study in 2019). These approaches have enabled a proportion of durable responses, with mOS increasing to 13 months and 5-year survival reaching 15%

Two questions arise:

- What is the role of taxanes in the first-line setting in terms of efficacy and tolerability?
- What second-line treatment should be proposed after platinum salts and pembrolizumab

MATERIAL & METHODS

To address the first question, we retrospectively analyzed a cohort of 39 patients treated at ICANS in the first-line R/M setting with a combination of paclitaxel (80 mg/m² weekly), carboplatin (AUC2 weekly), and pembrolizumab (200 mg every 3 weeks) for 4 to 6 cycles, followed by maintenance pembrolizumab every 3 weeks (PCP regimen).

To address the second question, we retrospectively analyzed a cohort of 26 patients treated at ICANS in the second or third-line R/M setting after failure of anti-PD1 ± platinum salts, with a combination of paclitaxel (80 mg/m² weekly), carboplatin (AUC2 weekly), and cetuximab (400 mg/m² loading dose followed by 250 mg/m² weekly) for 16 weekly infusions, followed by maintenance cetuximab (PCC regimen).

RESULTS

PCP regimen: first-line R/M Thirty-nine consecutive patients were identified and treated Median age was 63 years, PS2 in 18%, CPS>1 in 100%.

Twenty percent of patients had T4b and/or N3, 54% had loco-regional recurrence in previously irradiated areas.

The ORR was 79%, including 7 complete responses and 24 partial responses. With a median follow-up of 19 months, median progression-free survival (mPFS) was 7.9 months and mOS was 17.2 months.

PCC regimen: second or third-line R/M (platinum and/or paclitaxel-free interval ≥3 months) Twenty-six consecutive patients were treated. Median age was 59 years, PS2 in 27%.

Sixty-two percent received PCC as second-line treatment after failure of immune checkpoint inhibitors, and 38% as third-line treatment after platinum-based chemotherapy plus CTX followed by anti-PD1 at progression.

The ORR was 62%, with a disease control rate of 84%. With a median follow-up of 18 months, mPFS was 5.3 months, with 4 patients maintaining complete remission, and mOS was 14.7 months.

CONCLUSIONS

The PCC regimen in the second or third-line R/M setting yields results that appear markedly superior to paclitaxel monochemotherapy, which is usually proposed after carboplatin/5-FU + pembrolizumab.

Within the PCC regimen:

- Cetuximab plays a major role, suggesting probable synergy with anti-PD1 agents.
- Approximately 15% of durable complete responses (lasting several years) are observed, even after cetuximab discontinuation.
- After anti-PD1 therapy, rechallenge with previously used drugs is feasible, provided that the treatment-free interval is at least 3 months.

Paclitaxel, carboplatin, cetuximab, pembrolizumab

OP-509

THE ROLE OF ORAL MICROBIOTA IN ORAL CAVITY SQUAMOUS CELL CARCINOMAS

Özge Çam[1], **Haydar Murat Yener**[1]

[1]*Istanbul University Cerrahpasa, Cerrahpasa Faculty of Medicine, Istanbul, Turkey*

BACKGROUND & AIM

Oral cavity cancers have a relatively high survival rate when detected early. Although treatment has improved in recent years, early diagnosis is still very important for a better prognosis. The oral cavity serves as one of the largest microbial reservoirs in the human body, and microbial variations in the oral cavity are highly associated with malignancies. The aim of our study was to evaluate the role of oral microbiota in oral cavity cancers and whether targeting them would provide diagnostic, prognostic or therapeutic benefits.

MATERIAL & METHODS

Our study included 20 patients with confirmed pathological diagnosis of OSCC between 2024-2025 and 20 healthy controls. Samples were taken from tumor tissue in the study group and from intact mucosa in the healthy group using a sterile swap method. The samples were delivered to the laboratory for DNA extraction and purification. The isolated DNA was then used in an amplicon-based metagenomic study and next-generation sequencing (NGS) was performed. Metagenomic bioinformatic analysis of V3-V4 amplicon sequences was performed. The composition and abundance of bacterial species between the groups were compared targeting them would provide diagnostic, prognostic or therapeutic benefits.

RESULTS

Capnocytophaga, Alloprevotella, TM7x (Candidatus Saccharibacteria), Prevotella, Gemella and Treponema were found more in the patient group compared to the control group. In the control group, Veillonella, Streptococcus, Haemophilus, Hoylesella and Lautropia genera were detected at higher rates. Phocaeicola and Parvimonas genera were observed to be found at higher rates in the patient group, while Oribacterium, Mycoplasma and Filifactor genera were detected more dominantly in the control group.

CONCLUSIONS

Findings indicate a possible relationship between oral microbiota and carcinogenesis. Dysbiotic changes in the microbiota may affect the tumor microenvironment through mechanisms such as chronic inflammation and immune modulation. These results suggest that the microbiota is not just a passive IX environmental component but a potentially active contributor to the development of OSCC.

OP-510

Validity And Reliability Study Of The Turkish Version Of The Parotidectomy Quality Of Life Index (PQOL-TR) In Patients Who Underwent Parotidectomy

Parmida Soysal[1], **Tankut Uzun**[1]

[1]*Bakırçay University Faculty of Medicine, Department of Otorhinolaryngology, İzmir, Türkiye*

BACKGROUND & AIM

Parotidectomy may lead to functional, aesthetic, and psychosocial consequences that can affect patients' quality of life. Disease-specific patient-reported outcome measures are essential for evaluating postoperative outcomes. This study aimed to assess the validity and reliability of the Turkish version of the Parotidectomy Quality of Life Index (PQOL-TR) in patients who underwent parotidectomy.

MATERIAL & METHODS

A total of 114 patients who underwent parotidectomy were included in this study. The PQOLI was translated and culturally adapted into Turkish and administered postoperatively. Internal consistency was assessed using Cronbach's alpha coefficients. Construct validity was evaluated using factor analysis, including Kaiser–Meyer–Olkin (KMO) measure and Bartlett's test of sphericity. Demographic data, surgical type, histopathological findings, and postoperative facial nerve function were recorded and analyzed.

RESULTS

A total of 114 patients who underwent parotidectomy were included in the study. The mean age was 57.9 ± 14.2 years (range, 14–90). Of the participants, 59.6% were male (n=68) and 40.4% were female (n=46). Superficial parotidectomy was performed in 78.1% (n=89) and total parotidectomy in 21.9% (n=25). Histopathological examination revealed benign lesions in 89.5% of cases and malignant pathology in 10.5% (n=12). Postoperative facial nerve function was preserved in 89.5% of patients, while 10.5% (n=12) exhibited facial nerve dysfunction. The Turkish PQOLI demonstrated good internal consistency (Cronbach's α = 0.848). Domain-specific Cronbach's alpha values ranged from 0.537 to 0.895. The KMO value was 0.702, and Bartlett's test of sphericity was statistically significant ($p < 0.001$), confirming the suitability of the dataset for factor analysis.

CONCLUSIONS

The Turkish PQOLI demonstrated good overall internal consistency in patients assessed after parotidectomy. Most multi-item domains showed acceptable-to-excellent reliability, whereas the facial nerve function domain exhibited lower internal consistency. Malignant pathology was present in 10.5% of cases, and postoperative facial nerve function was preserved in the majority of patients. The significant Bartlett's test and acceptable KMO value indicate that the dataset was suitable for factor-analytic evaluation, supporting the feasibility of using the Turkish PQOLI as a patient-reported outcome measure in Turkish-speaking populations.

OP-511

Lymph Node Ratio Strongly Predicts Extranodal Extension After Neck Dissection In Head And Neck Cancer

Togay MÜDERRİS[1], **Gökçe ÇETİN DEMİR**[1]

[1]*Department of Otolaryngology–Head and Neck Surgery, İzmir Bakırçay University Çiğli Training and Research Hospital, İzmir, Turkey*

BACKGROUND & AIM

Lymph node ratio (LNR), defined as the number of metastatic lymph nodes divided by the total number of excised nodes, has emerged as a continuous marker of nodal tumor burden in head and neck cancer. We evaluated the agreement between clinical (cN) and pathological (pN) nodal staging and determined whether LNR independently predicts extranodal extension (ENE) and other adverse pathological features.

MATERIAL & METHODS

This single-center retrospective cohort study included 119 consecutive patients who underwent neck dissection for head and neck malignancies between 2020 and 2024. Demographic and clinicopathological data, including primary tumor site, lymph node counts, LNR, ENE, perineural invasion (PNI), lymphovascular invasion (LVI), and nodal staging, were recorded.

Patients with incomplete nodal data, prior neck treatment, non-malignant pathology, or absence of formal neck dissection were excluded.

Clinical–pathological nodal agreement was assessed using Cohen's kappa, sensitivity, specificity, and the McNemar test. Receiver operating characteristic (ROC) analysis identified the optimal LNR cut-off for predicting ENE. Univariable and multivariable logistic regression analyses were performed to identify independent predictors of ENE.

RESULTS

Pathological nodal metastasis was present in 58.8% of patients, while ENE was observed in 34.5%. Clinical–pathological nodal agreement was moderate ($\kappa = 0.342$, $p<0.001$), with a sensitivity of 50.0%, specificity of 87.5%, and accuracy of 65.3%. Occult metastasis was detected in 45.5% (35/77) of clinically node-negative patients.

Higher LNR values were significantly associated with ENE ($p<0.001$), advanced pathological nodal stage ($p<0.001$), and LVI ($p<0.001$). ROC analysis demonstrated good discriminative ability of LNR for predicting ENE (AUC = 0.824, 95% CI: 0.748–0.900), with an optimal cut-off value of 0.031 (sensitivity 85%, specificity 73%).

LNR differed significantly across primary tumor sites ($p=0.013$), with the highest values observed in cancer of unknown primary and thyroid malignancies.

On multivariable logistic regression analysis, LNR remained an independent predictor of ENE ($p<0.001$).

CONCLUSIONS

Clinical nodal staging shows only moderate agreement with pathological staging and fails to reliably detect occult metastasis, supporting the use of elective neck dissection. Lymph node ratio is a strong and independent predictor of extranodal extension and reflects aggressive tumor biology. LNR may serve as a simple and clinically actionable marker to identify high-risk patients who may benefit from intensified postoperative management.

OP-512

Neoadjuvant Therapy Of Juvenile Nasopharyngeal Angiofibroma

Grachev Nikolay Sergeevich[1], **Vorozhtsov Igor Nikolaevich**[1], **Druy Alexander Evgenievich**[1], **Chechev Egor Igorevich**[1]

[1]*Dmitry Rogachev National Medical Research Center Of Pediatric Hematology, Oncology and Immunology*

BACKGROUND & AIM

Juvenile angiofibroma of the skull base and nasopharynx is a benign neoplasm. The main directions in therapy of JNA are searching a method to reduce the risk of massive bleeding during surgical treatment of juvenile angiofibroma of the skull base and to reduce the risk of recurrence or progression of JNA in the postoperative period.

MATERIAL & METHODS

Currently at the Dmitry Rogachev NMRC of PHOI is conducting a prospective open non–randomized interventional study with a historical control group in accordance with the international standard of ethical standards and quality of scientific research - GCP (good clinical practice) since 30 may 2022r.

RESULTS

In Dmitry Rogachev NMRC of PHOI at the moment, 231 patients have received surgical treatment for JNA. At the moment, the pilot phase of the study has been completed with the achievement of control points. The main phase of the study has begun in patients with primary JNA. The recruitment of patients with recurrent angiofibroma in the pilot phase of the study continues. At the moment, 14 patients out of 15 patients with primary JNA in the pilot phase of the study have managed to achieve a reduction in tumor volume of more than 20%. In a number of several patients with recurrent JNA, surgical treatment was avoided in the absence of complaints of impaired nasal breathing and nosebleeds.

CONCLUSIONS

Surgical treatment of juvenile angiofibroma of the base of the skull is currently the method of choice of therapy, especially for patients with primary angiofibroma with a small tumor volume and with the stage I-II tumors according to the Fisch-Andrews classification. Of particular interest is the study of the effectiveness of targeted therapy with mTOR inhibitors, however, the efficacy and safety of Sirolimus requires further study.

Our Results Of Thyroidectomy In Patients With Laryngeal Cancer Involving The Subglottic Extension

Berk Alsancak[1], **İlda Tanrısever Pehlivan**[1], **Elvan Onan**[1], **Çağlar Eker**[1], **Muhammed Dağkıran**[1], **Özgür Sürmelioğlu**[1]

[1]*Çukurova University Faculty of Medicine, Department of Otolaryngology*

BACKGROUND & AIM

Thyroid gland invasion in laryngeal carcinoma is relatively uncommon but is reported more frequently in patients with subglottic extension and advanced-stage disease. Routine thyroidectomy during total laryngectomy remains controversial because unnecessary thyroid resection may increase postoperative endocrine morbidity. To evaluate thyroidectomy outcomes and histopathological thyroid gland invasion rates in patients with laryngeal carcinoma with subglottic extension.

MATERIAL & METHODS

A retrospective review was performed on 129 patients who underwent total laryngectomy for laryngeal squamous cell carcinoma between 2013 and 2024. Demographic characteristics, tumor stage, subglottic extension, thyroidectomy type, and histopathological thyroid gland invasion were evaluated. Thyroid invasion was defined as direct microscopic tumor infiltration into thyroid parenchyma. Cases showing only thyroid proximity without invasion were excluded. Statistical analyses were performed using SPSS software, and $p<0.05$ was considered statistically significant.

RESULTS

A total of 129 patients were included in the study, of whom 80 (62.0%) had subglottic extension. Thyroidectomy was performed in 67 patients (51.9%), including total thyroidectomy and hemithyroidectomy procedures.

Among patients with subglottic extension, 80% underwent thyroidectomy. Histopathological examination demonstrated true thyroid gland invasion in 7 patients (5.4%), with 6 of these patients showing subglottic extension.

All patients with thyroid gland invasion had T4-stage disease. Although thyroidectomy was frequently performed in patients with subglottic extension, the overall incidence of thyroid involvement remained relatively low.

CONCLUSIONS

The present study demonstrated that although thyroid gland invasion was more common in patients with subglottic extension, its overall incidence remained relatively low. Furthermore, all patients with thyroid invasion had T4-stage disease. These findings suggest that thyroidectomy should not be routinely performed in all patients with subglottic extension but rather selectively considered in patients with high-risk features suggestive of thyroid involvement.

This selective approach may preserve oncologic safety while minimizing unnecessary endocrine morbidity.

OP-514

Implementation Of Minimally Invasive Surgery In Patients With Parameningeal Rhabdomyosarcoma. Experience At The Dmitry Rogachev National Medical Research Center For Pediatric Hematology, Oncology, And Immunology.

Grachev Nikolay Sergeevich[1], **Vorozhtsov Igor Nikolaevich**[1], **Kachanov Denis Yurevich**[1], **Shevtsov Denis Valerievich**[1], **Chechev Egor Igorevich**[1]

[1]Dmitry Rogachev National Medical Research Center Of Pediatric Hematology, Oncology and Immunology

BACKGROUND & AIM

Rhabdomyosarcoma (RMS) is a malignant tumor of mesenchymal origin and is the most common type of soft tissue sarcoma in children, accounting for 3-4% of all cases of malignant neoplasms (MN) in childhood. Severe complications after extensive resections in children with PM localization of RMS often lead to disruption of the timing of systemic chemotherapy, and thus directly negatively affect the prognosis of the disease, which emphasizes the importance of using transnasal endoscopic surgery.

MATERIAL & METHODS

The study included 46 patients aged 1 to 17 years, diagnosed with RMS, who received special treatment from 2012 to 2025. All the patients received drug treatment according to the protocols CWS-2009 and CWS-2014. In all cases, minimally invasive endoscopic resection (MIER) was performed.

RESULTS

The volume of surgical interventions performed was distributed as follows: R0 resection was performed in 21 cases (44%), R1 in 21 cases (44%), and R2 in 4 cases (12%). 39(84%) patients are alive without signs of disease recurrence. 7 (16%) patients died after relapse/progression of the disease.

CONCLUSIONS

The introduction of minimally invasive surgery technology is of key importance in the treatment of patients with RMS of PM localization. In relation to PM localization, the introduction of minimally invasive surgery will not only improve and expand the possibilities of surgical treatment in children, but also achieve better results in terms of cosmetic defects, recovery rate and, as a result, improvement in overall and event-free survival rates.

Individualised Deintensified Versus Standard Follow-Up After Curative Treatment In Head And Neck Cancer: A Randomised Pilot Study (Deintensif)

Roland Giger[1], **Simon A. Mueller**[2], **Thomas Stadler**[2], **Gregoire Morand**[2], **Gunesh Rajan**[3], **Sara-Lynn Hool**[1], **Daniel H. Schanne**[4], **Panagiotis Balermpas**[5], **Samantha Chan**[6], **Jean-Benoit Rossel**[6], **Sven Trelle**[6], **Olgun Elicin**[4]

[1]ENT, Head and Neck Surgery, Inselspital, Bern University Hospital, Bern, Switzerland; [2]ENT, Head and Neck Surgery, Zurich University Hospital, Zurich, Switzerland; [3]ENT, Head and Neck Surgery, Lucern Cantonal Hospital, Lucern, Switzerland; [4]Radiation-Oncology, Inselspital, Bern University Hospital, Bern, Switzerland; [5]Radiation-Oncology, Zurich University Hospital, Zurich, Switzerland; [6]Clinical Research, University of Bern, Bern, Switzerland

BACKGROUND & AIM

Around 70% of head and neck cancer patients present with advanced disease. Oncological follow-up is essential for detecting recurrence and secondary malignancies, yet high-level evidence on optimal strategies is lacking. This study proposes a prospective, randomised, multicentre trial comparing traditional follow-up with a less intensive, individualised approach with active patient participation that relies on patient-reported outcome monitoring (PROM questionnaire). We hypothesise that this approach achieves similar survival outcomes with greater diagnostic efficiency. The pilot study evaluated the feasibility and compliance of monthly paper-based PROM monitoring.

MATERIAL & METHODS

This pilot study is part of a main trial. Following curative treatment, patients from three Swiss tertiary centres were randomised into an experimental (PROM-based, less intensive) or standard (traditional) follow-up group. Warning symptoms or missing PROM submissions triggered premature visits in the experimental group.

RESULTS

Feasibility was confirmed with 30 patients enrolled over 12 months; 84% of eligible patients agreed to participate. Reduced imaging motivated 55% of participants. All patients found the PROM questionnaire comprehensive and communication-enhancing, with 94% completing it in ≤10 minutes. Compliance reached 98.5%; 60% preferred an electronic version. PROM alerts led to early follow-up in 9.8% of cases, detecting recurrence or secondary malignancies in 4 patients.

CONCLUSIONS

Recruitment and PROM use proved feasible and was well accepted. The main trial will expand to 30 international sites, include 344 participants recruted over 2 years, and implement an electronic PROM monitoring to confirm non-inferiority of individualised, less intensive follow-up with active patient participation regarding overall survival.

Neutrophil-To-Lymphocyte Ratio As A Predictor Of Clinical Management In Peritonsillar Abscess

Rukiye Özçelik Erdem[1], **Leyla Alisoy**[1], **Mehmet Akif Dündar**[1]

[1]*Department of Otorhinolaryngology, Necmettin Erbakan University Medical Faculty*

BACKGROUND & AIM

Peritonsillar abscess (PTA) is one of the most common deep neck infections requiring inpatient management. While several inflammatory markers are routinely evaluated, their role in predicting clinical course and management decisions remains unclear. This study aimed to investigate the predictive value of the neutrophil-to-lymphocyte ratio (NLR) in determining prolonged hospitalization and the need for radiologic evaluation in hospitalized PTA patients.

MATERIAL & METHODS

A retrospective analysis was conducted on 54 consecutive patients hospitalized with PTA. Prolonged hospitalization was defined as length of stay >4 days (median-based cut-off; 27 vs 27 patients). Inflammatory markers including white blood cell count (WBC), C-reactive protein (CRP), hemoglobin (Hb), systemic immune-inflammation index (SII), and NLR were analyzed. Univariate comparisons were performed using Mann–Whitney U tests. Logistic regression models were used to identify independent predictors. Receiver operating characteristic (ROC) analysis was performed to determine the discriminative ability of NLR.

RESULTS

Among evaluated parameters, only NLR was significantly associated with prolonged hospitalization (p=0.021). In unadjusted logistic regression, NLR independently predicted prolonged stay (OR=1.146, p=0.032). After adjustment for age, NLR remained an independent predictor (OR=1.152, p=0.029). ROC analysis demonstrated moderate discriminative ability (AUC=0.683), with an optimal cut-off value of approximately NLR ≥6.

Additionally, higher NLR values were independently associated with the need for radiologic evaluation (OR=1.230, p=0.017; AUC=0.675). WBC, CRP, Hb, SII, abscess size, and trismus showed no significant association with hospitalization duration or imaging requirement.

CONCLUSIONS

In hospitalized PTA patients, NLR appears to reflect clinical course rather than local abscess characteristics. Elevated NLR values are independently associated with prolonged hospitalization and increased likelihood of radiologic evaluation. NLR may serve as a simple and accessible biomarker to support clinical management decisions in PTA.

OP-517

Surgical Approaches And Outcomes In Locally Advanced (T4) Differentiated Thyroid Carcinoma

Athanasios Ioannidis[1], **Stavroula Mouratidou**[1], **Ricard Simo**[1], **JP Jeannon**[1], **Aleix Rovira**[1]

[1]*Guy's and St. Thomas' NHS Trust*

BACKGROUND & AIM

Locally advanced differentiated thyroid carcinoma (DTC) represents a small subset of thyroid malignancies but carries significant operative complexity due to potential invasion of the trachea, esophagus, and recurrent laryngeal nerve (RLN). Achieving negative margins while preserving vital structures remains challenging. This study aimed to evaluate surgical strategies and outcomes in patients with invasive (T4) DTC over a ten-year period at a tertiary referral centre.

MATERIAL & METHODS

A retrospective cohort study was conducted of all adult patients who underwent surgery for pathologically confirmed T4 DTC between 2013 and 2023, with ≥24 months' follow-up. Pre-operative imaging with computed tomography (CT) and/or magnetic resonance imaging (MRI) informed surgical planning through multidisciplinary team (MDT) discussion. Surgical technique was individualized according to the extent of invasion. Primary outcomes included operative approach, morbidity, recurrence, and overall survival.

RESULTS

Forty-three patients (mean age 52 years; 56% female) were included; 13 had previous surgery elsewhere. Pre-operative vocal cord palsy was present in 44% and distant metastases in 23%. RLN sacrifice occurred in 58%, tracheal resection in 28%, and sternotomy in 16%. Aggressive histological subtypes (tall-cell, diffuse sclerosing) comprised 51% of cases. Permanent vocal cord palsy occurred in 58%, transient hypoparathyroidism in 16%, and postoperative haemorrhage in 7%. No disease-specific mortality was observed; locoregional recurrence occurred in 9%.

CONCLUSIONS

Individualized, MDT-guided surgery enables effective disease control and acceptable morbidity in T4 DTC. Tailored resection, complemented by adjuvant radioiodine therapy, supports favorable long-term outcomes. Concentration of such cases in experienced, high-volume centres is crucial for optimizing results. The structure of the abstract is:

Surgical Indications And Natural Course Of Benign Parotid Tumors

Rima Osawa[1], **Hiromitsu Hatakeyama**[1], **Takashi Wada**[1], **Toshimasa Aoki**[1], **Kenta Fukui**[1], **Kiyoshi Sakasai**[1], **Anna Tsubokura**[1], **Nobuhiko Oridate**[2]

[1]*Yokohama City University Medical Center;* [2]*Yokohama City University Hospital*

BACKGROUND & AIM

Surgical resection is often indicated for benign parotid tumors, whereas observation may be chosen for elderly or comorbid patients. Delayed intervention may lead to tumor growth, increased surgical difficulty, and delayed detection of malignancy. This study investigated factors associated with surgery and tumor-size changes during observation, focusing on Warthin tumors.

MATERIAL & METHODS

A total of 1,006 patients with parotid tumors treated from January 2000 to December 2024 were reviewed. After excluding FNAC classes 0, III, IIIb, IV, and V, missing FNAC class, pleomorphic adenoma, atypical diagnoses, epithelial cell abnormality, missing cytological diagnoses, biopsy cases, and cases treated surgically at other institutions, 547 benign or probably benign tumors were analyzed. Surgery was defined as resection within one year after the first visit; 198 patients underwent surgery and 349 were observed. Among observed patients, 131 with evaluable tumor-size changes were analyzed. Annual growth rates and postoperative pathology were reviewed for FNAC-diagnosed Warthin tumors.

RESULTS

Surgery was associated with younger age (median, 62 vs 69 years; $p<0.001$), ASA-PS 1–2 (96.0% vs 75.9%; $p<0.001$), larger tumor diameter (median, 31 vs 24 mm; $p<0.001$), FNAC class IIIa (34.3% vs 25.8%; $p=0.034$), and deep-lobe or whole-gland involvement (12.1% vs 6.9%; $p=0.037$). Sex, bilaterality, and an FNAC diagnosis of Warthin tumor were not associated with surgery. In the observation cohort, enlargement, stability, and regression were observed in 49, 44, and 38 patients, respectively. Bilaterality ($p=0.004$) and an FNAC diagnosis of Warthin tumor ($p<0.001$) were associated with tumor growth. Among 47 FNAC-diagnosed Warthin tumors for which annual growth rates could be calculated, the median growth rate was 1.85 mm/year. Among 129 surgically treated FNAC-diagnosed Warthin tumors, postoperative pathology confirmed Warthin tumor in 115 cases (89.1%), other benign lesions in 10 (7.8%), and malignancy in 4 (3.1%).

CONCLUSIONS

Age, systemic condition, tumor size, FNAC class, and tumor location influenced surgical decision-making. FNAC-diagnosed Warthin tumors were pathologically confirmed in nearly 90% of surgically treated cases, although a small proportion were malignant. Because Warthin tumors frequently enlarged during observation, surgical timing should be individualized using multiple clinical factors.

DIAGNOSTIC ACCURACY OF PREOPERATIVE ULTRASONOGRAPHY IN PREDICTING POSTOPERATIVE HISTOPATHOLOGICAL DIAGNOSIS AND MASS SIZE IN THYROID NODULES

MEHMET KESKİN[1], **SALİH AKYEL**[1], **SERHAT BAYRAK**[1], **TÜRKÜ BAYRAMOĞLU**[1], **MUHAMMED GAZİ KÜÇÜKBAY**[1], **ÖZGÜR YİĞİT**[1]

[1]*Department of Otorhinolaryngology, Başakşehir Çam and Sakura City Hospital, Istanbul, Turkey*

BACKGROUND & AIM

The widespread use of high-resolution ultrasonography (USG) has substantially increased the detection of thyroid nodules, while only approximately 5–10% of these lesions are malignant. The American College of Radiology Thyroid Imaging Reporting and Data System (ACR TI-RADS) was developed to refine malignancy risk estimation and standardize reporting. The aim of this study was to evaluate the diagnostic accuracy of preoperative USG (TI-RADS score, mass size, lymph node assessment) in predicting definitive postoperative histopathological diagnosis and macroscopic mass size in patients undergoing thyroid surgery.

MATERIAL & METHODS

In this retrospective, observational, single-center study, patients who underwent subtotal or total thyroidectomy for thyroid mass at Başakşehir Çam and Sakura City Hospital between March 2020 and January 2026 were analyzed. Preoperative USG

findings (ACR TI-RADS score, maximum mass dimension, cervical lymph node positivity, sonographic extrathyroidal extension) were retrieved from the Hospital Information System and matched with definitive postoperative pathology reports (final diagnosis, macroscopic mass size, capsular invasion, lymphatic invasion, extrathyroidal extension, surgical margin status). Cases of metastases from non-thyroidal primary malignancies were excluded. A total of 76 lobes/lesions from 64 patients were analyzed. Statistical analyses included descriptive statistics, Pearson chi-square / Fisher's exact test, Mann–Whitney U test, paired t-test / Wilcoxon signed-rank test, Pearson correlation, Cohen's kappa, and Bland–Altman analysis. 95% confidence intervals (CI) for proportions were calculated with the Wilson method. Statistical significance was set at $p < 0.05$.

RESULTS

This study evaluated the diagnostic performance of preoperative ultrasonography (USG) and ACR TI-RADS classification in predicting thyroid malignancy, as well as the agreement between USG and pathological tumor size.A total of 64 patients with 76 thyroid lesions were included.The overall lesion-based malignancy rate was 76.3%.All TI-RADS 5 lesions were malignant (100%), demonstrating perfect specificity and positive predictive value, but low sensitivity (24.1%).The TI-RADS ≥4 threshold showed moderate sensitivity (56.9%) and low specificity (44.4%), with limited overall accuracy.Cervical lymph node positivity on USG had high specificity (83.3%) but low sensitivity (22.4%). USG and pathological measurements showed a strong positive correlation ($r = 0.731$, $p < 0.001$), with no significant difference between mean sizes, although agreement was limited. Papillary thyroid carcinoma was the most common histopathological subtype.These findings suggest that TI-RADS 5 and lymph node positivity are strong rule-in markers, while overall diagnostic performance may be affected by surgical cohort selection bias.

CONCLUSIONS

Preoperative ultrasonography shows strong correlation with pathological tumor size ($r = 0.731$), although wide variability limits precise dimensional planning. ACR TI-RADS 5 is a reliable rule-in marker for malignancy with perfect positive predictive value, while intermediate categories (TI-RADS 2–4) demonstrate limited discriminatory power in surgical cohorts, likely due to selection bias. Sonographic cervical lymph node positivity is strongly associated with malignancy and provides additional value in preoperative assessment. Overall, USG remains essential in thyroid evaluation, but its diagnostic performance is optimized when combined with TI-RADS-based risk stratification, cytological findings, and clinical context rather than used alone.

Tailored Approach To Surgical Management Of Advanced Thyroid Cancer

MOHAMMED ALESSA[1]

[1]*KING SAUD UNIVERSITY*

BACKGROUND & AIM

Locally invasive thyroid cancer is an uncommon disease process, which carries significant morbidity and mortality. Surgical strategy should evolve from multidisciplinary discussion that integrates individual disease characteristics and patient preference. Intraoperative neuromonitoring has important applications in surgery for advanced disease and should be used to guide surgical strategy and intraoperative decision-making

I will present an algorithm tailored for surgical managment of locally advanced thyroid carcinoma

MATERIAL & METHODS

I will present varierty of cases presented with laryngotracheal , esophageal and vascular invasion

RESULTS

I will present varierty of cases presented with laryngotracheal , esophageal and vascular invasion

CONCLUSIONS

Surgical treatment of advanced thyroid cancer is complex and may be associated with significant morbidity.Thoughtful multidisciplinary planning should be tailored to balance oncologic and functional outcomes. Shifts in treatment paradigms, including staging of surgery and neoadjuvant therapy, may mitigate the morbidity associated with surgical treatment of invasive disease, as well as provideopportunity to frame the approach based on the disease characteristics and patient preferences.

Papillary Thyroid Carcinoma In Patients With Carotid Body Tumors: Prevalence And Management In A Retrospective Surgical Series From Two Tertiary Centers

Manar Alzahrani[1], **Mohammed Alshahrani**[2], **Sharif Almatrafi**[4], **Alanoud Alshathri**[2], **Mohammed Alessa**[3], **Saleh Aldhahri**[3], **Majed Albarrak**[2], **Mohammed Almayouf**[2], **Khalid AlQahtani**[3]

[1]*King Abdulaziz Medical City;* [2]*King Fahad Medical City;* [3]*King Khalid University Hospital;* [4]*Prince Sattam University*

BACKGROUND & AIM

The co-occurrence of a carotid body tumor (CBT) and papillary thyroid carcinoma (PTC) is a rare clinical event. The frequency of this dual pathology in recent reports has sparked a debate on whether it represents a true pathophysiological association or an artifact of increased diagnostic surveillance. This study aims to report the prevalence, clinicopathological characteristics, management, and outcomes of concurrent CBT and PTC in a contemporary cohort.

MATERIAL & METHODS

We conducted a retrospective review of patients who underwent CBT resection at two tertiary centers between 2014 and 2024. Data on patient demographics, tumor characteristics, preoperative imaging, surgical management (single stage vs. staged), final histopathology, and clinical outcomes were collected and analyzed.

RESULTS

Overall, 32 patients with surgically resected CBTs were included. Eleven patients (34.4%) had thyroid nodules identified on preoperative imaging. The mean age of the participants was 57.2 ± 16.3 years. Females represented the majority of the population (n = 27, 84.4%). Nine patients underwent thyroid surgery with subsequent pathological confirmation. Management involved resection at two different time intervals in five cases (55.6%) and a single-stage operation in four (44.4%). On final pathology, PTC was confirmed in eight patients (25.0%). During the follow-up period, no recurrences of either tumor type were observed.

CONCLUSIONS

The prevalence of concurrent PTC in patients with CBTs is significantly higher than previously reported, reaching 25% in our cohort. This incidental finding raises the possibility of surveillance bias or underlying genetic mechanisms. Management with either a single-stage or staged surgical approach was not associated with major complications. The prognosis for patients with this dual pathology is excellent and appears to be dictated by the independent characteristics of each tumor.

OP-522

Persistent Hyperparathyroidism After Parathyroidectomy: Causes Of Surgical Failure And Reoperative Outcomes In A 3-Year Single-Center Study

Ömer Faruk Koçer[1], **Erdem Köroğlu**[1]

[1]*Kocaeli City Hospital*

BACKGROUND & AIM

Persistent hyperparathyroidism following parathyroidectomy represents a clinically significant challenge, often resulting from missed adenomas, ectopic gland localization, or multiglandular disease. Despite advances in preoperative imaging and intraoperative techniques, a subset of patients fails to achieve biochemical cure after initial surgery. This study aimed to evaluate the incidence, underlying causes, and surgical outcomes of persistent hyperparathyroidism in a three-year single-center experience.

MATERIAL & METHODS

A retrospective analysis was conducted on patients who underwent surgery for parathyroid adenoma between 2023 and 2026 at a single tertiary referral center. Demographic characteristics, preoperative localization findings, serum parathyroid hormone (PTH) and corrected calcium levels, operative details, and postoperative biochemical outcomes were reviewed. Persistent hyperparathyroidism was defined as failure of serum PTH and/or corrected calcium levels to normalize after the initial surgery. Patients requiring revision surgery were further analyzed in terms of localization, intraoperative findings, and postoperative outcomes.

RESULTS

A total of 72 patients underwent parathyroidectomy for parathyroid adenoma. Persistent hyperparathyroidism was identified in 4 patients, corresponding to a persistence rate of 5.6%. The mean age of these patients was 47.7 years, with an equal sex distribution (50% female, 50% male). Initial suspected localization was predominantly in the right-sided glands.

The mean preoperative PTH level was 248.6 pg/mL, decreasing to 186.2 pg/mL after the initial surgery, indicating an inadequate biochemical response. Following revision surgery, the mean PTH level significantly decreased to 43.8 pg/mL. Similarly, mean corrected calcium levels decreased from 12.2 mg/dL preoperatively to 11.5 mg/dL after the initial surgery and further to 9.3 mg/dL after revision.

Biochemical cure was achieved in all 4 patients (100%) following revision surgery.

CONCLUSIONS

Persistent hyperparathyroidism was observed in a small but clinically significant proportion of patients (5.6%). The primary causes of surgical failure were most likely related to missed or inadequately explored parathyroid tissue, particularly in right-sided glands.

Careful postoperative biochemical monitoring enabled early detection of persistent disease. Revision surgery resulted in marked biochemical improvement, achieving a 100% cure rate and complete normalization in all patients.

These findings highlight the importance of accurate preoperative localization, meticulous intraoperative assessment, and timely reoperation in the management of persistent hyperparathyroidism.

OP-523

En Bloc Parotidectomy: Surgical Efficacy And Clinical Outcomes In Parotid Neoplasms

Dr. Mohammad Hanif[1]

[1]*National Institute of ENT, Tejgaon, Dhaka, Bangladesh*

BACKGROUND & AIM

The surgical management of aggressive parotid tumors remains challenging due to the risk of capsule rupture and subsequent tumor seeding. Standard dissection techniques, while effective for most benign lesions, may yield inadequate margins for high-grade malignancies or recurrent pleomorphic adenomas. This study evaluates the efficacy of en bloc parotidectomy in achieving locoregional control while prioritizing facial nerve preservation.

MATERIAL & METHODS

We conducted a retrospective observational analysis of patients undergoing en bloc parotidectomy for benign, suspected, or proven malignant salivary gland tumors without prior facial nerve palsy. Procedures were performed at the National Institute of ENT and private centers in Bangladesh from January 2019 to December 2024. The approach involved a modified Blair incision, early identification of the facial nerve trunk, and strict adherence to the "en bloc" principle with a continuous cuff of healthy glandular tissue around the lesion. Forty cases met these criteria. Statistical analysis used descriptive methods. Institutional ethical approval was obtained.

RESULTS

Of 40 cases, 18 (45%) were male and 22 (55%) female; mean age was 24 years (range 12-60). Right parotid involvement occurred in 26 (65%) cases and left in 14 (35%). Histopathology showed benign tumors in 22 (55%) and malignant in 18 (45%). Mean follow-up was 12 months. The en bloc approach achieved negative surgical margins (R0) in 89% of primary malignancies. Tumor pseudocapsule integrity was confirmed in all pleomorphic adenomas. Temporary facial nerve paresis (House-Brackmann grade II/III) affected the marginal mandibular branch in 45% of cases and caused global paresis in 5%; 92% recovered fully within 6 months. Frey's syndrome occurred in 2.5%. No locoregional recurrences were observed.

CONCLUSIONS

En bloc parotidectomy is a robust technique that reduces the risk of local recurrence by preventing tumor spillage. Combined with intraoperative nerve monitoring, it enables maximal tumor clearance without increasing permanent facial nerve paralysis risk. This technique may be considered a preferred surgical approach for selected tumors.

Dynamic Whole-Body FDG PET/CT For Predicting Malignancy In Head And Neck Tumors And Cervical Lymphadenopathy

Gregor Horňák[1], **André H. Dias**[2,3], **Ole L. Munk**[2,3], **Lars C. Gormsen**[2,3], **Jaroslav Ptáček**[4], **Pavel Karhan**[4]

[1]*Department of Nuclear Medicine, University Hospital Olomouc, Palacký University Olomouc, Zdra-votníků 248/7, 77900 Olomouc, Czech Republic;* [2]*Department of Nuclear Medicine & PET-Centre, Aarhus University Hospital, Palle-Juul-Jensens Boulevard 165, 8200 Aarhus, Denmark;* [3]*Department of Clinical Medicine, Aarhus University, Palle-Juul-Jensens Boulevard 99, 8200 Aarhus, Denmark;* [4]*Department of Medical Physics and Radiation Protection, University Hospital Olomouc, Palacký University Olomouc, Zdravotníků 248/7, 77900 Olomouc*

BACKGROUND & AIM

Dynamic whole-body FDG PET/CT is a novel technique that enables the direct reconstruction of multiparametric images representing the FDGmetabolic uptake rate and “free” FDG. Applying complementary parameters with distinct characteristics compared to static images, the aims of this study are as follows: to determine the threshold values of SUV, MRFDG, and DVFDGfor malignant and benign lesions; to compare the specificity of MRFDG and DVFDG images with static SUVbw images; and to assess whether any of the dynamic imaging parameters correlate more significantly with malignancy or non-malignancy in the examined lesions based on the measured values obtained from D-WB FDG PET/CT.

MATERIAL & METHODS

The study was a retrospective analysis of D-WB PET/CT data from 43 patients (23 males and 20 females) included both in the context of primary staging as well as imaging performed due to suspicion of post-therapeutic relapse or recurrence. Standard scanning was performed using a multiparametric PET acquisition protocol on a Siemens Biograph Vision 600 PET/CT scanner.

Pathological findings were manually delineated, and values for SUVbw, MRFDG, and DVFDG were extracted. The findings were classified and statistically evaluated based on their was histological verification of a malignant or benign lesion. Multinomial and binomial logistic regression analyses were used to find parameters for data classification in different models, employing various combinations of the input data (SUVbw, MRFDG, DVFDG). ROC curves were generated by changing the threshold p-value in the regression models to compare the models and determine the optimal thresholds.

RESULTS

Patlak PET parameters (MRFDG and DVFDG) combined with mean SUVbw achieved the highest diagnostic accuracy of 0.82 (95% CI 0.75–0.89) for malignancy detection (F1-score = 0.90). Sensitivity reached 0.85 (95% CI 0.77–0.91) and specificity 0.93 (95% CI 0.87–0.98). Classification accuracy in tumors was 0.86 (95% CI 0.78–0.92) and in lymph nodes 0.81 (95% CI 0.73–0.88). Relative contribution analysis showed that DVFDG accounted for up to 65% of the classification weight. ROC analysis demonstrated AUC values above 0.8 for all models, with optimal thresholds achieving sensitivities of around 0.85 and specificities up to 0.93. Thresholds for malignancy detection were, for mean values, SUVbw > 5.8 g/mL, MRFDG > 0.05 µmol/mL/min, DVFDG > 68%, and, for maximal values, SUVbw > 8.7 g/mL, MRFDG > 0.11 µmol/mL/min, DVFDG > 202%.

CONCLUSIONS

The D-WB [^{18}F]FDG PET/CT images in this study highlight the potential for improved differentiation between malignant and benign lesions compared to conventional SUVbw imaging in patients with locally advanced head and neck cancers presenting with cervical lymphadenopathy and carcinoma of unknown primary origin (CUP). This observation may be particularly relevant in common diagnostic dilemmas, especially in distinguishing residual or recurrent tumors from post-radiotherapy changes. Further validation in larger cohorts with histopathological confirmation is warranted, as the small sample size in this study may limit the generalizability of the findings.

OP-525

'Combined Approach' Parotidectomy For Malignant Tumours

Emily Lowe[1], **Joanne Ridgley-Vaidya**[1], **Ahmed Saleh**[1], **Fabian Sipaul**[1]

[1]*University Hospital Southampton, UK*

BACKGROUND & AIM

There is on-going debate about the best approach for parotid tumours. We refined a surgical technique called 'combined approach parotidectomy'. It is similar to the extra-capsular method but with the intention to obtain at least 5mm cuff of margin and to identify the facial nerve only if detected close to the lesion. It is suitable for most tumour size, as long as it is partially mobile. We report the outcomes for those with malignant histology. This study evaluated a decade of practice. Specifically, we recorded the margins, rate of revision surgery, adjuvant radiotherapy and post-operative complications.

MATERIAL & METHODS

This was a retrospective chart review to evaluate a single-consultant parotidectomy approach.

RESULTS

There were 27 malignant tumours. R0 margins were obtained in 10 (37%), with narrow (<1mm) margins in 11 (40.7%). There were 6 cases (22%) with involved margins, commonly due to facial nerve branches being intimately related to tumour. Post-operative radiotherapy was required in 14 cases (51.9%). Three underwent further excision with neck dissection (11%). Three cases had recurrence requiring further surgery. Facial nerve paresis was seen in 18.5% immediately post-operatively and 3.7% at 1 year, with zero cases of complete paralysis. Paraesthesia of inferior pinna was reported in 29.6% and 22.2% had sialocoele.

CONCLUSIONS

This study suggests that the combined approach parotidectomy technique is a viable primary surgical option, with acceptable outcomes for malignant tumours, which are comparable to the literature1-3. With similar or fewer complications than existing techniques it can reduce intra-operative stress to surgeons.

Association Of Toll-Like Receptors 3, 4, 9 Expression With Clinicopathological Features In Oral Squamous Cell Carcinoma

Melih Solhan[1], **Betül Öğüt**[2], **Melike Urgancı**[2], **İsmet Bayramoğlu**[1]

[1]*Department of Otorhinolaryngology, Gazi University Faculty of Medicine, Ankara, Türkiye.*; [2]*Department of Pathology, Gazi University Faculty of Medicine, Ankara, Türkiye*

BACKGROUND & AIM

This study aimed to evaluate the expression levels of Toll-like receptor 3, 4, and 9 in oral cavity squamous cell carcinoma (SCC) and their associations with clinicopathological parameters.

MATERIAL & METHODS

Fifty-three patients diagnosed with oral cavity SCC between 2010 and 2015 were retrospectively analyzed. Immunohistochemical staining for TLR-3, TLR-4, and TLR-9 was performed on formalin-fixed, paraffin-embedded tumor tissues. Expression was assessed based on staining intensity, staining status and percentage of positive tumor cells (prevalence). Associations with tumor stage (T, N, TNM), depth of invasion (DOI), lymphovascular invasion (LVI), perineural invasion (PNI), extranodal extension (ENE), histological grade, recurrence, and survival status were evaluated statistically.

RESULTS

No statistically significant correlations were found between TLR-3, TLR-4, or TLR-9 expression and any of the examined clinicopathological features ($p > 0.05$). Although an increasing trend in DOI was observed with stronger TLR-3 and TLR-4 staining, the results were not statistically significant.

CONCLUSIONS

This study did not establish a clear prognostic role for TLR-3, TLR-4, or TLR-9 in oral cavity SCC. However, the findings highlight the biological complexity of TLR-mediated pathways in cancer. Further large-scale, multi-institutional studies are necessary to better understand the clinical relevance of TLRs in oral carcinogenesis

OP-527

Management And Outcomes Of Postoperative Salivary Leak After Total Laryngectomy

Bailey Balouch, MD[1], **Chloe M Jones, BS**[2], **Swar Vimawala, MD**[1], **Brian Swendseid, MD**[1], **Nadir Ahmad, MD FACS**[1,3]

[1]*Division of Otolaryngology - Head & Neck Surgery, Cooper University Hospital*; [2]*Cooper Medical School of Rowan University*; [3]*Head and Neck Cancer Program, MD Anderson Cancer Center in Camden*

BACKGROUND & AIM

Postoperative salivary leak is a well-known complication following total laryngectomy (TL). Prior failed radiation therapy, chemotherapy, hypothyroidism, and malnutrition are associated with a heightened risk for postoperative salivary leak. This study aimed to describe outcomes following postoperative salivary leak after TL.

MATERIAL & METHODS

This was a retrospective study of patients undergoing oncologic total laryngectomy, either in the primary or post-radiation setting, at our tertiary care medical center.

RESULTS

129 patients were included. 88 underwent primary TL and 41 underwent salvage TL. The neopharynx was closed by primary closure (84.5%), pedicled pectoralis flap (8.5%) or free flap (7.0%) reconstruction. The rate of postoperative salivary leak did not differ significantly between the primary TL (21.6%) versus salvage TL (31.7%) setting ($p=0.274$). Among the 32 patients who were found to have a postoperative salivary leak, 78.1% were managed conservatively and 21.9% required operative repair. The rate of operative repair for postoperative salivary leak was similar between patients who underwent salvage TL (15.4%) versus primary TL (26.3%, $p=0.851$). Postoperative salivary leak was associated significantly with increased hospital length of stay (18.3±12.0 versus 10.8±6.8 days, $p=0.002$), time until PO resumed (38.24±37.7 versus 9.1±4.6 days, $p<0.001$), feeding tube placement (65.0% versus 18.8%, $p<0.001$), and neopharyngeal stricture requiring dilation (25.0% versus 8.3%, $p=0.026$). 80.7% of patients with a postoperative leak ultimately resumed a PO diet.

CONCLUSIONS

Postoperative salivary leak is a complication frequently encountered after total laryngectomy due to dehiscence at the neopharyngeal anastomosis. Most patients can be managed conservatively, with resolution of the leak and resumption of a PO diet, while a minority of patients will develop a persistent pharyngocutaneous fistula. However, postoperative salivary leak after TL is associated with an increased hospital length of stay, a delay in resuming a PO diet, increased need for prolonged non-PO nutrition, and a higher rate of neopharyngeal stricture.

OP-528

Adult Cystic Lateral Neck Masses: Primary-Site Detection And Diagnostic Pathway Performance

Dr Murtaza Shah[1], **Professor Anastasios Kanatas**[1], **Mr James Moor**[2]

[1]*University of Leeds*; [2]*Leeds Teaching Hospitals NHS Trust*

BACKGROUND & AIM

Adult cystic lateral neck masses are a diagnostic dilemma because metastatic human papillomavirus (HPV)-associated oropharyngeal squamous cell carcinoma (OPSCC), nasopharyngeal carcinoma and papillary thyroid carcinoma may mimic benign branchial pathology. Cystic aspirates can be hypocellular, and primary tumours may be occult on initial assessment. We aimed to define malignant aetiology, HPV burden, primary-site detection and diagnostic pathway performance in a large UK tertiary head and neck centre.

MATERIAL & METHODS

A retrospective cohort study was undertaken at Leeds Teaching Hospitals NHS Trust between August 2022 and August 2025. Adults with cystic or mixed cystic-solid lateral neck masses discussed at the Head and Neck multidisciplinary team (MDT) or Thyroid and Parathyroid MDT were included where tissue diagnosis was available. Variables included demographics, final pathology, p16/HPV status, imaging, cytology, primary-site identification and diagnostic intervals. Fisher's exact test and Mann-Whitney U testing were used.

RESULTS

Forty-one adults were analysed; median age was 59 years (52–68) and the male:female ratio was 34:7. Final diagnoses comprised upper aerodigestive tract carcinoma in 29/41 patients, papillary thyroid carcinoma in 8/41 and benign pathology in 4/41. Patients with upper aerodigestive tract carcinoma were older than those with papillary thyroid carcinoma: 62 versus 43 years (p=0.010). Among SCC cases, 24/27 were p16-positive (88.9%, 95% confidence interval [CI] 70.8–97.6) and 22/27 had molecular HPV confirmation (81.5%, 95% CI 61.9–93.7). Positron emission tomography-computed tomography (PET-CT) localised a primary site in 14/23 upper aerodigestive tract carcinoma cases (60.9%). In paired magnetic resonance imaging (MRI)/PET-CT cases, PET-CT added primary localisation in 4/20 cases where MRI was non-localising. PET-CT localisation was markedly lower in clinically non-localised primaries than clinically apparent primaries (1/9 versus 13/14, p<0.001). PET-CT localisation was associated with a shorter presentation-to-diagnosis interval: 23 versus 65 days (p=0.010).

CONCLUSIONS

Adult cystic lateral neck masses should be investigated as tumour-origin-specific diagnostic problems rather than presumed benign cysts. The dominant phenotype was older, male-predominant, HPV-associated oropharyngeal carcinoma, but a distinct papillary thyroid carcinoma subgroup was also identified. Clinical examination and cytology alone missed important malignant signals. These findings support early HPV/p16 testing, thyroid-directed assessment where appropriate, and escalation to PET-CT or endoscopic primary-site search when MRI is non-localising.

Effects Of Parotidectomy Surgery On Facial Perception And Psychosocial Status

DURSUN MEHMET MEHEL[1], **MELİKE PINAR DÜGENCİLİ**[1], **ASUDE ÜNAL**[1], **GÖKHAN AKGÜL**[1], **DOĞUKAN ÖZDEMİR**[1], **HANDE ARSLAN**[1], **AYŞE ÇEÇEN**[1], **ESRA YILMAZ**[1], **EMRE DEMİREL**[1]

[1]*SAĞLIK BAKANLIĞI ÜNİVERSİTESİ SAMSUN EĞİTİM VE ARAŞTIRMA HASTANESİ KBB KLİNİĞİ*

BACKGROUND & AIM

This study aims to evaluate patients' aesthetic perceptions, functional status, psychosocial impact, and satisfaction with the treatment process after parotidectomy surgery using the FACE-Q questionnaire, and to determine the effects of these parameters on overall quality of life.

MATERIAL & METHODS

This study was designed as a prospective cross-sectional study. Facial appearance, functional status, psychosocial effects, and overall patient satisfaction following parotidectomy were evaluated using patient-reported outcome measures. A total of 50 patients aged 18 years and older who underwent partial or total parotidectomy at the Department of Otorhinolaryngology, Samsun Training and Research Hospital, were included in the study. Inclusion and exclusion criteria were defined. Patients were administered a FACE-Q–based patient assessment questionnaire evaluating facial appearance, functional status, psychosocial effects, and treatment satisfaction after parotidectomy. Demographic data (age, gender) and clinical information were recorded from patient files. Postoperative facial paralysis was assessed according to the House–Brackmann grading system. Patients were divided into two subgroups based on the presence or absence of facial paralysis. The relationship between House–Brackmann grade and FACE-Q scores was analyzed. Additionally, partial versus total parotidectomy and postoperative duration groups were compared. Data were analyzed using SPSS 29.0 software.

RESULTS

Of the 50 patients included in the study, 28 were male and 22 were female. The mean age of the patients was calculated as 55.38 years. Of the surgeries performed on the parotid gland, 43 (86%) were superficial parotidectomy (44% right, 42% left), and 5 (10%) were total parotidectomy (6% right, 4% left). Facial nerve paralysis was not observed in 96% of the cases.

Approximately 45% of the patients were active smokers. Pathological results showed a heterogeneous distribution; however, benign lesions were predominant, particularly pleomorphic adenoma and Warthin tumor. Post-treatment satisfaction domain had the highest mean score and the lowest standard deviation, suggesting high and relatively homogeneous satisfaction levels among participants. The facial appearance domain also demonstrated a high score with low variability , indicating consistent positive evaluations. Greater variability was observed in the psychosocial impact and functional status domains, suggesting more pronounced differences in individual experiences in these areas.

CONCLUSIONS

This study demonstrates that patients generally report high satisfaction levels and positive perceptions of facial appearance following parotidectomy surgery. The low rate of postoperative facial paralysis supports the aesthetic and functional safety of the procedure. However, the variability observed in functional status and psychosocial impact domains indicates the presence of individual differences in patient experiences. These findings highlight the importance of considering patient-reported outcome measures in addition to surgical success criteria in the evaluation of patients after parotidectomy.

Gene Expression Profiling Of High-Grade Salivary Gland Cancers: Prognostic And Diagnostic Insights In A Cohort Of 136 Patients.

Davide Mattavelli[1], **Chiara Romani**[1], **Stefano Calza**[1], **Mattia Bugatti**[1], **Chiara Piloni**[1], **Carla Facco**[3], **Michele Tomasoni**[1], **Alberto Arosio**[3], **Alessia Lambertoni**[3], **Deborah Marchiori**[3], **Sara Ronchi**[4], **Francesca Gaino**[2], **Stefano La Rosa**[3], **Davide Lombardi**[1], **Paolo Bossi**[2], **Cesare Piazza**[1]

[1]*ASST Spedali Civili of Brescia - University of Brescia;* [2]*Humanitas Research Hospital-Rozzano;* [3]*Ospedale di Circolo e Fondazione Macchi - Varese;* [4]*Centro Nazionale di Adroterapia Oncologica - Pavia*

BACKGROUND & AIM

High-grade salivary gland cancer (HG-SGC) are rare and characterized by great histologic variability and poor outcomes. INDAGA is an Italian multicenter retrospective study designed to identify gene expression prognostic signatures.

MATERIAL & METHODS

HG-SGC patients were collected from 3 Italian referral centers: “ASST Spedali Civili di Brescia”, Brescia; “Ospedale di Circolo e Fondazione Macchi”, Varese; “Humanitas Research Hospital”, Rozzano. Included histology were salivary duct carcinoma (SDC), high-grade mucoepidermoid carcinoma, carcinoma ex pleomorphic adenoma, adenocarcinoma NOS, oncocytic, myoepithelial and acinic cell carcinoma.

Transcriptomic profiles were generated using a microarray-based platform. Gene filtering based on associations with clinical features was performed using individual-level Cox regression models. Differential expression (DE) analysis between histological subtypes was performed using linear models, with t-statistics computed through an empirical Bayesian approach. Unsupervised hierarchical clustering was conducted using the most variable genes across samples (coefficient of variation, CV > 20%) to identify transcriptomic subgroups independent of pathological classification and to link them with prognosis.

RESULTS

136 patients were included (mean age 64 years, 32% SDC, 43% N+, 59% T3-T4). With a median follow up of 45 months, 55 recurrences and 66 deaths were recorded. SDC, positive margins, T4 class and positive nodes were significantly associated with both disease free (DFS) and overall (OS) survivals.

Unsupervised hierarchical clustering based on the most variable genes (CV >20%) segregates HG-SGC cases independently of their pathological classification, identifying three main transcriptomic clusters: CL-1, CL-2, and CL-3. Significant association was observed between CL-3 and improved OS (HR = 0.22; 95% CI: 0.05–0.99; p = 0.049).

A four-gene signature (TSLP, PPP1R14C, NBPF3, and DLAT) effectively stratified HG-SGC patients into high- and low-risk groups, CL-A and CL-B respectively, with prognostic impact independent of age, gender, histology, margin status, pT and pN class (CL-B: HR=0.03; 95%CI: 0.01-0.16; P<0.001). TSLP and PPP1R14C may be linked to tumor–microenvironment crosstalk and contractility-related signaling that characterize more aggressive disease.

CONCLUSIONS

Transcriptomic and genomic profiling reveals molecular signals that are independent of histological type and has prognostic significance beyond conventional clinicopathological criteria, potentially influencing diagnosis and targeted therapy.

OP-531

Biomarkers Predicting Flap Failure In Head And Neck Reconstruction

Ömer SANCAKTAR[1], **Gökçe Önder**[1], **Can Tekin**[1], **Cem Bulut**[1], **Ilker Burak Arslan**[1]

[1]Department of Otorhinolaryngology, University of Health Sciences Türkiye, Izmir City Hospital, Izmir, Türkiye

BACKGROUND & AIM

Myocutaneous flap reconstruction, most commonly utilising the pectoralis major myocutaneous flap (PMMF), remains the predominant reconstructive strategy following ablative head and neck oncological surgery. Despite technical refinements, flap failure and associated complications continue to impose a substantial clinical burden, frequently necessitating unplanned revision surgery. Objective, laboratory-based predictors of flap viability would enable perioperative risk stratification and facilitate timely surgical re-intervention. This study evaluated the predictive utility of a comprehensive panel of preoperative and early postoperative haematological and inflammatory biomarker, for predicting flap outcomes and the need for secondary surgery following head and neck oncological reconstruction.

MATERIAL & METHODS

Fourteen patients (11 male, 3 females; median age 74.5 years) who underwent myocutaneous flap reconstruction for head and neck malignancies between 2023 and 2025 were retrospectively analysed. All biomarkers were measured at four time points: preoperatively and on postoperative days (POD) 1, 3, and 7. Flap outcome was classified as successful or failed. Secondary surgery was defined as any unplanned operative intervention for flap-related complications. Between-group comparisons were performed using the Mann-Whitney U test; ROC curve analysis with Youden Index-optimised cutoffs was applied to significant markers.

RESULTS

Seven patients (50%) experienced flap failure; four (28.6%) required unplanned secondary surgery, exclusively within the failure group. Among preoperative biomarkers, only hemoglobin demonstrated significant discriminatory capacity (12.6 vs. 10.6 g/dL; p = 0.047; AUC = 0.827; cutoff < 11.5 g/dL; sensitivity 85.7%, specificity 85.7%). POD7 markers yielded the strongest predictive performance: CRP (22.0 vs 90.0 mg/L; p = 0.011; AUC = 0.918; cutoff > 85 mg/L; specificity 100%) and absolute neutrophil count (3.48 vs 5.67 × 10^9/L; p = 0.021; AUC = 0.878; sensitivity 100%). No preoperative composite inflammatory index reached statistical significance.

CONCLUSIONS

POD7 CRP and neutrophil count demonstrate clinically meaningful predictive performance for flap failure following myocutaneous head and neck reconstruction, whereas preoperative anaemia is a potentially modifiable preoperative risk factor. Prospective validation in adequately powered multicenter cohorts is mandatory before clinical translation.

OP-532

Impact Of Ligasure Versus Conventional Suture Ligation Techniques On Postoperative Parameters In Thyroidectomy: A Clinical Comparison

Barkın Başaranhıncal[1], **Derya Özer**[1]

[1]İzmir Bakırçay University Çiğli Training Research Hospital, Otolaryngology-Head&Neck Surgery

BACKGROUND & AIM

The objective of this study is to compare the effects of an energy-based vessel sealing system (LigaSure) versus the conventional suture ligation (clamp-and-tie) technique on postoperative calcium and hemoglobin levels, operative duration, and complication rates in patients undergoing thyroidectomy.

MATERIAL & METHODS

Thirty-three patients who underwent thyroidectomy (18 LigaSure, 15 Suture Ligation) were retrospectively analyzed. Preoperative and postoperative 24-hour calcium (Ca) and hemoglobin (Hb) levels, operative durations, and complications were recorded for both groups. Statistical analysis was performed using Mann-Whitney U and Fisher's Exact tests, with a significance level of p < 0.05$.

RESULTS

- Calcium Change: A statistically significant decrease in postoperative calcium levels was observed in the LigaSure group (-0.81 mg/dL) compared to the suture ligation group (-0.22 mg/dL) (p = 0.044).
- Hemoglobin Change: No significant difference was found between the groups regarding hemoglobin changes (LigaSure: -0.87 g/dL, Suture Ligation: -0.35 g/dL; p = 0.164).
- Operative Duration: Operative time was significantly shorter in the suture ligation group (mean 111 min) compared to the LigaSure group (138.6 min) (p = 0.022).
- Complications: No significant difference in complication rates was observed between the groups (p = 1.0).

CONCLUSIONS

The findings suggest that the conventional suture ligation method may be more advantageous in preserving postoperative calcium balance and optimizing operative time compared to the LigaSure technique. While both methods appear safe

regarding complications, the potential thermal impact of energy-based devices on parathyroid function should be considered during surgery.

OP-533

Management Of High Risk Skin Squamous Cells Carcinoma In Head And Neck

Luaay Aziz[1], **Magnus Niklasson**[1]

[1]*Sahlgrenska University Hospital. Gothenburg. Sweden*

BACKGROUND & AIM

Cutaneous squamous cell carcinoma (cSCC) of the head and neck accounts for 20–50% of all skin cancers, with a steadily increasing incidence over recent decades in northern European countries. While most tumors are successfully treated with surgery, high-risk cSCC may develop regional metastases, particularly to the cervical lymph nodes and parotid gland.

MATERIAL & METHODS

We conducted a retrospective review of patients with advanced or metastatic head and neck cSCC treated in the western region of Sweden over a 10-year period. Medical records were reviewed to identify demographic data, tumor characteristics, treatment modalities, and outcomes.

The study is approved by ethics committee

RESULTS

A total of 248 patients with advanced or metastatic cSCC were identified. 19% presented with primary skin cancer and synchronous metastasis, while 81% presented with metastases secondary to cutaneous SCC. The majority of patients were male, and the most common primary tumor site was the external ear. Immunodeficiency was present in 23% of cases. Treatment with curative intention included surgery with postoperative radiotherapy, surgery alone, or radiotherapy alone. Patients of advanced age and with significant comorbidities received palliative radiotherapy or best supportive care. The best survival outcomes were observed in patients treated with surgery followed by postoperative radiotherapy.

CONCLUSIONS

Advanced and metastatic head and neck cSCC is increasing in incidence. Combined treatment with surgery and postoperative radiotherapy provides the best survival and should be considered standard of care when feasible.

OP-534

Early Postoperative PTH Determination As Predictor For Post-Thyroidectomy Hypocalcemia

Mr Hassan Baig[2], **Mr Faizan Shah**[1], **Mr Irfan Khan**[1], **Mr Ahmed Youseff**[1]

[1]*ENT department, Ninewells Hospital, Dundee, Scotland, United Kingdom;* [2]*General Surgery department, Queen Elizabeth University Hospital Glasgow*

BACKGROUND & AIM

Post thyroidectomy hypocalcemia is a major complication following total thyroidectomy. We sought to study the use of early post-operative parathyroid hormone (PTH) measurement as an early predictor of hypocalcemia after thyroidectomy and the impact on same-day discharge.

MATERIAL & METHODS

This was a prospective and meta-analysis study, for prospective study IRB-approved correlation study on 43 patients who underwent total thyroidectomy. PTH was measured at 1 hour after surgery and compared to the standard 4-hour post-surgical draw that had been utilized at our institution, for meta-analysis 5 observational studies were included.

RESULTS

Using Spearman's rank correlation (rho=0.59, p-value 0.01), there was a significant positive correlation between PTH measured 1H after surgery with 4 H Ionized Ca. Sensitivity of early PTH assay "Measured below 14 pg/ml" to detect hypocalcemia was 100%"AUC: 0.797 (95% CI [0.565-1])". Meta analysis of previous studies found that there was a highly positive association between early PTH and late measurements.

CONCLUSIONS

Early measurement of PTH 1H after surgery is a very sensitive tool to detect post-thyroidectomy hypocalcemia, what would help reduce hospital stay following thyroidectomy.

OP-535

The Neck-Persistency-Net: A Deep Neural Network Aids In Distinguishing Vital From Non-Vital Persistent Cervical Lymph Nodes In HNSCC After Radiochemotherapy

Matthias Santer[1]

[1]*Department of Otorhinolaryngology-Head and Neck Surgery, Medical University of Innsbruck, 6020 Innsbruck, Austria*

BACKGROUND & AIM

To evaluate the diagnostic performance (DP) of the high-resolution contrast computed tomography (HR-contrast-CT) based Neck-Persistency-Net in distinguishing vital from non-vital persistent cervical lymph nodes (pcLNs) in patients with advanced head and neck squamous cell carcinoma (HNSCC) following primary concurrent chemoradiotherapy (CRT) with [18F]-fluorodeoxyglucose positron emission tomography and high-resolution contrast-enhanced computed tomography ([18F]FDG-PET-CT). Furthermore, the Neck-Persistency-Net's potential to justify omitting post-CRT neck dissection (ND) without risking treatment delays or preventing unnecessary surgery was explored.

MATERIAL & METHODS

All HNSCC patients undergoing primary CRT followed by post-CRT-ND for pcLNs recorded in the institutional HNSCC registry were analyzed. The Neck-Persistency-Net DP was explored for three scenarios: balanced performance (BalPerf), optimized sensitivity (OptSens), and optimized specificity (OptSpec). Histopathology of post-CRT-ND served as a reference.

RESULTS

Among 68 included patients, 11 were female and 32 had vital pcLNs. The Neck-Persistency-Net demonstrated good DP with an area under the curve of 0.82. For BalPerf, both sensitivity and specificity were 78%; for OptSens (90%), specificity was 62%; for OptSpec (95%), sensitivity was 54%. Limiting post-CRT-ND to negative results would have delayed treatment in 27%, 40%, and 7% for BalPerf, OptSens and OptSpec, respectively, versus 23% for [18F]FDG-PET-CT. Conversely, restricting post-CRT-ND to positive results would have prevented unnecessary post-CRT-ND in 78%, 60%, and 95% for BalPerf, OptSens and OptSpec, respectively, versus 55% for [18F]FDG-PET-CT.

CONCLUSIONS

The DP of the Neck-Persistency-Net was comparable to [18F]-FDG-PET-CT. Depending on the chosen decision boundary, the potential to justify the omission of post-CRT-ND without risking treatment delays in false negative findings or reliably prevent unnecessary surgery in false positive findings outperforms the [18F]-FDG-PET-CT.

Immune Microenvironment Remodeling In Laryngeal Carcinogenesis: From Activation To Immune Suppression

Toni Vidović[1], **Filip Tudor**[1], **Blažen Marijić**[1], **Maximilian Pfeiler**[2], **Ita Hadžisejdić**[3], **Emina Babarović**[3]

[1]*Department of Otorhinolaryngology and Head and Neck Surgery, Clinical Hospital Center Rijeka, 51000 Rijeka, Croatia;* [2]*Faculty of Medicine, University of Rijeka, 51000 Rijeka, Croatia;* [3]*Clinical Department of Pathology and Cytology, Clinical Hospital Center Rijeka, 51000 Rijeka, Croatia.*

BACKGROUND & AIM

The tumor microenvironment (TME) plays a pivotal role in the development and progression of head and neck squamous cell carcinoma (HNSCC). However, data focusing on site-specific immune dynamics, particularly in laryngeal carcinogenesis, remain limited. Evidence on how immune infiltration and checkpoint pathways evolve from benign to preinvasive and invasive lesions is scarce. This study aimed to evaluate immune infiltration and checkpoint expression across the laryngeal disease spectrum, with emphasis on compartment-specific differences.

MATERIAL & METHODS

This retrospective cross-sectional study included benign laryngeal polyps (N=45), precancerous lesions (N=55), and laryngeal SCC (N=127). Immunohistochemistry on tissue microarrays was used to assess CD4, CD8, CD68, CD163, FOXP3, CTLA-4, and PD-1. Additionally, double immunohistochemistry was performed to identify regulatory T cells (Treg) co-expressing FOXP3 and CTLA-4 (FOXP3+CTLA4). All markers were evaluated separately in intraepithelial/tumoral (i-) and stromal (s-) compartments.

RESULTS

A stepwise increase in immune cell infiltration was observed from benign through dysplastic to malignant lesions, with changes being more pronounced in the stromal compartment. In the intraepithelial compartment, differences between groups were generally modest, with no significant variation observed for FOXP3 or $FOXP3^{+}CTLA\text{-}4^{+}$ Treg cells. In contrast, stromal expression of multiple markers, including sFOXP3 and sFOXP3+CTLA4, were significantly increased in SCC compared to both control and precancerous groups (all $p<0.001$), indicating expansion of immunosuppressive regulatory populations. Within SCC, advanced-stage tumors demonstrated higher sFOXP3 ($p=0.006$) and increased macrophage infiltration (total CD68 $p=0.0003$; total CD163 $p=0.001$), indicating a quantitative increase in immune infiltration. Correlation analysis revealed strong positive associations between sCD4 and sCD8 ($r=0.664$, $p<0.0001$), sPD-1 and sCD4 ($r=0.561$, $p<0.0001$), and sCD68 and sCD163

(r=0.803, p<0.0001), supporting coordinated immune infiltration and macrophage polarization. Significant correlations were also observed between regulatory and checkpoint markers, particularly involving FOXP3, CTLA-4, and PD-1 (all p<0.05).

CONCLUSIONS

Laryngeal carcinogenesis is characterized by progressive immune infiltration accompanied by stromal enrichment of regulatory T cells and checkpoint molecule expression. Despite the presence of effector immune cells, the TME appears functionally immunosuppressed, consistent with an exhausted immune phenotype. These findings underscore the importance of compartment-specific immune analysis and support the potential relevance of checkpoint-targeted therapies in laryngeal SCC.

The Voice As A Tool To Detect Recurrence Of Laryngeal And Hypopharyngeal Cancer (Voicedetect) - Interim Analysis Of A Feasibility Study

Roland Giger[1], **Simon A. Mueller**[2], **Eberhard Seifert**[3], **Mathew Magimai-Doss**[4], **Daniel H. Schanne**[5], **Nikola Cihoric**[5], **Olgun Elicin**[5], **Miranda Visini**[1]

[1]*Department of Otorhinolaryngology, Head and Neck Surgery, Inselspital, Bern University Hospital and University of Bern, Bern, Switzerland;* [2]*Department of Otorhinolaryngology, Head and Neck Surgery, University Hospital Zurich and University of Zurich, Zurich, Switzerland;* [3]*Division of Phoniatrics, Department of Otorhinolaryngology, Head and Neck Surgery, Inselspital, Bern University Hospital and University of Bern, Bern, Switzerland;* [4]*Idiap Research Institute, Martigny, Switzerland;* [5]*Department of Radiation-Oncology, Inselspital, Bern University Hospital and University of Bern, Bern, Switzerland*

BACKGROUND & AIM

The aim is to assess feasibility of long-term systematic voice monitoring in laryngeal and hypopharyngeal squamous cell carcinoma (LSCC/HPSCC) follow-up (FU).

The long-term goal is to utilize a smartphone application that passively analyzes voice during patient-selected telephone conversations. In case of voice changes indicating tumor suspicion, it would trigger early clinical examination.

MATERIAL & METHODS

This prospective, multicenter, feasibility study is conducted from August 2023 until December 2026 at two tertiary referral centers. Patients with curatively treated LSCC/HPSCC without distant metastases undergo 3-monthly voice recordings captured simultaneously via smartphone and a condenser room microphone, fiberendoscopic examinations, and voice quality questionnaires for at least six months. We evaluate temporal voice changes over time, their correlation with endoscopic findings and subjective voice quality.

RESULTS

To date, patient compliance is very high (95.4%). Of 87 enrolled patients, only two withdrew prematurely and one was lost to FU. The remaining 84 attended scheduled appointments regularly, with rare rescheduling. A total of 32 visits (8.6%) were postponed by 25 patients (1-3 postponements), 11 visits (34%) due to illness. There were three no-shows and no cancellations.

The mean and median FU duration were both 10 months. Overall, 370 recordings with an average of 4 recordings per patient were conducted.

CONCLUSIONS

Systematic voice monitoring in LSCC/HPSCC FU is feasible with excellent patient compliance and may support early detection of recurrence, second primary malignancy and treatment sequelae in the future.

OP-538

Effectiveness Of Prophylactic HPV Vaccination In HPV-Positive Oropharyngeal Squamous Cell Carcinoma Partners: A Systematic Review

Syed Zohaib Maroof Hussain[1], **Mariam Asif Malik**[1], **Mr Husham Barrak**[1]

[1]*Warwick Hospital, UK*

BACKGROUND & AIM

Human papillomavirus (HPV)-positive oropharyngeal squamous cell carcinoma (OPSCC) is an important and growing clinical issue, and the potential role of prophylactic HPV vaccination in adult sexual partners of affected patients remains uncertain. Evidence regarding the prevention of oral HPV infection and subsequent HPV-related malignancy in this population is limited

MATERIAL & METHODS

A systematic review will be conducted using MEDLINE, Embase, and the Cochrane Library from inception to the search date. Two reviewers will independently screen studies published in English that include adults with confirmed HPV-positive OPSCC and/or their adult sexual partners, evaluating licensed prophylactic HPV vaccines and outcomes including oral HPV infection, malignancy, recurrence, uptake, acceptability, psychosocial outcomes, and adverse events. Risk of bias will be assessed with study-design-appropriate tools.

RESULTS

To systematically evaluate the evidence on the effectiveness of prophylactic HPV vaccination in preventing oral HPV infection and subsequent HPV-related malignancy among sexual partners of adults with HPV-positive OPSCC, and to summarise available data on recurrence, second primary disease, safety, and current practice

CONCLUSIONS

This review will address an important evidence gap in counselling and management for patients with HPV-positive OPSCC and their partners. The findings may help inform clinical recommendations and future research on targeted HPV vaccination strategies.

OP-539

Collision Tumors of the Head and Neck: Clinicopathological Characteristics, Diagnostic Challenges, and Management Strategies: A Structured Narrative Review"

Albaraa najmi[1]

[1]*King saud university*

BACKGROUND & AIM

Background

Collision tumors represent the coexistence of two histologically distinct neoplasms within the same anatomical site without intermixture. In the head and neck region, these rare entities pose diagnostic and therapeutic challenges.

Objective

To provide a contemporary structured narrative synthesis of head and neck collision tumors, focusing on clinicopathological characteristics, diagnostic considerations, management strategies, and outcomes.

MATERIAL & METHODS

Methods

A structured literature review was conducted using PubMed/MEDLINE, Scopus, and Web of Science for cases published from 2020 onward. Histopathologically confirmed head and neck collision tumors were included. Data were extracted descriptively and analyzed qualitatively.

RESULTS

Results

Twenty-eight studies comprising 30 cases were identified. The thyroid was the most frequently involved site (40%), followed by the oropharynx and sinonasal region. Malignant–malignant combinations predominated (96.7%). Surgical management was performed in 90% of cases, often supplemented by adjuvant therapy. Mortality (13.3%) was confined to patients with advanced-stage or biologically aggressive tumorcomponents. Follow-up averaged 21.8 months.

CONCLUSIONS

CONCLUSION

Head and neck collision tumors are rare, heterogeneous entities in which prognosis is determined by the dominant tumor component rather than the collision phenomenon itself. Diagnosis relies on careful histopathological evaluation, and management should be individualized with multidisciplinary follow-up.

Masseter And C3 Muscle Measurements On PET/CT Predict Fistula Risk After Total Laryngectomy

Sermin Kibar Sayan[1], **Gulsah Koca**[1], **Kutay Mengi**[1], **Neriman Zengin**[1], **Raziye Banu Atalay Erdoğan**[1]

[1]*Kartal Dr. Lütfi Kırdar City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Laryngeal squamous cell carcinoma (LSCC) carries significant morbidity, especially in advanced disease requiring multimodal treatment. Pharyngocutaneous fistula (PCF) is a major complication after total laryngectomy, prolonging hospitalization and delaying adjuvant therapy. Sarcopenia, reflecting reduced physiological reserve, is linked to adverse surgical outcomes in head and neck cancer. Skeletal muscle mass is commonly assessed at the third cervical vertebra (C3), whereas masseter muscle area offers a practical alternative on routine imaging. We hypothesized that reduced pre-treatment C3 and masseter measurements on fluorodeoxyglucose positron emission tomography/computed tomography (FDG PET/CT) increase PCF risk and postoperative morbidity.

MATERIAL & METHODS

This retrospective cohort study included 78 patients of Kartal Dr. Lutfi Kirdar City Hospital with LSCC treated at a tertiary referral center. Pre-treatment FDG PET/CT images were used to quantify skeletal muscle area at the C3 level and bilateral masseter muscle area. Clinical data including age, body mass index (BMI), comorbidities, tumor stage, and prior radiotherapy/chemoradiotherapy were recorded. The primary outcome was PCF development. Secondary outcomes included overall postoperative complications, intensive care unit (ICU) requirement, and length of hospital stay. C3 and masseter muscle measurements were analyzed as independent variables. Statistical analyses were performed using appropriate parametric or non-parametric tests, and $p<0.05$ was considered statistically significant.

RESULTS

PCF occurred in 15 of 78 patients (19.2%). Lower C3 and masseter muscle measurements were associated with higher PCF rates, increased overall postoperative complications, greater ICU requirement, and longer hospital stay ($p<0.05$). No statistically significant association was observed between muscle measurements and 30-day mortality or certain minor complications ($p>0.05$).

CONCLUSIONS

Lower pre-treatment C3 and masseter muscle measurements are associated with increased PCF and postoperative complications in LSCC patients. Combined assessment may improve preoperative risk stratification.Masseter muscle measurement is easier and more practical to perform than C3-based assessment, making it a feasible alternative in routine clinical practice.

Long Term Outcomes Of Transoral CO_2 Laser Microsurgery For Early-Stage Laryngeal Carcinoma: A 10-Year Single-Center Experience

Ana Raquel Andrade[1], **Vera Miranda**[1], **Miguel Lopes**[1], **Luciana Rodrigues**[1], **Diogo Nascimento**[1], **Inês Ribeiro**[1], **Paulo Gonçalves**[1]

[1]*Unidade Local de Saúde Entre Douro e Vouga*

BACKGROUND & AIM

Transoral CO_2 laser microsurgery (TOLM) is an established organ-preserving approach for early-stage laryngeal carcinoma, providing favorable oncologic and functional outcomes. This study aims to evaluate oncologic outcomes, including 5-year disease-free survival (DFS) and overall survival (OS), in patients with early-stage laryngeal carcinoma treated with TOLM.

MATERIAL & METHODS

A retrospective observational study including patients with Tis–T2 laryngeal squamous cell carcinoma treated with TOLM between 2011 and 2021 was performed. Clinical, surgical, and pathological data were analyzed. DFS and OS at 2 and 5 years were estimated using the Kaplan–Meier method.

RESULTS

A total of 42 patients were included, predominantly male (approximately 95%), with a high prevalence of smoking (approximately 75%). Most tumors were glottic (approximately 95%). At 2 years, DFS and OS were approximately 90% and 95%, respectively. At 5 years, DFS was 83% and OS was 91%. Recurrence occurred in approximately 15% of patients. Laryngeal preservation was achieved in 95% of cases. No statistically significant prognostic factors for overall survival were identified.

CONCLUSIONS

TOLM provides effective and durable oncologic control in early-stage laryngeal carcinoma, with high disease-free and overall survival at 5 years. These findings support its role as a first-line treatment in appropriately selected patients.

In Silico And Immunohistochemical Evaluation Of The JAK3 Gene And Clinical And Pathological Prognostic Factors In Head And Neck Squamous Cell Carcinomas

Enes Ahmet SUBAY[1], **Müge KARADAŞ**[1], **Cansu ÖZYAPICIEL**[3], **Yağız GÜCEĞLİOĞLU**[3], **Ece ÖZOĞUL**[2], **Begüm KOCATÜRK**[3], **Oğuz KUŞÇU**[1]

[1]*Hacettepe University Faculty of Medicine Department of Otorhinolaryngology Ankara, Türkiye;* [2]*Hacettepe University Faculty of Medicine Department of Pathology Ankara, Türkiye;* [3]*Hacettepe University Institute of Oncology Department of Basic Oncology Ankara, Türkiye*

BACKGROUND & AIM

Head and neck squamous cell carcinoma (HNSCC) is a biologically heterogeneous malignancy with variable clinical outcomes. Janus kinase 3 (JAK3), a key mediator of the JAK/STAT pathway, is well characterized in hematologic malignancies; however, its role in solid tumors remains unclear. This study aimed to evaluate the association between phosphorylated JAK3 (p-JAK3) expression, clinicopathological parameters, and survival outcomes in HNSCC, and to validate these findings using in silico analyses.

MATERIAL & METHODS

A retrospective cohort of 189 patients diagnosed with HNSCC between 2014 and 2025 was analyzed. p-JAK3 expression was successfully evaluated in 174 cases using tissue microarray-based immunohistochemistry, and quantified by H-score methodology. Clinicopathological parameters were recorded. Overall survival (OS) and disease-free survival (DFS) were assessed using Kaplan–Meier and Cox regression analyses. External validation was performed using The Cancer Genome Atlas (TCGA) dataset to explore gene expression, methylation patterns, and immune microenvironment correlations.

RESULTS

Reduced JAK3 expression was significantly associated with advanced tumor stage, lymph node metastasis, and perineural invasion ($p<0.001$). Higher JAK3 H-scores were significantly correlated with improved OS and DFS ($p<0.001$). In multivariate Cox regression analysis, JAK3 expression remained an independent favorable prognostic factor for OS (HR: 0.743; 95% CI: 0.681–0.811; $p=0.001$) and DFS (HR: 0.611; 95% CI: 0.528–0.708; $p=0.001$). In silico analyses demonstrated concordant findings and revealed a positive correlation between gene body methylation and JAK3 expression levels.

CONCLUSIONS

Loss of JAK3 expression is associated with aggressive clinicopathological features and poorer survival in HNSCC. These findings suggest a potential protective role of JAK3 within the tumor microenvironment and highlight its value as a prognostic biomarker with translational relevance.

Head and neck squamous cell carcinoma, JAK3, prognosis, immunohistochemistry, methylation, tumor microenvironment.

OP-543

Compressive Symptoms In Relation To Patient, Radiological And Gland Features In Thyroid Disease

Sarah M Alqahtani[1], **Shaykhah AlNaimi**[1], **Abdulaziz Alenazi**[1]

[1]*Department of Otolaryngology Head and Neck Surgery, King Fahad University Hospital, AlKhobar, Saudi Arabia*

BACKGROUND & AIM

Thyroid goiter is the abnormal enlargement of the gland. Worldwide prevalence of goiter is 15.8%, and in Arab countries it ranges from 6.18 to 47.34%. Presentation of goiter vary from asymptomatic patients to obstructive symptoms. US and CT are radiological modalities used in the assessment of goiter. This study aims to assess the relationship between thyroid gland clinical features, patient's demographics, radiological measurements obtained from computerized tomography (CT) and ultrasound (US), and thyroid specific features including weight and size.

MATERIAL & METHODS

Patient's data who underwent thyroidectomy (n= 113) over the period of 2014-2022 in King Fahad University Hospital (KFUH) were reviewed in a retrospective cohort. The data included demographics, risk factors, thyroid function tests, compressive symptoms, intraoperative and post-operative complications, histopathological findings, and radiological measurements extracted from CT scans and neck US.

RESULTS

Subject's average age was 44 years. Dyspnea and lump globus were significantly related to thyroid volume and tracheal deviation. Tracheal compression ratio was significantly related to dysphagia (0.41±0.23), dyspnea (0.42±0.23), cough (0.46±0.22) and lump globus (0.39±0.22). Lump globus was significantly related to retrosternal extension. Obstructive symptoms were significantly related to tracheal deviation at C7 level. Final pathology was not related to compressive symptoms, whereas specimen weight was significantly related to dysphagia and lump globus. Average specimen weight was significantly high among patients who had post operative complications ($p=0.032$). Obese patients had significantly high specimen weight ($p=0.007$).

CONCLUSIONS

Goiter presentation vary from asymptomatic to obstructive symptoms. This study reports significant correlation between clinical symptoms and patient BMI, thyroid specimen weight/size. Also, significant association between specimen weight and post operative complications and patient BMI. Furthermore, significant correlation between obstructive symptoms and radiological parameters was found. Further research on the utilization of radiological data to predict compressive symptoms in asymptomatic thyroid goiter is recommended.

KEYWORDS

Thyroid goiter, compressive symptoms, tracheal compression ratio

OP-544

FACTORS ASSOCIATED WITH SURGICAL MANAGEMENT OF PHARYNGOCUTANEOUS FISTULA AFTER LARYNGECTOMY

Esra Altunal[1], **Feride Fırat**[1], **Adalet Aşkın**[1], **Ahmet Yeşiltepe**[1], **Şahin Öğreden**[1]

[1]*Department of Otorhinolaryngology – Head and Neck Surgery, İstanbul Başakşehir Çam and Sakura City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Pharyngocutaneous fistula (PCF) is one of the most common complications after laryngectomy and is associated with delayed oral intake, prolonged hospitalization, and increased morbidity. Although many fistulas can be managed conservatively, a substantial proportion require surgical intervention. Early identification of patients unlikely to respond to conservative treatment may facilitate timely surgical intervention. We aimed to compare the characteristics and clinical outcomes of patients managed conservatively versus surgically for PCF and to identify factors associated with the need for surgical management.

MATERIAL & METHODS

We retrospectively reviewed patients who developed PCF after laryngectomy at our tertiary referral center between 2021 and 2026. Patients were categorized according to management strategy as conservative treatment or surgical repair. Demographic characteristics, comorbidities, tumor-related factors, laboratory parameters, and clinical outcomes were compared. Correlation analyses were performed to assess factors associated with prolonged fistula duration and hospitalization.

RESULTS

A total of 42 patients with PCF were included; 27 were managed conservatively and 15 required surgical intervention. The surgical group had significantly lower serum albumin levels (30.6 ± 4.5 vs 36.5 ± 4.9 g/L, p=0.001), higher rates of anemia (80.0% vs 18.5%, p<0.001), and larger primary tumor size (47.7 ± 15.0 vs 33.9 ± 14.8 mm, p=0.009). They also had significantly longer hospital stay (59.8 ± 24.7 vs 31.6 ± 14.1 days, p<0.001) and longer fistula discharge duration (55.8 ± 43.6 vs 14.7 ± 10.7 days, p<0.001). Serum albumin was negatively correlated with both hospital stay and fistula duration, while fistula duration strongly correlated with length of hospitalization. Among surgically treated patients, closure techniques included primary suture repair (n=8), pectoralis major flap (n=4), deltopectoral flap (n=2), and regional rotation flap (n=1). Outcomes did not significantly differ according to reconstructive technique (p=0.856), although interpretation was limited by small subgroup numbers.

CONCLUSIONS

Hypoalbuminemia, anemia, and larger tumor burden are strong predictors of refractory PCF requiring surgical management after laryngectomy. Early recognition of these systemic risk factors may help identify patients unlikely to benefit from conservative treatment and support timely surgical planning, potentially reducing morbidity and hospitalization.

Age-Related Trends Of Thyroidectomies In Saudi Arabia: A Multicenter Retrospective Study

Hassan Alalawi[2], **Abdullah F. Alharbi**[1], **Hani Z. Marzouki**[1], **Hoda Alsayid**[1]

[1]*King Abdulaziz University;* [2]*Dr. Soliman Fakeeh Hospital;* [3]*King Saud Bin Abdulaziz University for Health Sciences, National Guard Hospital*

BACKGROUND & AIM

Understanding the relationship between aging and postoperative complications is critical because it may influence how the condition is managed. The safety of thyroidectomy in the older age group is debated in literature. All previous studies were conducted outside of the Middle East, and there is a scarcity of data in the literature describing the relationship between age and postoperative outcomes after thyroidectomy. This study aimed to compare the clinical trends of patients undergoing thyroidectomy between younger and older age groups.

MATERIAL & METHODS

A multicenter retrospective study was conducted at 3 tertiary care centers in Jeddah, Saudi Arabia. Our inclusion criteria consisted of patients of all ages of both sexes who underwent thyroidectomy. Patients were divided into 2 age groups, <60

years and ≥60 years. Chi-square test and independent t test were used to evaluate the differences between qualitative and continuous variables. Logistic regression analysis was performed with postoperative complications and length of hospitalization as the dependent variables.

RESULTS

798 patients were included in this study. The ≥60 years age group had a statistically significant longer mean postoperative length of hospitalization (5.37 ± 7.21 days) compared to the <60 age group (3.33 ± 4.24 days; P = .003). A total of 14.4% of the patients in the <60 years age group developed at least one postoperative complication compared to 17.9% of the patients in the ≥60 years age group (P = .385). Seroma and recurrent laryngeal nerve injury occurred more commonly in the ≥60 years age group compared to the <60 years age group with a statistically significant difference (P = .003 and P < .001, respectively). In contrast, hypocalcemia occurred more commonly in patients of the <60 years age group with a statistically significant difference (P = .044). These findings were further verified by multivariate logistic regression after adjustment for gender, type of procedure, and type of diagnosis.

CONCLUSIONS

In our region, the overall risk of developing postoperative complications was not different between the younger and older age groups. However, certain complications were more likely to develop in the older age group which requires vigilance from surgeons performing thyroidectomy. Likewise, the length of hospitalization was significantly longer in the older population. Awareness of complications and challenges of thyroidectomy in the older age group is crucial to improve care.

Surgical Practice Patterns And Educational Feedback Among Participants Of The Turkish School Of Head-Neck And Thyroid Surgery: A Cross-Sectional Survey Study

Ali Bayram[1], **Güleser Saylam**[2], **Kürşat Gökcan**[3]

[1]Department of Otolaryngology, Kayseri Faculty of Medicine, University of Health Sciences, Kayseri, Türkiye; [2]Department of Otolaryngology, Lokman Hekim University Faculty of Medicine, Ankara, Türkiye; [3]Department of Otolaryngology, Ankara University School of Medicine, Ankara, Türkiye

BACKGROUND & AIM

Head and neck and thyroid surgery is a rapidly evolving subspecialty that requires continuous surgical skill development and up-to-date knowledge. Although specialized training schools play a crucial role in this process, there is limited data regarding the current surgical practice patterns and educational satisfaction of the participants attending these programs. The aim of this study was to evaluate the current surgical practice patterns, training experiences, and educational feedback of participants attending the Turkish School of Head-Neck and Thyroid Surgery (SHNTS).

MATERIAL & METHODS

A 22-question electronic survey was distributed to ENT specialists of all ages and levels of experience who participated in and graduated from the Turkish SHNTS. Descriptive statistics were used to summarize responses and demographics of respondents.

RESULTS

Eighty-one otorhinolaryngologists participated, most with 11-20 years of experience and working in tertiary referral hospitals. While 40% reported the presence of a dedicated head and neck surgery team in their institution, only 49.4% considered their residency training in this field sufficient. Most participants enhanced their experience through post-residency efforts, particularly courses and congresses (87.5%) and the Turkish SHNTS (98.8%).

In clinical practice, 58% of respondents reported performing more than five head and neck procedures per month, with salivary gland (88.9%) and laryngeal surgeries (66.7%) being the most common. The most reported challenges were lack of multidisciplinary collaboration (55.7%), team insufficiency (39.2%), and limited experience (34.2%). Motivation to perform head and neck surgery was primarily driven by professional interest (84.6%) and perceived patient benefit (76.9%); however, only 42.5% reported high motivation levels. Heavy workload (44.1%) and low patient volume (41.2%) were the leading reasons for reduced surgical activity.

CONCLUSIONS

Participants of the Turkish SHNTS maintain active engagement in post-residency education and clinical practice; however, limited multidisciplinary support and workload-related constraints continue to hinder optimal surgical performance.

Hearing Aid Fitting Based On Automated Real-Ear Measurements 'Autorem-Based Fitting'

Dalia Hassan[1]

[1]*Audiovestibular medicine unit, ORL Dept, Ain Shams University, Cairo, Egypt*

BACKGROUND & AIM

Hearing aid fitting guidelines recommended the use of real ear measures (REM) as a verification step during hearing aid fitting process. In order to increase the clinical use of REMs, hearing aid manufacturers developed and incorporated integrated REMs (Auto-REM) in the fitting software with subsequent automatic fitting to target.The objective of this study was to Compare the AutoREM-based hearing aid fitting and the default manufacturer's first-fit approaches objectively and subjectively.

MATERIAL & METHODS

Thirty-eight adults sensorineural hearing loss subjects (40 ears) were included in the present cross sectional study with an age range from 18 to 60 years. The degree of hearing loss varied from mild to moderate severe degree in the tested ears. All subjects of the study group were fitted with Bernafon Zerena 9 receiver-in-the-canal (RIC) hearing aid. The hearing aid was programmed using either the Manufacturer's first fit or the AutoREM-based fitting. The outcome of the two fitting procedures were evaluated through REM, aided sound field thresholds, aided word recognition score and the Arabic version of client-oriented scale of improvement (COSI) questionnaire.

RESULTS

The AutoREM-based fitting was superior than default first fit in all measures tested. the Auto-REM aided sound field and insertion gain showed statistically significant better thresholds than that of the Manufacturer first fit and DSLv5 formula gives higher gain than BernafitNL formula.

CONCLUSIONS

Automated real ear measurements–based fitting can enhance how well the hearing aid matches prescription targets, resulting in better listening experiences. This will add more precision, efficiency, and ensures benefit in difficult to fit or pediatric population.

OP-548

Assessment Of Audiological Findings And Neurodevelopmental Characteristics In Children With Suspected Hearing Loss: Preliminary Results

Meryem Mutlu[1], **İbrahim Özcan**[2]

[1]*Kayseri Şehir Hastanesi Odyoloji Bölümü;* [2]*Kayseri Şehir Hastanesi Sağlık Bilimleri Üniversitesi Kulak Burun Boğaz Anabilim Dalı*

BACKGROUND & AIM

In children, the suspicion of hearing loss can also arise from various different etiologies. Therefore, it is important to evaluate not only hearing, but also otherdevelopmental characteristics.

The aim of this study is to evaluate the relationshipbetween audiological findings and neurodevelopmentalcharacteristics.

MATERIAL & METHODS

The study included children aged 2-7 years whopresented to the Kayseri City Hospital ENT outpatient clinicwith suspected hearing loss. Children who passed the newbornhearing screening test for the audiological evaluation, age-appropriate hearing tests were performed for each child. Theseincluded diagnostic ABR, transient evoked otoacousticemissions (TEOAEs), tympanometry, sound-field testing, andlanguage development tests. Neurodevelopmental outcomeswere also evaluated.

RESULTS

According to the audiological test battery, hearingwas within normal limits in the vast majority of cases. Amongchildren with normal hearing who presented with suspectedhearing loss, the most frequently encountered conditions werediagnoses within the autism spectrum. Daily screen exposureaveraged approximately 4.6 hours/day, and approximately halfof the children reported screen exposure of 4 hours or moreper day.

CONCLUSIONS

Based on the data currently obtained from ourpatients (56 patients), our study shows that the vast majorityof children who passed newborn hearing screening but laterpresented to the clinic with suspected hearing loss in childhood do not have an actual hearing loss, and that theirsymptoms may be more attributable to neurodevelopmentalproblems.

OP-549

Sight Is Routine, Sound Is Overlooked: Perceived Barriers To Hearing Aid Utilization In Lebanon

Omar Aboul Hosn[1], **Lynn Abdel Malak**[1], **Lana Ghzayel**[1], **Justin Ghadieh**[1], **Lucien Khalil**[1], **Ghena Lababidi**[1], **Nijad Zeineddine**[1], **Aren Marajanian**[1], **Rita Jreige**[1], **George Zaytoun**[1]

[1]*Department of Otorhinolaryngology Head & Neck Surgery- American University of Beirut Medical Center*

BACKGROUND & AIM

Hearing loss is a growing global health issue affecting over 430 million people, projected to reach 700 million by 2050. It is associated with depression, social isolation, and cognitive decline. Hearing aids improve communication and may reduce dementia and depression risk, yet utilization remains low, with studies reporting rates as low as 9.7% among individuals with hearing loss. Use is limited by financial and psychosocial barriers. In contrast, eyeglasses are widely accepted, highlighting differing perceptions of sensory impairment. Data on perceptions of hearing and hearing aid use in Lebanon are limited; this study evaluates related perceptions and barriers.

MATERIAL & METHODS

A retrospective cross-sectional study at the American University of Beirut Medical Center reviewed EPIC records of patients evaluated between January 1 and December 31, 2024, in private (full-fee) and resident-run (low-cost) clinics, with equivalent care under the same attending supervision. Following IRB approval, adults aged 18–85 years with sensorineural or mixed hearing loss were included (n=870). Sample size was calculated using Cochran's formula ($n=Z^2 \cdot p(1-p)/d^2$) based on WHO estimates, requiring 246 participants; 600 were randomly recruited and equally distributed between clinics, of whom 274 completed the questionnaire. A structured questionnaire assessed five domains: demographics, clinical characteristics, perceptions and attitudes, awareness of untreated hearing loss, and experience with hearing aid use, and was administered via structured telephone interviews with responses recorded on 5-point Likert scales. Data were analyzed using SPSS v29 with chi-square and correlation tests, with $p<0.05$ considered significant.

RESULTS

274 patients completed the questionnaire, of whom 46.4% were from private clinics and 53.6% from the resident-run clinic. Patients in the resident-run clinic were older ($p=0.014$), with lower education and employment ($p<0.001$). Sensorineural hearing loss was most common (61.3%), and more prevalent in the resident-run clinic ($p=0.004$), while hearing aid use was 24.5% with no difference ($p=0.406$). Difficulty accessing care (25.5%), financial burden (62%), and loss to follow-up (63.9%) were common without differences ($p>0.05$). 47.4% perceived eyesight as more important than hearing ($p=0.013$), and 46.4% considered hearing aids less effective than eyeglasses ($p=0.002$), both higher in the resident-run clinic. 59.1% reported greater stigma ($p=0.006$), and lack of knowledge (28.5%) was higher in the resident-run clinic ($p=0.009$). Hearing aid satisfaction was higher in private clinics ($p=0.003$), while negative reactions were higher in the resident-run clinic ($p=0.012$). Quality of life correlated more with subjective than objective severity ($p<0.001$).

CONCLUSIONS

Hearing aid utilization in Lebanon remains limited and is shaped less by audiometric severity than by individuals' perceived hearing difficulty, functional impact, awareness, and socioeconomic context. Although vision and hearing represent

comparable sensory functions, corrective eyewear is socially prioritized, whereas hearing aids are still influenced by negative social attitudes. This contrast highlights the need to present hearing rehabilitation as a normal, proactive step to preserve communication, relationships, and independence. Improving affordability and access, providing structured counseling with post-fitting support, and advancing public awareness efforts are essential to normalize hearing aid use and support healthy aging.

OP-550

Psychosocial Factors Affecting Hearing Aid Adjustment: A Turkish Validity And Reliability (Pilot Study)

Belde Çulhaoğlu[1], **Azra Sivari**[1], **Hatice Seyra Erbek**[1]

[1]*Lokman Hekim University*

BACKGROUND & AIM

The effectiveness of a hearing aid depends not only on the device settings but also on psychological and social factors. In response to this need, “Psychosocial Factors Affecting Hearing Aid Adjustment” questionnaire was developed in Denmark to assess hearing aid users’ satisfaction from a psychosocial perspective (Ceylan & Hudemann, 2011). It is planned to adapt it into Turkish under the title “Psychosocial Factors Affecting Hearing Aid Adjustment: A Turkish Validity and Reliability Study”.

MATERIAL & METHODS

This study was conducted as a pilot study and included 19 participants (8 women - 42.1%, 11 men - 57.9%) who has been actively using hearing aids for at least 3 months. The data collection tool used was the Turkish version of the 32-item questionnaire, which assesses expectations, motivation, social life, adaptation to hearing aid use, and usage habits related to hearing aid use. The questionnaire was adapted using the back-translation method and administered to participants in person.

RESULTS

The participants, aged between 7 and 84 years, had a mean device usage duration of 97.1±134.89 months; 11 reported using their devices for more than 10 hours daily. Based on hearing aid satisfaction and expectation scores, users were found to be highly satisfied. However, 73.7% reported encountering at least one issue, such as ear mold problems or device adjustment issues, which made it difficult to use the devices. Despite this, only 3 of them (15.8%) considered general usage difficult. While 88.9% are satisfied with the information provided regarding device use, they consider the training insufficient. Overall, 77.8% reported being satisfied or very satisfied with their hearing aids.

CONCLUSIONS

Although most users reported high satisfaction, the presence of usage-related difficulties highlights the importance of psychosocial factors in hearing aid adjustment. Further research is needed to establish the validity and reliability of the Turkish adaptation.

KEYWORDS

hearing aids, device adjustment, psychosocial factors

OP-551

The Role Of Audiogram Configuration In Sound Intolerance Among Patients Undergoing Hearing Aid Fitting

Ömer Küçüköner[1], **Zeynep Er**[1], **Doğukan Özdemir**[1]

[1]*Department of Audiology, Ear, Nose and Throat Clinic, Faculty of Medicine, Samsun University, Samsun, Türkiye*

BACKGROUND & AIM

Hearing loss is increasingly recognized as a complex phenotype characterized not only by elevated peripheral thresholds but also by decreased sound tolerance (DST) disorders, including tinnitus, hyperacusis, and misophonia. While audiometric configuration has been linked to tinnitus, misophonia and hyperacusis are reported to correlate more strongly with uncomfortable loudness levels (UCL) than with pure-tone thresholds. We hypothesized that audiogram configuration independently influences the prevalence and severity of DST symptoms in sensorineural hearing loss (SNHL), and aimed to evaluate misophonia, hyperacusis, and tinnitus across three configuration groups to inform individualized hearing-aid fitting strategies.

MATERIAL & METHODS

In this cross-sectional study, adults (≥18 years) with audiometrically confirmed SNHL, candidates for hearing aids, were classified into three groups by audiogram configuration: low-frequency loss, high-frequency loss, and flat configuration. The misophonia scale, hyperacusis questionnaire, and tinnitus handicap inventory (THI) were administered. Groups were compared using one-way ANOVA or the kruskal-wallis test (bonferroni-corrected pairwise comparisons) depending on normality (shapiro-wilk), and categorical variables with chi-square testing (cramér's v). Significance was set at $p<0.05$.

RESULTS

This preliminary analysis included 50 patients (low-frequency n=9, high-frequency n=25, flat n=16) of a target sample of 108. Hyperacusis scores differed significantly across groups (kruskal-wallis h=8.12, p=0.017), being lower in the low-frequency group than in the high-frequency (p=0.009) and flat groups (p=0.013), with no difference between the latter two (p=0.678). Misophonia and THI scores did not differ significantly between groups (p=0.944 and p=0.771, respectively). Uncomfortable loudness levels also differed significantly across groups (p<0.001), consistent with the hyperacusis findings. Sex distribution differed between groups (p=0.031); age, UCL, and speech-discrimination correlations with symptom scores were not significant.

CONCLUSIONS

Preliminary findings suggest that audiogram configuration is independently associated with hyperacusis severity, but not with misophonia or tinnitus handicap, in patients with SNHL. Steeply configured (low-frequency) losses were associated with lower hyperacusis burden, potentially reflecting reduced high-frequency trigger exposure. These findings, once confirmed in the full target cohort, may help tailor hearing-aid output and compression strategies to individual sound-tolerance profiles.

Investigation Of The Factors That Affect The Beliefs And Attitudes Of The Elderly People Regarding The Use Of Hearing Aids, Based On The Health Belief Model.

Konstantinos Valsamidis[1], **Konstantinos Garefis**[2], **Konstantinos Mantsopoulos**[1], **Athanasia Printza**[1], **George Psillas**[1], **Stefanos Triaridis**[1]

[1]*1st Otorhinolaryngology, Head and Neck Surgery Department, Medical School, Aristotle University of Thessaloniki, AHEPA Hospital, Thessaloniki, Greece.*; [2]*2nd Otorhinolaryngology, Head and Neck Surgery Department,Medical School, Aristotle University of Thessaloniki, Papageorgiou Hospital, Thessaloniki, Greece*

BACKGROUND & AIM

Presbycusis is a common disorder with significant negative impact in daily life, emotional status and quality of life of older people. Despite the fact that the application of hearing aids is the gold standard treatment for this disease, there are many people suffering from hearing loss who do not choose to use them. The aim of the study is to analyze the beliefs of the people older than 60 years regarding the use of hearing aids and to investigate the predictive factors that affect them.

MATERIAL & METHODS

The Health Belief Model was used for the main purpose of the study. Participants also completed questionnaires for the evaluation of the five fundamental factors of personality, locus of control, coping strategies and perceived social support.

RESULTS

142 individuals older than 60 years with normal hearing were included in the study. The main finding was that most of the participants reported high perceived severity, gains and cues to action. Perceived susceptibility and self-efficacy were found lower, while a significant proportion of individuals reported high perceived barriers regarding the use of the hearing aids. Another finding was that people who were of higher socio-economic status and had higher education level were found to have more chances to use the hearing aids. Additionally, individuals high on agreeableness, extraversion, conscientiousness, openness, internal locus of control and positive coping style preferences were found to have more positive opinions for the hearing aids. Further, perceived social support was found to significantly affect the participants' beliefs related to the hearing aids.

CONCLUSIONS

The Health Belief Model in combination with the evaluation of the personality, the locus of control, the coping strategies and the perceived social support may be a useful tool for the planning of health policy programs aiming at the older people's awareness of the benefits of the hearing aids' use for the treatment of presbycusis.

OP-553

Determinants Of Delayed Hearing Aid Purchase After Hearing Loss Diagnosis

Furkan Büyükkal[1], **Aleyna Sap**[1], **Sibel Büşra Kopuz**[1], **Mustafa Bülent Şerbetçioğlu**[1]

[1]*Istanbul Medipol University*

BACKGROUND & AIM

Untreated hearing loss can negatively affect communication, social participation, emotional well-being, and quality of life. Although hearing aids are an effective rehabilitation option, many individuals delay obtaining them after diagnosis. This study

aimed to determine the time interval between hearing loss diagnosis and hearing aid purchase and to identify demographic, social, and clinical factors associated with this delay.

MATERIAL & METHODS

This cross-sectional survey study included 150 adults aged 18 years and older who had been diagnosed with hearing loss and were using hearing aids. Participants consisted of 75 females and 75 males. Hearing loss was classified according to the four-frequency pure-tone average of 500, 1000, 2000, and 4000 Hz in the better ear. A 23-item questionnaire was administered face-to-face to evaluate demographic characteristics and factors potentially influencing the hearing aid purchase process. The interval between the date of hearing loss diagnosis and the date of hearing aid purchase was calculated. Statistical analyses were performed using Mann–Whitney U and Kruskal–Wallis tests, with significance set at $p < 0.05$.

RESULTS

The mean time between hearing loss diagnosis and hearing aid purchase was 3.03 years. A significant association was found between purchase delay and educational level ($p = 0.02$). High school graduates purchased hearing aids later than primary school graduates, with mean delays of 4.31 and 0.73 years, respectively. Concerns about deterioration in social relationships or fear of social exclusion were also significantly associated with delayed purchase ($p = 0.03$). Participants reporting poor social reactions to their decision to use hearing aids showed the longest delay, with a mean of 13.60 years ($p < 0.01$). Previous ear or head-neck surgery was also associated with longer purchase time ($p = 0.03$). Hearing aid cost and maintenance showed a borderline but non-significant association ($p = 0.05$).

CONCLUSIONS

Adults with hearing loss may delay hearing aid purchase for several years after diagnosis. Educational level, perceived social stigma, social circle reactions, and previous ear or head-neck surgery appear to influence this process. Interventions addressing stigma, counseling, and patient education may support earlier hearing aid adoption.

The Impact Of Psychiatric Symptoms On Hearing Aid Adherence

Muhammet Ensar ÖLEKLİ[1], **Sevim Öykü TUNÇ ÖLEKLİ**[2], **Tuğçe Gül ÇAĞLAR**[1], **Hatice Seyra ERBEK**[1]

[1]*Department of Otolaryngology, Head and Neck Surgery , Lokman Hekkim Hospitals;* [2]*Department of Psychiatry, Ankara Oncology Hospital*

BACKGROUND & AIM

Hearing aid adherence may be influenced not only by audiological factors but also by patients' psychological well-being and perceptions of their physical appearance. Psychiatric symptoms may interfere with the acceptance and consistent use of hearing aids, while concerns regarding body image and the visibility of the device may contribute to avoidance or reduced adherence. This study aimed to investigate the associations between psychiatric symptoms and hearing aid adherence among adult hearing aid users. A secondary aim was to determine whether psychiatric symptom severity and body image perception were significant predictors of hearing aid adherence.

MATERIAL & METHODS

This cross-sectional study included 30 adult (≥18 years) hearing aid users. Participants completed the Symptom Checklist-90-Revised (SCL-90-R) and the Body Image Scale. Sociodemographic and clinical data were recorded, and hearing aid adherence was assessed. The associations between psychiatric symptoms, body image, and hearing aid adherence were analyzed using appropriate statistical methods. A p-value of <0.05 was considered statistically significant.

RESULTS

A significant positive correlation was observed between the duration of hearing aid use in years and all SCL-90-R symptom dimensions except somatization. This finding indicates that longer-term hearing aid use was associated with higher levels of psychiatric symptoms across multiple domains. In addition, daily hearing aid use was positively correlated with the interpersonal sensitivity and depression subscales of the SCL-90-R. No significant association was found between the somatization subscale and either the duration of hearing aid use or daily hearing aid use.

CONCLUSIONS

Our findings suggest that psychological factors are associated with patterns of hearing aid use. Longer duration of hearing aid use was associated with higher levels of psychiatric symptoms across most SCL-90-R dimensions, while greater daily hearing aid use was specifically associated with depressive symptoms and interpersonal sensitivity. These findings highlight the complex interplay between psychological well-being and hearing aid use and suggest that psychiatric assessment may be valuable as part of the comprehensive management of individuals with hearing impairment. Further studies with larger samples and longitudinal designs are needed to clarify the direction and clinical significance of these associations.

Hearing Aid Usage Habits Among Individuals Aged 80 Years and Older

Fatih Recai Kablan[1], **Tuğçe Gül Çağlar**[2], **Hatice Seyra Erbek**[1]

[1]*Department of Otorhinolaryngology, Lokman Hekim University Hospital, Ankara, Türkiye;* [2]*Department of Audiology, Lokman Hekim University Hospital, Ankara, Türkiye*

BACKGROUND & AIM

This study aimed to investigate the relationships among hearing aid outcomes, quality of life, and depressive symptoms in hearing aid users aged 80 years and older, and to evaluate the associations of daily hearing aid use duration and demographic and audiological characteristics with these outcomes.

MATERIAL & METHODS

This cross-sectional study included 50 hearing aid users aged 80–96 years. Participants were initially assessed using the Mini-Mental State Examination (MMSE). Hearing aid outcomes were evaluated using the International Outcome Inventory for Hearing Aids (IOI-HA); quality of life was assessed using the physical health, psychological health, social relationships, and environment domains of the Turkish version of the World Health Organization Quality of Life-BREF (WHOQOL-BREF-Tr); and depressive symptoms were evaluated using the 30-item Geriatric Depression Scale (GDS-30). Demographic and audiological characteristics, as well as hearing aid use characteristics, were recorded. Associations between variables were analyzed using Spearman's rank correlation coefficient. Comparisons between two groups were performed using the Mann–Whitney U test, whereas comparisons among more than two groups were conducted using the Kruskal–Wallis test. For significant Kruskal–Wallis results, Dunn's post-hoc test with Holm correction was applied.

RESULTS

The mean age of the participants was 84.86±3.63 years, and 58.0% were female. The total IOI-HA score showed strong positive correlations with all WHOQOL-BREF-Tr domains, including physical health (r_s=0.848), psychological health(r_s=0.709), social relationships(r_s=0.752), and environment(r_s=0.777) (all p<0.001). Significant differences according to daily hearing aid use duration were observed in IOI-HA scores (p<0.001) and in the physical health (p<0.001), psychological health (p=0.012), social relationships (p<0.001), and environment(p=0.005) domain scores. In particular, individuals who used their hearing aids for less than 1 hour per day had poorer outcomes. No significant correlations were found between GDS-30 scores and IOI-HA scores (r_s=-0.075; p=0.604) or any of the four WHOQOL-BREF-Tr domains (all p>0.05). However, age was significantly and positively correlated with GDS-30 scores (r_s=0.315; p=0.026). No significant differences in the primary outcome variables were observed according to sex, degree of hearing loss, total years of hearing aid use, or unilateral versus bilateral hearing aid use.

CONCLUSIONS

Among hearing aid users aged 80 years and older with Mini-Mental State Examination scores above 24, better hearing aid outcomes were strongly associated with higher quality-of-life scores across the physical, psychological, social, and environmental domains.The association of daily hearing aid use duration with both IOI-HA outcomes and quality-of-life domains highlights the importance of evaluating daily hearing aid use behavior alongside patient-reported outcomes in the auditory rehabilitation of very old adults.These findings support a person-centered approach to hearing rehabilitation in advanced age that integrates audiological assessment with quality-of-life and psychosocial evaluations.

OP-556

Technology Anxiety and Social Appearance Anxiety as Predictors of Hearing Aid Outcomes

Berna Deniz Kuntman[1]

[1]*University of Health Sciences, Gulhane Faculty of Health Sciences, Department of Audiology, Ankara, Türkiye*

BACKGROUND & AIM

Hearing aid outcomes are influenced by audiological, technological, and psychosocial factors. Technology anxiety may reduce users' confidence in managing hearing aids, whereas social appearance anxiety may discourage hearing aid use because of concerns about social evaluation and stigma. However, their contribution to patient-reported hearing aid outcomes remains unclear. This study aimed to investigate whether technology anxiety and social appearance anxiety are associated with hearing aid outcomes in adult hearing aid users.

MATERIAL & METHODS

This quantitative, cross-sectional, correlational study was approved by the Lokman Hekim University Scientific Research Ethics Committee (Project No. 2026060; Decision No. 2026/078; February 25, 2026) and conducted in accordance with the Declaration of Helsinki. Adult hearing aid users attending the Department of Otolaryngology were recruited using consecutive sampling. Inclusion criteria were age ≥18 years, hearing aid use for ≥6 months and ≥1 hour/day, mild-to-severe hearing loss, voluntary participation, and absence of cognitive impairment. Participants underwent otolaryngological examination and

audiological assessment and completed a Demographic Information Form, Abbreviated Technology Anxiety Scale (ATAS), Social Appearance Anxiety Scale (SAAS), and International Outcome Inventory for Hearing Aids (IOI-HA). The primary outcome was the IOI-HA total score. ATAS and SAAS were examined as independent variables. Spearman correlation and multiple linear regression analyses were performed, with $p<0.05$ considered statistically significant.

RESULTS

A total of 82 hearing aid users were included. Mean scores were 26.48±9.94 for ATAS, 32.38±13.60 for SAAS, and 27.30±5.78 for IOI-HA. SAAS was moderately and negatively correlated with IOI-HA scores ($\rho=-0.550$; $p<0.001$), whereas ATAS was not significantly correlated with IOI-HA scores ($\rho=-0.145$; $p=0.211$). In univariate regression analysis, SAAS significantly predicted IOI-HA scores ($\beta=-0.572$; $p<0.001$; $R^2=0.327$). In the multiple regression model including SAAS and ATAS, the model explained 34.4% of the variance in IOI-HA scores ($R^2=0.344$). SAAS remained a significant negative predictor ($\beta=-0.572$; $p<0.001$), whereas ATAS was not a significant predictor ($\beta=-0.076$; $p=0.169$). Older age was positively correlated with technology anxiety ($\rho=0.333$; $p=0.003$).

CONCLUSIONS

Social appearance anxiety, but not technology anxiety, was independently associated with poorer patient-reported hearing aid outcomes. These findings highlight the importance of addressing social appearance concerns in hearing aid rehabilitation and counseling.

OP-557

Hearing, Social Connection, And Cognition: Evidence From The ACHIEVE Clinical Trial

Nicholas S Reed AuD PhD[1,2]

[1]*Amplifon;* [2]*Johns Hopkins University*

BACKGROUND & AIM

Social connection may mediate an association between hearing loss and cognitive decline. This secondary analysis of the Aging and Cognition Health Evaluation in Elders (ACHIEVE) hypothesizes that hearing care impacts social connection and social connection functions as a mechanistic pathway through which hearing intervention affected cognition among older adults.

MATERIAL & METHODS

ACHIEVE (United States,2018-2022) was a multicenter, parallel-group, unblinded 1:1 randomized controlled trial of 977 community-dwelling older adults (70-84 years) with mild-moderate hearing loss that examined the effects of a best-practice hearing intervention (n=490) versus a health education control (n=487) on 3-year change in cognition. Global cognition (10 test battery), Social (Cohen Social Network Index with network size, diversity, and embedded subcategories), loneliness (UCLA Loneliness scale) were included. The intervention effect of hearing care on social and loneliness outcomes over 3 years were estimated using a 2-level linear mixed-effects model under the intention-to-treat principle. In casual mediation analysis models, each of the social network subdomains and loneliness were operationalized as baseline to 3-year change across separate models to estimate indirect effects. Each indirect effect quantified the extent to which a mediator functioned as a mechanistic pathway between hearing intervention and cognition. Missing data was addressed using multiple imputations by chained equations.

RESULTS

In fully adjusted models, hearing intervention (vs health education control) reduced social isolation (social network size [difference, 1.05; 95%CI,0.01-2.09], diversity [difference, 0.19;95%CI,0.02-0.36], embeddedness [difference, 0.27;95%CI,0.09-0.44], and reduced loneliness [difference, −0.94 95%CI,−1.78 to −0.11]) over 3 years. Results were substantively unchanged in sensitivity analyses by recruitment source. A statistically significant indirect effect was detected for embedded networks ($\beta=0.015$;95%CI,0.001, 0.030, $p=0.036$) in the full sample. Indirect effects for other components were not statistically significant. When stratified by recruitment source, point estimates of the indirect effect were larger among participants recruited from ARIC compared to de novo participants, but none of the indirect effects were statistically significant.

CONCLUSIONS

Best practice hearing care resulted in the retention of 1 additional person in a social network over a 3-year period compared to a healthy education control. The effect of a best-practice hearing intervention on subsequent cognitive function was partially mediated by network embeddedness, which represents the depth of an individual's engagement in different social network domains. These results provide the first preliminary evidence suggesting that social connection functions as a mechanistic pathway through which hearing intervention may reduce cognitive decline in older adults with hearing loss.

OP-558

Hearing Aid Usage Patterns Among Hearing Aid Users

TUĞÇE GÜL ÇAĞLAR[1], **LEYLA TÜRE**[2], **SEYRA ERBEK**[3]

[1]Lokman Hekim University, Faculty of Health Sciences, Audiology, Ankara, Türkiye; [2]İstanbul Kent University, Faculty of Health Sciences, Speech and Language Disorders, İstanbul, Türkiye; [3]Lokman Hekim University, Faculty of Medicine, ENT

BACKGROUND & AIM

This study seeks to identify patterns of hearing aid (HA) use through users' retrospective reports regarding their device use. Specifically, it aims to collect retrospective data—at least one year after fitting—on the contexts in which hearing aids are consistently worn and the situations in which they are removed. Furthermore, the study attempts to explore the common underlying factors associated with both use and non-use among participants in order to better understand hearing aid utilization behaviors.

MATERIAL & METHODS

The target population of the study consists of adult individuals with hearing loss in Turkey who obtained their hearing aids through public or private clinics. The sample includes a total of 150 adult patients who were followed at Lokman Hekim University Hospital and its Audiology Departments and who agreed to participate in data collection. Inclusion criteria were: being 18 years of age or older, having a diagnosed hearing loss, being a native Turkish speaker, and being a hearing aid user.

RESULTS

Identifying underlying subpopulations of hearing aid users is important for understanding how hearing aid use and outcomes are associated with sociodemographic characteristics, auditory differences, and hearing aid–related factors. It is assumed that demographic, audiological, and device-related characteristics of users may vary across different usage conditions (e.g., social activities, gardening, workplace settings, rainy days, exercising), and that these variations may be reflected in self-reported outcomes related to hearing aid use in specific contexts.

CONCLUSIONS

The findings demonstrate that hearing aid users exhibit distinct patterns of use influenced by demographic, socioeconomic, and individual factors. The most prominent finding is that individuals who report regular use of their devices achieve better self-reported outcomes compared to other user groups. Overall, consistent hearing aid use is associated with greater perceived benefit and satisfaction, highlighting the importance of supporting regular use in clinical practice.

Effects Of Frequency Composition On Temporal Processing In Hearing Aid Users

Mert Kılıç[1], **Hatice Merve Yücel**[2]

[1]Department of Audiology, Hamidiye Faculty of Health Sciences, University of Health Sciences, Istanbul, Türkiye; [2]Department of Audiology, Faculty of Health Sciences, Ankara Medipol University, Ankara, Türkiye

BACKGROUND & AIM

High-frequency sensorineural hearing loss reduces consonant perception and speech intelligibility. Frequency-lowering (FL) strategies address this by shifting inaudible high-frequency cues into audible regions. The frequency composition (Fcomp) algorithm keeps high-frequency information while replicating it at lower frequencies, a process that could alter temporal cues. Because temporal processing is critical for speech perception, the aim of this study was to examine the effect of Fcomp on temporal processing and to test the hypothesis that preserving high-frequency information would support temporal abilities in hearing aid users.

MATERIAL & METHODS

Seventeen adults (45-64 years; mean = 55.71) with bilateral, symmetrical, mild-to-moderately severe high-frequency sloping sensorineural hearing loss who had used receiver-in-the-ear (RITE) hearing aids for ≥1 year and no prior FL experience were included in the study. Measurements were conducted in two sessions using participants' own hearing aids: (1) before FL activation (Fcomp off), and (2) after four weeks of daily use with Fcomp on. To assess temporal processing, all participants completed the Random Gap Detection Test (RGDT) at 500, 1000, 2000, and 4000 Hz, which measures temporal resolution, and the Frequency Pattern Test (FPT) and Duration Pattern Test (DPT), which evaluate temporal sequencing. Data were analyzed with paired-sample t-test or Wilcoxon signed-rank test depending on normality, with a significance level set at $p < 0.05$.

RESULTS

After Fcomp activation, FPT performance improved significantly ($p = 0.012$). No significant difference was found in the DPT results ($p = 0.287$). In the RGDT analyses, a significant enhancement in temporal resolution performance was detected only at 4000 Hz ($p = 0.020$); however, no significant differences were found at 500 Hz ($p = 0.467$), 1000 Hz ($p = 0.623$), and 2000 Hz ($p = 0.450$) or in the composite score (average across all frequencies) ($p = 0.380$).

CONCLUSIONS

The improvement in RGDT at 4000 Hz likely reflects increased audibility of high-frequency temporal cues through Fcomp, whereas unchanged lower RGDT frequencies indicate no benefit in those bands. The FPT improvement may stem from better access to high-frequency spectral detail. The absence of DPT changes suggests negligible effects of Fcomp on duration-based tasks. These findings indicate limited improvements of Fcomp on temporal processing.

OP-560

Perceived Stigma, Hearing Aid Outcomes, Health-Related Quality Of Life

Asuman Küçüköner[1], **Ömer Küçüköner**[2]

[1]Department of Audiology, Vocational School of Health Services, Ondokuz Mayıs University, Samsun, Türkiye; [2]Assist. Prof. Dr., Department of Audiology, Ear, Nose and Throat Clinic, Faculty of Medicine, Samsun University, Samsun, Türkiye

BACKGROUND & AIM

Hearing loss and hearing aid (HA) use are frequently associated with social stigma, which may negatively influence device benefit and health-related quality of life (QOL). However, the relationship between perceived stigma, HA outcomes, and QOL remains inconsistently characterized in adult HA users. This study aimed to examine the associations between perceived stigma, HA outcomes, and QOL in adults using hearing aids. We hypothesized that higher perceived stigma would be associated with poorer HA outcomes and lower QOL.

MATERIAL & METHODS

This is an ongoing cross-sectional, descriptive-correlational study. Adults aged 18–80 years with a confirmed hearing loss diagnosis, using hearing aids for at least six months, were recruited from otolaryngology and audiology clinics. Data were collected face-to-face using a Sociodemographic/Clinical Information Form, a 9-item hearing loss-related Stigma scale (1–5 Likert), the International Outcome Inventory for Hearing Aids (IOI-HA, 7 items), and the EUROHIS-QOL 8-item scale. Pearson/Spearman correlation analyses examined associations between total scale scores. Preliminary analysis included the first 44 enrolled participants (target sample: 120–150).

RESULTS

The sample (N=44) had a mean age of 45.8±17.8 years (range 18–82), with equal sex distribution (50% female). Mean scores were: Stigma 17.4±7.4 (range 9–45), IOI-HA 28.7±4.4 (range 16–35), and EUROHIS-QOL 30.8±6.8 (range 14–40). No statistically significant correlations were found between Stigma and IOI-HA (r=0.07, p=0.665), Stigma and QOL (r=-0.18, p=0.237), or IOI-HA and QOL (r=0.14, p=0.376).

CONCLUSIONS

In this interim analysis, perceived stigma was not significantly associated with hearing aid outcomes or quality of life, contrasting with some prior literature. This may reflect the limited preliminary sample size and cross-sectional design rather than a true absence of relationship. Data collection is ongoing toward the target sample, and final analyses—including multivariable regression—are planned to clarify these associations.

Cumulative Musical Exposure And Early High-Frequency Hearing Loss: Implications For Preventive Screening In Musicians

Meltem Demirdağ Çevikkan[1], **Elif Kelebek**[2], **Harun Baki**[3]

[1]*Manisa Merkezefendi State Hospital, Department of Otorhinolaryngology, Manisa, TURKEY;* [2]*Manisa Merkezefendi State Hospital, Department of Audiology Manisa, TURKEY;* [3]*Manisa Celal Bayar University, Department of Music, Manisa, Turkey*

BACKGROUND & AIM

This study aimed to evaluate the impact of cumulative musical exposure on hearing thresholds in professional musicians and to determine the role of extended high-frequency audiometry (EHF) in detecting early cochlear vulnerability.

MATERIAL & METHODS

The study included 54 music students and instructors and 30 healthy controls. Participants completed a 16-item questionnaire assessing hearing health awareness and exposure patterns. All subjects underwent extended high-frequency audiometric evaluation covering 0.25–20 kHz. As data were not normally distributed, non-parametric tests (Mann–Whitney U and Kruskal–Wallis) were applied for frequency-based group comparisons. Statistical significance was set at $p<0.05$.

RESULTS

There was no significant difference in age between the musician and control groups ($p=0.092$), indicating comparable demographic characteristics. Musicians demonstrated significantly elevated hearing thresholds compared to controls across multiple frequencies. In the left ear, significant differences were observed between 0.25–8 kHz and particularly within the 12.5–16 kHz range ($p<0.05$). In the right ear, threshold elevations extended from 0.25 kHz up to 20 kHz ($p<0.05$), with the most pronounced differences detected in the 14–16 kHz range. Instrument category was not significantly associated with threshold variation, and no significant left–right asymmetry was identified among violinists. Although age was evaluated as a potential contributing factor, high-frequency threshold elevation appeared to reflect cumulative occupational exposure rather than age-related changes alone. Approximately 76% of musicians reported not using any hearing protection, while only 7% reported regular use. Nearly 48% reported experiencing post-performance tinnitus and/or aural pressure.

CONCLUSIONS

Extended high-frequency audiometry reveals early cochlear vulnerability in professional musicians, particularly within the 14–16 kHz range. Threshold elevation appears to reflect cumulative occupational stress. These findings strongly support incorporating EHF testing into routine preventive screening programs and implementing structured hearing conservation strategies early in musicians' careers.

OP-562

EFFECT OF HYPERICUM PERFORATUM ON WOUND HEALING AFTER VOCAL FOLD INJURY

Şamil Çakır[1], **İrfan Kaygusuz**[1], **Tuncay Kuloğlu**[1], **Gökhan Artaş**[1], **Eyüp Bağcı**[1], **Orkun Eroğlu**[1], **Abdulvahap Akyiğit**[1]

[1]*Firat University*

BACKGROUND & AIM

Vocal fold function depends on an intact histological structure and a balanced extracellular matrix (ECM) organization. Scar formation post surgery and trauma disrupts the viscoelastic properties of lamina propria, restricts mucosal wave propagation and may lead to persistent voice disorders. Therefore, biological agents that reduce scar formation are of considerable importance. Although Hypericum perforatum is known for its wound-healing effects, its impact on vocal fold scar healing has not yet been investigated. In this study, we evaluated the effects of Hypericum perforatum extract on histopathological healing and ECM remodeling in a rat model of experimentally induced vocal fold injury.

MATERIAL & METHODS

Thirty-five male Sprague–Dawley rats were included in the study. Under endoscopic visualization, we created tissue injury on the left vocal fold of all rats using a laser. The animals were randomly assigned to the following groups: Group A (untreated group, n = 7), Group B (HP extract, n = 14; B1: single dose, B2: four doses), and Group C (pure olive oil, n = 14; C1: single dose, C2: four doses). The right vocal fold of Group A was used as the control group. Treatments were applied to the injured left vocal fold using sponges soaked with the extract or olive oil for 10 minutes. On day 21, all animals were euthanized, and laryngeal tissues were harvested for histopathological examination. Each specimen was semi-quantitatively graded for epithelial regeneration, inflammation, granulation tissue, submucosal fibroblast density, collagen deposition, and elastin content.

RESULTS

Histopathological evaluation demonstrated that in the repeated-dose Hypericum perforatum group (B2), fibroblast density and collagen deposition were significantly reduced compared with the injury-only group, while elastin fiber organization was significantly more regular. In the single-dose Hypericum perforatum group (B1), collagen deposition was significantly reduced compared with the injury group; however, changes in fibroblast density and elastin deposition were not statistically significant. No significant differences were observed among the groups in terms of epithelial regeneration, inflammation or granulation tissue formation. No significant difference was detected between Groups C1, C2 and Group A in terms of extracellular matrix components.

CONCLUSIONS

Traditionally prepared Hypericum perforatum oil extract modulated extracellular matrix remodeling in rat vocal fold injury by limiting fibroblast proliferation and reducing excessive collagen deposition. Preservation of elastin fiber architecture was also observed, suggesting attenuation of excessive fibrotic scar formation. This experimental study is the first in the literature to demonstrate the histological effects of Hypericum perforatum on vocal fold scar healing, thereby providing a pioneering contribution to the field. These findings suggest that Hypericum perforatum may represent a potential adjunctive agent for reducing scar formation following vocal fold surgery.

OP-563

Laryngeal Pathology In Law Enforcement And Legal Professionals: Does It Mirror Professional Voice Users?

Sevasti Konstantinidou[1], **Rehab Awad**[1], **Antony Aymat**[1], **Sean Fang**[1], **Nicholas Gibbins**[1]

[1]*University Hospital Lewisham, Laryngology Department*

BACKGROUND & AIM

Professional voice users (PVUs) are known to present with a spectrum of laryngeal disorders that differ from those seen in the broader population of dysphonic patients.[1] In this study, we hypothesised that individuals working in law enforcement and legal professions demonstrate a laryngeal pathology profile more similar to PVUs than to the general dysphonic ENT population.

MATERIAL & METHODS

We performed a retrospective review of all new adult patients from law enforcement and legal backgrounds who attended our tertiary Voice Clinic between December 2010 and December 2025. Patient demographics, diagnostic findings, investigation results, and treatment modalities were extracted and analysed.

RESULTS

A total of 70 patients were included. The mean age was 46 years, with a female-to-male ratio of 21:14. Mean Voice Handicap Index-10 (VHI-10) was 18.7, Reflux Symptom Index (RSI) 19.8, Maximum Phonation Time (MPT) 8.6 seconds, and mean GRBAS score 4.3.

Multiple laryngeal pathologies were present in 60% of patients. The most common diagnosis was muscle tension imbalance (52.8%), comparable to professional voice users (41%) and higher than the general dysphonic population (24.3%). 1 Structural

and neoplastic lesions were identified in 41.4%, exceeding rates in professional voice users (31%) and the general population (29.2%) in the literature. 1 Inflammatory pathology was present in 32.8% and neuromuscular dysfunction in 17.1%.

Management included Speech and Language Therapy in 60% of patients. Phonosurgery was performed in 25.7%, higher than in the general dysphonic population (16.5%). 2 Additional treatments included osteopathy (17.1%) and reflux management (15.7%).

CONCLUSIONS

Law enforcement and legal professionals appear to exhibit a pattern of laryngeal pathology more closely aligned with PVUs than with the general dysphonic population. Muscle tension imbalance and structural abnormalities were the predominant findings. There was a higher requirement for phonosurgical management compared to the reported general population.

Age-Related Changes In The Cricoarytenoid Unit: A Postmortem Computed Tomography And Histopathology Study

Ezgi Keskin[1], **Yeşim Karagöz**[2], **Yuşa Yayla**[2], **Kadriye Ebru Akar**[3], **Abdulvahap Sevin**[4], **Özgür Yiğit**[5]

[1]*Department of Otorhinolaryngology – Head and Neck Surgery, University of Health Sciences, Istanbul Training and Research Hospital, Istanbul, Türkiye;* [2]*Department of Radiology, University of Health Sciences, Istanbul Training and Research Hospital, Istanbul, Türkiye;* [3]*Department of Pathology, Council of Forensic Medicine, Ministry of Justice, Istanbul, Türkiye;* [4]*Eighth Specialization Board, Council of Forensic Medicine, Ministry of Justice, Istanbul, Türkiye;* [5]*Department of Otorhinolaryngology – Head and Neck Surgery, University of Health Sciences, Basaksehir Cam and Sakura City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Preservation of at least one functional cricoarytenoid unit is a prerequisite for open partial horizontal laryngectomy, and advanced age often counts against candidacy. Whether the unit deteriorates structurally with age is unknown, and radiological ageing findings have never been histopathologically validated. We hypothesised that age causes histopathologically demonstrable degeneration and that age-related computed tomography (CT) findings have histopathological counterparts.

MATERIAL & METHODS

Cross-sectional ex vivo postmortem study, Council of Forensic Medicine, Istanbul. Eighty-two consecutive larynges without laryngeal disease, trauma, surgery, radiotherapy or intubation were studied (66 male, 16 female; mean age 56.6 ± 15.6 years, range 31–95). Each larynx underwent high-resolution CT after formalin fixation, then histopathology of both joints and the posterior and lateral cricoarytenoid muscles. Outcomes were CT calcification appearance, surface irregularity/subchondral cysts, joint space width and muscle attenuation, graded independently by two radiologists, plus histopathological inflammation, fibrosis and calcification (0–3). Independent variables were age (continuous) and sex. Analyses comprised sex-adjusted Firth penalized logistic regression, Spearman correlation, Cohen kappa, intraclass correlation, Bland-Altman analysis and Benjamini-Hochberg correction. No primary endpoint was pre-specified; all results are exploratory.

RESULTS

The only age-related CT finding reproduced by both radiologists was the appearance of cricoarytenoid joint calcification (OR 1.63 per 10 years; 95% CI 1.17–2.38; p=0.003), with predicted prevalence increasing from 44% at age 35 to 90% at age 85. No histopathological variable showed a significant association with age. Although CT suggested joint calcification in approximately 70% of cases, histopathological calcification was present in only 8.5% of right and 3.7% of left joints. Independently of age, increasing histopathological fibrosis of the posterior cricoarytenoid muscle was associated with higher CT muscle density in a dose-response pattern (rho=0.290; p=0.008). Cricoarytenoid joint-space width was not associated with age.

CONCLUSIONS

No clear age-related histopathological structural deterioration of the cricoarytenoid unit was demonstrated. CT-detected joint calcification became more frequent with age but often lacked a histopathological correlate, suggesting that chronological age and isolated radiologic calcification should not be used alone as indicators of structural impairment. The correlation between posterior cricoarytenoid muscle fibrosis and CT density also suggests that CT may provide a non-invasive marker of muscle fibrosis.

Clinical Outcomes Of Systemic Bevacizumab In Recurrent Respiratory Papillomatosis: A Preliminary Study From Azerbaijan

Ramil Hashimli[1]

[1]*Faculty of Medicine and Health Sciences, Karabakh University, Khankendi, Azerbaijan*

BACKGROUND & AIM

Recurrent respiratory papillomatosis (RRP) remains a surgically driven disease characterized by repeated airway obstruction and high procedural burden. While systemic bevacizumab has emerged as a promising anti-VEGF therapy, optimal dosing strategies and real-world outcomes remain under investigation. This study aimed to evaluate the clinical impact of single-dose systemic bevacizumab on recurrence patterns and surgical burden in pediatric and adult patients with severe RRP.

MATERIAL & METHODS

A retrospective observational series was conducted including five patients (four pediatric, one adult) with confirmed RRP and high surgical dependence. All patients underwent surgical debulking followed by a single intravenous dose of bevacizumab (5–10 mg/kg). No maintenance cycles or repeat dosing were administered.

Clinical follow-up included serial endoscopic examinations and assessment of recurrence requiring surgical intervention. Primary outcome measures included change in inter-surgical interval and duration of clinical remission.

Ethical approval was obtained from the Azerbaijan State Advanced Training Institute for Doctors (Approval No. LAR.4. [10.01.2026], 01.02.2026). Written informed consent was obtained from adult participants and from the legal guardians of pediatric patients.

RESULTS

At the time of abstract submission, follow-up is ongoing. To date, all five patients have demonstrated clinically meaningful prolongation of disease-free intervals following a single systemic dose of bevacizumab.

Pre-treatment recurrence intervals ranged from 2–4 months in aggressive cases. Post-treatment remission currently ranges from 6 to 24 months (median 9 months). Four patients (80%) remain surgery-free to date, and two pediatric patients have maintained sustained remission for 24 months at the time of reporting.

The adult patient with extensive tracheobronchial involvement and a history of 112 prior surgical procedures has achieved a 6-month surgery-free interval thus far, representing the longest interval observed in more than a decade of prior disease activity.

No clinically significant bevacizumab-related adverse events have been observed during the current follow-up period.

CONCLUSIONS

Single-dose systemic bevacizumab was associated with meaningful prolongation of inter-surgical intervals and reduction of procedural burden in both pediatric and adult patients with severe RRP.

Although follow-up is ongoing, early real-world outcomes from this first national experience in Azerbaijan suggest that even a single systemic administration may provide clinically relevant disease suppression in selected surgically dependent patients. Larger prospective studies are required to define optimal dosing strategies and long-term safety.

OP-566

Patient-Perceived Empathy In Otolaryngology: A Randomized Evaluation Of AI-Assisted Consultations

Samantha Mairesse[1], **Lise Sogalow**[1], **Giovanni Briganti**[2], **Jérome Lechien**[1]

[1]*Department of Surgery, University of Mons (UMONS), Belgium;* [2]*Department of Computational Medicine and Neuropsychiatry, University of Mons (UMONS), Belgium*

BACKGROUND & AIM

Patient-perceived empathy is linked with higher satisfaction, improved therapeutic adherence and better patient reported outcomes. AI-based tools may reduce administrative burden and cognitive load, potentially increasing physician attentional availability. However, their impact on validated empathy outcomes in ENT remains limited. The aim of this study is to Patient-perceived empathy is linked with higher satisfaction, improved therapeutic adherence and better patient reported outcomes. AI-based tools may reduce administrative burden and cognitive load, potentially increasing physician attentional availability. However, their impact on validated empathy outcomes in ENT remains limited.

MATERIAL & METHODS

Eighty adult ENT outpatients were randomized to AI-assisted or standard care and completed the Consultation and Relational Empathy (CARE) Measure and Jefferson Scale of Patient's Perceptions of Physician Empathy (JSPPPE) at their first consultation. Patients in AI group provided medical history, symptom severity, and other classical information from the consultation before presenting to the consultation through an AI-mediated consultation (Bingli® system). Patients in the standard care group follow the classical consultation with medical history and other information requested directly by the otolaryngologist. Consultation duration was recorded and groups were compared for empathy outcomes.

RESULTS

A total of 80 patients were included (median age 52 years [41–60]; 63.8% female). AI-assisted consultations were associated with significantly higher patient-perceived empathy on both validated instruments. Median CARE scores were significantly higher in the AI-assisted group (47 [42.5–49.2]) compared with standard consultations (42 [35.8–45]; p = 0.0017; r = 0.35).

Similarly, JSPPPE scores were markedly higher in the AI-assisted group (31 [29.5–35]) compared with controls (25 [22–28]; p < 0.001; r = 0.49). Consultation duration was slightly longer in AI-assisted consultations (14.5 [13–15] minutes) than in standard consultations (13 [10–16] minutes), although this difference did not reach statistical significance (p = 0.072). No significant gender-related differences in empathy perception were observed. Notably, higher scores in the AI-assisted group were consistently observed across all individual items of both empathy scales.

CONCLUSIONS

AI-assisted consultations were associated with higher patient-perceived empathy, without significantly increasing consultation time. Recruitment is ongoing, and final results will be presented at IFOS 2026.

OP-567

Acoustic And Perceptual Analysis Of Laryngeal Involvement In Systemic Lupus Erythematosus: Effects Of Disease Activity On Voice Characteristics

Ozan Tuysuz[1], **Ozlem Ozum**[1], **Cemal Bes**[1], **Fatıma Gul Gulbahce Incesu**[1], **Zeynep Yıldırım**[1], **Ozgur Yıgıt**[1]

[1]*Basaksehir Cam and Sakura City Hospital, Department of Otorhinolaryngology, Istanbul, Turkey*

BACKGROUND & AIM

Systemic Lupus Erythematosus (SLE) is a chronic autoimmune disease characterized by multisystem inflammation. Although laryngeal involvement and alterations in voice parameters have been reported in SLE, the relationship between these changes and disease activity remains unclear. This study aimed to evaluate vocal characteristics in patients with SLE using objective acoustic measurements, patient-reported outcome measures, and clinician-based perceptual assessments, and to investigate their association with disease activity.

MATERIAL & METHODS

This prospective, cross-sectional controlled study included 35 patients diagnosed with SLE according to the American College of Rheumatology (ACR) criteria and 35 age- and sex-matched healthy controls (n=70). Sustained /a/ phonation was recorded under standardized conditions. Acoustic analysis included fundamental frequency (F0), jitter, shimmer, harmonics-to-noise ratio (HNR), maximum phonation time (MPT), and s/z ratio. Subjective voice assessment was performed using the Voice Handicap Index-10 (VHI-10), and perceptual evaluation was conducted using the GRBAS scale. Disease activity in the SLE group was assessed using the SLE Disease Activity Index (SLEDAI). Correlation analyses were performed to evaluate the relationship between disease activity, clinical parameters, and voice measures.

RESULTS

Thirty-five SLE patients (30 females, 5 males) were analyzed. Mean F0 was 220 Hz in female patients and 116 Hz in male patients. Group mean jitter (0.28%), shimmer (1.98%), and HNR (24.1 dB) were within normative limits. However, mean maximum phonation time (11.4 seconds) was lower than reported values for healthy adults. No significant correlations were found between SLEDAI scores and F0, jitter, shimmer, HNR, MPT, s/z ratio, or VHI-10 scores (all p>0.05). Disease duration and daily steroid dose were also not significantly associated with voice parameters. In contrast, patients with serositis demonstrated significantly higher shimmer values (2.87 vs 1.91; p=0.014). Additionally, patients receiving mycophenolate mofetil showed higher shimmer values (2.39 vs 1.71; p=0.044).

CONCLUSIONS

Voice parameters in SLE may be independent of overall disease activity; however, specific clinical manifestations and treatment subgroups may exhibit measurable acoustic alterations. Multidimensional voice assessment may contribute to better characterization of laryngeal involvement in SLE. Larger studies are needed to clarify these findings.

OP-568

Regenerating The Vocal Fold: PRP Versus Stem Cell Therapy In An Experimental Model

irem yazıcı[2], **burak ulkumen**[3], **onur celik**[3], **Elgin Türköz**[1]

[1]*Department of Histology and Embryology, Manisa Celal Bayar University, Türkiye;* [2]*ENT Clinic, Akhisar State Hospital, Ministry of Health, Türkiye;* [3]*Department of Otorhinolaryngology, Manisa Celal Bayar University, Türkiye*

BACKGROUND & AIM

Vocal fold injury leads to scarring and impaired vibration, resulting in persistent dysphonia. Regenerative approaches such as platelet-rich plasma (PRP) and stem cell therapy show promising results, yet comparative data remain limited. This study aimed to compare the regenerative effects of PRP and stem cell therapy on vocal fold healing in an experimental model. We hypothesized that both treatments would improve tissue regeneration compared to controls, with differences in extracellular

matrix organization and inflammation. These findings may guide future clinical applications and optimize treatment strategies for vocal fold disorders and improve patient outcomes in clinical practice settings worldwide and beyond.

MATERIAL & METHODS

An experimental study was conducted using an established animal model of vocal fold injury. Subjects were randomly assigned to three groups: control, PRP-treated, and stem cell-treated. Standardized vocal fold injury was induced under general anesthesia. In the treatment groups, PRP or stem cells were injected into the injured vocal fold immediately after injury. Animals were sacrificed at predefined time points for histopathological and immunohistochemical analysis. Outcome measures included epithelial regeneration, collagen deposition, inflammatory cell infiltration, and vascularization. Additionally, extracellular matrix organization was evaluated using specific staining techniques. Blinded observers performed all assessments to minimize bias. Statistical analysis was conducted to compare differences between groups, with significance set at $p<0.05$. This methodology allowed for a controlled comparison of regenerative effects between PRP and stem cell therapies.

RESULTS

Both PRP and stem cell groups demonstrated significantly improved healing compared to the control group. Histological analysis revealed enhanced epithelial regeneration and reduced inflammatory infiltration in the treatment groups. The PRP group showed moderate improvement in collagen organization and vascularization, whereas the stem cell group demonstrated more organized extracellular matrix structure and lower fibrosis levels. Quantitative analysis indicated significantly decreased inflammatory markers and improved tissue architecture in both treatment groups ($p<0.05$). The stem cell group exhibited superior outcomes in terms of collagen alignment and reduced scar formation compared to PRP. No adverse effects were observed in any group. Overall, regenerative therapies contributed to improved structural and functional recovery of the vocal folds, with stem cell therapy showing a more pronounced effect.

CONCLUSIONS

Both PRP and stem cell therapies enhance vocal fold healing by promoting tissue regeneration and reducing inflammation. While PRP provides beneficial effects, stem cell therapy appears to offer superior outcomes in terms of extracellular matrix organization and fibrosis reduction. These findings suggest that stem cell-based approaches may represent a more effective strategy for the treatment of vocal fold injuries. However, further studies are needed to evaluate long-term functional outcomes and to translate these results into clinical practice. Comparative clinical trials will be essential to determine the optimal regenerative treatment and to establish standardized protocols for patient management in laryngology.

The Effect Of A Patient-Specific Dental Guard On Upper Dental Injury In Microlaryngeal Surgery

Muhammed Furkan Özgan[1], **Erol Şentürk**[1], **Muhammed Said Ekinci**[1], **Elif Dilara Arslan**[2], **Sefanur Kocagöz**[2], **Orhan Özturan**[1]

[1]Bezmialem Vakif University, Faculty of Medicine, Department of Otorhinolaryngology, Fatih, Istanbul, Turkey; [2]Bezmialem Vakif University, Faculty of Dentistry, Department of Orthodontics,Fatih,İstanbul,Turkey

BACKGROUND & AIM

Microlaryngeal surgery requires rigid transoral instrumentation and suspension laryngoscopy, during which the maxillary teeth, gingiva, lips, tongue, and oropharyngeal mucosa may be exposed to considerable mechanical stress. Dental trauma is a clinically relevant complication of this procedure. This study aimed to evaluate whether a patient-specific upper dental guard reduces postoperative traumatic dental findings compared with a standard silicone dental guard in patients undergoing microlaryngeal surgery.

MATERIAL & METHODS

This two-center, prospective, controlled clinical study was conducted in patients scheduled for microlaryngeal surgery under general anesthesia. All patients underwent preoperative dental and periodontal assessment by the same dentist. Patients were allocated to either the study group, in which a patient-specific upper dental guard was fabricated using a 3.0-mm soft thermoplastic material based on maxillary dental impressions, or the control group, in which a standard silicone dental guard was used. Demographic characteristics, operative duration, periodontal status, dental vitality, overjet, overbite, and mouth opening were recorded. Postoperative dental evaluation was performed within three weeks by the same dentist, who was blinded to group allocation. The primary outcome was the presence of newly developed postoperative traumatic dental findings. Secondary outcomes included dental vitality changes, postoperative pain/sensitivity assessed with the visual analogue scale (VAS), periodontal deterioration, and the relationship between dentoalveolar measurements and traumatic dental findings.

RESULTS

Results: A total of 31 patients were analyzed: 13 in the patient-specific dental guard group and 18 in the standard guard group. The groups were comparable regarding demographic, clinical, periodontal, vitality, and dentoalveolar characteristics. Newly developed traumatic dental findings occurred in 1 patient in the study group (7.7%) and 8 patients in the control group (44.4%),

with a significantly lower incidence in the patient-specific guard group (p=0.045). New dental vitality loss was observed in 2 patients in the study group (15.4%) and 1 patient in the control group (7.7%), without statistical significance (p=1.000). Postoperative VAS scores and periodontal deterioration rates were similar between groups. No significant association was found between traumatic dental findings and dentoalveolar measurements.

CONCLUSIONS

The use of a patient-specific upper dental guard significantly reduced the incidence of newly developed traumatic dental findings compared with a standard silicone dental guard in patients undergoing microlaryngeal surgery. However, no significant differences were observed between groups in terms of dental vitality changes, postoperative pain/sensitivity, periodontal deterioration, or dentoalveolar measurements. Patient-specific dental guards may provide a clinically useful protective strategy against dental trauma during microlaryngeal surgery, although larger multicenter studies with longer follow-up are needed to confirm these findings and evaluate long-term pulpal and periodontal outcomes.

OP-570

Idiopathic Subglottic Stenosis And GLP-1 Receptor Agonists: Attitudes, Barriers And Facilitators

Laura-Elisabeth Gosselin[1,2], **Catherine Anderson**[3], **Chadwan Al Yaghchi**[1,4]

[1]National Centre for Airway Reconstruction, Imperial College Healthcare NHS Trust, London, UK; [2]Department of Ophthalmology and Otorhinolaryngology—Head and Neck Surgery, Faculty of Medicine, Université Laval, Quebec City, QC, Canada; [3]Living with Idiopathic Subglottic Stenosis Facebook Group Founder; [4]Department of Surgery and Cancer, Medical School, Imperial College London

BACKGROUND & AIM

Idiopathic subglottic stenosis (iSGS) is a rare disease of unknown etiology. There has been growing interest within the patient community regarding the potential therapeutic role of GLP-1 receptor agonists (GLP-1 RA) in iSGS, through both weight loss-mediated and direct anti-inflammatory mechanisms. The objective of our study was to analyze patient's perspective and attitudes towards the possible benefits and impact of GLP-1 RA on the global management of iSGS.

MATERIAL & METHODS

We conducted a cross-sectional observation study through a structured online anonymous survey, that allowed us to understand patient's perspective and attitude towards GLP-1 RA. The survey comprised 53 items organized across four domains: demographics;attitudes, barriers and facilitators to GLP-1 RA use;therapy details and adverse effects; and perceived therapeutic impact.

RESULTS

A total of 1382 patients with iSGS completed the survey. Diagnostic delay of iSGS was a prominent finding, with patients reporting a substantial lag between symptom onset and confirmed diagnosis. Overall, 407 patients used GLP-1 RA therapy. Among these patients, a significant proportion reported a perceived reduction in airway symptoms and reduced time interval between procedures following initiation of GLP-1 RA. Key barriers included cost, access, and limited physician awareness. Thematic analysis revealed patients' attitudes toward GLP-1 RA therapy were largely favorable, with patients citing anti-inflammatory benefits and quality of life improvements as primary motivators for use.

CONCLUSIONS

GLP-1 RA is positively perceived amongst iSGS patients, as it may reduce subjective symptoms and increase the inter-dilation interval. More research will be needed to establish the mechanistic basis of therapeutic benefit and clinical management details.

The Effectiveness Of Non-Selective Recurrent Laryngeal Nerve Reinnervation In The Treatment Of Unilateral Vocal Cord Paralysis: A Comparative Retrospective Study With Combined Medialization Laryngoplasty And Arytenoid Adduction

Sefa Özcan[1], **Necati Enver**[2], **Orhan Asya**[3]

[1]Department of Otorhinolaryngology, Yozgat City Hospital, Yozgat/TÜRKİYE; [2]Istanbul Voice Disorders Center, Fenerbahçe, Kadıköy, Istanbul/TURKEY; [3]aculty of Medicine, Department of Otorhinolaryngology, Marmara University, Pendik Training and Research Hospital, Fevzi Çakmak, Muhsin Yazıcıoğlu Street, Istanbul, 34899, Turkey

BACKGROUND & AIM

This study aims to compare the outcomes of medialization laryngoplasty combined arytenoid adduction (ML+AA) and non-selective laryngeal reinnervation (NSLR) in patients with unilateral vocal fold paralysis presenting with arytenoid malposition, vocal fold atrophy, and interfold level asymmetry.

MATERIAL & METHODS

Data from patients who underwent ML+AA or NSLR surgery due to unilateral vocal cord paralysis between July 1, 2024, and July 1, 2025, were retrospectively reviewed. Based on subjective (GRBAS and CAPE-V) and objective voice assessments (Acoustic Voice Quality Index (AVQI), Cepstral Peak Prominence (CPPS/a/), Maximum Phonation Time (MPT), Jitter, Shimmer) and questionnaire-based measurements (Voice Handicap Index(VHI-30), Voice-related quality of life (V-RQOL)) conducted preoperatively and at 1, 3, 6 and 12 months postoperatively, the effects of both surgical methods on voice quality were compared.

RESULTS

Statistically significant improvement in the ML+AA group was only observed in the Acoustic Voice Quality Index (AVQI) and GRBAS parameters ($p<0.032$, $p<0.022$) . In contrast, statistically significant improvements were obtained in the NSLR group in sound quality assessment parameters such as VHI-30, V-RQOL, MPT, CAPE-V, GRBAS, CPPS/a/, and AVQI, and the effect sizes of these changes were determined to be high ($p<0.003$, $p<0.001$, $p<0.005$, $p<0.001$, $p<0.001$, $p<0.001$, $p<0.001$). Only the two youngest patients who underwent NSLR demonstrated complete perceptual voice recovery, with scores of 0 on the average GRBAS and CAPE-V assessments. Additionally, no improvement was observed in any parameter for the oldest patient who underwent NSLR. No statistically significant change was observed in the EAT-10 questionnaire scores used to assess swallowing function in either group (NSLR; $p> 0.184$, ML+AA; $p>0.244$); however, patients who underwent ML+AA achieved average EAT-10 scores within the normal range.

CONCLUSIONS

Both surgical methods improve voice quality in appropriate patients with unilateral vocal fold paralysis. However, the NSLR method is considered a more reliable and effective option for achieving normal or near-normal voice quality, while ML+AA appears to have a potentially greater positive impact on swallowing function.

OP-572

Voice Alterations And Laryngeal Function Assessment In Patients With Multiple Sclerosis

Muhammet Fatih GÖKMEN[1], **Dilara AYDIN**[1], **Haluk GÜMÜŞ**[2]

[1]*Selcuk University, Medical School, ENT Department*; [2]*Selcuk University, Medical School, Neurology Department*

BACKGROUND & AIM

Multiple Sclerosis (MS) is a demyelinating disorder of the central nervous system that affects motor, sensory, and cognitive functions and may also impair vocal fold function, leading to disturbances in speech and voice production. Although dysarthria and dysphonia are common in patients with MS, comprehensive objective laryngological evaluations of vocal fold function remain limited. In particular, multidisciplinary investigations integrating acoustic analysis, videostroboscopic examination, and patient-reported outcome measures are scarce in the current literature.

MATERIAL & METHODS

After obtaining approval for the study from the University Local Ethics Committee, firstly MS patients were examined using objective (acoustic parameters and maximum phonation time(MPT)), perceptual (GRBAS scale), and subjective (Voice Handicap Index) measures and to compare the findings with those of a healthy control group. In addition, flexible laryngoscopy and videolaryngostroboscopy will be performed to assess vocal fold mobility, glottic closure patterns, and vibratory characteristics in detail. The obtained data will be analyzed in relation to neurological disability severity, as determined by the Expanded Disability Status Scale (EDSS).

RESULTS

Forty healthy patients and forty MS patients were included in the evaluation. Care was taken to ensure that the age and gender characteristics of the patients in the groups were similar. It was observed that MPT scores were lower in MS patients compared to the healthy group, and GRBAS scores were also significantly worse. No significant pathology was detected in laryngostroboscopic evaluations compared to the healthy group. Evaluation of disease severity and voice parameters and statistical studies are still ongoing.

CONCLUSIONS

This study aimed to facilitate the identification of subclinical laryngeal dysfunction in MS patients, clarify the relationship between voice parameters and disease severity, and demonstrate that these measurements can be used as potential biomarkers for the early detection of bulbar involvement. The findings can contribute to the development of early diagnosis

and rehabilitation strategies for MS with simple telephone applications, especially in the digital age, and shed light on clinical approaches aimed at improving quality of life in this patient population.

Hociota" Institute of Phonoaudiology and Functional ENT Surgery, 21st Mihail Cioranu Street, Bucharest, Romania; [3]" Carol Davila" University of Medicine and Pharmacy, Bucharest, Romania; [4]"Prof. Dr. D. Hociota" Institute of Phonoaudiology and Functional ENT Surgery, 21st Mihail Cioranu Street, Bucharest, Romania

BACKGROUND & AIM

Recurrent laryngeal papillomatosis (RLP) is a rare benign pathology caused by Human Papilloma Virus (HPV), especially type 6 and 11. The disease has two forms: adult onset and juvenile onset with the latter being more aggressive. The course of laryngeal papillomatosis is variable and unpredictable when it comes to recurrence and sites of further involvement. The symptomatology is characterized by dysphonia and -rarely- by dyspnea, when the lesions affect the glottis. The treatment of choice is surgical resection of the lesions with CO2 laser; in cases with multiple recurrences adjuvant therapies (HPV vaccination, immunotherapy) are also considered.

MATERIAL & METHODS

The aim of this presentation is to emphasize the challenges of the surgical management of RLP and illustrate them with selected clinical cases. The recurrence rate, the location and the extent of the lesions beyond the larynx might be elements that increase the complexity and difficulty of the surgical procedure.

RESULTS

Surgical resection of the lesions with CO2 laser is suitable for most cases; for tumor ablation though, photoangiolytic lasers can also be taken into account. Due to the high rate of recurrence multiple surgeries are often necessary.

CONCLUSIONS

Surgical resection with CO2 laser represents the treatment of choice in RLP. Constant endoscopic follow-up of the patients is required for early detection of the recurrent lesions and prompt resection. Adjuvant therapies are available; nevertheless, their effectiveness in terms of increasing the timeframe between surgeries is variable.

Lrig1-Expressing Quiescent Stem Cells Sustain Vocal Fold Mucosal Homeostasis And Exhibit Organoid-Forming Capacity

Vlasta Lungova[1], **Jessica M. Fernandez**[1], **Yujia Cai**[2], **Christina Kendziorski**[2], **Susan L Thibeault**[1]

[1]Department of Otolaryngology, University of Wisconsin Madison, Madison WI, USA; [2]Department of Biostatistics and Medical Informatics, University of Wisconsin Madison. Madison, WI, USA

BACKGROUND & AIM

Identifying progenitor cells in laryngeal and vocal fold (VF) mucosa is essential for advancing stem cell–based therapies for VF diseases. In this study, we used Lrig1 (leucine-rich repeats and immunoglobulin-like domains 1) gene to label tissue-resident stem cells within laryngeal and VF mucosa, aiming to investigate cellular networks underlying VF homeostasis and regeneration.

MATERIAL & METHODS

To investigate the role of Lrig1 expressing cells in laryngeal and VF tissues, we combined lineage tracing in Lrig1CreERT2/+;ROSALSL-tdTomato/+ reporter mice with single-cell RNA sequencing (scRNA-seq) of flow cytometry-sorted tdTomato$^+$ (tdTom) cells. This approach enabled spatial characterization and transcriptional profiling of Lrig1 cells. In addition, we induced epithelial injury using naphthalene to assess the regenerative contribution of Lrig1-expressing cells in vivo. To identify LRIG1$^+$ cells in human VFs, we performed histological analyses. Finally, to test the regenerative properties of Lrig1$^+$ cells in vitro, tdTom$^+$ cells were isolated and cultured to generate organoids.

RESULTS

Our data demonstrate, that Lrig1$^+$ cells exhibited hallmark features of quiescent stem cells—including slow cycling, long-term persistence, and differentiation potential—and contributed to sustained VF epithelial homeostasis and repair after naphthalene injury. By one week post-injury, Lrig1$^+$ progeny restored the VF epithelium. Transcriptionally, these cells

suppressed cell type specific genes and proliferation while activating global transcriptional programs related to RNA metabolism, epigenetic regulation, and protein ubiquitination, consistent with quiescence and readiness for activation. Lrig1$^+$ cells were enriched in basal, parabasal, and immature secretory populations within surface epithelium and submucosal glands, residing in niches characterized by transcriptional flexibility and spatial shielding from direct stress - features that likely prevent premature or chronic mobilization. Notably, analogous Lrig1 expressing cells were identified in human laryngeal and VF tissues, highlighting the translational relevance of our findings. When cultured in vitro, these cells are capable of assembling into organoids that fully re-establish epithelial stratification.

CONCLUSIONS

In summary, Lrig1 marks a conserved, quiescent stem cell population in the larynx and VFs that supports long-term tissue homeostasis and repair. These cells can be harnessed to create a novel experimental system for investigating the mechanisms underlying laryngeal and VF diseases.

Quiescent stem cells, vocal fold homeostasis, regeneration, organoids

OP-575

Tezepelumab In Refractory Eosinophilic Sialodochitis Associated With Severe Asthma: A Multidomain Case Follow-Up

Pilar Benavent Marín[1], **Álvaro Sanchez Barrueco**[2], **Marta Santiago Horcajada**[1], **Gonzalo Díaz Tapia**[2], **Javier Morales Dominguez**[1], **José Miguel Villacampa Aubá**[1]

[1]*Fundación Jiménez Díaz University Hospital*; [2]*Villalba General University Hospital*

BACKGROUND & AIM

Eosinophilic sialodochitis is a rare obstructive inflammatory disorder of the major salivary glands, characterized by recurrent gland swelling, eosinophil-rich mucus plugs and frequent atopic comorbidity. Evidence on biologic therapy is scarce and has mainly involved IgE, IL-4/IL-13 or IL-5/IL-5Rα targeting. Tezepelumab blocks thymic stromal lymphopoietin, an upstream epithelial alarmin involved in type 2 inflammation. This report aims to describe, to our knowledge, the first multidomain follow-up of refractory eosinophilic sialodochitis after initiation of tezepelumab for severe uncontrolled asthma.

MATERIAL & METHODS

We report the prospective follow-up of a woman with refractory eosinophilic sialodochitis, defined by recurrent obstructive swelling of the major salivary glands, ductal involvement, eosinophil-rich salivary material and exclusion of relevant differential diagnoses. The patient also had severe uncontrolled asthma, with insufficient response to conventional therapy and previous anti-IL-5Rα biologic treatment. Tezepelumab was initiated for the respiratory indication. A standardized six-month multidomain assessment was designed. Asthma control was evaluated using the Asthma Control Test and Asthma Control Questionnaire. Sinonasal disease burden was assessed using the 22-item Sino-Nasal Outcome Test. Salivary disease-related quality of life was evaluated using the Chronic Obstructive Sialadenitis Questionnaire, applied at gland level.

RESULTS

This structured follow-up allowed simultaneous assessment of lower airway, sinonasal and major salivary gland outcomes after upstream TSLP blockade. The multidomain approach enabled evaluation of whether clinical response was concordant across inflammatory compartments or dissociated between asthma control, sinonasal burden and obstructive salivary symptoms. The use of a salivary-specific questionnaire allowed glandular disease activity to be assessed independently, rather than inferred from respiratory or sinonasal outcomes. This is particularly relevant because ductal obstruction, mucus plug formation and chronic glandular inflammation may influence treatment response differently from airway disease.

CONCLUSIONS

This preliminary case report explores the use of tezepelumab in eosinophilic sialodochitis associated with severe refractory asthma. TSLP inhibition represents a conceptually distinct strategy from direct eosinophil depletion, acting on an upstream epithelial target involved in several type 2 inflammatory pathways. In multisystem eosinophilic disorders, therapeutic response should be evaluated with organ-specific outcome measures. Salivary-specific instruments may help characterize disease activity and define the potential role of biologic therapy in this rare condition.

OP-576

Association Between Extended High-Frequency Hearing Thresholds And Tonal Perception In Professional Musicians

Meltem Demirdağ Çevikkan[1], **Elif Kelebek**[2], **Harun Baki**[3], **Cenk Akbulut**[3]

[1]*Department of Otorhinolaryngology, Manisa Merkezefendi State Hospital, Manisa, Turkey*; [2]*Department of Audiology, Manisa Merkezefendi State Hospital, Manisa, Turkey*; [3]*Department of Music, Faculty of Fine Arts, Manisa Celal Bayar University, Manisa, Turkey*

BACKGROUND & AIM

Professional musicians are exposed to prolonged high sound levels, increasing the risk of early high-frequency cochlear changes. While extended high-frequency (EHF) audiometry can detect subtle peripheral hearing shifts, it remains unclear whether such changes affect functional auditory performance. Tonal discrimination is essential for musical accuracy and auditory processing. This study aimed to investigate the association between extended high-frequency hearing thresholds and tonal perception performance in professional musicians.

MATERIAL & METHODS

Fifty-four professional musicians underwent EHF audiometry (0.25–20 kHz). For standardization purposes, 30 age-comparable individuals without regular noise exposure also underwent EHF assessment. Musicians were categorized according to their mean 14–16 kHz threshold (≥20 dB vs <20 dB).Tonal perception was evaluated using a 15-item same/different discrimination task consisting of paired three-note melodic motifs. In “different” trials, one note was altered by one semitone. Stimuli were generated using a Kawai ES120B digital piano and recorded via direct line connection (Behringer UMC204HD) into Cubase 12. Files were stored in WAV format (24-bit, 44.1 kHz). Playback was delivered through M-Audio Forty Sixty active studio monitors at approximately 70–80 dB SPL in a controlled indoor environment. Total tonal scores (0–15) were calculated for analysis.

RESULTS

Among musicians, 13 participants demonstrated elevated EHF thresholds (≥20 dB at 14–16 kHz), while 41 had lower thresholds. Tonal discrimination performance showed minimal variability, with nearly all musicians achieving maximum scores. No significant difference in tonal performance was observed between musicians with elevated and non-elevated EHF thresholds (Mann–Whitney U, p=1.00). Correlation analysis between mean 14–16 kHz thresholds and tonal scores did not reveal a significant association. These findings indicate that early high-frequency threshold elevations were not associated with impairment in basic tonal discrimination within this trained cohort.

CONCLUSIONS

EHF threshold elevations were not associated with reduced basic tonal discrimination performance in professional musicians. These results suggest that early cochlear changes may not immediately translate into measurable deficits in simple tonal perception tasks. A possible dissociation between peripheral auditory sensitivity and functional auditory performance may exist in trained musicians. More sensitive psychoacoustic measures may be required to detect subtle perceptual consequences of early high-frequency hearing changes.

OP-577

Our Clinical Approach To Patients With Bilateral Vocal Cord Paralysis: A 10-Year Retrospective Review

Esra Ekin Atac[1], **Mustafa Aslıer**[1]

[1]*Bursa Uludag University Faculty of Medicine, Otorhinolaryngology and Head and Neck Surgery*

BACKGROUND & AIM

Bilateral vocal cord paralysis (BVCP) is a critical clinical condition that poses significant challenges for airway safety and laryngeal functions. Management strategies vary widely depending on etiology, symptom severity, and patient-specific requirements. This study aims to evaluate the demographic characteristics, etiological distribution, and treatment outcomes of patients diagnosed, treated, and followed up for BVCP in our tertiary academic center

MATERIAL & METHODS

A retrospective chart review was conducted on 47 patients treated for BVCP between January 2016 and December 2025. Patient demographics, etiology, the time interval between etiology and first intervention, primary and secondary treatment modalities, types of endolaryngeal surgery, the total number of interventions, and recent follow-up status were analyzed.

RESULTS

The cohort comprised 38 females (80.9%) and 9 males (19.1%), with a mean age of 50 years. Surgical trauma (predominantly thyroidectomy) was the leading cause of BVCP (n=38, 80.9%), followed by idiopathic (n=4, 8.5%), malignant (n=2, 4.3%), and neurological (n=2, 4.3%) etiologies. No cases were linked to endotracheal intubation. The mean time from etiology to initial treatment was 54 months.

Primary treatments included tracheotomy (n=17, 36.2%), botulinum toxin injection (n=16, 34.0%), and endolaryngeal laser surgery (n=11, 23.4%). Most patients required multiple, staged procedures (n=39, 83.0%), averaging 3.4 interventions. In secondary treatments, endolaryngeal laser surgery was the most frequent modality (n=24, 61.5%). Posterior cordotomy was the most common endolaryngeal procedure utilized in both primary (n=12) and secondary (n=15) interventions, showing a 40% revision rate, compared to 7.7% for arytenoidectomy. The overall decannulation rate was 77.2% (17/22).

CONCLUSIONS

Surgical trauma remains the primary etiology of BVCP, and the vast majority of patients require custom-tailored, staged, and multi-modal interventions. Endolaryngeal laser surgery, specifically posterior cordotomy, serves as a highly effective and

preferred tool in both primary and revision settings. Long-term follow-up and adaptive, symptom-driven management are essential to achieving a safe airway while preserving functional voice quality.

OP-578

MANAGEMENT OF TRACHEAL STENOSIS IN EMERGENCY SITUATIONS VIA A NOVEL TECHNIQUE

MOHAN RAJ[2]

[1]*NEUROFOUNDATION;* [2]*AMCH*

BACKGROUND & AIM

Tracheal stenosis is one of the most formidable situations in medicine and is encountered in ENT emergencies. We introduce here our method of emergency hand-held rigid zero-degree Hopkins endoscope-guided endotracheal tube placement through tracheostoma

MATERIAL & METHODS

This technique is performed in the supine, or rose positionA hand-held rigid Hopkins zero degree 4mm endoscope attached to battery operated light source istaken and introduced into the previously made tracheostoma. The level of the stenosis below the tracheostoma and the grade of stenosis is visualized through the eyepiece. Then the endotracheal tubewas prepared and an endoscope was introduced into the tube. The endotracheal tube was pushed through the tracheostoma bypassing the stenotic segment by direct visualization. Later once the airway is secured, defenetive treatment like coablation stenotic release, stenting etc can be done.

RESULTS

We have encountered 6 cases with tracheal stenosis at the level of the thoracic trachea. The cause for developing tracheal stenosis is post-decannulation following tracheostomy for neurological cause. All patients presented to ENT emergency with stridor. All patients underwent uneventful tracheostomal endotracheal tube placement and stridor was immediately ceased.

CONCLUSIONS

In the case of Tracheal Stenosis showing severe stridor, the clinician should perform airway maintenance even in an emergency or OPD setting apart from a more monitored environment like an operation theatre. This technique resembles the usual endoscopy and can be done in an ENT opd or emergency room. . This method is also less invasive for patients.

Multifactorial Pathophysiology Of Globus Pharyngeus: Psychological Distress, Laryngopharyngeal Reflux, And Muscle Tension Dysphonia

Furkan Melih Koçak[1], **Özgenur Koçak**[2], **Zahide Mine Yazıcı**[2], **İsmet Vurur**[2]

[1]*Ozel Avcılar Anadolu Hospital;* [2]*Bakırköy Dr. Sadi Konuk Training and Research Hospital*

BACKGROUND & AIM

Globus pharyngeus is considered a multifactorial disorder involving psychological distress, laryngopharyngeal reflux (LPR), and laryngeal muscle dysfunction. Previous studies demonstrated significant associations between globus symptoms and anxiety/depression, while others suggested a possible role of muscle tension dysphonia and LPR in symptom generation. However, the relationship between psychological distress, reflux findings, and videolaryngoscopic muscle tension patterns remains unclear. This study aimed to evaluate the association between Glasgow Edinburgh Throat Scale (GETS) and Hospital Anxiety and Depression Scale (HADS) scores, laryngopharyngeal reflux findings, and Morrison–Rammage muscle tension patterns in patients with globus pharyngeus

MATERIAL & METHODS

This prospective observational study included adult patients diagnosed with globus pharyngeus in a tertiary otorhinolaryngology clinic. Demographic data, smoking status, and reflux-related symptoms were recorded. Patients who smoked, under 18 years of age, and patients with a mass larger than 1 cm in the neck detected by any imaging method were removed.Symptom severity was assessed using the Glasgow Edinburgh Throat Scale (GETS), while psychological status was evaluated with the Hospital Anxiety and Depression Scale (HADS). Laryngopharyngeal reflux findings were assessed using videolaryngoscopy and Reflux Finding Score criteria. Videolaryngoscopic examinations were independently reviewed for

Morrison–Rammage muscle tension patterns (Types I–IV). Associations between GETS scores, HADS scores, reflux findings, and muscle tension patterns were analyzed. Correlation and subgroup analyses were performed to determine whether globus symptoms were predominantly associated with psychological distress, laryngeal muscle hyperfunction, or reflux-related pathology.

RESULTS

The total of 72 patients with globus pharyngeus were included in the study. GETS scores showed a significant positive correlation with HADS-anxiety ($r=0.61$, $p<0.001$) and HADS-depression scores ($r=0.54$, $p<0.001$). Patients with high psychological distress demonstrated significantly higher symptom severity compared to those with low HADS scores ($p<0.001$). Although mild laryngopharyngeal reflux findings were detected in 38.1% of patients, Reflux Finding Scores were not significantly associated with GETS severity ($p=0.27$). Morrison–Rammage muscle tension patterns were observed in 29.8% of patients; however, no significant relationship was found between muscle tension type and globus symptom severity ($p=0.34$). These findings suggest that globus pharyngeus is more strongly associated with psychological distress than with objective laryngeal pathology or reflux-related abnormalities.

CONCLUSIONS

The findings of this study support the multifactorial nature of globus pharyngeus; however, psychological distress appears to play a more prominent role than objective laryngeal pathology or reflux-related abnormalities. Consistent with previous literature, higher anxiety and depression scores were strongly associated with increased globus symptom severity, whereas videolaryngoscopic muscle tension patterns and laryngopharyngeal reflux findings showed limited clinical significance. These results suggest that globus pharyngeus should be considered predominantly a functional and stress-related disorder, highlighting the importance of psychological assessment in the diagnostic and therapeutic approach to affected patients.

OP-580

Retrospective Analysis Of Patient Management With Subglottic Stenosis

Ömer Erdur[1], **Serhat Pazır**[2], **Utku Yılmaz Özdemir**[2]

[1]*Ulus Liv Hospital, Department of Otolaryngology, Head and Neck Surgery, İstanbul, Türkiye;* [2]*Selçuk University School of Medicine, Department of Otolaryngology, Head and Neck Surgery, Konya, Türkiye*

BACKGROUND & AIM

Subglottic stenosis is a challenging clinical entity characterized by the narrowing of the airway due to congenital or acquired etiologies. Currently, prolonged intubation is recognized as the most prevalent iatrogenic etiological factor. While laryngoscopy remains the gold standard for diagnosis, treatment planning is strictly individualized based on the localization, length, and Cotten-Meyer grade of the stenosis. The aim of this study is to contribute to the current literature by analyzing the demographic characteristics, treatment modalities, and surgical outcomes of patients with subglottic stenosis followed in our clinic over a 14-year period.

MATERIAL & METHODS

In this study, the data of patients diagnosed with subglottic stenosis at a tertiary referral center between August 2013 and March 2026 were retrospectively reviewed. Patients' demographic data, etiological factors, comorbidities, and presenting clinical findings were recorded. The characteristics of the stenosis were determined through preoperative radiological (CT) and endoscopic evaluations. Surgical techniques performed (dilatation, reconstruction, resection, etc.), postoperative complications, and the requirement for revision surgeries were analyzed.

RESULTS

A total of 24 patients (17 males, 7 females) were included in the study, with ages ranging from 1 month to 60 years. 45.8% (n=11) of the patients were in the pediatric age group. According to the Cotten-Meyer grading system, 12.5% (n=3) were diagnosed with Grade 1, 66.6% (n=16) with Grade 2, 12.5% (n=3) with Grade 3, and 8.3% (n=2) with Grade 4 stenosis. The three most frequently performed surgical techniques were balloon dilatation in 66.6% (n=16), laser surgery in 45.8% (n=11), and cold dissection with micro-scissors in 12.5% (n=3) of the cases. A history of recurrent surgery was present in 12.5% (n=3) of the patients, and revision surgery was recorded three times in one specific case. While balloon dilatation was the most preferred adjuvant method in endoscopic interventions, the use of laser was particularly prominent in the adult group and in recurrent cases.

CONCLUSIONS

In the management of subglottic stenosis, the stage and duration of the stenosis and the patient's age play a critical role in the selection of treatment modalities. Our study indicates that minimally invasive endoscopic balloon dilatation and laser applications are implemented as primary options with high success rates, particularly in low-grade (Grade 1-2) stenoses. Conversely, open surgical techniques and resection procedures remain the mainstay of treatment for advanced-stage (Grade

3-4) or recurrent stenoses. A multidisciplinary approach and individualized treatment planning based on the anatomical characteristics of the stenosis are essential for enhancing surgical success and minimizing complication rates.

COMPARISON OF METHYLPREDNISOLONE AND TOCILIZUMAB IN THE PREVENTION OF LARYNGOTRACHEAL STENOSIS FOLLOWING A SUBGLOTTIC TRAUMA MODEL IN RATS

Ahsen Aydin[1], **Burak Kersin**[1]

[1]*Department of Otolaryngology–Head and Neck Surgery, Kartal Dr. Lütfi Kırdar City Hospital, Istanbul, Türkiye*

BACKGROUND & AIM

Laryngotracheal stenosis (LTS) is a challenging disease to manage due to its multifactorial pathogenesis, inflammatory nature, and high recurrence rates. Despite surgical interventions, additional medical therapies are often required. This study aimed to investigate the effect of interleukin-6 (IL-6) blockade on the development of laryngotracheal stenosis in an experimental subglottic stenosis model and to compare the histopathological and morphometric effects of systemic tocilizumab and methylprednisolone.

MATERIAL & METHODS

In this experimental study, 33 female Sprague– Dawley rats were randomly divided into three groups after creation of a subglottic stenosis model. The control group underwent surgery alone, while the other groups received intraperitoneal methylprednisolone (2 mg/kg) or tocilizumab (2 mg/kg) following surgery. Animals were sacrificed on day 10, and laryngotracheal segments were excised. Luminal stenosis percentage was calculated using area-based morphometric measurements. Histopathological evaluation included semi-quantitative scoring of inflammation, fibroblast proliferation, collagen formation, and neovascularization. Statistical analyses were performed using Kruskal–Wallis and Fisher's exact tests ($p<0.05$).

RESULTS

No statistically significant differences were observed among groups in terms of inflammation or neovascularization ($p=0.354$ and $p=0.669$, respectively). Severe inflammation was detected in the control and methylprednisolone groups but was not observed in the tocilizumab group. Fibroblast proliferation differed significantly between groups ($p=0.005$); severe fibroblast activity was predominant in the control group, whereas no severe proliferation was observed in the methylprednisolone or tocilizumab groups. Although collagen formation did not differ significantly among groups, severe collagen deposition was seen only in the control group. No statistically significant differences were found in luminal stenosis or wall thickness measurements; however, the tocilizumab group demonstrated a trend toward lower stenosis values.

CONCLUSIONS

Both methylprednisolone and tocilizumab significantly reduced fibroblast proliferation, while their effects on inflammation and stenosis were limited. Tocilizumab may be considered a potential agent that modulates the progression of inflammatory and fibrotic processes in laryngotracheal stenosis.

Turkish Validation Of The Reflux Sign Assessment-10 Scale

Nurullah Türe[1], **Selin Çelik**[1], **Zehra Savaş**[2]

[1]*Department of Otorhinolaryngology, Kutahya Health Sciences University, Kutahya, Turkey;* [2]*Department of Speech and Language Therapy, Kutahya Health Sciences University, Kutahya, Turkey*

BACKGROUND & AIM

The aim of this study was to evaluate the psychometric properties of the Turkish version of the Reflux Sign Assessment-10 scale in a sample of patients and healthy controls, specifically assessing internal consistency, construct validity, and discriminant validity.

MATERIAL & METHODS

A prospective, cross-sectional case-control study design was employed. The internal consistency of the scale was evaluated using Cronbach's alpha coefficient with 95% confidence intervals. To assess construct validity, the suitability of the dataset for factor analysis was verified using the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity.

RESULTS

A total of 110 participants were analyzed (patients n = 57, controls n = 53). Gender distribution was similar between groups ($p = .323$); however, the patient group was significantly older than the control group (51.17 ± 12.84 vs. 39.41 ± 16.08 years; $p < .001$). The internal consistency of the scale was found to be at a borderline level, with a Cronbach's α of .665 (95%

CI: .526–.777). A statistically significant and strong positive correlation was observed between the Reflux Sign Assessment-10 scores and the physician-assessed Reflux Finding Score (RFS) (r = .661, p < .001). Suitability tests for factor analysis yielded adequate results (KMO = .697; Bartlett's χ^2 = 164.20, p < .001).

CONCLUSIONS

The Turkish version of the Reflux Sign Assessment-10 is a valid and reliable measurement tool that demonstrates high concordance with clinical examination findings (RFS) and possesses excellent ability to discriminate between patients and healthy individuals.

OP-583

Treatment Of Vocal Cord Polyps: Institutional Experience And Outcomes.

Gagauz Alexei[1], **Andrian Vița**[2]

[1]*"Nicolae Testemițanu" State University of Medicine and Pharmacy;* [2]*Republican Clinical Hospital "Timofei Moșneaga"*

BACKGROUND & AIM

One of the most common benign lesions of the vocal cords (VC) is presented by VC polyps. According to the results of several studies, benign VC lesions consist of polyps in 45.1%, Reinke's edema in 25.7%, nodular disorders in 18.9%, and VC cysts in 4.1%. Suspended microlaryngoscopy is a minimally invasive surgical solution for these lesions. There is no unanimous opinion regarding the choice micro-surgical endoscopic technique, whether using CO2 laser or "cold" instruments, for the treatment of VC polyps. The decision on the surgical method is conditioned by the medical institution's equipment, the individual preferences and surgeon's skills.

MATERIAL & METHODS

A retrospective analysis of data from 108 patients diagnosed with VC polyps and subjected to endoscopic microsurgical treatment using the "cold" method (CM) or CO2 laser method (LM) between 2019 and 2023, at the ENT clinic of the "Timofei Moșneaga" Republican Clinical Hospital was performed.

RESULTS

Approximately 1/4 (26.9%) of all polyploid VC formations were pedunculated, while 79 (73.1%) were sessile. Eighteen (16.7%) patients had small VC polyps, 82 (75.9%) had medium-sized polyps, and only 8 (7.4%) had giant polyps. In 16 (14.8%) patients, the polyp was located paracommissural, in 62 (57.4%) it was in the anterior third of the VC, and in 30 (27.8%) it was in the middle third of the VC. Unilateral polyp was observed in 94 (87.0%) patients, while bilateral formations were founded in 14 (13.0%) patients. Fifty (46.3%) patients were treated with CM, and 58 (53.7%) with LM (P>0.05).

CONCLUSIONS

Postoperative results were favorable at follow-up visits at 2 weeks, 1 month, 3, 6, and 12 months, showing a significant reduction in glottic insufficiency (statistically significant only at the 2-week mark, P<0.01).

A 3D-Printed Dynamic Larynx Model For Teaching Laryngeal Movement

Tsuyoshi Kojima[1], **Atsushi Suehiro**[1], **Yoshitaka Kawai**[1], **Shintaro Fujimura**[1], **Ken Iwanaga**[1], **Yasuharu Haku**[1], **Akira Yoshizawa**[1], **Yo Kishimoto**[1]

[1]*Kyoto University*

BACKGROUND & AIM

The larynx's complex anatomy and dynamic motions are difficult to grasp through textbooks or videos. Traditional training with animal or cadaver larynges can enhance understanding but is limited by ethical, cost, and logistical issues. To address these challenges, we developed a 3D-printed larynx model that illustrates key laryngeal movements to facilitate learning about laryngeal anatomy.

MATERIAL & METHODS

The model consists of multiple 3D-printed parts connected with elastic bands, allowing simulation of major laryngeal motions. It was designed to emphasize intuitive understanding of movement rather than detailed anatomical fidelity. We integrated the model into a medical student airway management workshop to evaluate its utility. Over one academic term, weekly small-group sessions (4–5 students each, ~100 students total) were held. In each session, students practiced a tracheostomy on an excised porcine larynx, followed by a laryngeal anatomy dissection session. Throughout the session, the 3D-printed dynamic larynx model was used as a visual aid to review key laryngeal structures and movements. After the session, participants completed a survey on the clarity of instruction, pacing, materials, difficulty, and overall learning experience.

RESULTS

Approximately one hundred students participated, and nearly all completed the post-session survey. All respondents reported that the content was easy to understand. The majority felt the session pacing was “just right,” and almost all considered the materials (including the model) sufficient. Most participants rated the overall difficulty as easy. The most frequently valued aspects were the hands-on anatomy experience (reported by about 90% of respondents), clear instruction (over 80%), and a positive learning environment (around 70%). Most participants reported no suggestions for improvement, indicating high overall satisfaction.

CONCLUSIONS

The 3D-printed larynx model focusing on laryngeal movement proved to be a valuable educational tool. It enabled repeated, realistic demonstrations of laryngeal motion in a cost-effective, ethical manner, addressing limitations of cadaver-based teaching. Integrating this model into airway training sessions enhanced students’ understanding and confidence, as reflected by very positive feedback. This accessible, interactive model is a useful addition to traditional laryngeal education for medical trainees, speech-language therapy students, and even patient education, by providing a clear, hands-on visualization of laryngeal function.

3D printing, Larynx model, Medical education, Laryngeal movement

OP-585

ON THE METHODOLOGICAL FOUNDATIONS OF THE FORMATION OF A STABLE TUBELESS TRACHEOSTOMY

Alfisa[1]

[1]*Kyrgyz-Russian Slavic University*

BACKGROUND & AIM

Introduction. Tracheostomy and tracheotomy remain among the most frequently performed operations on the cervical trachea, while the problem of choosing between cannular and non-cannular tracheostomy remains relevant. The formation of a stable tubeless tracheostomy is a more complex surgical procedure that requires a high level of technical training and consideration of the anatomical features of the neck, as well as concomitant pathological changes.

MATERIAL & METHODS

Materials and methods. The study material consisted of 434 patients with laryngeal and tracheal stenoses of various etiologies who underwent various tracheostomy options; in 44 patients, the previously formed cannular tracheostomy was replaced with a tubeless one. The main causes of tracheostomy failure were scarring, granulation, tracheomalacia, deformation of the tracheal rings, tumor or fatty compression of the trachea, as well as technical errors in the primary intervention. The retracheostomy technique was selected individually depending on the clinical task and included excision of the cutaneous tracheal canal, removal of pathological tissues, mobilization of the trachea, correction of its deformities and the formation of gentle contours of the tracheostomy. The key principles of the formation of a stable tubeless tracheostomy were: complete excision of altered tissues, sufficient mobilization of the trachea, suturing the skin with the edges of the trachea without overlapping the mucous membrane and creating moderate suture tension.

RESULTS

Results. The application of the developed methodological approaches made it possible to achieve stable gaping of a tubeless tracheostomy and free breathing in 38 out of 44 patients; in 6 cases, repeated narrowing was noted, requiring additional intervention or cannula insertion. The formation of a stable tubeless tracheostomy instead of a cannula in all cases led to a marked improvement in the subjective and objective condition of patients and an improvement in their quality of life. The use of modern tracheostomy cannulas remains justified in certain clinical situations associated with compression and displacement of the trachea by tumor or fatty tissues.

CONCLUSIONS

Conclusions. The described methodological foundations for the formation of a stable tubeless tracheostomy in cannula carriers are effective and can be recommended for widespread implementation in clinical practice. At the same time, we do not ignore the use of modern tracheostomy cannulas, because in some cases, the formation of a stable tracheostomy was not enough without the use of a cannula.

Deep Learning–Based Computer Vision System For Screening Laryngeal And Ear Diseases: Development And Clinical Validation In Moscow

Pavel Sudarev[1], **Andrej Krukov**[1,2], **Natalia Kunelskaya**[1,2], **Evgenij Garov**[1], **Svetlana Romanenko**[1], **Victoria Zelenkova**[1], **Vitautas Kiselyus**[1], **Oleg Pavlikhin**[1], **Diana Kurbanova**[1], **Ekaterina Krasilnikova**[1], **Ekaterina Lesogorova**[1]

[1]*The Sverzhevskiy Otorhinolaryngology Healthcare Research Institute;* [2]*Pirogov Russian National Research Medical University*

BACKGROUND & AIM

Early detection of laryngeal and middle ear pathology remains challenging in high-volume outpatient ENT practice. Objectives: To develop and clinically evaluate a deep learning–based computer vision system for screening and quality control of endoscopic examinations of the larynx, external and middle ear.

MATERIAL & METHODS

Convolutional neural networks using transfer learning (VGG16 backbone with subsequent experiments involving lightweight MobileNetV3) were trained on large, expert-annotated otoscopic and laryngoscopic image datasets from a tertiary ENT institute in Moscow, covering normal findings and the most prevalent pathologies. Data augmentation (random rotation, scaling, and brightness shifts) was applied to improve generalization. For binary otoscopic classification (normal vs pathology), performance was assessed on an independent test set of 100 images (50 normal, 50 pathological); an analogous pipeline was adapted for primary classification of common laryngeal diseases.

RESULTS

The baseline VGG16 ear model achieved accuracy 92%, sensitivity 94%, specificity 90%, F1-score 0.924 and ROC-AUC 0.938 on the independent test set, demonstrating robust discrimination between normal and pathological findings. Confusion-matrix analysis showed few false negatives, mainly very early or subtle lesions, and slightly more false positives related to mild hyperemia or edema. Extension of the architecture to laryngeal images yielded promising performance and ROC-curve characteristics, supporting generalizability of the approach across ENT subsites. The models were integrated into a cloud platform and piloted in three Moscow medical organizations; 3451 patients were examined between May and November 2025, with a 25% relative increase in detected laryngeal neoplasms and high physician satisfaction.

CONCLUSIONS

A deep learning–based computer vision system for ear and laryngeal endoscopy demonstrates high diagnostic accuracy and clinically meaningful impact when used as a real-world screening and quality-control tool, warranting further multicenter validation.

deep learning; computer vision; endoscopy; otorhinolaryngology; laryngeal cancer; middle ear diseases; screening; decision support systems

OP-587

The Effect Of Nintedanib In Vocal Fold Damage: An Experimental Animal Model

Nurbanu Kaçar[1], **Ahmet Erim Pamuk**[1], **Olcay Kurtulan**[1], **Ayşe Arzu Yiğit**[2]

[1]*Hacettepe University, Ankara, Turkey;* [2]*Başkent University, Ankara, Turkey*

BACKGROUND & AIM

Vocal fold scar is histologically characterized by fibroblast proliferation, collagen deposition, elastin fiber loss, and changes in ECM components in the mucosa and superficial lamina propria after trauma, resulting in dysphonia.

Nintedanib is an antiangiogenic, antineoplastic, and antifibrotic molecule used in the treatment of idiopathic pulmonary fibrosis, acting on FGFR 1, VEGFR 2, PDGFR α, and β. Clinical studies have shown its efficacy in reducing fibroblast proliferation and migration, inhibiting the transformation of fibroblasts into myofibroblasts, suppressing inflammation, and reducing neoangiogenesis.

The success of nintedanib in fibrosis driven diseases suggests a potential role for its treatment in vocal fold scar.

MATERIAL & METHODS

Three experimental groups, each consisting of 10 rats, were formed. The control group underwent vocal fold injury by microscissor to the left vocal fold and received oral saline for 14 days. The low-dose experimental group underwent vocal fold injury by microscissor to the left vocal fold and received 25 mg/kg of nintedanib once daily via oral gavage for 14 days. The high-dose experimental group underwent vocal fold injury by microscissor to the left vocal fold and received 50 mg/kg of nintedanib once daily via oral gavage for 14 days.

The rats were sacrificed on day 15, and laryngeal specimens were examined histopathologically.

RESULTS

The groups were scored separately on a scale of 0-3 by a pathologist in a double-blind method for histopathological analysis of lymphocyte and neutrophil infiltration, fibroblast proliferation, presence of vascular organization, and collagen deposition.

Lymphocyte infiltration in the control group was found to be significantly higher than in the low-dose and high-dose experimental groups (p: 0.0, p: 0.0).

No difference was observed between the groups in terms of fibroblast proliferation (p: 0.519), however, collagen deposition was significantly lower in the high-dose experimental group than in the control group (p: 0.037).

No statistically significant difference was found between the groups when comparing the scores for the presence of vascular organization (p: 0.214).

CONCLUSIONS

Our study demonstrated the anti-inflammatory and the antifibrotic effects of nintedanib on scar formation in vocal cord injuries. Its effect on angiogenesis was not observed after 2 weeks of treatment.

Further studies are needed to determine long-term effects.

Recovery Of Vocal Fold Paralysis After Chemotherapy And/Or Radiotherapy: A Case Series

Sung Joon Park[1], **Pilkeun Jang**[2], **Seo Young Kim**[2], **Jeon Seong**[2], **Wonjae Cha**[2]

[1]Chung-Ang University Gwangmyeong Hospital, Chung-Ang University College of Medicine; [2]Seoul National University Bundang Hospital, Seoul National University College of Medicine

BACKGROUND & AIM

The recurrent laryngeal nerve (RLN) is the primary motor nerve responsible for innervating the intrinsic muscles of the vocal folds. Because its course extends from the carotid sheath through the mediastinum, along the tracheoesophageal groove, and up to the thyroid region, it is vulnerable to dysfunction caused by a wide range of pathologies in these areas. Nerve paralysis due to invasion by malignant tumors has traditionally been considered irreversible. The purpose of this study was to analyze 18 cases in which recovery of RLN function was observed following chemotherapy and/or radiotherapy.

MATERIAL & METHODS

This is a single-center retrospective review. We collected data on sixteen patients who experienced recovery of vocal fold function after chemotherapy and/or radiotherapy. We analyzed their demographics, primary diagnosis, side of vocal fold paralysis (VFP), anatomical cause of the paralysis, treatment modality, treatment regimen, duration of paralysis, and tumor burden reduction documented on imaging studies.

RESULTS

Eleven (61.1%) patients had lung cancer, three (16.7%) had thyroid cancer, two (11.1%) had esophageal cancer, one (5.56%) had lymphoma, and one (5.56%) had common bile duct cancer. Twelve (66.7%) patients underwent chemotherapy only, two (11.1%) patients underwent radiotherapy only, and four (22.2%) patients underwent chemotherapy and radiotherapy. Median time to recovery of VFP was 84 days (range, 6-361). Thirteen (72.2%) patients showed complete recovery from immobile vocal folds, whereas five (27.8%) patients exhibited partial recovery. Imaging studies demonstrated tumor size reduction ranging from 47.0% to 100% in patients with available pre-VFP and post-VFP imaging.

CONCLUSIONS

This study included the largest reported series of patients whose VFP recovered after chemotherapy and/or radiotherapy. Our findings indicate that nerve paralysis due to cancer invasion can be reversible when tumor burden is effectively reduced through treatment.

Can A 30-Second Smartphone Sustained /A/ Triage Dysphonia? Acoustic–Cepstral Classification Of Benign Lesions And Glottic SCC

Nevbahar GENÇ, MD[1], **Eray UZUNOĞLU, MD**[1]

[1]İzmir Bakırçay University Faculty of Medicine, Department of Otolaryngology–Head and Neck Surgery, Çiğli Training and Research Hospital, İzmir, Türkiye

BACKGROUND & AIM

Dysphonia is a common reason for ENT consultation and may reflect benign vocal fold lesions or early glottic squamous cell carcinoma (SCC). We evaluated whether a single 30-second smartphone-recorded sustained /a/ can support voice-based triage. Hypothesis: Acoustic/cepstral features can discriminate (1) normal vs pathological laryngeal status and enable exploratory (2) benign vs glottic SCC discrimination.

MATERIAL & METHODS

Prospective single-centre pilot study including 76 adults: 30 controls with normal laryngoscopy/stroboscopy, 30 benign vocal fold lesions, and 16 histopathology-confirmed glottic SCC. A standardized smartphone protocol was used (WAV, 44.1 kHz/16-bit, mono; 15–20 cm). Praat-derived features included jitter, shimmer, mean F0, HNR, intensity, and CPPS (dB). VHI-10 was collected in pathological groups only and assessed only for the benign–SCC task. Two binary SVM classifiers were evaluated using repeated stratified k-fold cross-validation: Model-1 (control vs pathological) and Model-2 (benign vs SCC). Discrimination was summarized by AUC-ROC (and PR-AUC for Model-2) with bootstrap 95% confidence intervals. For reporting threshold-

dependent metrics (sensitivity, specificity, PPV, and NPV), an operating threshold was selected using the Youden index on cross-validated out-of-fold predictions.

RESULTS

The SCC group was older than controls/benign and comprised males only (p<0.001). For Model-1, CPPS alone achieved an AUC of 0.804 (95% CI 0.701–0.896); at the selected operating point, sensitivity was 63.0%, specificity 96.7%, PPV 96.7%, and NPV 63.0%. For Model-2, the multifeature SVM achieved an AUC of 0.798 (95% CI 0.658–0.915); at the selected operating point, sensitivity was 68.8%, specificity 83.3%, PPV 68.8%, and NPV 83.3%. Adding VHI-10 did not improve discrimination (AUC 0.743). In exploratory analyses, adding demographic/smoking variables increased Model-2 AUC to 0.946, likely reflecting cohort imbalance. CPPS differed across groups (p<0.001).

CONCLUSIONS

A single 30-second sustained vowel recorded on a smartphone provides clinically relevant discrimination of normal vs pathological voice in this pilot cohort. Benign–glottic SCC discrimination using voice features alone is feasible but exploratory; larger, demographically balanced cohorts with external validation are required. A simple 30-second smartphone sustained /a/ can help prioritize dysphonic patients for prompt laryngoscopic evaluation, supporting practical clinic-level triage.

Vocal Fold Muscle Reduction As A Second-Line Voice Feminisation Procedure

Miss Melanie Dias[1], **Miss Abi Simpson**[1], **Miss Gemma Clunie**[1], **Miss Christella Antoni**[1], **Mr Chadwan Al Yaghchi**[1]

BACKGROUND & AIM

Voice feminisation surgery using the modified Wendler glottoplasty (MWG) remains the gold standard surgical intervention for transfeminine patients seeking pitch elevation. However, a subset of patients continue to experience unsatisfactory pitch elevation following MWG. Given the significant role of voice in gender perception and quality of life, there remains a need for effective second-line interventions. In this study, we present vocal fold muscle reduction (VFMR) as a secondary procedure for voice feminisation in patients with suboptimal outcomes following MWG.

MATERIAL & METHODS

A retrospective review was conducted of 20 patients who underwent VFMR following previous glottoplasty.

Reading and free-speaking fundamental frequency (F0), Voice Handicap Index-10 (VHI-10), and Trans Woman Voice Questionnaire (TWVQ) scores were compared pre- and post-operatively.

Two experienced speech and language therapists, who were not directly involved in patient care, acted as independent blinded assessors of vocal quality using the GRBAS scale, and of perceived vocal femininity using a visual analogue scale (VAS).
